When the seat is occupied the tank fills, when vacated the water in the tank discharges into the closet. The pipe and valve drain into the trap, as shown, leaving no water above freezing point, it matters not at what height above the seat the tank is placed.

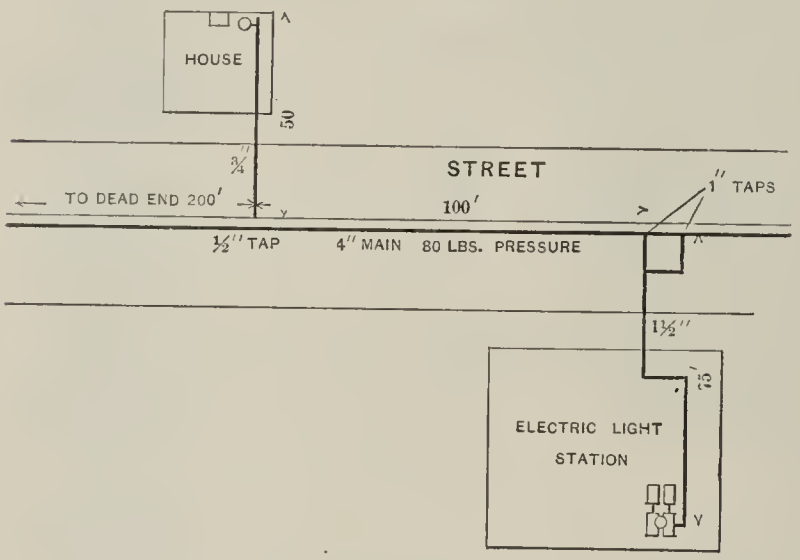
The Business Situation.

The belated wintry weather which arrived last week and spread its frigid touch over a large section of the country, as if to make up for past deficiencies, has made its presence felt in storms of unusual severity, impeding communications and crippling transportation to a considerable extent during the past week. The volume of general trade has suffered thereby, not in the West only, but also in the Middle and Eastern States, where heavy snows have temporarily interfered with the distribution of merchandise. At the same time the sale of winter goods, which had been unusually slack during the mild weather which prevailed earlier in the season, has received a fresh stimulus. As a whole, the volume of current business continues excellent. Judging by the trade reports, the month of January was the most active in point of general trade of any corresponding period in the commercial history of the country. With the exception of December, 1892, it furnished the largest total of bank clearings for any one month on record, aggregating close to six billion dollars, a gain of no less than 33 per cent. over January, 1897, and of 30 per cent. over January, 1896. Moreover, the gains were distributed over the entire country, only the cotton manufacturing centers of New England, where strikes have closed many of the mills, making an unfavorable showing. The manufacturing industries generally display marked activity. Most of the mills and factories are running full, and many overtime, to keep up with business in hand or in prospect. Merchants report a better feeling among retailers and consumers. Orders now coming in are reported to be on a more liberal scale, and there is a more distinct tendency toward buying for stock than has been in evidence for a long time. Prices, while showing no noteworthy changes, are in general steady, with an upward tendency in some quarters. The price of cereals has advanced sharply, wheat selling at the highest point in six years, and continued heavy exports of wheat and corn, despite the advance, show plainly the urgent call for breadstuffs abroad. The stock market shows pronounced strength, with heavy speculative and investment buying, on an advance in prices for the week averaging $1.37 per share in railways and 61 cents per share in "industrials." The tonic effect of the emphatic rejection by the House of the Teller resolution to pay interest on Government bonds in silver, and of the declaration in favor of the maintenance of the gold standard made by President McKinley at the banquet of the Manufacturers' Association, has done much to stimulate confidence in the minds of the business community here, while its favorable influence abroad is seen in the strength and activity of American securities in the European markets. The record of business failures last week showed the smallest total for five years. Railway earnings continue to improve radically and the gains reported cover practically all the roads, the increase for last month averaging about 15 per cent. over January, 1897.

Peace in the Western Coal Trade.

According to general opinion one of the most important industrial contests in the history of this country came to a peaceful conclusion in Chicago last week after a ten days' struggle. The bituminous coal operators and miners of Illinois, Indiana, Ohio and the Pittsburgh thin vein district of Western Pennsylvania, with a portion of West Virginia, met to agree upon a scale of wages for the year ending April 1, 1899, in order to avoid friction in this important industry. It is stated that no less than 200,000 miners are affected by the scale which was adopted. This is not only an enormous number of workmen, but dependent upon their labors is a much greater army employed in all sorts of occupations in the Central West which cannot be prosecuted without a regular supply of coal. The questions to be settled between the operators of the different sections and the coal miners were so complicated that from time to time the difficulties seemed insurmountable, and hope of harmony would almost be extinguished. But both sides were deeply anxious to have a fair settlement made and renewed efforts were put forth as old propositions were set aside, until finally common ground was struck amid mutual rejoicing. The leading features of the agreement are a uniform working day and a straight increase of 10 cents per ton in miners' wages. The uniform day is to consist of eight hours, with eight hours' pay, and for six days per week, with uniform wages for day labor in all districts.



The New York Trade School Lectures.

The management of the New York Trade School has this year provided a series of entertainments for the pupils which should be beneficial as well as entertaining. The last lecture was by Paul Du Chaillu, the African explorer, and a large audience listened with great interest. The next lecture will be given on February 15 and will be by Cosmos Mindcliff, the well-known writer and explorer, who for years was connected with the United States Geological Survey Department. His ethnological researches in Arizona among the cliff dwellers will be the subject of his lecture, and it will be illustrated with numerous stereopticon views taken from photographs made by Mr. Mindcliff.

THE LETTER BOX.

Shock in Service Pipes from Pump.

From G. C., Dover, N. J.—As habit ofttimes becomes a custom, so appealing to the Letter Box becomes a necessity. The trouble in this case is with a double acting pump. In July last we put a plumbing system in a dwelling house situated on a corner, as will be seen in the sketch, and on the left you will notice an electric light plant. Things went smoothly until the middle of Novem ber when the electric light people turned the water on the pump from the street. Previous to this they had taken their water supply from the river nearby. But the pump did not draw sufficient water, as the sand had cut one of the cylinders, so the street pressure was needed to help it along. You will see that the electric light plant is on one side of the street and the house on the other quite a distance away. The end of the main is dead, as is shown on the diagram. The pressure is 80 pounds per square inch. The first thing noticed at the house was the action

Shock in Service Pipes from Pump

of the pump. The stroke could be heard nearly as plain as in the station, and in a few days the bottom of the boiler, although concave in shape, vibrated up and down like the throat of a greenback bull frog on the bank of a mill pond on a hot summer day, and in less than two weeks the writer had to replace the boiler with a new one, as the bottom cracked from the strain. What seems strange about the circumstance was that the boiler was stamped "Tested 150 pounds per square inch." Now should the action of the pump strain the boiler in that way? The writer placed a water gauge at the bib on the sink on the same floor, and had the pump in question started. The pressure was irregular, varying from 74 to 80 pounds. The lavatory is connected with ½ inch 2 A A lead pipe to the basin cock, according to the table given for working pressure of pipes, that weight being 60 pounds. Now how is it that the bottom went out of a new boiler? There are a great many theories that will not stand in practice, and I think this is a case in point, unless the boiler bottom was defective. As far as outside inspection showed, however, it was all right. To remedy this trouble I placed a 3 inch pipe 2 feet long on the ¾ main in the cellar for a cushion, and that muffled the sound so it could not be heard unless you placed your ear close to the air chamber. I don't think placing an air chamber in the suction of the pump would properly confine the shock so as not to make the boiler "dance" as they expressed it. But to overcome the trouble entirely I suggested connecting the dead end of main with the 6-inch main a block away. That would let the momentum equalize itself and pass off without any trouble. There are some people who differ in opinion from me, and I submit this to your judgment and await your decision.

Answer.—The water in a pipe system is non-elastic to a high degree, almost equally with the iron pipes of a water supply plant, and sounds and the harsher vibrations of a pump are sometimes carried through a whole water distributing system. The breaking of the head of the kitchen boiler was due to the constant vibration of the water and its pressure acting upon the weak part of the head, causing it to vibrate in unison with the strokes of the pump

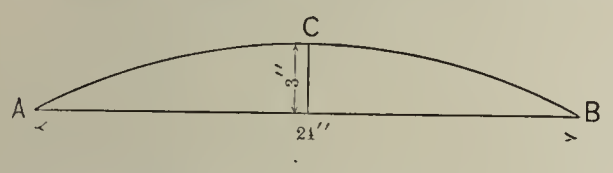
There is the strongest probability, as indicated by the vibration of the water, that the pump has no air chamber on the suction side, or if it has one, that it has lost its air and the pump is moving a long column of water by jerks at every stroke. As the water is not elastic, the long column of water throughout the neighborhood cannot keep pace with the pump and stop and start with every stroke. The consequence is that a vacuum is formed in the pipe near the pump at every pull of the piston, which separates the water, and at the end of the stroke the water at the point of vacuum rushes together with a shock like a hammer striking the pipe. The impact is transmitted to great distances, and when it meets a yielding substance, like the head of the boiler in question, will in a little time destroy the tenacity of the copper and make it give way. The remedy is to put a large suction air chamber on the suction pipe near the pump with appliances to keep it nearly full of air, for water under pressure, as in this case, soon absorbs the air in the chamber and it becomes solid water when the old trouble will repeat itself. Another remedy is to draw the water into a tank with a regulating ball cock and pump from the tank. The 3-inch pipe that you placed in cellar will act as an air cushion, if arranged for that purpose. The connection of the dead end of the street main to the next main is very desirable to prevent stagnation of the water beyond the last tap, but it will not stop the hammer of the water.

Laying Copper Valleys.

From C., Mansfield, Ohio.—Will some reader of *The Metal Worker* kindly inform me through the columns of *The Metal Worker* what is the best way to put in new copper valleys on a slate roof, having two-thirds pitch? Shall I take off the slate on each side of the valley or cut the copper in pieces 10 x 14 and slide each piece up under the slate? There will be 16 valleys to be renewed, each about 16 feet long, and I would like to hear from some one who has done work of this kind before what the best and safest way is to do it.

Price for Connecting Service Pipes.

From T. R. W., Port Gibson, Miss.—I am doing business in this town, which has about 3000 inhabitants, and where a system of water works is now being put in. I would like to obtain information through *The Metal Worker* as to what is considered a fair price for tapping the main and running the pipes to the curb line. Is it customary for the corporation to buy a tapping machine, as the corporation has been thinking of doing this? I should be glad to hear from the readers on this subject.



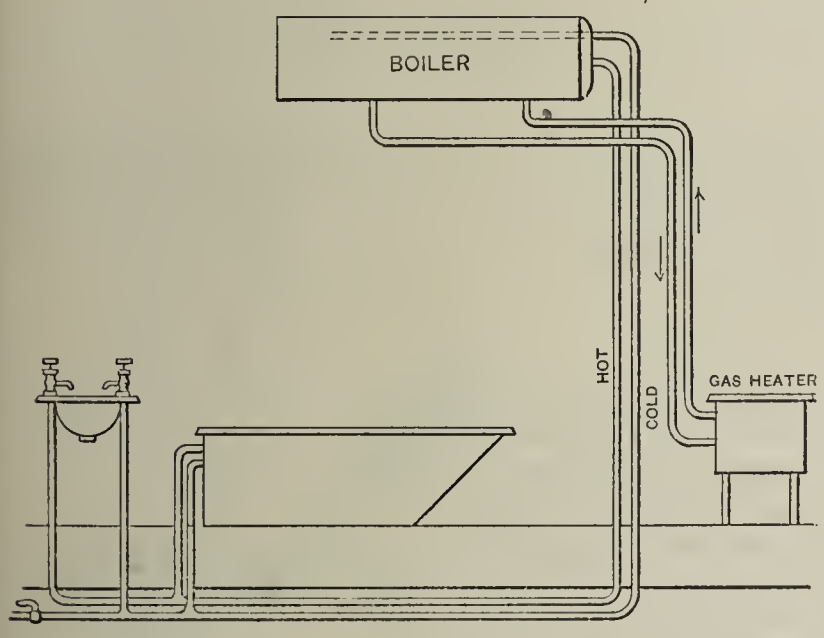
Note.—We trust that the inquiry of this correspondent will not be overlooked by our readers. In the meantime we would say that the custom in regard to tapping the water mains varies, but as a rule the corporation purchases its tapping machine and inserts the tap into the main. In some instances it also runs the pipe to the

curb line. Some of the manufacturing houses, in addition to making what are known as corporation taps, also sell goose necks for attaching to the taps to which several feet of lead pipe are connected by means of a wiped joint, leaving the plumber to connect his service pipe to the end of this lead pipe. If our correspondent will write to the water works commissions of some of the towns in his vicinity of about the same size as his own they will doubtless give him the figures which they pay for doing the work about which he inquires. In so small a town it is quite possible that the Water Works Board would be willing to purchase the tapping machine and arrange to have some competent plumber tap the main and make the connection.

Finding the Radius of a Circle from Chord and Rise.

From E. M. B., Celina, Ohio.—Be kind enough to publish in *The Metal Worker* a rule for setting a pair of compasses to draw a circle, when the length of the chord and the rise are given, as shown in the sketch sent herewith. The line A B is 24 inches long and the arc A B C rises 3 inches from the chord.

Answer.—A rule for this is somewhat complicated, but we think our correspondent will be able to follow it. The radius, which is the distance which the compasses would have to be set, is equal to one-half the distance A



Finding the Radius of a Circle from Chord and Rise.

B, which is equal to 12 squared (or multiplied by itself), which equals 144, added to the hight 3 inches squared, which is 9, making 153 for the sum. This figure is divided by twice the rise or 6, giving for an answer 25½ inches, which is the radius of a circle that will pass through the points A, C and B.

Setting a Vertical Boiler Horizontally.

From H. J. D., Friendship, N. Y.—There is in use in this place a boiler suspended horizontally from the ceiling of a bathroom, which does not work satisfactorily. The

Setting a Vertical Boiler Horizontally.—Fig. 1.—The Piping System that is Unsatisfactory.

water in the boiler is heated by an instantaneous gas heater and connected as shown in Fig. 1. The people using the fixtures say that they draw hot water from the cold pipes and *vice versa*. Sometimes on opening the hot water faucet at the bathtub hot water only runs a short time, then it comes cold. I should be glad to have you give your opinion as to whether the connections are properly made, and if not how they should be made.

Answer.—In the book entitled "Kitchen Boiler Connections," which can be furnished by our book department, a chapter is devoted to this subject. The unsatisfactory service in the case presented is entirely due to improper piping connections. A vertical boiler is not intended to be used horizontally, but can be made to render efficient service if properly piped. One method is presented in Fig. 2, which allows sediment to be washed out of the boiler in case of accumulation. It is placed so

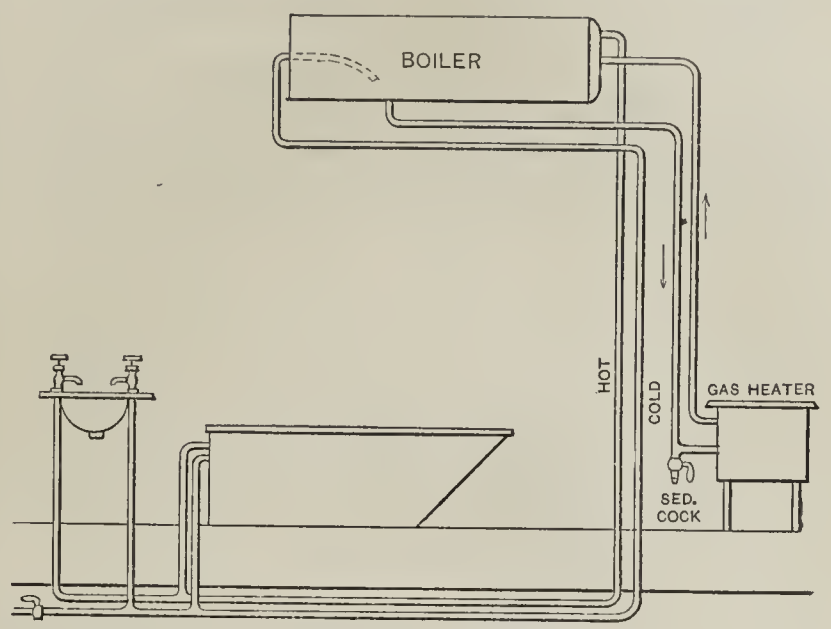


Fig. 2.—The Remedy Suggested.

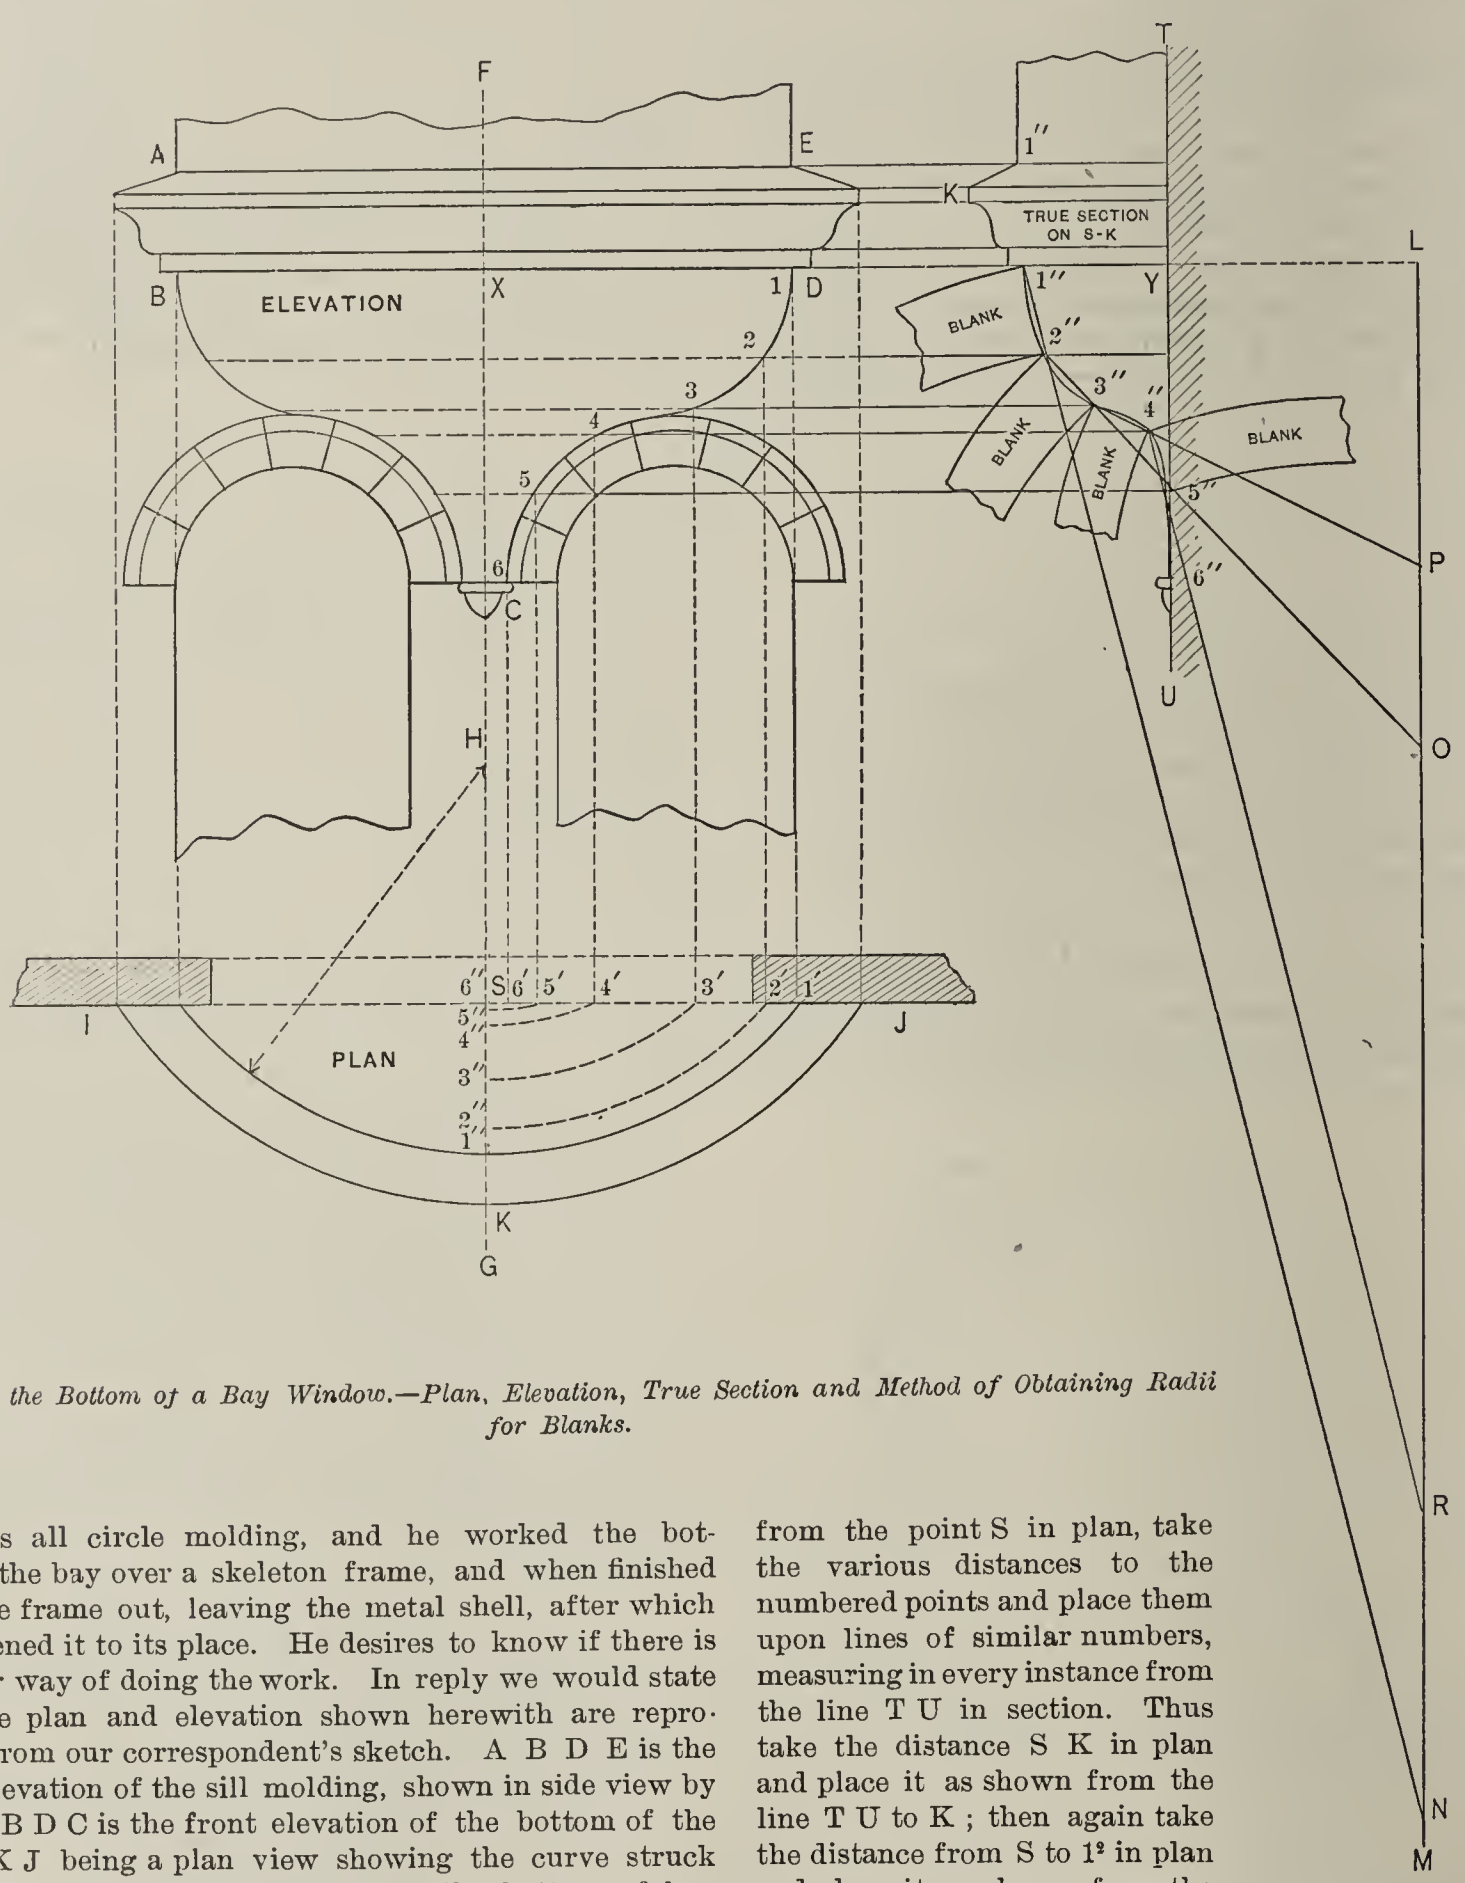
that the hot water from the water heater enters the opening that is ordinarily used for the hot water service pipe at the top when the boiler is placed vertically. The cold water is brought to the water heater from what is ordinarily the side opening in the boiler. This affords opportunity for a free circulation and a storage of the hottest water at the top of the boiler. By placing a sediment cock as shown at the water heater the boiler and water heater can be drained. A pipe can be carried from this sediment cock and connected with the house drain or arranged to discharge over some fixture so as to make the flushing of the system a simple matter free from labor. The cold water delivery tube should be taken out of the boiler and the hot service pipe connected to it as shown. The cold water supply should be connected at what is usually the bottom opening in the boiler at the left end as shown. In order to prevent the inflow of cold water from mixing with the warmed water and chilling it, a curved delivery tube should be provided. The curved tube may be made of either sheet copper or seamless tubing, as the slight bend necessary can be easily made. If the hole to which the hot service pipe is connected is not near the outside of the boiler, or the top as placed, another curved tube should be used at that connection, the end of the tube turning upward so as to be near the top of the boiler where the hottest water is stored. If the system of piping is changed to conform with these suggestions, we think there will be none of the troubles now experienced. We shall be glad to have an account and sketches of any changes that may be made, and the success that attends them.

Gas Heated Smoothing Irons.

From K. S., Yonkers, N. Y.—Will *The Metal Worker* please inform me who manufactures pressing irons such as tailors use that are heated by gas?



Answer.—Goods of this character are manufactured by the Chalfant Mfg. Company, Lancaster, Pa.

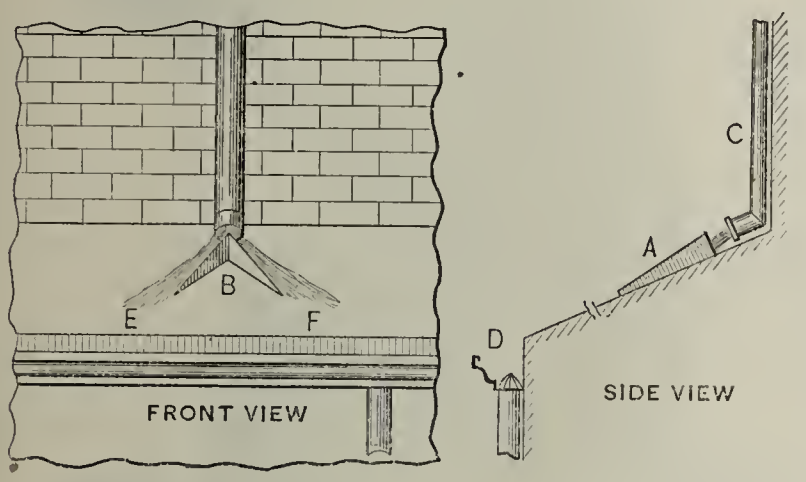
The De Witt Wire Cloth Company, New York, are now making wire cloth of aluminum for certain special purposes. On account of its lightness there seems to be a field for aluminum wire cloth in directions where that quality is especially desirable. Its immunity from rust is also a recommendation. It is considered that the metal will be found specially suited to mosquito netting. The difficulty of securing a sufficiently fine gauge of aluminum wire is, however, said to be an obstacle to its use in this and other fields at the present time.

SHEET METAL WORK.

Making the Bottom of a Bay Window.

A correspondent writing from Reading, Pa., asks if there is a rule for making the bottom of a bay, as shown in the sketch, and such being the case he will be glad to see the drawing. The sill molding, he says, is made the same as all circle molding, and he worked the bottom of the bay over a skeleton frame, and when finished took the frame out, leaving the metal shell, after which he fastened it to its place. He desires to know if there is a better way of doing the work. In reply we would state that the plan and elevation shown herewith are reproduced from our correspondent's sketch. A B D E is the front elevation of the sill molding, shown in side view by K, and B D C is the front elevation of the bottom of the bay, I K J being a plan view showing the curve struck from the center H. As the front of the bottom of bay must have the shape indicated by B C D taken on the line I J in plan, it will be necessary to establish a true section on the line S K in plan from which to obtain the radii for blanks or patterns. To obtain this true section proceed as follows. Divide the curve D E into any number of spaces, as shown by the small figures 1 to 6. From these points and at right angles to B D drop lines as shown, intersecting the wall line I J at points 1^1 to 6^1. Then with H as center and radii equal to H 6^1, H 5^1, &c., draw arc intersecting the center line S K, as shown from 1^2 to 6^2. At any convenient point opposite the front elevation draw any vertical line, as T U. Now extend the lines from the points in the profile E D C until they intersect the vertical line T U, as shown. Now, measuring in every instance from the point S in plan, take the various distances to the numbered points and place them upon lines of similar numbers, measuring in every instance from the line T U in section. Thus take the distance S K in plan and place it as shown from the line T U to K ; then again take the distance from S to 1^2 in plan and place it as shown from the line T U to 1^2 on the line 1 in section. Proceed in this manner until all the points in the true section have been obtained. Trace a line as shown, when 1^2 6^2 Y will be the true section on the line S K in plan.

Making the Bottom of a Bay Window.—Plan, Elevation, True Section and Method of Obtaining Radii for Blanks.



For the patterns or blanks proceed as follows. It should be understood that the usual method for making

the bottom of bays round in plan is to divide the profile of the molding into such parts as can be best raised or stretched. Assuming that this has been done, take the distance from 1^2 to H in plan, and place it as shown by 1^2 to L in section. From the point L draw a vertical line, L N, as shown. For the pattern for the mold 1^2 2^2 in section average a line through the extreme points, as shown, and extend the same until it meets L N at N. Then with N as center and N 2^2 and N 1^2 as radius describe the blank, as shown. The other blanks are obtained in precisely the same manner. The lower portion shown from 5^2 to 6^2 is a straight strip stretched as required. The upper or convex molds will be raised either by hand or machine. If by hand use the raising hammer and block. The lower or concave mold will be stretched by machine or hand, using the stretching hammer and stake. A model should be made to which to raise and stretch the work. This model may be made as follows : If the bay is large, draw the elevation of the bottom of bay on the floor and put in the various horizontal lines 2, 3, 4, 5 and 6, also the center line X C, upon which place the true section 1^2 Y 6^2. Now upon the various horizontal lines 2, 3, 4 and 5 place sections of similar numbers shown in plan. Then upon this model the molds will be raised or stretched to conform to the various sections. Tack the joints or seams, take it off the model, rivet and soak with solder. Allowance for lap should be made on all patterns.

WATER SPREADER FOR STEEP ROOF.

BY W. N.

It is often the case that the rain water from an upper roof is drained through leaders on to a lower roof. When the latter is very steep and the upper roof has a large surface

Water Spreader for Steep Roof.—Fig. 1.—Front and Side View of Water Spreader.

the rain water in a storm or shower rushes through the leader and out of the elbow, shown at C, Fig. 1, and in some cases the force of the rush not being broken it is apt

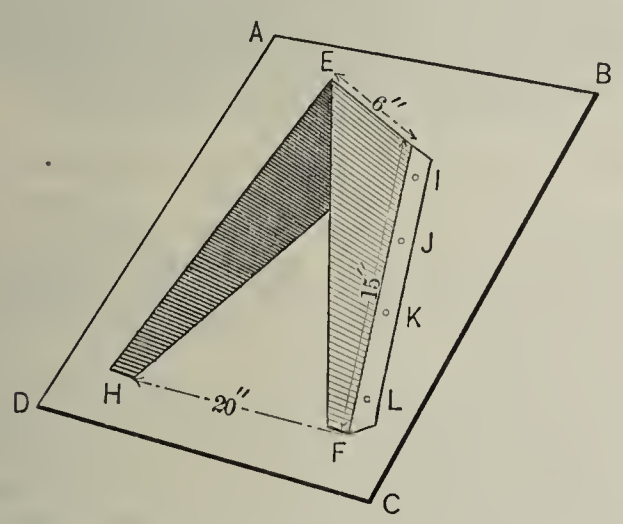


Fig. 2.—General View of Water Spreader as it would Appear on a Steep Roof.

to flow or spray over the gutter D, shown in the side view. To avoid this and to break the rush of the water there is shown in Fig. 2 a view of a water spreader with dimensions. The spreader is riveted on a sheet of tin, copper or sheet iron, as required. If the roof is of tin or copper a lock is edged on to the sheet A B C D and laid in with the courses, while if the roof is of slate or wood shingles the spreader is fastened to heavy galvanized sheet iron and slated in with the courses. E F H represents the spreader, being 6 inches high, 15 inches long and having 20-inch spread, and is riveted at I J K L on each side. In Fig. 1 is shown the method of placing the spreader in position, A being the spreader in side view and B in front view. The water rushing through the leader C is cut by the spreader, throwing the water in either direction at E and F, then flowing into the gutter D.

TINSMITHING FIFTY YEARS AGO.

Through the courtesy of John D. Ottiwell, 199 Third avenue, New York City, we are enabled to present a portion of a list that was of great interest to tinsmiths in New England a half a century ago. To many in the trade some of the items will not be understood, the ovens mentioned being similar to what many have heard of as tin kitchens. The dish kettles with pewter bottoms were made in the usual way and afterawrd reinforced on the inside with a heavy coating of pewter, so as to better stand the wear and tear of dish washing and the contact with plates and crockery. The 20 stoves which a man was supposed to make in a day were foot stoves—that is, tin water cans intended to be filled with hot water and provided with an opening for filling, which was stopped with a cork. The lanterns referred to in this case did not consist mostly of glass as the lanterns of to-day, but the light was shed through openings cut with what was known as a lantern chisel or punch, having a cutting edge about ¾ inch long and ⅛ inch thick, making a slot that was oval in shape. It will be noticed that the price is given in English money—shillings and pence. This list slightly differs from the list that was used in the South, which it is possible some of the older workmen of the South have in their posession and which would interest the readers of *The Metal Worker* if it could be reproduced.

Mr. Ottiwell, after serving his apprenticeship, worked in many of the Southern States, going down the coast until he reached New Orleans and then up the Mississippi River, working in several of the larger towns, and he is familiar with plantation life of the early period. From the Mississippi River he came east to Pittsburgh and over the Alleghany Mountains previous to the building of any railroad. He established his present business at 199 Third avenue in 1851, and has furnished us the following bill of days' work that was used in New England, having copied it from a list owned by a fellow workman in 1844:

Bill of Days' Work and List of Prices for Plain and Japanned Ware for New England.

	⌐Selling price.¬ Shillings.	Pence.
3 large ovens	20	0
4 second size	18	0
4 third size	16	0
6 fourth size	12	0
16 large dish kettles (bottoms pewtered)	5	6
16 large dish kettles (without pewter)	5	0
10 water pots	4	0
18 large pails	4	0
18 large pans	4	0
20 stoves	4	0
24 10-quart pails	3	6
24 10-quart pans	3	6
18 gallon coffee pots	3	6
18 large covered pails	3	6

20 3-quart covered pails	2	0
24 small wash bowls	2	0
24 saucepans	2	0
30 ½-gallon measures	1	6
48 bean pans	1	6
72 graters	0	7

In his journeyman days Mr. Ottiwell remembers distinctly being called upon to heat a conservatory attached to the mansion of a customer, and, as there was no chimney or opportunity for using a stove in the conservatory,

the first example of hot air furnace heating he ever saw was planned for the work. A large cast iron stove was encased in brick work and pipes run from the chamber to the conservatory. This hot air system was in use for several years, giving satisfaction. Mr. Ottiwell also, with the assistance of a fellow workman, received one of the first hot air furnaces that was shipped from Connecti cut to New York at Peck slip, and set it up in a hotel building near where the United States Express Company's present office is located on Broadway. This was previous to 1844.

EMPLOYERS' ASSOCIATION OF ROOFERS AND SHEET METAL WORKERS.

As a result of several well attended meetings held during December and January by the manfacturers of builders' sheet metal work in New York and adjoining cities, it was decided to take out articles of incorporation. A certificate of incorporation was therefore filed in the County Clerk's office, at New York, on Wednesday afternoon, February 2, of the Employers' Association of Roofers and Sheet Metal Workers of Greater New York and Adjoining Cities. The certificate, which was signed by Justice Freedman in the Supreme Court, sets forth that the association is organized

To foster the trade and interest of manufacturers of sheet metal roofing, cornices, skylights, corrugated iron work, ventilating and heating pipes, and all other sheet metal work ; to reform abuses relative thereto, to secure freedom from unjust and unlawful exactions, to diffuse accurate and reliable information as to matters connected with the trade, to secure uniformity and certainty in the customs and usages of said trade and commerce, and of those interested therein ; to settle differences between its members, and to promote a more enlarged and friendly intercourse between business men in said trade.

The incorporators of the new association are Jacob Ringle, Jersey City, N. J.; John Seaton, Brooklyn; George Hayes, Chas. T. Galloway, John Morrow, James Smith and John J. Grace of New York.

At a recent meeting the following officers were elected:

President, George Hayes.

Viee-President, Chas. T. Galloway.

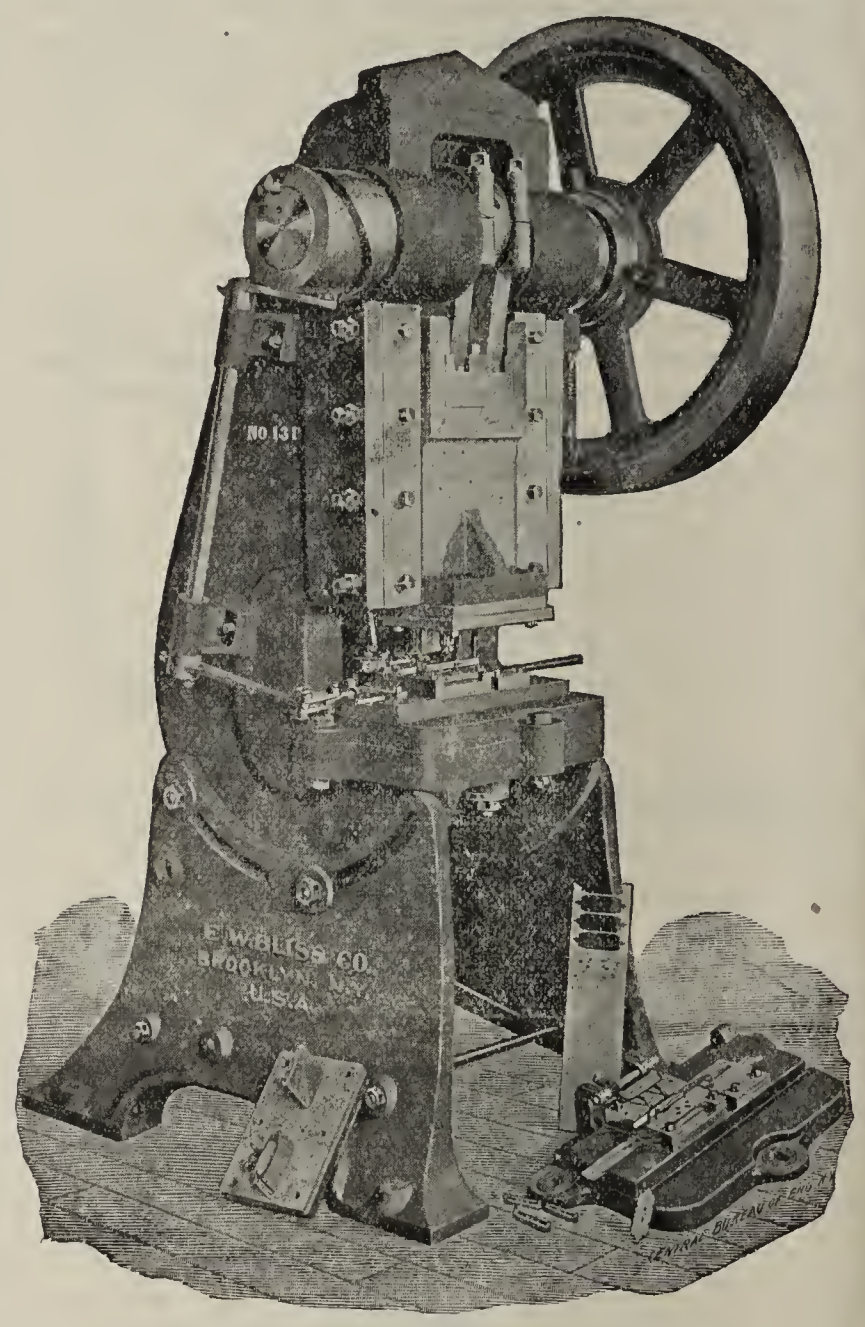
Seeretary, J. R. McAfee.

Treasurer, Frank P. Cunningham.

A meeting of the incorporators will be held Tuesday, February 8, when an Executive Committee will be appointed, and at that meeting a call will be issued for the first regular meeting of the new association, to which all manufacturers of builders' sheet metal work will be invited, with a view of learning the objects of the association and the benefits that are expected to be gained by membership.

FLASHINGS.

A large poster distributed by the Ferracute Machine Company, Bridgeton, N. J., and known as Sheet 30, presents illustrations of an extensive variety of Foot and Power Presses which they manufacture.



The Youngstown Iron & Steel Roofing Company, Youngstown, Ohio, have increased their capital stock to $50,000, and intend putting up an addition to their building, as they have recently made arrangements for the manufacture of Expanded Metal Lathing, Fire Proof Flooring and Bridge Flooring, and expect to do quite a large business in this line, in addition to their regular Corrugated and T and C Metal Lath. The business outlook they report to be decidedly promising for the coming year.

Marlin & Co., Incorporated, Liberty avenue and Twenty-fourth street, Pittsburgh, manufacturers of Conductor Pipe, Eave Troughs and Skylights and Cornices, have been awarded a contract for a large lot of roofing, skylight and ornamental cornice work for the new Market House to be built in the East End, Pittsburgh. The contract is one of the largest of the kind given out in Pittsburgh for a long time, and competition to secure it was quite keen. Marlin & Co. have numerous other orders on hand and are running their shops full time.

Pittsburgh was chosen Wednesday as the meeting place for the biennial convention of the Amalgamated Association of Sheet Metal Workers. The Executive Board of the association is now in session on the South Side, arranging for the event and discussing ro utine matters. The board is constituted as follows: President, H. H. Brauch, Peoria, Ill.; secretary, James Hughes, Pittsburgh; vice-presidents, F. C. Cole, Ithaca, N. Y.; M. F. Gilmore, Toledo, Ohio; J. H. Kennedy, Toronto, Ohio, and H. A. Daniel, Lexington, Ky. Wednesday the board visited the various tin plate factories and in the evening the officials were banqueted at the Hotel Jacobs. The organization has a membership of about 5000.

The Stiles Open Back Press With Push Feed and Finger Gauge.

The machine illustrated in the accompanying cut has been designed and built by the E. W. Bliss Company (owners and operators of the Stiles & Parker Press Company), 16 Adams street, Brooklyn, N. Y., for cutting, perforating and shaping at one and the same handling the lock cases used on satchel frames. It will be understood that the operator pushes the metal strip into the die against an automatic finger gauge, which permits of running the press continuously. After the piercing and punching operations, which are done in a double die, the blank is moved sideways into the forming die, which finishes it and drops it out of the press at a rate of about 60

The Stiles Open Back Press with Push Feed and Finger Gauge.

to 80 per minute. Similar feeds can be applied to other presses and are extensively used in the manufacture of belt hooks, tobacco tags, staples, &c., &c. Sometimes a roll feed is used in addition to the feed illustrated for feeding the stock.

The principal dimensions of the press as shown are as follows: Size of opening in bed, 5 x 12½ inches; width of opening in back, 15 inches; distance back from center of slide, 5½ inches; distance from bed to bottom of slide when up, 9⅜ inches; standard stroke of slide, 1½ inches; adjustment of slide, 1 inch; diameter and face of fly wheel, 38 x 5¼ inches; speed of fly wheel, 100 revolutions per minute; weight of fly wheel, 725 pounds; distance between gibs, 11 inches; total weight, about 3300 pounds.

An appropriation for the establishment of a Government powder factory for the manufacture of smokeless powder for the naval service is to be asked for from Congress in the naval bill now in preparation. This step will obviate the present difficulty of obtaining a sufficient supply of smokeless powder at short notice from private companies.

HEATING AND PLUMBING.

The New President of the Heating Engineers, ——Wiltsie F. Wolfe.——

The new president of the American Society of Heating and Ventilating Engineers is well known to many of our readers who recognize Wiltsie F. Wolfe in the portrait which we present. Mr. Wolfe was reared in an atmosphere alive with ideas on heating and heating apparatus, having been born in Troy, N. Y., on October 24, 1854. On March 6, 1870, he entered the employ of his father, who was a member of the firm of Hicks & Wolfe, Troy, N. Y. Here he became engaged in solving the problems of church heating with hot air furnaces, a branch of business to which the firm gave special attention. Since that time he has had a number of connections with manufacturing houses in the heating business, and for several years has made a special study of school house heating, in which field he has achieved an enviable success and reputation. Last year he formed the Wolfe Warming & Ventilating Company, Exchange Building, Boston, Mass., of which he is the president. His study in this field has led to several inventions for controlling heating and ventilating systems which he has patented. In New England, and in Massachusetts particularly, where there are stringent laws governing ventilation, he has had notable success in heating and ventilating school buildings, and in Baltimore, Md., also, plants that he has designed and installed are representative of the best systems in use. Mr. Wolfe is possessed of all the qualities for advancing the interests of the society, and the members have done well to place its affairs in his hands.

WILTSIE F. WOLFE.

The Call for the New York State Convention.

The call for the annual convention of the New York State Association of Master Plumbers has been issued by Secretary C. F. Fisher, over the signature of the president, W. G. Reed. The convention will open on Tuesday, March 8, in the city of Binghamton, and the headquarters will be at the Hotel Bennett, on Washington street. The call is accompanied by a credential blank, so that the different associations may fill out the names of the delegates and alternates and hand them in. The call is also accompanied by a notice that the per capita tax is now due and the statement that each association is entitled to one delegate for each ten members or fraction thereof, in addition to the president, who is a delegate by virtue of his office.

The specifications in a contract for public work in the city of Boston stated that union labor should be preferably employed. The contractors who received the contract did not employ exclusively union men, and in consequence an attempt was made to nullify the contract, and on suit the court holds that the Mayor did not terminate the contract, it being still in force. In his decision the judge said: "The court finds that the preference for union labor is without authority in law for the forcing of such discrimination between workmen in respect to the privilege to labor on public work which is paid for by taxes levied upon all. This discriminating clause is void. It is against public policy and is in violation of the State constitution and not in accord with the ideas of a government founded on equal rights, and it is inconsistent with an impartial administration of public business. It creates an unlawful and unconstitutional class privilege."

The Pierce, Butler & Pierce Mfg. Company.

An announcement has been received from the Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., relating to the steam and hot water heaters heretofore manufactured by them for the American Boiler Company. The Pierce, Butler & Pierce Mfg. Company will now not only manufacture but sell in the East the entire line of steam and hot water heating apparatus formerly sold by the American Boiler Company. The trade in the West will be looked after by Kellogg, Mackay & Cameron from 84 Lake street, Chicago. The New York office, at 94 Centre street, will be under the management of F. T. Bassett, Jr., and the Philadelphia office in charge of W. H. Peterson. The announcement states that two new constructions will soon be presented to the trade, one being a round sectional boiler for steam and hot water, and the other a vertical sectional boiler. It also points out that the company manufacture a complete line of steam and water radiators in all hights, of first-class workmanship, handsome design and efficient operation. They call special attention to the fact that they will carry ample stocks at the New York, Boston and Chicago houses to insure prompt deliveries to their customers. They refer to their new and extensive plant and its equipment with modern machinery so that they can produce high grade goods at the lowest possible prices and say they are prepared to deal generously with the trade. The company have had long experience in the manufacture and sale of boilers and have already established for their goods a wide reputation which aids the local contractor materially in making sales. A new catalogue is in course of preparation, which will be sent as soon as completed to those who apply for it. At the New York house, Manager Bassett has rearranged the office and showroom. Samples of the various boilers are at the front attractively decorated so that their construction may be examined and their operation explained. In the rear of the samples is the general office where catalogues and information can readily be secured by the trade. The back portion of the building is reserved for carrying a light stock of various parts of the goods made by the house and such trimmings as are needed by the trade. Here Manager Bassett has a private office, which seemingly will be of little use in view of the open and courteous treatment accorded the customers of the company.

Col. William T. McGurren, president of the Michigan State Association of Master Plumbers, issued a call for the annual convention of the association and Secretary W. E. Weatherby has sent out notices announcing that the meeting will be held at Lansing, February 15 and 16.

NATIONAL EXECUTIVE COMMITTEE MEETING.

CHANGE IN DATE OF CONVENTION.

A meeting of the Executive Committee of the National Association of Master Plumbers was held at the Revere House, Chicago, January 25, and 26, all members of the committee being present with the exception of C. C. Dewstoe and J. L. E. Firmin. The date of the convention was changed from June to April 13, 14 and 15, 1898. This was on account of the fear of many members that it would be too hot at San Antonio, Texas, the place selected for the convention, in June. Mr. Braden, the member of the Executive Committee from San Antonio, said April would be the best month of the year. Mr. Braden has been assured of one fare for the round trip and has hopes of doing even better. Mr. Braden read a paper dealing with the condition of the trade in his territory, which was in part as follows:

Texas, that little isolated spot upon the map whose growth was prematurely checked by the Gulf of Mexico, the Republic of Mexico and the Llano Estacado, greets you through her humble but earnest representative. I am glad that the committee met in this city. I believe every one has a desire to come to Chicago. We Texans particularly have a fellow feeling for the people of Chicago, because we are the next biggest thing on the map. You should have a fellow feeling for us because we keep you in meat. We do more than that for you. We send you the porterhouse and the tenderloin, and keep the horns, hoofs and tails. It is a solemn fact that you can get a better piece of Texas meat in Chicago than you can in Texas, which is a positive proof that we give you Chicago people the best of it. Since you fellows are coming down to visit us this year, we are not going to send all our good meat to Chicago; we are going to keep enough choice Texas steers to feed the delegates.

I am here not only as a member of the Executive Committee of the national association, which honor I fully appreciate, but also as president of the Southern League of Master Plumbers, the birth of which I believe marks a new era in the history of the plumbing business. We organized as thoroughly as possible under the national. We got everybody in but a few plumbers in the border cities. We were all members, for the most part friendly socially, but deadly enemies commercially.

To sum up, we murdered the business of plumbing and were fastening the crime upon our children. This was what Texas, one of the best organized States in the national, was doing. We began to think. There was no longer any money in the plumbing business. We had time to think. The result was the Southern League of Master Plumbers for the prevention of disease. In just seven months we opened the doors of the Legislature and secured the Texas State law. We had trade protection under the national because Texas was thoroughly organized, but we found that trade protection was only one of the very many things we needed, that trade protection without business harmony and co-operation did not add one dollar to our plumbing profit nor one iota to our standing among the people.

Instead of combining to put up the price of work we have been combining to perpetuate cheap and dangerous plumbing in which there is neither profit nor honor. A glance at *Dun* or *Bradstreet's* reports should convince the people that no money has been made in the plumbing business for a number of years outside of the very large cities. And even here, in Chicago, and in New York the rank and file have properly felt the grip of this era of relentless competition. The honest plumber has this excuse for the deplorable condition which I sketch. The people condemn the modern plumber without taking into account the wonderful improvement in method and appliances, and this ignorance of the public regarding the progress of sanitary plumbing has forced the honest plumber to do what we designate as "skin work" in localities where there is no law or inspection. A short time ago we were ignorant of these things, and that was an excuse, but in the light of modern progress we have learned the relation of plumbing to health, and if we do not formulate methods to protect the people from the dangers of defective plumbing and drainage we will be classed as criminals.

In this connection I desire to state that the most ridiculous charge to which we are subjected in our efforts to remedy some of these deplorable conditions by sanitary law is that the law we urge is believed to be a gigantic swindle imposed upon a long suffering people by a shameless combine. This would be funny if it were not pitiful. We plumbers know that the absence of law and inspection gives us every opportunity to defraud and rob the people by means of cheap labor and defective material, while the right kind of State law, examination, registration and inspection makes such deceptions impossible. Now, if our association was a combine for revenue only the last thing on earth we would want would be a law which prohibited the use of unskilled labor, defective, second hand or very cheap material. This fact is so apparent that I am astonished more and more every day that the people who oppose the provisions of our new Texas State law do not see it. If the Texas State law were enforced to the letter to-morrow and the plumbers should continue their reckless, cut throat, antagonistic methods, there would not be a plumber in Texas 12 months from to-day. They would sink every dollar they could borrow or beg so deep that there would be no possible hope of business resurrection.

Now, gentlemen, the suggestion that Texas has to offer this committee is that you study the plan which will save us from ourselves if we follow it. You have in the North and West the same troubles in a greater or less degree that we have in the South. The Inter-State League organized a wheel within a wheel for better trade protection; you got it. Are you perfectly satisfied with it? Is there nothing more you would like? We know there is. You need harmony and business co-operation and the right kind of sanitary law as much as we do. Each member of this Executive Committee has been supplied with literature which fully describes our methods, purposes and accomplishments. As president of the Southern League of Master Plumbers, I call your attention to this matter again in the interest of the whole craft, and I urge you with all the earnestness of my nature in behalf of the struggling plumbers of the United States to carefully go over this plan, as a committee, with a view to its adoption as the future basis of work for the national association.

The Weiskittel Lavatory.

In the engraving presented herewith we show a new cast iron white enameled lavatory which has just been placed upon the market by A. Weiskittel & Son, Baltimore, Md. These lavatories are made in two styles, one as shown in the engraving and another designed for use in a corner. In both instances the bowls are oval, and the bowl, slab and back are all cast in one piece, then thoroughly covered with a pure white porcelain enamel. This avoids all joints and crevices and makes a thoroughly clean and sanitary fixture. The house are also making a full line of fine porcelain enameled baths and other enameled iron plumbers' goods. They are preparing a special catalogue of these goods, and can furnish circulars of many other specialties to those who apply in the meantime.

The Weiskittel Lavatory.

Achilles P. Deily, city plumber of Allentown, Pa., died at his residence recently of paralysis of the heart. After learning the plumbing trade with Evans & Seagrave of that city he was elected city plumber by the Water Board, a position which he held for several years. He is survived by a widow and four children.

Heating and Ventilating Church and Parish Building by Forced Draft.*

BY B. H. CARPENTER, WILKES-BARRE, PA.

In designing and carrying out this system it was necessary, in order to insure its success, to obtain the following results: 1, to heat the buildings by the gravity system at all times; 2, to heat and ventilate the buildings when necessary by mechanical means; 3, to avoid drafts of any nature; 4, to prevent objectionable noises. Under the first head there were several features to contend with. The basement was but 6 feet in hight, and in order to get the proper elevation between the steam coils and the water line in the boilers it was necessary to excavate to a depth of 6 feet and set the boilers on the concrete 12 feet below the joists. By using coils 4½ feet high I was enabled to get 22 inches between the water line of the boilers and the bottom of the coils.

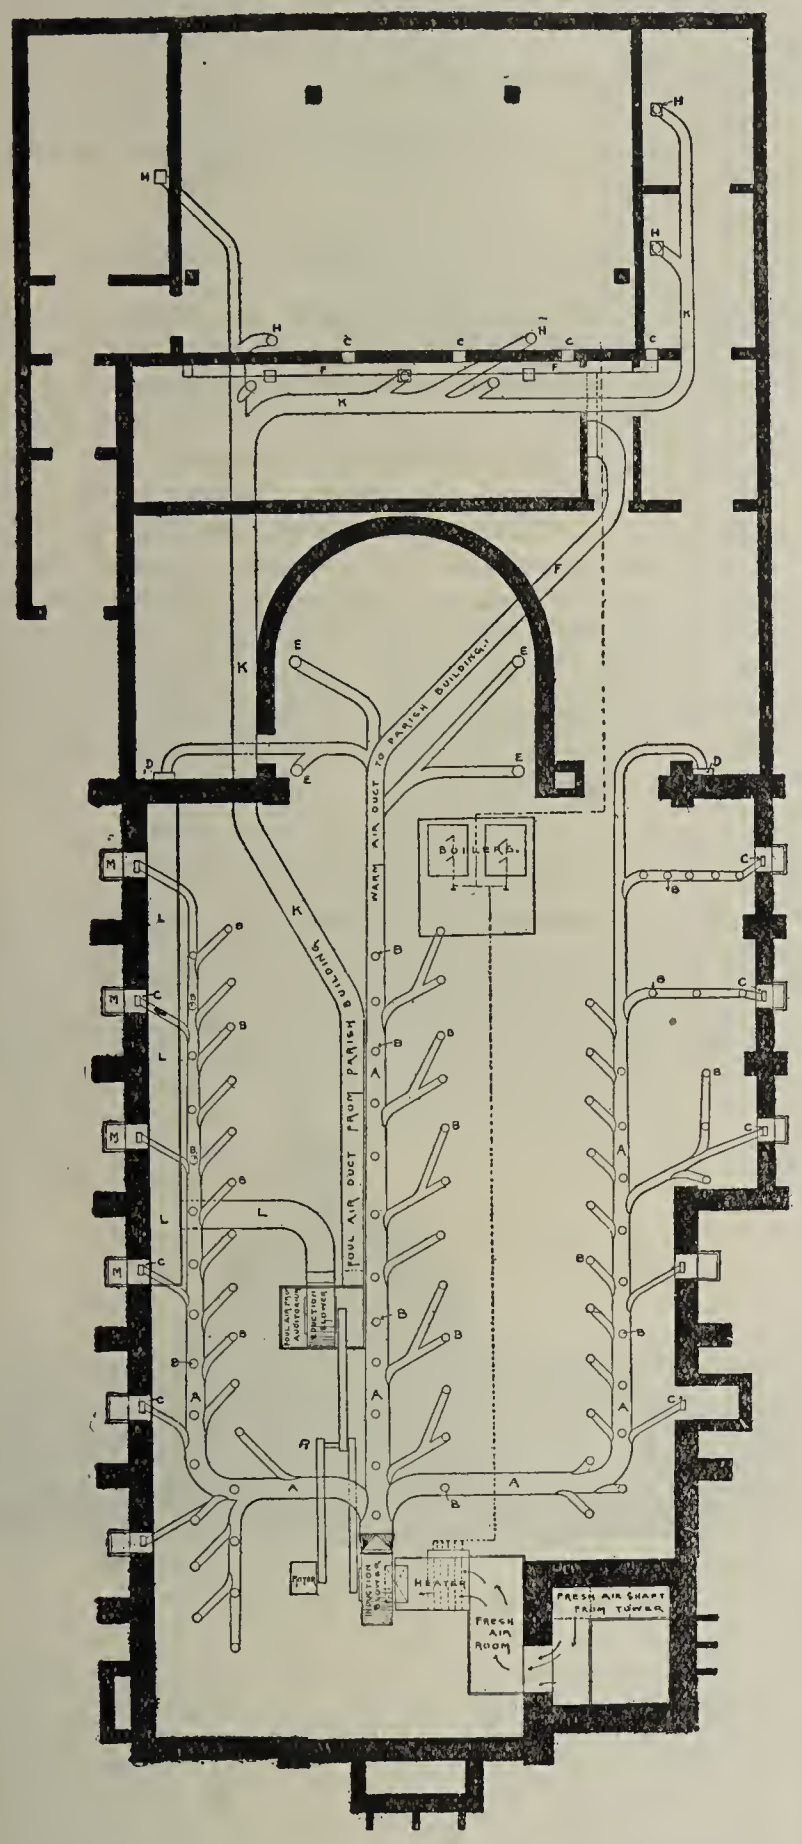


FIG. 1.

The chimney was located at one end of the building, while the fresh air inlet was at the other end of the building, about 80 feet away. This would necessitate either a long smoke pipe, a long fresh air duct or a long steam pipe. The last mentioned was thought most feasible and the apparatus was so planned, with boilers near the chimney and the heater near the fresh air inlet, enlarging the steam and return pipes, in proportion to the distance, to overcome friction.

The boilers used were of the cast iron sectional type, two in number, each having 13 sections. Each section was rated at 270 square feet capacity, making a total capacity of 7000 square feet. A 24-inch smoke pipe of No. 12 iron connected the boilers to the chimney, which was lined with 24-inch square terra cotta flue lining. The

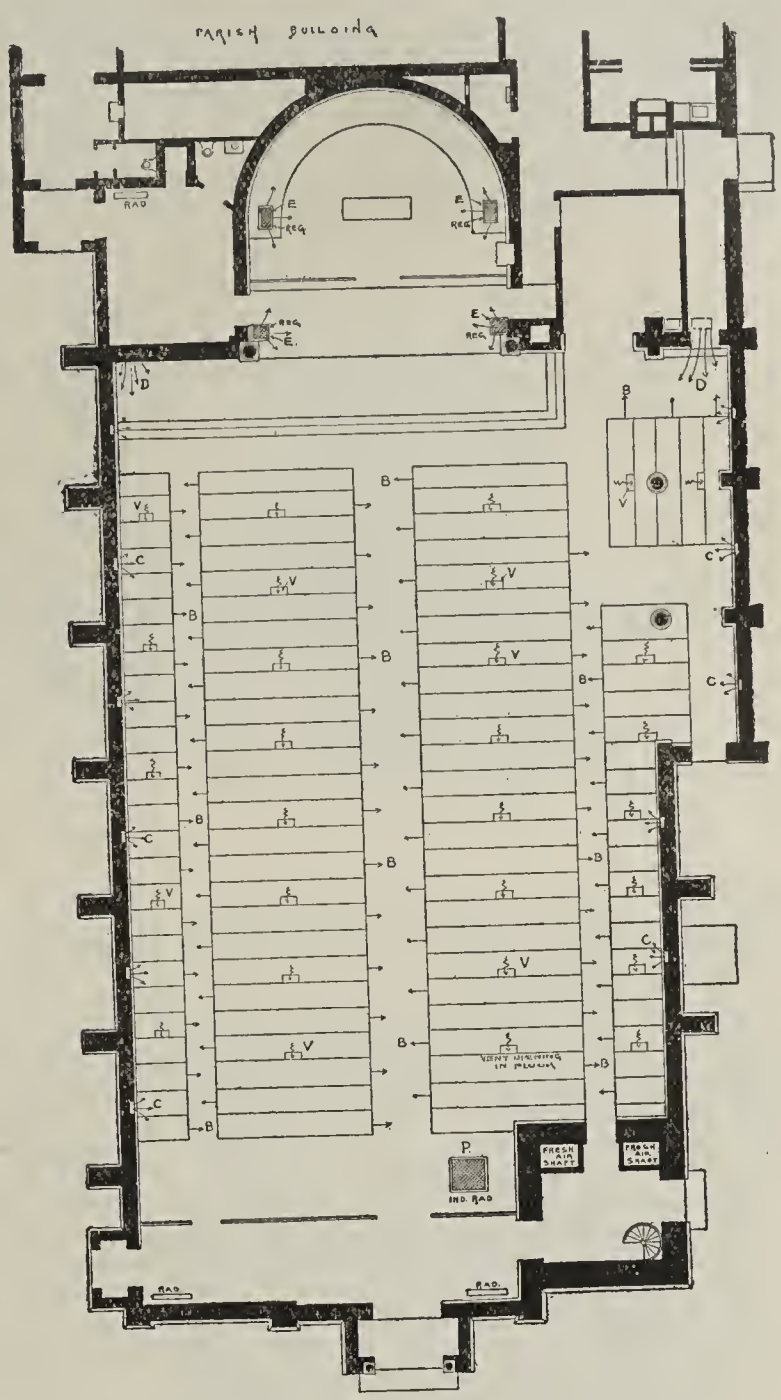

FIG. 2.

piping from the boilers was run as shown on the accompanying plan, Fig. 1, and was so arranged with valves that either or both boilers could be put in service.

The heater, composed of 5000 feet of heating surface, was divided into six equal divisions, each part being valved at feed and return and supplied with an automatic float air valve. Above the heater and at one side was placed a register, P, Fig. 2, connected to the heater by a wooden register box lined with asbestos, to convey the heated air to the room above when the fan is not running. This box has a tight slide or valve with which to cut off when the fans are running.

The vestibule and vestry are both heated by direct radiation. In the vestibule are two radiators, each having 100 square feet of heating surface. The parish building in the rear of the church proper is not a new building. It was formerly heated by direct and indirect radiation, with an attempt at ventilation, which was a failure, though the heating was successful. This building was supplied with a wrought iron steam generator, which I abandoned, connecting the piping system, after some minor changes, to the new boilers. The radiation was not disturbed. The piping above ground in the basements is all protected by asbestos sectional covering. The pipes underground are incased in wooden boxes.

Our second point was to ventilate when necessary. To do this two three-quarter housing steel plate pulley fans were installed, the induction fan being 110 inches diameter and the eduction fan 100 inches. The induction fan draws the air down from the flues in the tower, as shown in Figs. 1 and 2, where it enters the tower at a hight of 80 feet from the ground. The air then passes over the heated coils in the heater and thence is either driven through the galvanized iron ducts A A A to openings into auditorium or, if desired, is forced through the main center duct A to duct F, which conveys the air to the parish building. The eduction fan draws the air from

*Read at the New York meeting of the American Society of Heating and Ventilating Engineers, January 25-27, 1898.

the auditorium through openings V in the floor, or from the parish building through openings H and duct K, at will. and drives it through duct L to openings in the side wall M, whence the air is thrown outside the building.

The warm fresh air passes into the auditorium through 87 8-inch ducts, B, to openings in pew ends; also through 11 5 x 12 inch flues, C. leading to 10 x 12 inch registers in side walls; also through two 8 x 24 inch flues, D, leading to 20 x 24 inch registers in end wall and four 20 x 24 inch registers, E, in chancel. The air, by passing through pew ends at a velocity of 5 feet per second, through wall flue C at 8¼ feet per second, through flues D at 8¼ feet per second, and through floor registers E at 6½ feet per second, furnishes a total of 20,300 cubic feet per minute to the auditorium, which gives 1000 persons (the seating capacity of the auditorium) 20 cubic feet each every minute, a sufficient volume, at its maximum

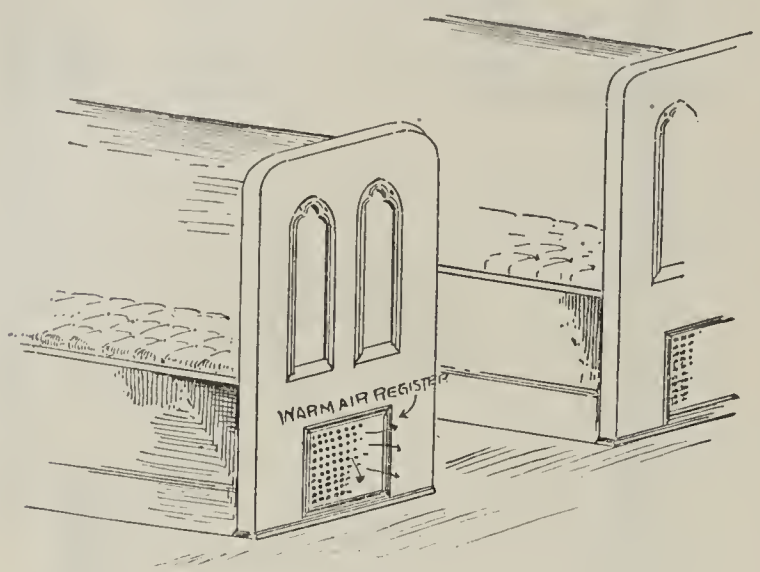

FIG. 3.

speed, to change the whole body of air in the auditorium every 12½ minutes.

It was the purpose of the system to heat but not to ventilate the church and parish building at the same time. Valves were provided where necessary to cut the air off from auditorium and force it through duct F to the parish building. When the air is being forced into the parish building the valve in the duct K is opened and the door O closed, and the air is drawn from the parish building and forced outside. The parish building was furnished with fresh air through duct F. thence through rising duct and through four registers, C, located 16 feet above the floor. The air is drawn down through eight floor registers, H, into the duct K and carried back to the eduction fan. The ducts are proportioned according to the amount of air passing through them necessary to ventilate the various rooms.

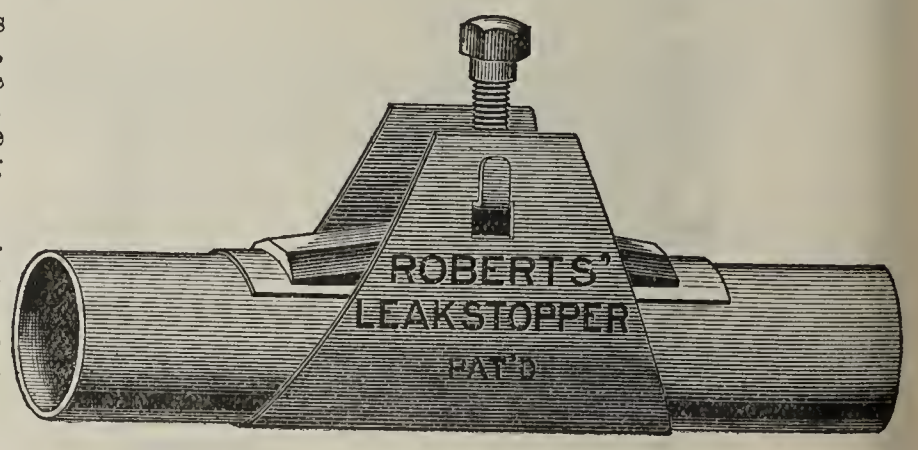
In order to avoid drafts in the auditorium the air was brought into the room, as well as expelled from the room, through the large number of openings, and by having the pipes of sufficient size the air was driven at a slow speed. The openings C in the auditorium are placed under the windows to counteract the currents of cold air falling from the windows.

The fourth point was to prevent objectionable noises. The fans are driven by a 12½ horse-power electric motor of the four-pole type, running at a speed of 900 revolutions per minute. The motor drives the countershaft R, which is belted to the two fans. A resistance coil is placed in connection with the motor in order that its speed can be varied at will to suit the requirements. The fans, the motor and the countershaft are all bolted to planks, these being bolted to brick and concrete foundations. To prevent the carrying of vibration from fans to ducts all connections between them are made with canvas and asbestos cloth.

The openings D and E in the chancel end of the auditorium are of good size and evenly distributed in order that the large volumes of air which are introduced through them may convey more clearly the sounds of the human voice and the tones of the organ to the congregation. By the use of the mechanical system the buildings can not only be heated in winter, but may also be cooled and ventilated in summer, the air being drawn down through the tower and coming in contact with the thousands of feet of cold piping before entering the auditorium.

Up to the time of going to press with this paper the system, as far as tested, has proved to be mechanically correct. Pea, or No. 6, coal is used in the boilers and the buildings are well heated. At the opening of the church, on Christmas day, with the outside temperature at 10 degrees above zero at 7 o'clock in the morning, the air in the auditorium was kept at 68 degrees with but two of the steam coils turned on, the circulation of air being very good.

Standard Radiator Mfg. Company.



The New York office of the Standard Radiator Mfg. Company, Buffalo, N. Y., has undergone a complete rearrangement and redecoration in the hands of Manager John I. Leitch, who again extends an invitation to the steam and hot water heating trade to look over the standard line of radiators at 206 Centre street. A handsome new carpet is on the floor and the walls and ceiling have been frescoed in mellow tints. An aisle is formed through the showroom by the arrangement of the radiators on exhibition. A very pretty effect is gained by grouping the single column radiators in the foreground with the two, three and four column standards for steam and for hot water behind them. The low radiators are near the asile and the radiators increase in hight toward the wall. The effect is varied by the radiators being decorated in different tints and colors and the relief portions being finished in gilt or color. Some of the radiators for both hot water and steam are made with entirely plain surface, giving a high efficiency in service and by the contour and appearance that will harmonize with fine furniture. For heating the office a four-column standard steam radiator is used, tapped for the supply and return on the same end to show one of the many special forms of connections for which the line is adapted.

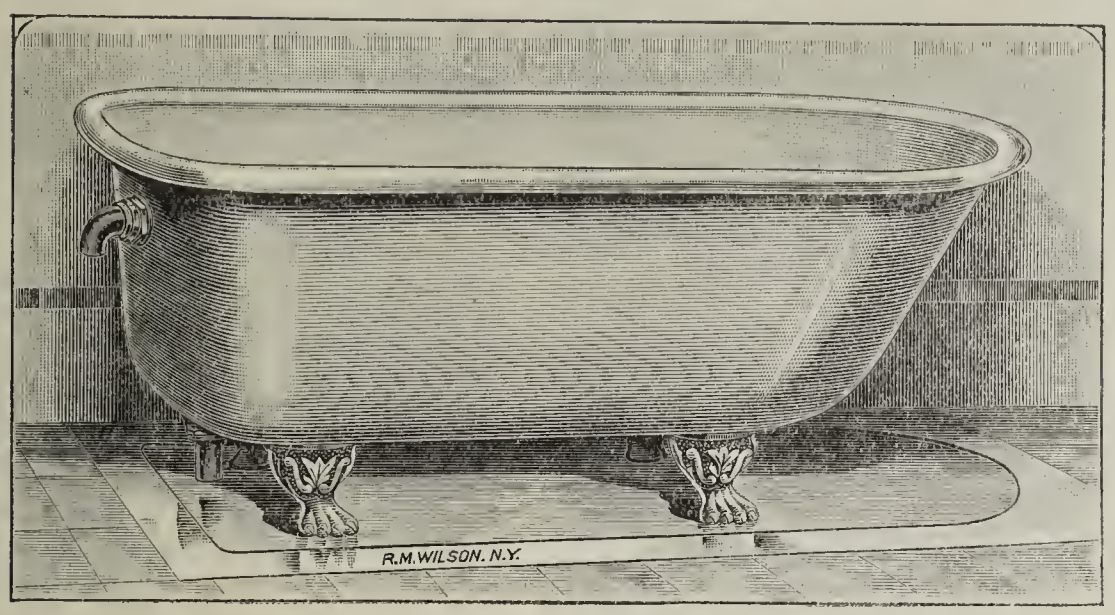
Newark, N. J., Plumbers' Smoker.

At the last regular meeting of the Master Plumbers' Association of Newark, N. J., in January, the committee appointed to arrange for a smoker reported that it would be held in Achelstetter's Hall, at 852 Broad street, on February 16. The committee in charge is A. S. Walker, William Jacobi, F. J. Stern, Robert Berla and L. Stephens. Invitations have been issued to the Master Plumbers' Associations in Paterson, Passaic, Bayonne and Jersey City, and a special invitation has been sent to State Vice-President John Hickman of Paterson. The Newark association is noted for the social feeling existing among its members, and in the hands of this committee it is a foregone conclusion that the smoker will be an event to be remembered.

The Roberts Leak Stopper.

In the accompanying illustration we show a leak mender put on the market by George I. Roberts & Bro., 473 Fourth avenue, New York. It is made in three different sizes, adapted for all sizes of pipe from ½ to 2½ inches in diameter. It is designed for stopping leaks in pipes used for conveying steam, water, gas or sewage,

The Roberts Leak Stopper.



until the damaged piping can be replaced, and is recommended for emergency work. It consists of a specially prepared rubber strip, a malleable iron plate for holding the strip to the pipe and a strap which encircles the pipe. The strap is provided with slots for the ends of a casting, which is tapped for a set screw to force plate tightly against the rubber strap and the pipe. The plumber, steam and gas fitter will find these leak stoppers a very convenient appliance to carry in the repair kit.

We have received from the Ideal Mfg. Company, Detroit, Mich., circulars printed in two colors showing halftone engravings of their No. 1 and No. 2 Low Tank Closet Combination. The engravings show their Sileo and different closets using Low Down Tank Combinations of different styles of finish and design. This combination avoids the necessity of a flush tank near the ceiling, and in connection with the Sileo the closet is said to be flushed with a noiseless double flush, so that its entire surface is thoroughly scoured. It is pointed out that the combina

tion is free from complication and is not liable to get out of order. Over 1000 are said to have been put into active operation and demonstrated their merit.

New Enameled Baths.

One of the latest firms to engage in the manufacture of white enameled cast iron bathtubs are the R. M. Wilson Mfg. Company, Rome, N. Y. Having established a reputation in the trade for solid copper and copper lined wood tubs and plumbers' goods, the company have completed their line of bathtubs by the addition of a plant for the manufacture of high grade enameled baths and other plumbers' enameled ware. In the accompanying illustration we show the Rome Special, one of their finest bathtubs, which is furnished in all the usual styles and sizes and adapted for the use of the various styles of supply and waste fixtures. The Rome Special tub is made with a 2½-inch roll rim and the ends have a graceful sweep in rounding to the sides. The Mohawk is another of their tubs, which has a 3-inch rim. The manufacture of these tubs is facilitated by the use of natural gas under the enameling ovens, a well having recently been sunk on the grounds of the company. Natural gas is also used under their power boilers in their brass foundry and copper shop, coal being used only in the cupola for melting cast iron. The company have just issued a 16-page catalogue specially devoted to the white enameled cast iron bathtubs, in which the goods are shown with plain overflow and waste and with the supply fixtures attached. The catalogue also illustrates their solid copper, steel case, galvanized and painted steel and hospital baths. One page is devoted to a list of sizes, styles and prices of copper lined wood tubs.

New Enameled Baths.

The Plumber Turned Rah-Rah.

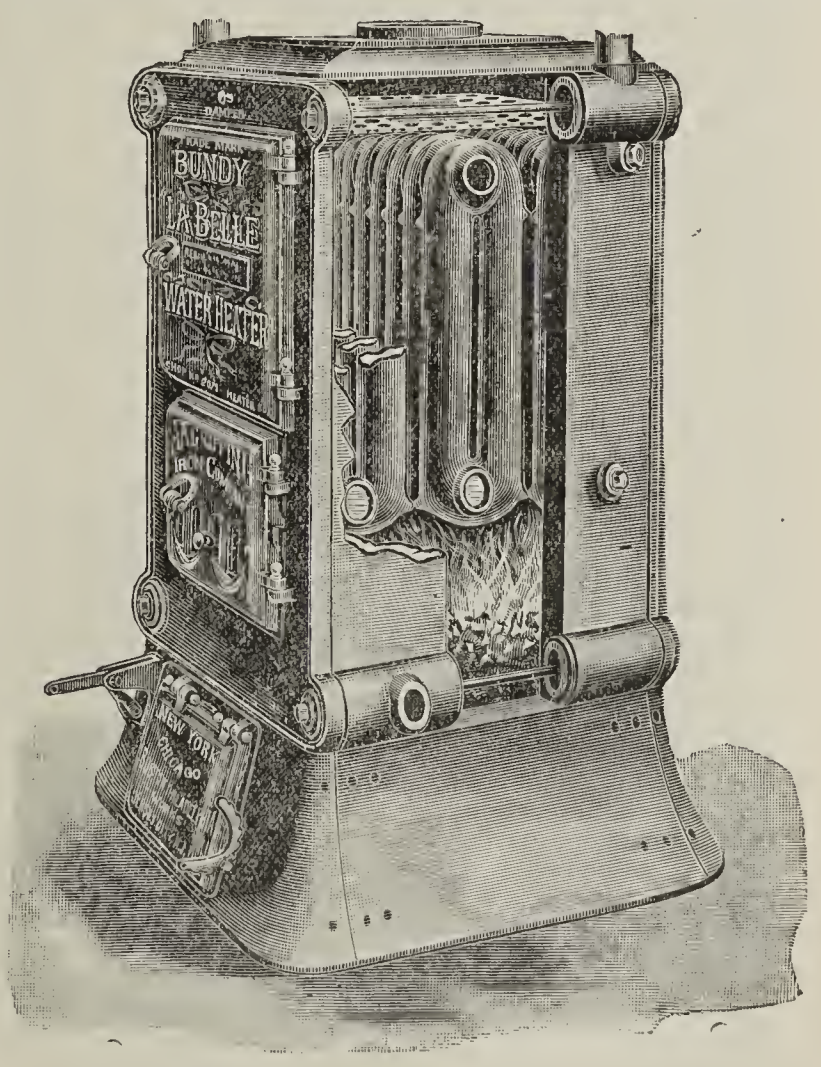
The boss plumber, says the Kansas City *Star*, had a man who was so tough that he was almost useless. There was only one place in which he could be allowed to work, and that was in an uninhabited house. If this plumber was sent to a house in which a family lived, a telephone message would be sent to his employer to remove him. He was an artless user of robust profanity. He expectorated on the wood work and he had an unpleasant habit of chucking servants, pretty or otherwise, under their chins. This made him unpopular in well regulated households. But he was a good workman and the boss plumber was regretfully compelled to give him "his time," which means in labor circles paying him off and discharging him.

One day the boss plumber sat at his desk, when there appeared to him a brawny youth, with a wadded sweater about his neck and a good peck of hair on his head. It was the tough plumber.

"Dis is me," said the tough plumber. "I ain't done a tap in t'ree monts. You ain't so warm, an' swipin' a joint ain't de only t'ing I can do. I'm swipin' college boys now. I'm a rah-rah meself, so to speak."

"I don't quite catch your meaning," said the boss plumber.

"W'y, I'm a gladiator of de pigskin sp'ere, as de sportin' editors say. I'm a foot ball player." And the tough plumber looked fierce. "I'm wot dey calls a center rush, an' when I get a goin' an' buck de line, sa-a-y, dere ain't no set of feet ball playin' stoodents of Greek that can stand up fer a minute. Oh, I swipe deir joints good an' plenty."



"Well, I am glad you are at work," said the boss plumber in a conciliatory tone. "How do you like it?"

"How do I like it?" said the tough plumber. "Say, it's great. Softest snap I ever had. It's one continuous scrap from start to finish. I don't pertend to know much about de game except de signals, 'A B x 240' an' t'ings like dat. All I got to do is to down de udder fellers, and dey gits downed. When dey gits troo wid me de ground's soft wid me beatin' 'em into it. Well, so long. But you don't git me to do no more plumbin' when I can git $10 a game an' four pounds of beef a day at de trainin' table fer bein' a rah-rah at a college wid a chancst fer a scrap an' no p'liceman to interfere. I'm goin' to get me pardner, Reddy McGuire, de iceman, a job playin' foot ball on de team next year. Say, won't we be holy terrors on de gridiron?"

The tough plumber swelled his muscles up until his sweater creaked, and walked off to the college to be a real rah-rah boy.

The Bundy La Belle Hot Water Heater.

In the accompanying illustration we show the Bundy La Belle hot water heater, which is made in five different sizes, ranging in capacity from 450 to 1125 square feet of radiation, all with a uniform hight of 60 inches, which makes it well adapted for use in cellars of low hight. It is made by the A. A. Griffing Iron Company, Jersey City, with offices at 66 Centre street, New York; 178 Fort Hill square, Boston, and 702 Arch street, Philadelphia. The boiler is of sectional construction, with all joints made with lathe turned smooth nipples, iron to iron. The grate

The Bundy La Belle Hot Water Heater.

rocks and dumps, and is of the Bundy non-warping type, adapted for burning hard or soft coal, coke, wood, gas or bagasse. The flame and hot gases heat by direct impingement against the sections as they ascend vertically to a perforated crown plate, which also has one large hole with damper to control the draft. The makers claim a maximum of direct fire surface for the La Belle heater; in fact, show that it is practically all direct fire touched surface. The side sections hold sufficient water to insure uniform results, while all openings are large to permit of the water of different temperatures passing up and down or crosswise without frictional conflict. A large front clean out door facilitates intelligent use of the brush for cleaning. The company will be glad to send their literature on heating apparatus to those who apply for it.

Inspection of Plumbing.

Thomas P. Watts, well known as a prominent plumber of Louisville, Ky., but who has retired from the plumbing business, writes a letter to the *Courier-Journal* in favor of city legislation to provide a plumbing inspector, from which we have taken the following extracts:

Louisville is the only city of more than 100,000 inhabitants in the United States that has no official of this kind. I have worked as an apprentice, journeyman and master plumber for 20 years, and being endowed with a reasonable amount of intelligence, I have given this matter some study. There should certainly be a plumbing inspector in Louisville, and in fact wherever water fixtures are introduced into a house for convenience.

Your physicians tell you that 5000 people die in the cities every year from preventable diseases. That is not many, you say, out of 70,000,000, but suppose one of them happened to be your wife? Then it would be different. There is not a reputable physician in the city who will not make inquiry into the plumbing apparatus when he finds a patient with typhoid, diphtheria and various other troubles; and this reminds me of a case where I was called in by a physician. A child was sick with typhoid fever, and the physician and father asked me to make an examination, which I did, in the presence of both, and found apparently new work extremely defective. The father gave me an order to make the alterations as speedily as possible, but he never came into the bathroom again, as he took sick with typhoid, and died almost before we were through with the changes. The defective work was not the fault of the father, because he was the owner, and able to pay for what he had ordered. It was the result of confiding in some one who did not have the intelligence to do his work in a sanitary way or was a rascal and wanted to cheat. Now, generally the well to do people pay a good price, get a plumber of reputation, and get correspondingly good work. But when work is let out to the lowest bidder, then generally the tenant will have to suffer the consequences. If the public could only look at the matter right, there would be no trouble. For instance, you go to buy a pair of shoes. You have prices ranging from $1.50 to $5; do you take the $1.50 shoes as the best? Not much! If you do take the $1.50 shoes, you only get $1.50 worth of wear; where, if you had bought the $5 shoe, you would get from $6 to $7.50 worth of wear. So it is with plumbing. Why, I know of numberless houses that it would be far better if the landlord would take out all the plumbing and let the tenants return to the primitive methods, so far as the health of the inhabitants is concerned. There are some men in the plumbing business (not many) who are conscientious and have sufficient knowledge to make a bathroom fit for a sleeping apartment in an emergency; but, usually these plumbers are either hampered by price (or an architect, who knows how to allot a space for various fixtures and could not describe a single one or give a reason why this or that fixture is better), or conditions over which they have no control. The city is flooded with a lot of incompetents, who lost their jobs because of incompetence, or other acts that a reputable man could not tolerate, but now, behold! they have blossomed into master plumbers, with a lot of landlords who want the water to run only, as they cannot stand the expense to make necessary repairs. Yes, sir; every house should be in a sanitary condition, so far as plumbing is concerned, or have no plumbing at all. The inspector should be a practical plumber, who could stand an examination from a committee of plumbers and also a few questions from physicians as to the scentific part of the business; and at the same time there should be a plumbing law governing the class of fixtures, pipe, traps, &c., as there are many fixtures in use to-day that, if an owner had explained to him the defects, he would remove them at once. It is not essential that the fixtures be expensive, as there are many of the cheaper fixtures which, from a sanitary standpoint, are much better than the more costly. You will find some of the master plumbers who will be opposed to this measure because of selfish motives, or fear of standing an examination, but I assure you that it will come. If this law is passed, it should embody in it that every master plumber and journeyman should stand an examination and qualify themselves before being allowed to do any service or dally with the health of the city. The examination fees would pay the expense of the committees. The capable physician cures disease. The capable plumber prevents disease. The physician has his diploma. Why not the plumber? I have spoken in this line because I think Louisville needs such an officer. I am not in business and never expect to be again in this city. I don't want the job of inspector, or anything pertaining to it, nor do I know who I could recommend for the position; but it should be given to the one who applied and stood the highest examination before the committee. The office need not cost the city $1 per year, as the certificates and licenses would cover all of the expense. If the city should enact such a law or ordinance, it would stand about this way: 75 per cent. benefit to the community and 25 per cent. benefit to the reputable master plumbers.

R. M. Wilson Mfg. Company,

Rome, N. Y., have been incorporated, with a capital stock of $50,000, to succeed R. M. Wilson. The new company will continue to make plumbers' supplies, bathtubs and enameled goods, and with increased capital and better facilities are looking forward to doing a much larger business than ever before, the prospects for the coming year being exceptionally bright. The directors of the new concern are Robert M. Wilson, Amanda C. Wilson, Jonathan S. Haselton, Willey L. Kingsley and William R. Huntington.

NOTES.

The Kenney Sanitary Mfg. Company, 47 Dey street, New York City, makers of the Kenney system of Water Column Water Closets, which have been described in *The Metal Worker*, and with which our readers are generally familiar, have been succeeded by the Kenney Company, a corporation organized under the laws of the State of New Jersey, and the business has been removed to 72 Trinity place, New York City, near the Rector street station of the elevated railroad. The new company propose to enlarge the business, pushing it to its fullest limit. They have large contracts now on hand and the prospects for further business are very promising. The new quarters of the Kenney Company will be handsomely decorated and convenient in every way.

Mark Dean has resigned his position with the Herendeen Mfg. Company to engage in a new venture in the heating specialty line in Boston, Mass.

W. B. Meyer has transferred his interest in the plumbing business of H. C. John & Co., Fort Wayne, Ind., to his son, Henry F. Meyer.

The St. Louis Radiator Mfg. Company, St. Louis, Mo., have filed affidavit of an increase of their capital stock from $50,000 to $100,000.

H. M. Page has opened a plumbing shop on Larimer street, Cheyenne, Wyo.

Henry Kidder has opened a plumbing shop in Winooski, Vt.

Clements & Aumoch are a new firm in the plumbing, gas fitting, tinsmithing, stove and heating business, at 7 Seaview avenue, East Long Branch, N. J. They have the contract now for the work on five new houses.

Langford Rogers and James Conners have opened a new plumbing shop at Olean, N. Y.

Frank H. Chishelm has opened a plumbing shop at Watseka, Ill.

C. M. Post has opened a plumbing shop on North Gray street, Champaign, Ill.

Kirk & Staton are preparing to engage in the manufacture of Heating Apparatus at Bellaire, Ohio.

I. G. James, 48 Centre street, the New York manager of the Gurney Heater Mfg. Company, Boston, Mass., has engaged W. H. Smith, who is well known to the heating trade, to assist in handling their growing trade in Bright Idea, Doric and the Gurney line of Heating Boilers.

A letter from Stevens & Cummings, Ligonier, Pa., informs us that they have purchased the plumbing and heating fixtures of A. P. Roberts of that place, and that they are now the only master plumbers in the city. They report that they met with good success last year.

The American Pin Company, Waterbury, Conn., well known as manufacturers of Pins, advise us that they possess complete facilities for the manufacture of articles in tinned or wrought brass and steel. They also make a specialty of Brass and Bronze Castings and furnish esti-

mates on articles in part or complete. Besides the above named articles, they make a line of Plumbers' Supplies and Upholsterers' Hardware.

The firm of Ingleson & Co. have succeeded R. M. Starbuck in the plumbing and gas fitting business at 1106 Main street, Worcester, Mass. The firm also do tin, copper and sheet iron work, tin roofing, hot air heating, &c. As they have just begun business they advise us that they would be glad to receive catalogues and price-lists from manufacturers and jobbers.

George W. Getchell and Joseph E. Chamberlain have formed a partnership in the plumbing business at Bangor, Maine.

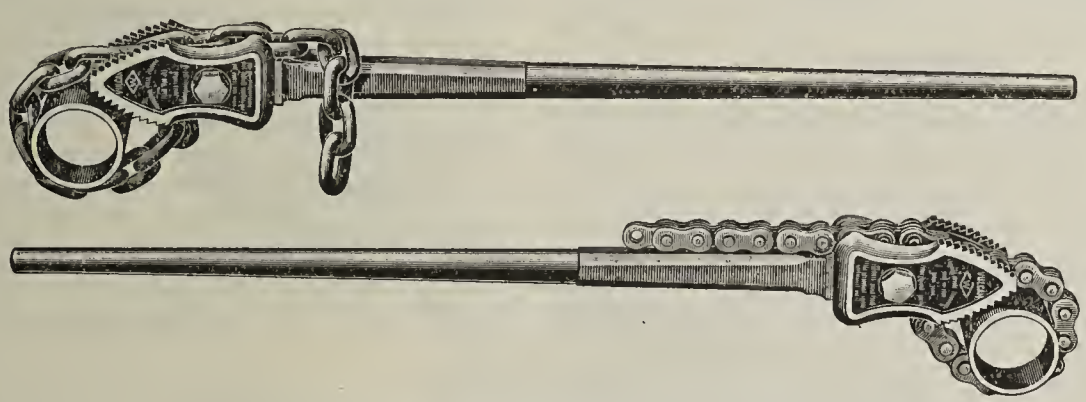
Frank Robertson has opened a plumbing shop in Menominee, Mich.

Byron Wallrath has opened a plumbing shop at Tottenville, Staten Island, N. Y. A water supply and a sewerage system are being provided in that place.

Peter A. McQuillan succeeds D. J. Harrington as plumbing inspector of St. Paul, Minn.

A bill has been introduced into the Legislature of New York to amend the Plumbers' Registration act of 1892, exempting cities of the third class from the provisions requiring that all inspectors shall be practical plumbers.

Edward E. McIntire has been elected inspector of plumbing at Portsmouth, N. H.

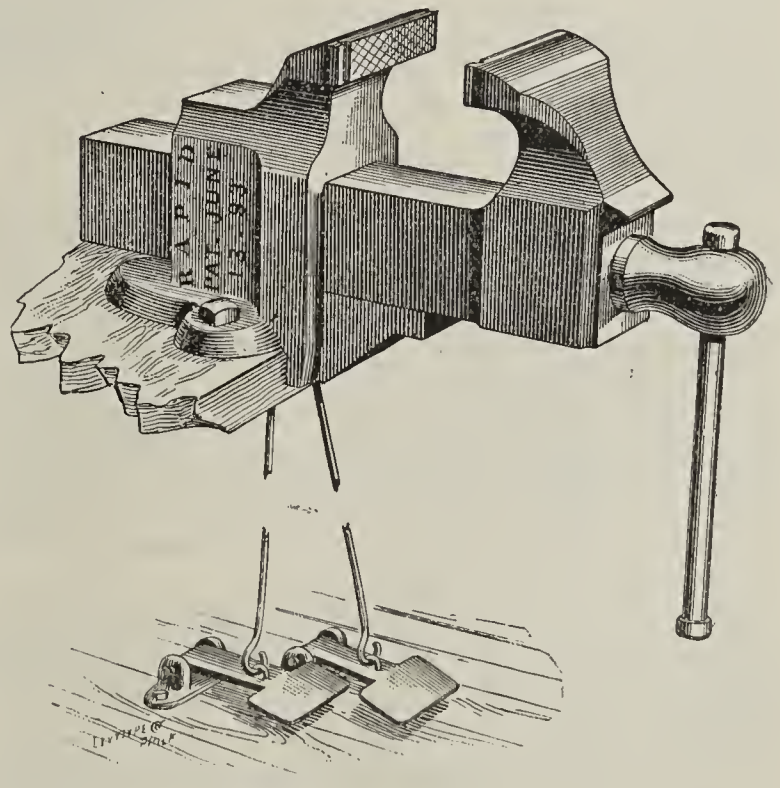


L. E. Millea has sold his plumbing business at Salem, Mass., to his brother, Wiliam H. Millea.

Howard Wortman, Baldwins, L. I., is now engaged in setting up several of the McGrane Acetylene Gas Apparatus made by the McGrane Acetylene Gas Company, 187 Broadway, New York, for customers in that place, there being no gas supply in the town, and those which he has already set up have given satisfactory results to the customers. Mr. Wortman has during the season set 21 Wind Mills made by the Aermotor Company of Park place and West Broadway, New York City. These Wind Mills are used in connection with tanks for supplying water for the pumping systems which he has installed in the buildings of his customers.

The Board of Aldermen of Chicago has passed an ordinance creating a Board of Examining Plumbers with three members and a secretary at a salary of $1500 a year each. The positions were filled under the old ordinance, passed December 13, 1897. The change was in the clause which made the first examination final instead of yearly. The examination fees are $5 for master plumbers and $1 for journeymen.

Drop Forged Steel Chain Pipe Wrench.



J. H. Williams & Co., 9-13 Richards street, Brooklyn, N. Y., are just putting on the market the Vulcan patent drop forged steel chain pipe wrench shown in the accompanying cuts. They are made with cable and with flat link chain, and are designed for gripping, turning or holding pipe, bolts, bars, shafts, &c. The wrench is made in seven sizes to take articles from ⅛ inch to 12 inches. They are made wholly from wrought steel, to be strong and durable. The drop forged jaws are stated to be of saw temper, so that the teeth can be sharpened by filing only. The pressure of the teeth, it is explained, is in a line tangent to the circumference of the pipe, which, combined with the encircling grip of the chain, prevents crushing. The wrench is sold with either cable or flat link chain, and is the only wrench, it is claimed, adapted for either. To change the chain one cap screw is unscrewed—neither jaw is removed—the internal pin on which the chain swings is slipped out, thus releasing the chain, when the new chain may be inserted. It is remarked that the cable chains are of finest quality, only the D. B. G. special crane chain being used. This chain is hand formed and tested link by link, and bears the trade-mark D. B. G. It is further remarked that the flat link chains are hand made from steel prepared expressly for the company and carefully tested in an Olsen testing machine. The point is made that the chain swings from the center and can be used on either side of the jaws, reducing wear of the teeth to a minimum. The wrench, it is shown, is equally efficient on fittings and straight pipe, in corners, against walls, between floors, in ditches, or for overhead work. Each fits a range of sizes equal to six pairs of common tongs, and will, it is claimed, outwear several pairs of any kind. The tools are interchangeable in all parts, repairs can always be had, and the wrenches are fully guaranteed. Among other advantages are that the jaws are duplicate, reversible and serrated on both sides; that the assistance of a blacksmith is not necessary when the teeth become dull; that the tool is not disabled if the teeth on one side break, as it can be instantly used on the other side, and that repairs can be secured without sending the wrench away. It is stated that the price-list has been revised, while a greater discount will be offered than for any other similar tool. The makers state that the wrench is the fruit of 12 years' experience in making chain pipe wrenches, and that they claim for it superiority in every respect.

Drop Forged Steel Chain Pipe Wrench.

The Ayars Rapid Vise.

The accompanying illustration shows the vise which the Ayars Machine Company, Salem, N. J., are putting on the market. In operation the vise may be instantly changed to take work of any size from 0 to 8 inches without turning the handle, by simply pressing the front treadle shown in the cut. Pressure on the back treadle holds the jaws fast until the hands are at liberty to tighten with the handle. The back lever is only used when there are two or more articles to be held at one time and both hands are required on the work. The vise has an ordinary screw and when required may be used in the same manner as any other vise. The rapid closing action is obtained by means of a nut actuated by a spring, both contained in the housing. A pressure of the front lever causes the spring to throw the nut clear of the screw, and a pressure of the rear lever, by pulling the nut forward,

The Ayars Rapid Vise.

holds the work securely until tightening can be effected by the handle. There is a V groove at one end of the jaws to hold round iron, pipe, screws, bolts, &c., perfectly rigid. The vise is described as being well made and having tempered steel jaws and steel screw and nut. It is made in two sizes, with jaws 5 and 5½ inches wide, and weighing 60 and 90 pounds respectively.

TIN PLATES.

Additions to Tin Plate Brand List.

Dickerson, Van Dusen & Co., 29 Cliff street, New York, advise us that they are the owners of the following brands of American tin and terne plates, which should be added to our list of Dealers' Special Brands, printed in *The Metal Worker* of January 1, 1898:

BRIGHT CHARCOAL PLATES.

Daisy.	Falcon.	Major.
Dale.	Ford.	Moro.
Douglas.	Madrid.	Poplar.

BRIGHT COKE PLATES.

Cornell.	Monarch.	Derby.
Watson.	Hanover.	

TERNE PLATES.

Aline.	Fulton.
Astoria.	Harold.
Axminster Old Style.	Stella Old Style.
Clinton.	Westminster Old Style.
Dickerson Old Style.	Yankee.

SCRAP.

The committee of Tin Plate makers who are engaged in drawing up plans for the proposed consolidation of tin plate interests are still diligently at work. The matter is understood to have made some important steps forward during the past week, but all the proceedings connected with the project are conducted with the utmost secrecy, and but little news has leaked out as to what has been actually accomplished. A meeting was held on Wednesday, at which some of the leading New York jobbing houses were represented. This has served to revive the rumor that an effort is being made by the houses in question to arrange for handling the entire output of American Tin Plate. Much interest in the whole matter is felt by the trade at large, and developments are somewhat anxiously awaited.

The Atlanta Steel & Tin Plate Company, Atlanta, Ind., have completed the addition of three new mills to their plant, thus doubling its capacity and making it a six-mill works.

Two of the mills in the new plant of the National Tin Plate Company, at Monessen, Pa., have been completed and put in operation. The balance of the mills will be started into work as they are finished, until the whole plant is in operation. The company will only turn out Black Plate for the present, as the Tin house will not be completed for some time.

At the recent quarterly Tin Plate meeting at Birmingham, England, a conference of Welsh Tin Plate manufacturers was held with Thomas Worthington, a special commissioner of the British Board of Trade, who has been appointed to visit South America to inquire into the conditions and prospects of trade in that country, and a committee was appointed to furnish the commissioner with facts and figures, so that his visit to South America might be made of special value to the Tin Plate trade of Wales. Particular efforts are to be made to enlarge the trade with the Argentine Republic, where the prospect for the establishment of canning factories on a large scale is regarded as encouraging.

The Joint Traffic Association has announced the freight on Sheet Bars and Tin Plate Bars from the Valleys to Cumberland, Md., to be $1.55 per gross ton, and the freight on wooden Tin Plate boxes from Hopkins, Pa., to Pittsburgh at 8 cents per 100 pounds.

It is currently reported that the capitalization of the proposed Tin Plate combine has been decided at $25,000,000.

The affairs of the Earlswood Tin Plate Company of Briton Ferry, South Wales, are announced to have been placed in the hands of a liquidator, with the view of winding up the concern.

In an interview printed in *The Iron Age*, Edward Le Bas, of the London firm of Edward Le Bas & Co., who represent in England the Illinois Steel Company, the National Tube Works Company and the Consolidated Steel & Iron Company, who has just returned home after a visit to this country, said that there is a good chance for American Tin Plate Bars in England. Mr. Le Bas states that there is always a market there for this class of material, and the quality of the American Bars sent over has been such that they are very much liked.

Thomas R. Cook, Jr., of Riter Bros. & Co., Philadelphia, was one of the recent visitors at the office of *The Metal Worker*, and had a good word to say for their Bright and Terne Plates for tinners.

A laurel crowned portrait of Lincoln, accompanied by a United States shield and pictures of a log cabin and the White House, is the decorative feature of the blotter calendar issued this month by Follansbee Brothers Company, Pittsburgh, Pa., in the interests of their Tin Plate and Sheet Iron.

McClure & Co., 211, 213 and 215 Second avenue, Pittsburgh, Pa., and 115 North Seventh street, Philadephia, are sending out to the trade a leather bound memorandum book which is sure to be appreciated by those receiving it. At the top of each page attention is called to McClure's Redipped Roofing Tin, concerning which it is stated that it is made from the best Siemens-Martin steel and coated by the pure palm oil process. Further reference is made to the weight and evenness of the coating, and every sheet is stamped and resquared. Another announcement on the inside cover page is to the effect that McClure's Redipped Roofing Tin was used in the construction of the following buildings in Pittsburgh: Consolidated Traction Company, in which 3000 squares were used; Department Public Safety, Zoo, Chautauqua Lake Ice Company, Weaver, Costello & Co., Bair & Gazzam Mfg. Company, Liberty National Bank and Western Pennsylvania State Institution for the Feeble Minded, at Polk, Pa., on which 1000 squares were used.

Production of Precious Metals.

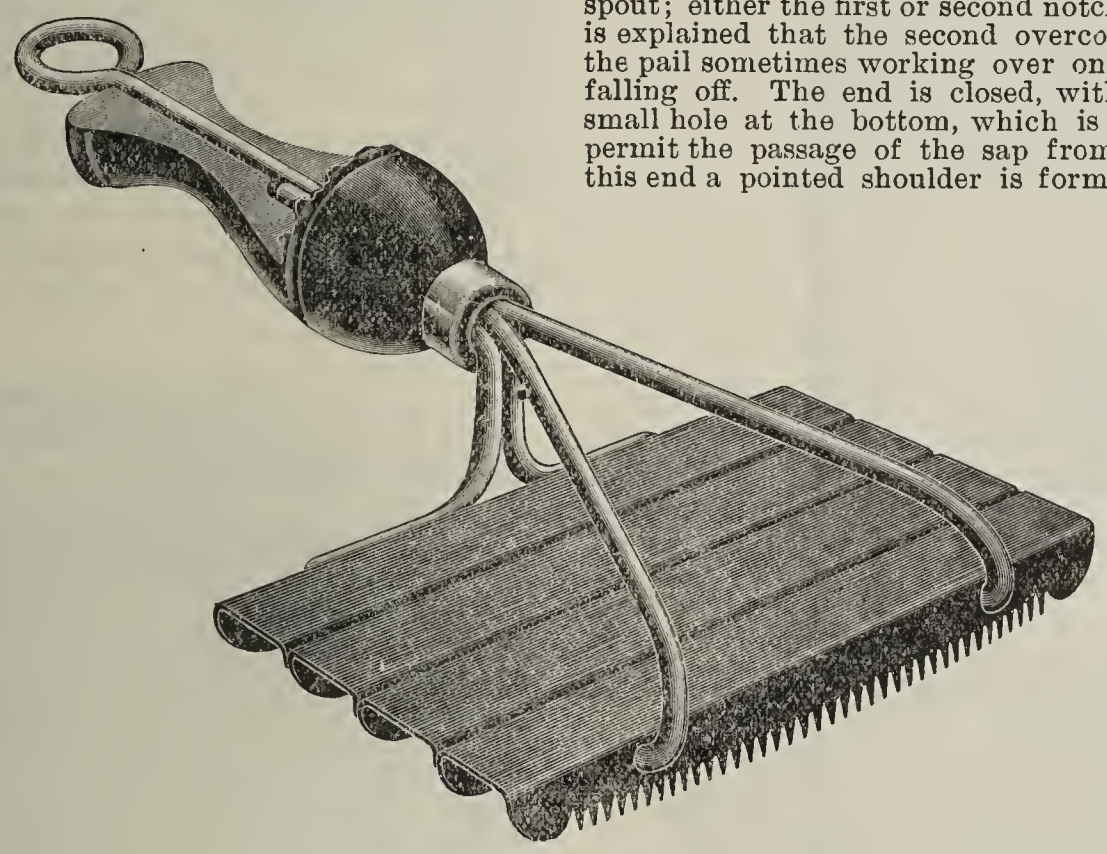
The annual report issued by Wells, Fargo & Co. of precious metals produced in the States and Territories west of the Missouri River (including British Columbia) during 1897 shows in the aggregate, gold, $69,830,597 ; silver, $37,184,034 ; copper, $36,645,694 ; lead, $9,775,144 ; giving a total value of $153,435,469. The following table of output is based on an estimated commercial value of silver at 60 cents per ounce, copper 11 cents per pound and lead $3 38 per 100 pounds : .

States.	Gold.	Silver.	Ores and base bull'n.	Total.
California	$17,621,959	$12,948	$1,195,917	$18,830,824
Nevada	2,632,340	451,494	234,052	3,317,845
Oregon	2,404,797	45,000	11,900	2,461,697
Washington	471,949	70,000	26,560	568,109
Alaska	3,571,000	.....	52,000	3,623,000
Idaho	2,725,000	4,555,600	2,741,000	10,021,600
Montana	4,450,000	9,452,000	26,325,500	40,277,500
Utah	1,663,254	813,748	6,770,440	9,247,442
Colorado	18,326,554	12,869,783	3,780,492	34,976,829
New Mexico	553,678	153,348	193,000	880,026
Arizona	3,392,991	143,693	8,698,821	12,235,505
Dakota	5,829,575	220,000	36,000	6,085,595
Texas	5,000	309,717	1,800	316,517
Wyoming	27,500	31,000	2,000	61,000
British Columbia and N. W. Territory	6,175,000	3,150,000	1,257,000	10,582,000
Totals	$69,830,597	$37,278,290	$51,326,582	$153,435,469

The Commercial Club of Mobile, Ala., is working hard for the establishment of a shipyard at that port. It is claimed that all the raw materials for shipbuilding, such as iron and steel, wood and coal, can be furnished at Mobile at as cheap a cost as at any other port of the country, and favorable sites for a yard are plentiful in the vicinity of the city.

Five carloads of 2½-inch chains for heavy vessels and other uses were shipped from Lebanon, Pa., last week *en route* to the Hawaiian Islands. The chains were manufactured at the chain works of the West End Rolling Mills. The chain works are running on extra time. Several Government contracts are being filled as speedily as possible.

The New York City office of the American Luxfer Prism Company has been removed from 24 Beekman street to 160 Fifth avenue.

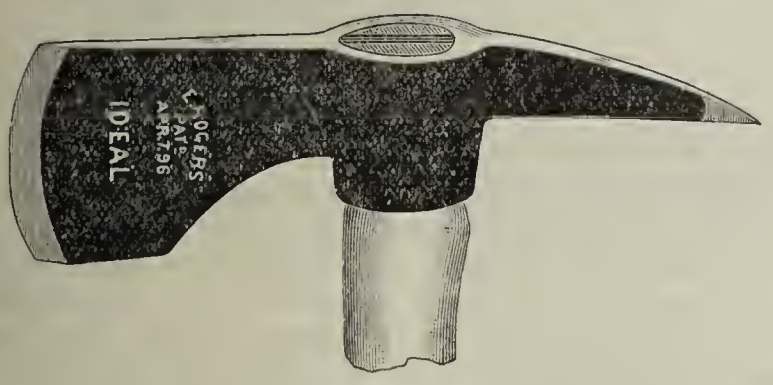


THE RETAIL STORE.

Pearl-Agate Ware.

In the revised catalogue and price-list of enameled ware just issued by the Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, a new kind of enameled ware, called pearl-agate, is listed. This ware is described as made of sheet steel, coated on the inside with an absolutely pure white porcelain, and on the outside with the enamel of bright mottled colors, presenting a tinted, wave like effect very handsome and attractive in appearance. The assortment of colors in which the ware is offered consists of violet, chocolate, salmon, russet and sage. The company are making a full line of utensils in pearl-agate ware for kitchen, house furnishing and other purposes.

Ringed Shank Curry Comb.

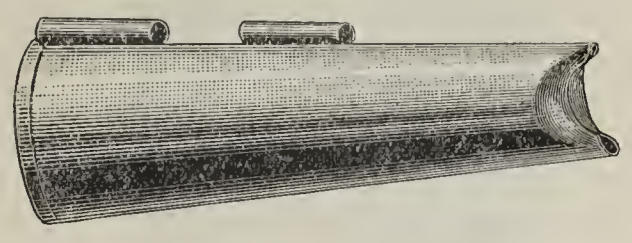


Edward S. Hotchkiss, Bridgeport, Conn., John H. Graham & Co., 113 Chambers street, New York, selling agents, is manufacturing the improved Lawrence pattern curry comb with ringed shank, here illustrated. The steel wire back of the frame is continued through the handle, and the ring formed afterward. The engraving illustrates a section of the handle cut away to show the construction. This method is said to strengthen the comb, while affording also a handy device for hanging the comb up. We are advised that henceforth all Lawrence pattern curry combs—now about 15 in number—will be made in this manner.

Lawrence Pattern Ringed Shank Curry Comb.

Ideal Ice Hatchet.

American Axe & Tool Company, 253 Broadway, New York, have put on the market an addition to their line of



Ideal Ice Hatchet.

Rogers hatchets in the form of an ice hatchet, as here illustrated. It is made of crucible cast steel, in one piece, with adze eye, forge finish. The edges are polished and the axe is fitted with extra quality hammer pattern hickory handle. The axes are put up in dovetailed wood box.

X. L. Sap Spout.

The Youngstown Specialty Mfg. Company, Youngstown, Ohio, are putting on the market the sap spout

X. L. Sap Spout.

represented herewith. This spout is referred to as made double throughout and heavily retinned. The coils on top are made so that the sap bucket can be hung on the spout; either the first or second notch can be used, but it is explained that the second overcomes the difficulty of the pail sometimes working over one of the catches and falling off. The end is closed, with the exception of a small hole at the bottom, which is sufficiently large to permit the passage of the sap from the tree. Inclosing this end a pointed shoulder is formed at the bottom and top, which is referred to as increasing the strength of the spout and lessening the liability of its coming from the tree accidentally. These spouts are made in regular sizes for ⅜-inch tapping bit.

The Buckeye Dish Washer Company, Toledo, Ohio, issue a large circular in the interests of the Buckeye Dish Washer, which they manufacture. There is a graphic representation of the advantage of this apparatus, compared with the old style of washing dishes, while in the corner are detail views showing the construction of the device.

Dewey & Lawson are building a new store and office building in Royal Oak, Mich., and contemplate running the Hardware business in connection with the lumber line, carrying a stock of Shelf Hardware, Stoves and Tinware and Agricultural Implements. Mr. Dewey has been handling an assortment of Builders' Hardware for some time, but, desirous of extending his business, recently disposed of an interest to Mr. Lawson.

The Hardware stocks of J. O. Walrath and the W. J. Healey Hardware Company, Mitchell, S. Dak., have been consolidated, and the firm will hereafter be known as Walrath & Healey, dealers in Shelf and Heavy Hardware, Stoves, Tinware, Sporting Goods, &c. The stock carried is quite extensive. Improvements will be made in the store building in the shape of additions to give more room, and a new modern front.

The Babcock Hardware Company.

The accompanying illustrations of store arrangement relate to the wholesale and retail Hardware establishment of the Babcock Hardware Company, Binghamton, N. Y. The interior of the building, which consists of four floors and basement, was rearranged after being seriously damaged by fire with improved facilities for doing business and in modern style. Many of the ideas were obtained from the "The American Hardware Store," published by *The Iron Age*, supplemented by suggestions from traveling men and observations made while visiting modern Hardware stores in different parts of the country. Such features from these sources were adopted as were thought practical and would result in making the store a most convenient and attractive one.

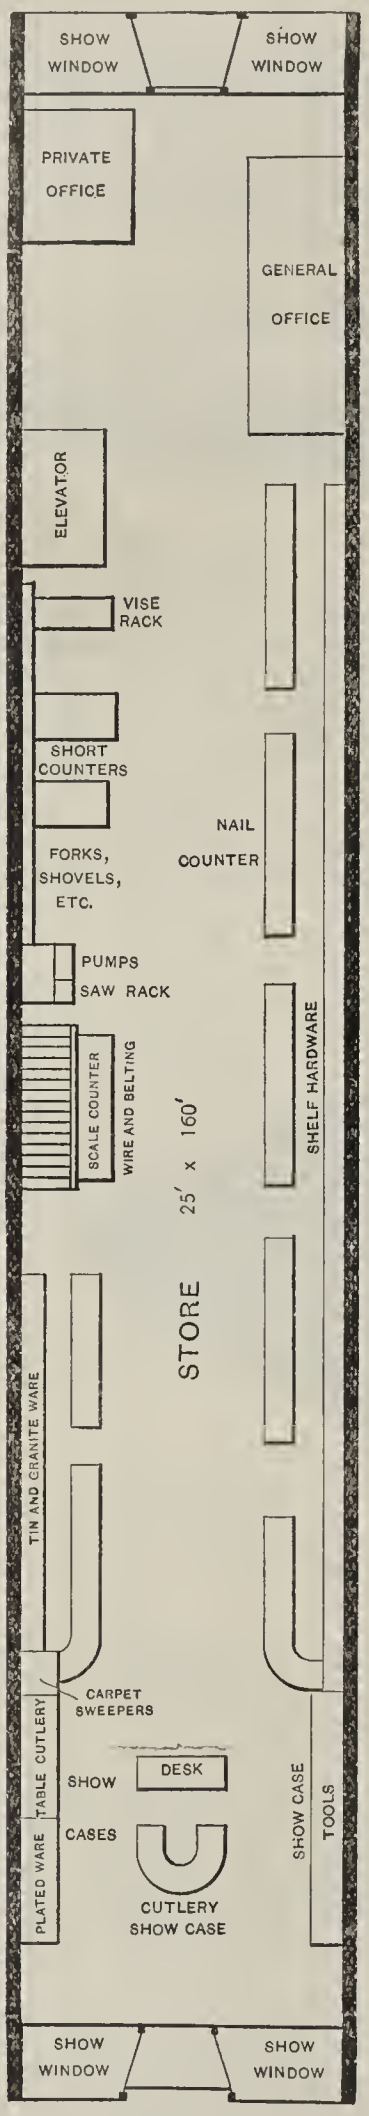


Fig. 1.—Floor Plan.

The store is 25 x 160 feet in size, and, as shown in Fig. 1, fronts on two streets, the front shown at the bottom of the cut, however, being the main one. This front is finished in quartered oak, with large plate glass windows. The recess between the windows forms a vesitbule, the floor of which is laid with tiling, in which the words "Babcock Hardware Company" appear.

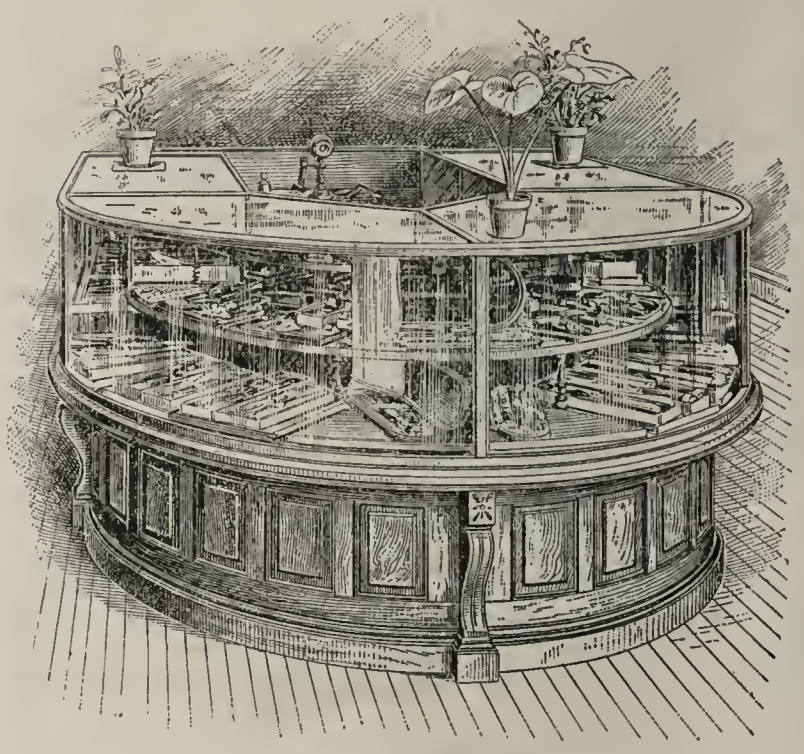

Fig. 2.—Horseshoe Shaped Case

The first floor is devoted to the retail part of the business, the goods displayed also serving as a sample room. This floor is furnished with electric lights, cash carrier system, traveling ladders and roll paper cutters, and with a ceiling of pressed steel of attractive design.

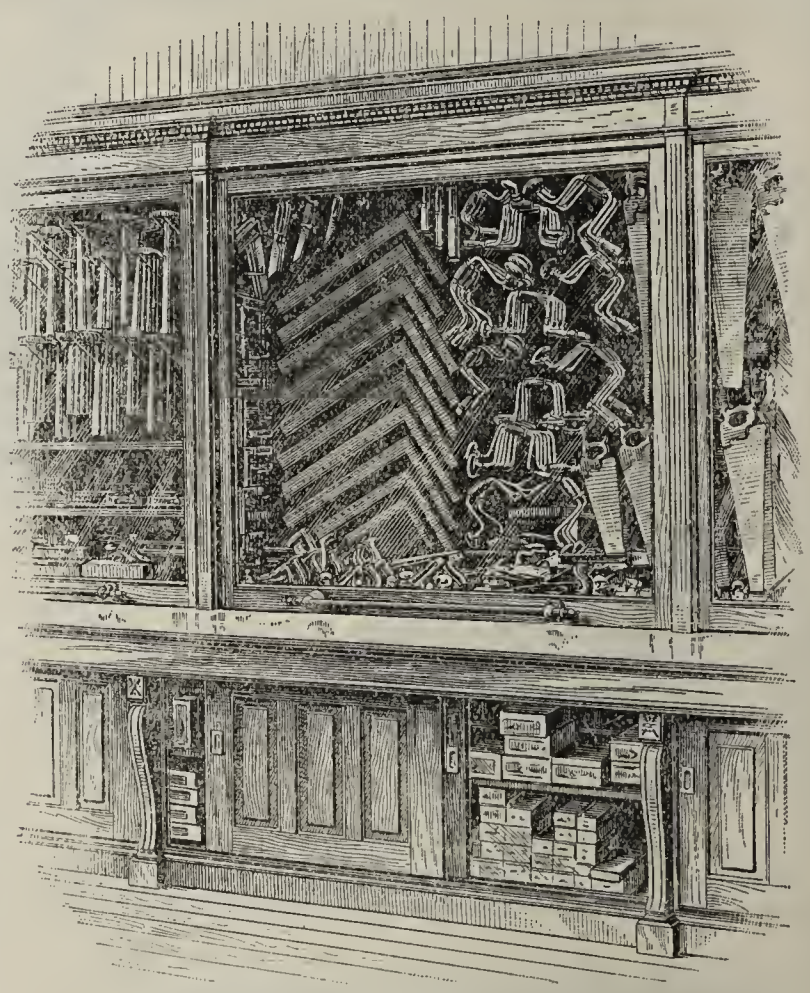

Fig. 3.—Tool Wall Case.

About 10 feet back from the entrance is a large horseshoe shaped case, Fig. 2, mounted on a low counter and containing Pocket Cutlery, Razors, Shears, Scissors, Revolvers, &c. Back of this is a desk, the space in the rear of which is used for seasonable goods, Refrigerators utilizing it in the summer. At the right of the Cutlery case and against the wall is an oak case, 20 feet long and 8 feet high, which is filled with Carpenters' Tools, Fig.

3. The case is built to be dust proof, with plate glass doors that raise, and is deep enough to contain a large stock and a varied assortment of Tools. The base upon

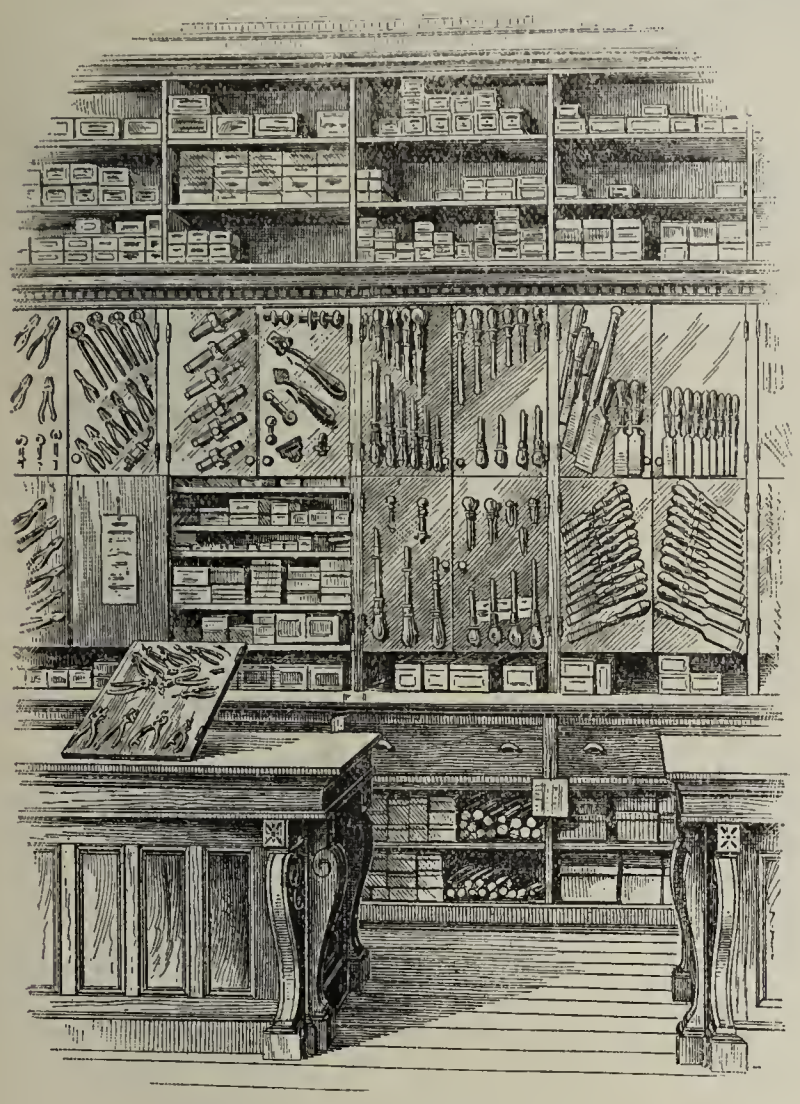

Fig. 4.—Shelving and Counters.

which the case rests has a wide ledge, under which are cupboards with sliding door for duplicate stock.

In the rear of this case is shelving arranged for Shelf

Fig. 5 —Step Ladders, Scales, Belting, &c.

Hardware, extending back 100 feet, with five counters in front, as shown in Fig. 4. On the uprights between the shelves doors of quartered oak are hung, which when closed protect the goods from dust, and upon which the samples of the goods contained in each section are fastened with holders, so that one sample may be removed and another easily substituted. The doors are hung on loose joint butts, so that they may be taken off and placed

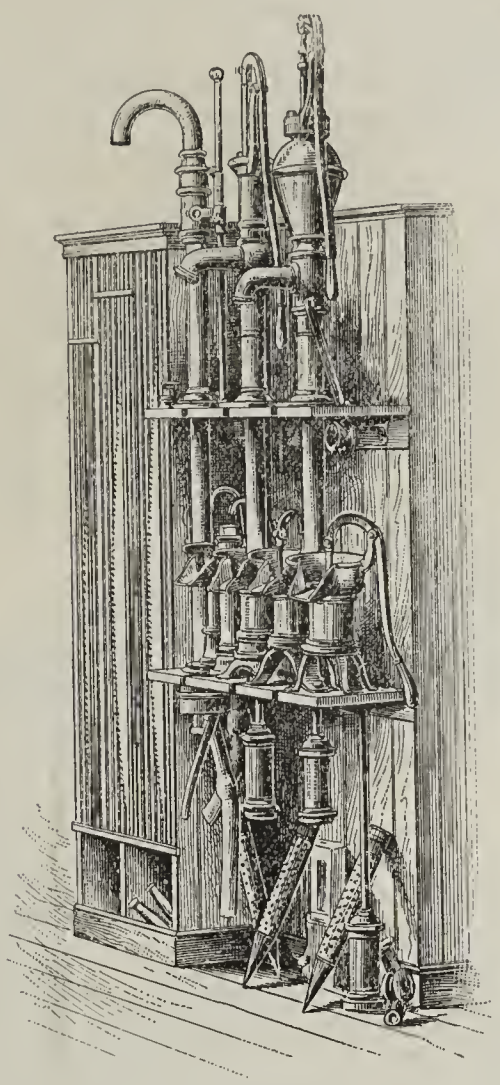

Fig. 6.—Cross Cut Saws and Pumps.

on the counter for the closer inspection of customers, as shown in Fig. 4. Price cards of the goods are hung on the inside of the doors, avoiding the necessity of marking prices on the original packages. The shelves throughout the store are adjustable, to accommodate boxes of differ-

Fig. 7.— Counters.

ent hights, or can be taken out entirely. Duplicate stock is kept in the shelves above, while underneath the ledge are drawers and bins for the accommodation of goods. At the rear of the shelving and counters is the general office.

At the left of the entrance is another wall case, the same size as the one in which Tools are kept. This is divided in two parts, one section being used for the display of Plated Hollow Ware and the other for Table Cutlery. The Cutlery case is shelved and between the shelves

fronts are placed inclining inwardly, upon which samples are fastened by clips. The shelves and clips are covered with black cloth, so as to show the Knives and Forks in bold relief. Behind the fronts is ample room for keeping the stock. In the rear of the case is a narrow open case for displaying Carpet Sweepers, which shows them in an attractive manner.

For 30 feet in the rear of this is shelving on which Tin and Granite Ware is kept, with a counter in front in two sections. Beyond this is the stairway leading to the second floor. On a strip fastened to the wall of the stairway are hung samples of Step Ladders, as in Fig. 5, the longer Ladders being near the bottom of the stairs. In front of the stairway is a counter upon which Scales are displayed. Under the counter are accommodations for heavy Galvanized Screen Cloth, and for Leather Belting of all sizes from 1½ to 14 inches in width. The Belting is

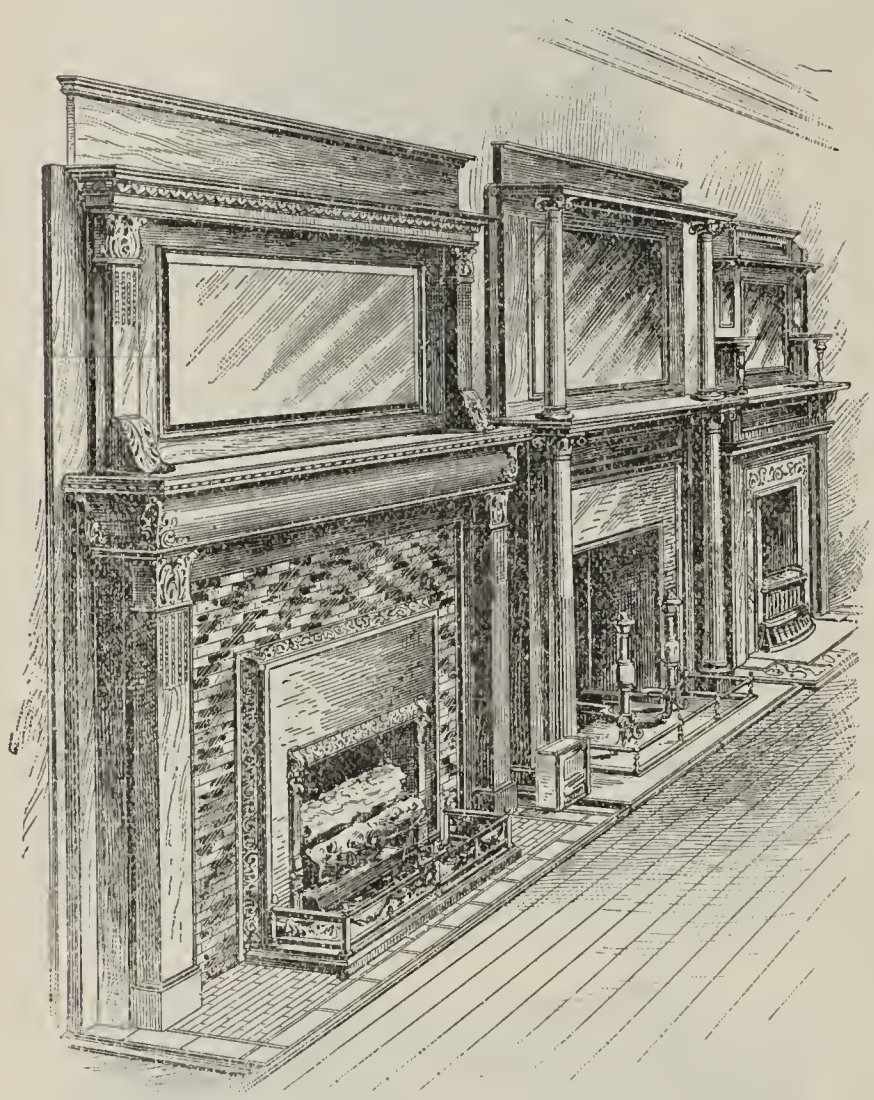

Fig 8.—Mantel and Gas Fixture Room.

hung on iron rods, so that it can be unrolled and cut off without lifting the roll.

Next to the stairway is a rack for Cross Cut Saws and a stand holding sample Pumps, Fig. 6. Between the Pumps and the elevator, hooks on the wall for a distance of 25 feet hold Forks, Hoes, Rakes, Shovels, Spades and other steel goods, besides Scale Beams and Pulley Blocks. The display of steel goods is partially shown in Fig. 7 back of the short counters. These counters, of which partial views are given, show the method of displaying Circular Saws and Axes at the ends. Poultry Netting, Vises, Corn Hooks, Snaths, &c., are laid on the top, while bins beneath contain Handles, Bolts and other heavy goods The elevator in the rear of the short counters is operated by an electric motor. Next to this are the private offices.

The rear portion of the second floor is used to display Mantels and Gas Fixtures, as in Fig. 8. The walls and ceiling are handsomely decorated, and from the latter is suspended a large line of Gas Fixtures, not shown in the cut. The firm state that they carry the most complete and best assorted stock of these goods in the city. Along both sides of the room, against the walls, are samples of Grates and Hardwood Mantels. There is also an attractive display of Tile work and wainscoting in almost endless variety.

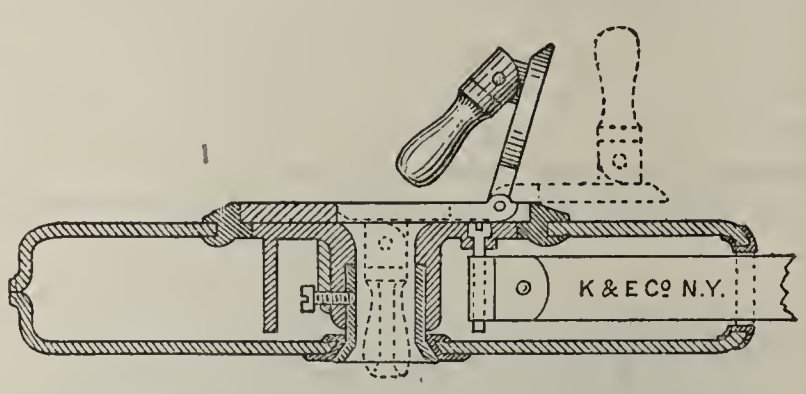
The front half of this floor contains part of the wholesale stock, the remainder being on the fourth floor. The front half of the third floor is the shipping room, with facilities for prompt dispatch of goods. Heavy goods, Cordage, &c., are kept in the basement. Neatness and order are the rules of the store, and no goods or obstructions of any kind are allowed on the floor.

Excelsior Measuring Tape.

The Keuffel & Esser Company, 127 Fulton street, New York, are now manufacturing a line of Excelsior measuring tapes with patented improved centers, as here shown.

Fig. 1.—Excelsior Measuring Tape, Improved Center.

These American made tapes are referred to by the company as a superior article in accuracy, construction, material and workmanship. The patent center with flush folding handle, as seen in Fig. 2, has a large drum which winds the tape quickly and avoids the close coiling which injures the steel lines. A long swiveling handle, when closed, protrudes beyond the surface of the tape case, so that the crank can be thrown open by pressing on the projecting end of the handle. The larger center permits of using a longer crank, giving more leverage in



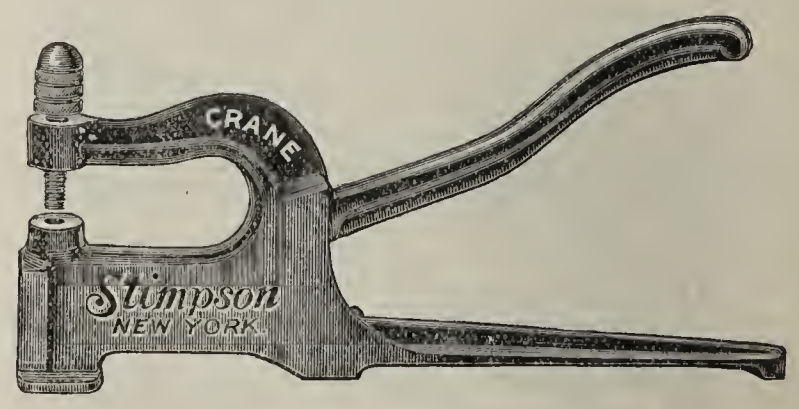


Fig 2.—Sectional View, Showing Interior of Case.

winding. Fig. 1 shows the article as put on the market. This style of tape is made in all their high grades both steel and metallic.

Crane Hand Riveting Machine.

E. B. Stimpson & Son, 31 Spruce street, New York, are manufacturing the Crane hand riveting machine here illustrated. It is designed for use in clinching tubular or

Crane Hand Riveting Tool.

bifurcated metal rivets in clothing, blankets, feed and mail bags, harness, belting, straps and numerous leather and other goods of similar character. In use the milled wrought screw at the top can be quickly adjusted to accommodate the necessary thickness up to ⅞ inch, the end of the screw being so shaped as to form the open end of the rivet. The rivet is dropped in the opening head downward, a down pressure of the lever forcing the rivet up through the material and clinching it against the end of the screw. Rivets with heads as large as 9-32 inch will enter the opening. The extreme length of the tool is 12¾ inches, it weighs 3¾ pounds, and can be retailed for $1.

Window Trimming Suggestions.

In Fig. 1 a show window is represented, trimmed with Brooms, Mops and Whisk Brushes. The center broom is fastened to a large screw hook at the top of the window by a string passed through the handle, after

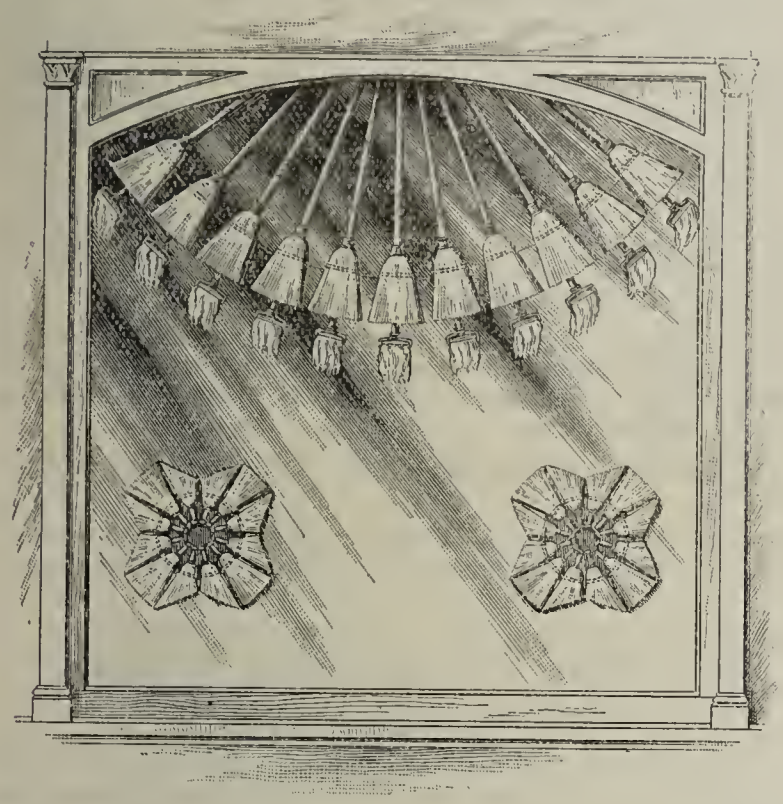

Fig 1.—*Window Trimmed with Brooms, Mops and Brushes.*

which the brooms are fastened to each side of the center one by tying each to its neighbor, working toward the ends. They will now hang in a bunch until separated. An artistic effect is produced by using a packing needle and twine, and sewing the twine through the body of the brooms, then fastening it at the top of each side of the window. The mop handles are fastened at the top to the broom handles and at the bottom to the body of each broom. This fills the upper portion of the window, making an attractive display, leaving the lower part necessarily bare and unfinished. The vacancy is filled with brush medallions hung by wire in the desired position. A detailed view is given of the medallions in Fig. 2, showing that they are made of angle and straight cut whisk brooms, fastened to a circular piece of wood 18 inches in diameter. The effect of this arrangement is pleasing and offers a scheme for relieving large show windows of their desolate, barnlike appearance. It can also be appropriately used in connection with displays of House Furnishing Goods.

Fig. 3 shows a pair of Wooden Shears, 3 feet in length, which could be cheaply made by a local carpenter. Scissors and Shears are attached to the wooden pair, which is suspended in the show window, on the line of vision. The rivet of the large pair is an incandescent electric lamp. For pushing a 25 cent line of Scissors and Shears this device is recommended as producing immediate results by A. Q. Casselberry, Pittsburgh, Pa., to whom we are indebted for these window trimming suggestions.

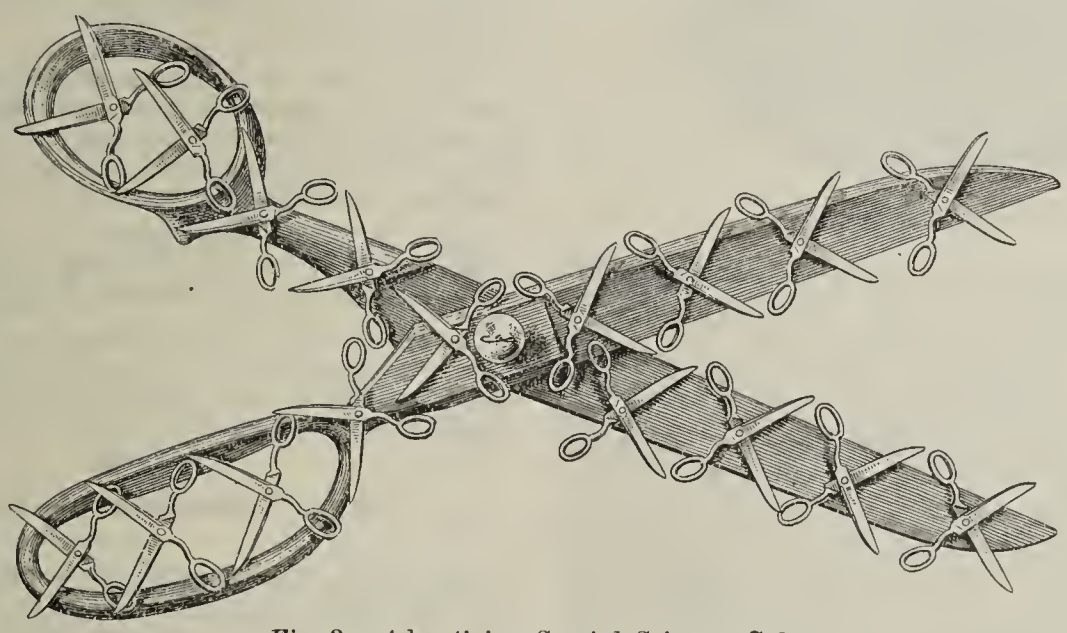

Fig. 3.—*Advertising Special Scissors Sale.*

Vent Nose Faucets.

A. B. Fisher, 385-387 Kent avenue, Brooklyn, N. Y., is introducing his improved vent nose dripless faucet for

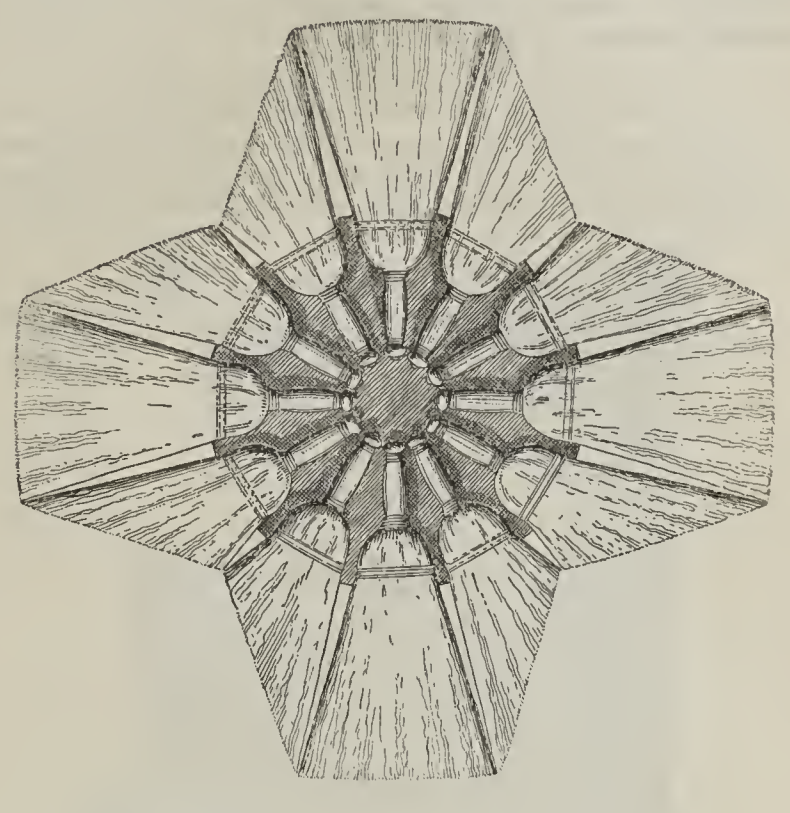

Fig. 2.—*Medallion of Whisk Brooms.*

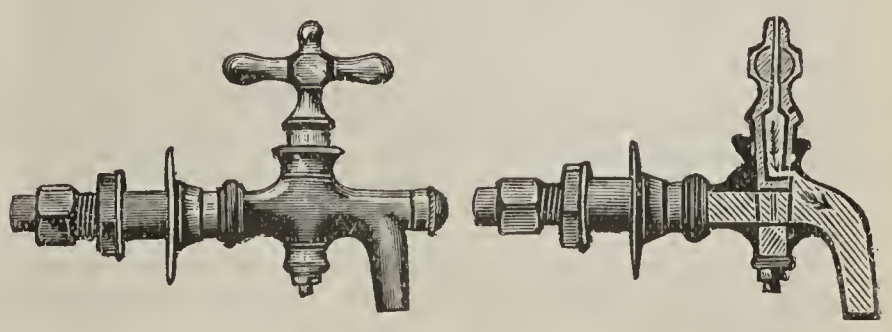
coffee, tea, milk, beer, ale, &c., as shown in the accompanying engravings. Fig. 1 illustrates it as put on the market, the cut showing a removable cap at the front end so that a brush or other appliance can be introduced to clean out the interior, especially valuable in connection with milk. The faucets are also made without the clean out, as seen in Fig. 2, which is a sectional view illustrating the vent nose principle, by means of which all drip and waste is avoided, insuring both economy and tidiness. The principle on which the faucet is constructed is that a clear passageway is provided through the handle and out the front



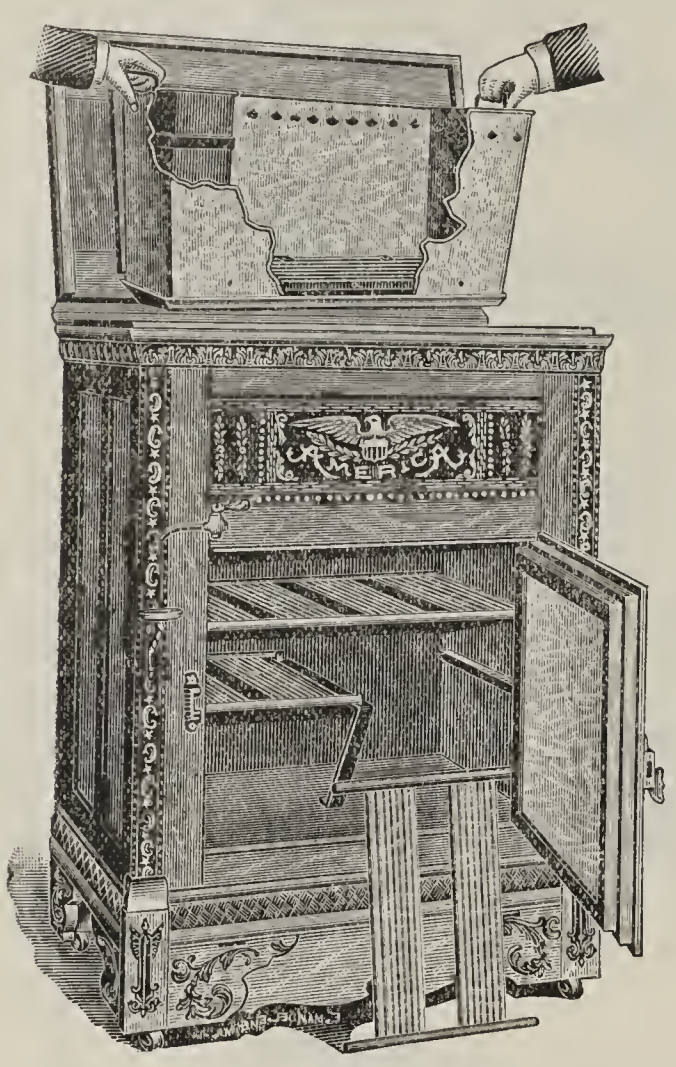


Fig. 1.—*Vent Nose Faucet, with Clean Out.*

Fig. 2.—*Sectional View of Vent Nose Faucet, without Clean Out.*

nose, so that when the liquid is cut off the air pressure being equalized top and bottom allows the material by gravitation to run out immediately instead of gradually, the air passage being indicated by the arrows in sectional view. Another modification of the form of faucet for urns, &c., is also offered in connection with gauge faucets. The portion to which the gauge glass is fixed is separate from the faucet proper and attached to the urn, so that should the faucet need attention it can be unscrewed and repaired without disturbing the glass at all or risk the breaking of it. This style is also made with loose cap for cleaning. Mr. Fisher manufactures in addition full lines of regular faucets for coffee, tea and hot water urns and confectioners' and hotel brass work.

The New America Refrigerator.

The Bowen Mfg. Company, Fond du Lac, Wis., have brought out the new America refrigerator for the season of 1898, as illustrated herewith. The refrigerator is fitted

The New America Refrigerator

with a patented removable galvanized ice compartment-shown lifted out in the cut. It also has a separable, re, movable porcelain lined water cooler. As these parts and the racks can be easily taken out, the interior of the refrigerator is thus accessible for cleaning with the least trouble. No weak attached bottoms are used. In the provision chamber a center removable shelf rest is placed, to accommodate parted shelves for convenience in storing jars or other tall articles. In the illustration the lower rack is shown with one-half lifted out for this purpose. The shelf rest can easily be taken out if a high space across the entire bottom is desired. These features will be appreciated by housewives who find it necessary to use every inch of space to advantage in storing provisions to be kept cool. It is stated that in the construction of this refrigerator a perfect interior circulation of air is secured, so as to get all the benefit from the ice in reducing temperature. The arrangements for draining are such as to secure a quick exit of the water. The walls are lined with charcoal sheathing and are filled, including the bottom, with mineral wool. The consumption of ice is claimed to be very economical. The joints surrounding all openings are carefully sealed, so as to guard against the admission of warm air at such points. The trimmings are of the latest design, manufactured especially for the company's use. The exterior of the refrigerator has received much attention, and the general design is regarded by the company as a model of its kind.

A. J. Patterson has succeeded J. J. Williams in the retail Shelf Hardware, Stove and Tinware business in Griggsville, Ill.

F. E. Sovey has commenced the erection of a new Hardware store on Woodside avenue, Essexville, Mich. Mr. Sovey expects to be ready for business about April 1. He will handle a line of Shelf Hardware, Stoves, Tinware, Bicycles and Sundries, &c.

MEMORANDA.

The proposed consolidation of Enameled Ware interests, which has been the subject of many meetings and negotiations between manufacturers in this line for the past two or three months, is announced to have fallen through. The cardinal difficulty, which caused the abandonment of the plan, was the question of the valuation of the different plants to be included in the combination. The fact, also that two or three important concerns could not be induced to take part in the project no doubt had an influence on the minds of its promoters when it came to a final decision. It is not believed that the formation of any consolidation of the kind will be undertaken again for some time to come.

Among the new goods in Enameled Ware made this season by the Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, are a line of Turk's Head Corn Cake or Lemon and Muffin Pans on frames.

The Hardware and Stove store of Panchot, Hunsicker & Co., Akron, Ohio, was damaged by fire on January 28 to the extent of $10,000. The loss is stated to be fully covered by insurance.

R. Garrett has opened a new Tinware store at Malvern, Pa.

Greer & Peters is the title of a firm who have opened a new Hardware and Tinware establishment at Lewiston, Minn.

The Knoxville Tinware Company, Knoxville, Tenn., are building a plant for the manufacture of Tinware.

Allen & Nichols, wholesale and retail Hardware and general Builders' Supplies, Raleigh, N. C., have removed to their new store, 214 South Wilmington street. They will shortly add to their stock Hubs, Spokes, Rims and a line of Stoves and Tinware, and state that they would like to have catalogues and quotations.

W. A. Kuhlman & Co. have succeeded H. E. Kuhlman & Co. in the Hardware, Stove and House Furnishing business, 620 South St. Clair street, Toledo, Ohio. Many improvements are being made in the old premises by the new firm.

Goodrich Bros., Winchester, Ind., have sold their stock of General Hardware, Stoves, &c., to Frank McDaniel, Fort Recovery, Ohio.

Doan & Pegan have recently put in a new stock of Hardware, Stoves, &c., at De Graff, Ohio. Mr. Doan was formerly connected with the firm of Wiegman & Doan of the same city.

Mason Bros. & Co., formerly in business in Liberty, Neb., have purchased the Hardware stock of Gunn & Reeves, Red Oak, Iowa, and will continue at the old stand, handling Shelf and Heavy Hardware, Stoves and Tinware, Sporting Goods, &c.

Chas. E. Green has opened up a new Hardware store in Alfred, N. Y., carrying a line of Shelf Hardware, Tinware, Plumbing and Furnace Goods, &c.

R. M. Hewitt expects soon to open a new Hardware store in Grand Marais, Mich. Mr. Hewitt will wholesale and retail Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

The Annealing of Cast Iron.*

The writer had the pleasure in May last of reading before this association a short article on "Malleable Cast Iron" with special reference to the chemical specifications. The most characteristic part of the process, the annealing, has not until very recently been at all understood. It was generally known that the carbon of the casting was oxidized by the oxygen of the packing, since the carbonic oxide could be seen burning at cracks in the luting during certain stages of the process, and further than that analysis showed that part of the carbon had been removed. Several writers on metallurgy treated this subject in a very non-committal way—saying that the oxygen of the air oxidized the carbon, a statement true enough where annealing in sand or like substances was the method described, but these writers carefully refrained from explaining how it was done in the Reaumur process. For if the air were the source of oxygen we should hardly expect to find the packing reduced nearly to the metallic state as it is in some cases. One writer in a book published in this city in 1872 advanced the idea that the dissociation of the carbonic acid contained in the gases of combustion was the true explanation, though his assertion was unsupported by any evidence. This view was at least plausible. Then the second difficulty was how the car-

*Read by George C. Davis, chemist to Thos. Devlin & Co., Philadelphia, before the Foundrymen's Association at Philadelphia January 5.

bon in a solid body could combine with the oxygen of the packing—a very stable substance not dissociated by heat—as it evidently did. The carbon from the casting for ⅛ inch or more had united with the oxygen of the inclosing packing, but how the two got together was an unsolved problem.

It remained for an English metallurgist to show that the process was one of diffusion. Thus if two bars of steel, one high carbon and one low carbon, are heated in contact with each other to a temperature of about 900 degrees C. the carbon diffuses gradually from the one to the other. This experiment was conducted in a porcelain tube in vacuo. And it is a similar diffusion that brings tne carbon of the casting into contact with the oxygen of the packing.

At the meeting of the British Iron and Steel Institute held in May of last year there was presented by G. P. Royston a paper on "Malleable Cast Iron," which with the discussion that followed has doubtless been read with great interest by makers of malleable castings in this country. This paper, so far as it presents what we may call the practical details of the process, brings out certain marked differences between British and American prac tice, so comment from the latter point of view may be of interest. Both Royston and Hadfield take the ground that manganese in appreciable amounts is injurious. The pig iron used in the experiments contained 0.112 per cent. and the casting 0.043 per cent. manganese, thus showing more than the usual loss in melting. I have never found any good casting that was made in this country that ran as low as this, even those made from charcoal iron exclusively. The average analyses of three typical brands of charcoal iron for the past year show for the No. 2 grade 0.24, 0.32 and 0.45 per cent. respectively, and for the No. 4 grade of the same brands 0.19, 0.14 and 0.18 per cent. The leading brands of coke malleable run still higher in this element; one contains from 0.60 to 1.00, another 0.60 and a third well-known brand from 0.20 to 0.50. A few concerns use small quantities of pig containing 3 per cent. manganese, but this is with a view to producing a smooth and solid casting free from pin holes. We see from these figures that it is impracticable with the pig at our disposal to produce castings as low in manganese as is held to be absolutely essential by the British writers, even were this result desirable. And I do not think that it is. In this country the most common practice is to make a mixture containing from 0.40 to 0.80 per cent. manganese, which would give from 0.20 to 0.40 per cent. in the castings.

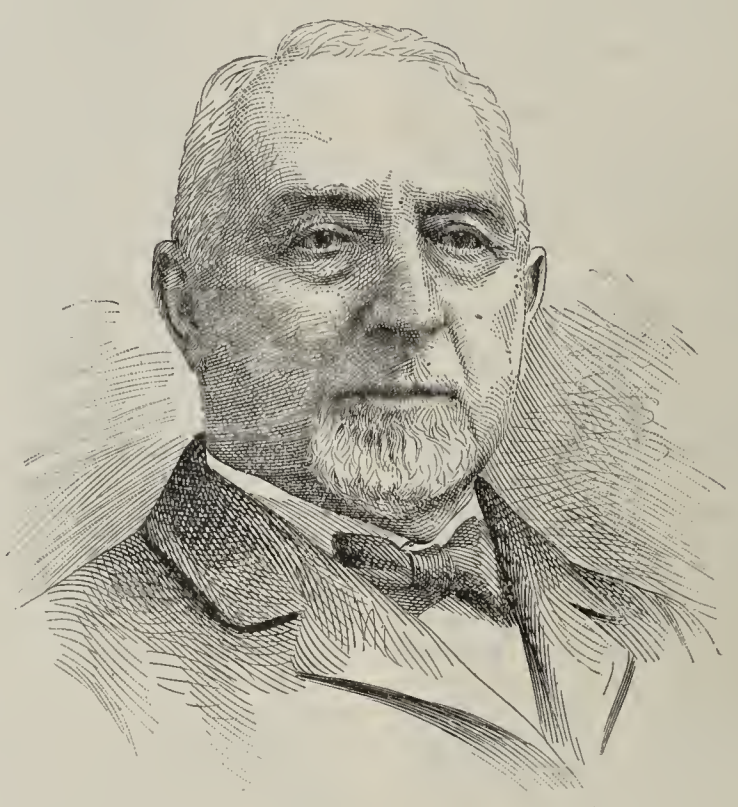
Whatever reason there may be for claiming that castings containing manganese anneal with difficulty, since carbide of manganese and iron is more difficult to decompose than carbide of iron, the fact remains that according to the writer's experience in actual practice castings of the composition mentioned above are annealed without the slightest trouble, the combined carbon being below 0.10 and frequently only a trace; the graphite of course depending on the cross section of the casting and time of annealing. A number of tests and analyses by a Western concern show silicon, 0.75 to 0.98 per cent.; manganese, 0.35 to 0.53 per cent.; tensile strength, 39,600 to 53,700 pounds; elongation, 3.85 to 7.83 per cent. Unfortunately, the carbons are not given, but it is obvious that to obtain these results the annealing must have been good. Sulphur, if present in large amounts, interferes with annealing, as was shown in a paper by H. R. Standford, read before the American Society of Civil Engineers in 1895.

In melting iron in an air furnace using a coal containing 1.12 per cent. sulphur I found the metal gained not over 0.03, so that the casting never ran over 0.06 per cent. Some castings are made from iron melted in a cupola, and here it occasionally happens from bad fuel or irregular melting of the sprues in the charge that the sulphur runs too high. In a previous paper I referred to an extremely tough casting containing 0.121 per cent. sulphur. This casting was about ⅛ inch thick, and had the carbon practically all removed. In the case of a thicker casting where the annealing did not remove all the carbon I found a slightly larger amount of sulphur sufficient to prevent complete annealing. A casting ⅜ inch thick after once annealing showed sulphur, 0.133 per cent.; graphite, 0.547 per cent.; combined carbon, 0.515 per cent.; after a second annealing, graphite, 0.505 per cent.; combined carbon, 0.380. Using the best fuel obtainable and the greatest care in charging it is possible to melt iron in a cupola wthout adding more than 0.03 per cent. sulphur, but I find that few works can show as good results as this, and more often 0.06 or over is added than the former figure. West Virginia ccke running from 0.50 to 0.65 per cent. sulphur and Connellsville at about 0.85 per cent. can be easily obtained, so it is entirely practicable to produce castings from cupola metal running below 0.11 per cent. sulphur, an amount not objectionable in the class of castings made from this iron.

The difference between Reaumur's process, where the carbon is wholly or partially removed, and the process described by Forquignon, where it is simply changed to graphite or decarburized and transcarburized respectivley (as one author puts it), is fully brought out in the discussion of Mr. Royston's paper. Many manufacturers of malleable iron in this country do not understand this matter. Some of them use various processes for annealing which do not decarburize to any appreciable extent, under the impression that they are producing Reaumur castings. A number of processes for the production of malleable castings have been proposed by men ignorant of the rationale of the Reaumur process. It is impossible for commercial reasons to discuss them here; suffice it to say they are no improvement and many are obvious frauds, such as the addition of mysterious fluxes in the furnace or ladle just before pouring. In the discussion Mr. Hadfield takes issue with Mr. Royston, who says no bend can be obtained if the graphite is present as in the so called black heart castings such as are produced by annealing in sand or bone ash in luted pots. Mr. Hadfield instances a casting made in this country containing 3.07 per cent. graphite, which could be bent in a manner approaching soft steel and had wonderfully good resisting properties to sudden blows. My own experience agrees in the main with Mr. Royston. While castings containing large amounts of graphite will sometimes bend well, I have never found them as tough as decarburized castings containing equal amounts of the other weakening elements, silicon and phosphorus.

In this country roll scale is used as a packing in preference to ore for several reasons. Ore sufficiently low in silica would be more expensive for works located east of the Alleghanies. Mill scale requires no grinding or other preparation than to oxidize or rust it, as the common saying is, with a weak solution of sal ammoniac. Instead of mixing three or four parts of spent ore with one of raw ore ground to the size of a pea, as described by Mr. Royston, it is the common practice to spread the spent packing on the floor and sprinkle it with a weak solution of sal ammoniac so that the mass becomes oxidized. This spent packing is, of course, finely divided as it falls through the crevices in the tumblers into which the whole charge is placed. The oxidized mill scale is added from time to time, as there is always some loss in handling the packing as dust and in other ways. So far as the pots are concerned no special mixture is made for them. They are cast from cupola metal, if this is available, and last five or six heats, depending on their position in the furnace. A number of types of annealing furnaces are used. Probably in the most efficient type the fire is built in furnaces along one side, the gases entering near the top, passing across the furnace down the opposite side and out of the ports to by pass flues underneath the floor and finally to the stack. Thus all sides of the furnace are heated to a nearly uniform temperature.

Mr. Royston refers to the question of scaly castings without covering the whole ground. In speaking of annealing in sand or bone ash, he says: "The reaction taking place between the carbon and the iron should be $C + O = CO$. Should it be $C + O_2 = CO_2$, the iron will also be oxidized by the carbonic acid and the casting will be scaled." To put it in other words: If you use too much air you will burn the castings. Continuing, the author says: "Where oxides of iron are used as a source of oxygen the carbon monoxide partially reduces the iron oxide to the metallic state." This sentence is of doubtful meaning, but I take it that he intended to say reduces the iron of the scale to the metallic state. It frequently happens that where a number of small castings are annealed in ferric oxide in the same pot some will scale and some will not. I have never found a scaly casting that contained the amount of manganese usual in good castings, and I believe that this element acts to prevent scaling, at least when annealing in ferric oxide. Thus in one case a scaly casting showed 0.08 per cent., and a good casting 0.27 per cent. manganese, both being annealed at the same time. With regard to phosphorus, if the Lorn pig used in Mr. Royston's experiment is one of their representative brands the English founders seem to be running lower in this element than is necessary. I certainly do not believe in adding phosphorus *ad libitum*, but in this country the usual specification is 0.20 or less, and certain it is that castings containing 0 18 (that is about a fair average figure) show excellent results.



The largest industrial company ever incorporated in New York State are the International Paper Company of Corinth, Saratoga County, N. Y., who received articles of incorporation this week. The capital stock of the new corporation, which is familiarly dubbed the "American Paper Trust," is placed at $45,000,000. All the large paper mills in the East and several in the West are in the combination, which aims to control the paper making industry in all its branches.

Thomas Worthington has been appointed by the British Board of Trade as a special commissioner to visit South America with the purpose of inquiring into the conditions and prospects of trade in that country.

STOVE TRADE NOTES.

William P. Abendroth.

The stove trade of the country has lost another veteran member in the death of William Philip Abendroth, which occurred at his residence, at Portchester, N. Y., on the morning of Saturday, January 29. Mr. Abendroth was born in Germany, December 18, 1818, and at the age of 14 years came to this country with his parents. They resided for a short time in New York, and then removed to Albany, where the young man entered the iron foundry of Dr. Ephraim Nott to learn the trade of foundryman. From this time forward until 20 years of age he improved his leisure in the evenings by attending night schools. In 1834 Dr. Nott transferred his business to New York City and started what was known as the Novelty Iron Works, in which place Mr. Abendroth completed his apprenticeship in 1836. In the same year he left the firm and engaged as journeyman in the foundry of Bartlett Bent in Jersey City, N. J. Mr. Abendroth, however, was anxious to improve his position and circumstances, so in the fall of 1839 he severed his connection with Mr. Bent and journeyed to New Orleans, making the trip in a sailing vessel. After sojourning in the South for a time and visiting some of the principal cities of what was then termed "the West," he returned East and entered the foundry of George E. Waring of Stamford, Conn. Here he remained but a few months, which completed his career as a journeyman.

WILLIAM P. ABENDROTH.

In 1840 he went to Portchester, and with Philip Rollhaus laid the foundation of the present large business of the Eagle Iron & Stove Works, Abendroth Brothers, proprietors. In 1842 an office in New York City was opened, it being now located at 109-111 Beekman street. Upon the retirement from the firm of Mr. Rollhaus in 1845 Mr. Abendroth took into the business his two brothers Augustus and John, and some years later his brother-in law, John D. Fraser. In 1874 John Abendroth withdrew from the firm, but Augustus continued his connection until his death in 1882. In the year 1876 a stock company was formed, with Mr. Abendroth as president, under the title of Abendroth Brothers, they being among the first under the law which then allowed incorporated concerns to retain the old name, and were not compelled to add either the terms "Co." or "Incorporated."

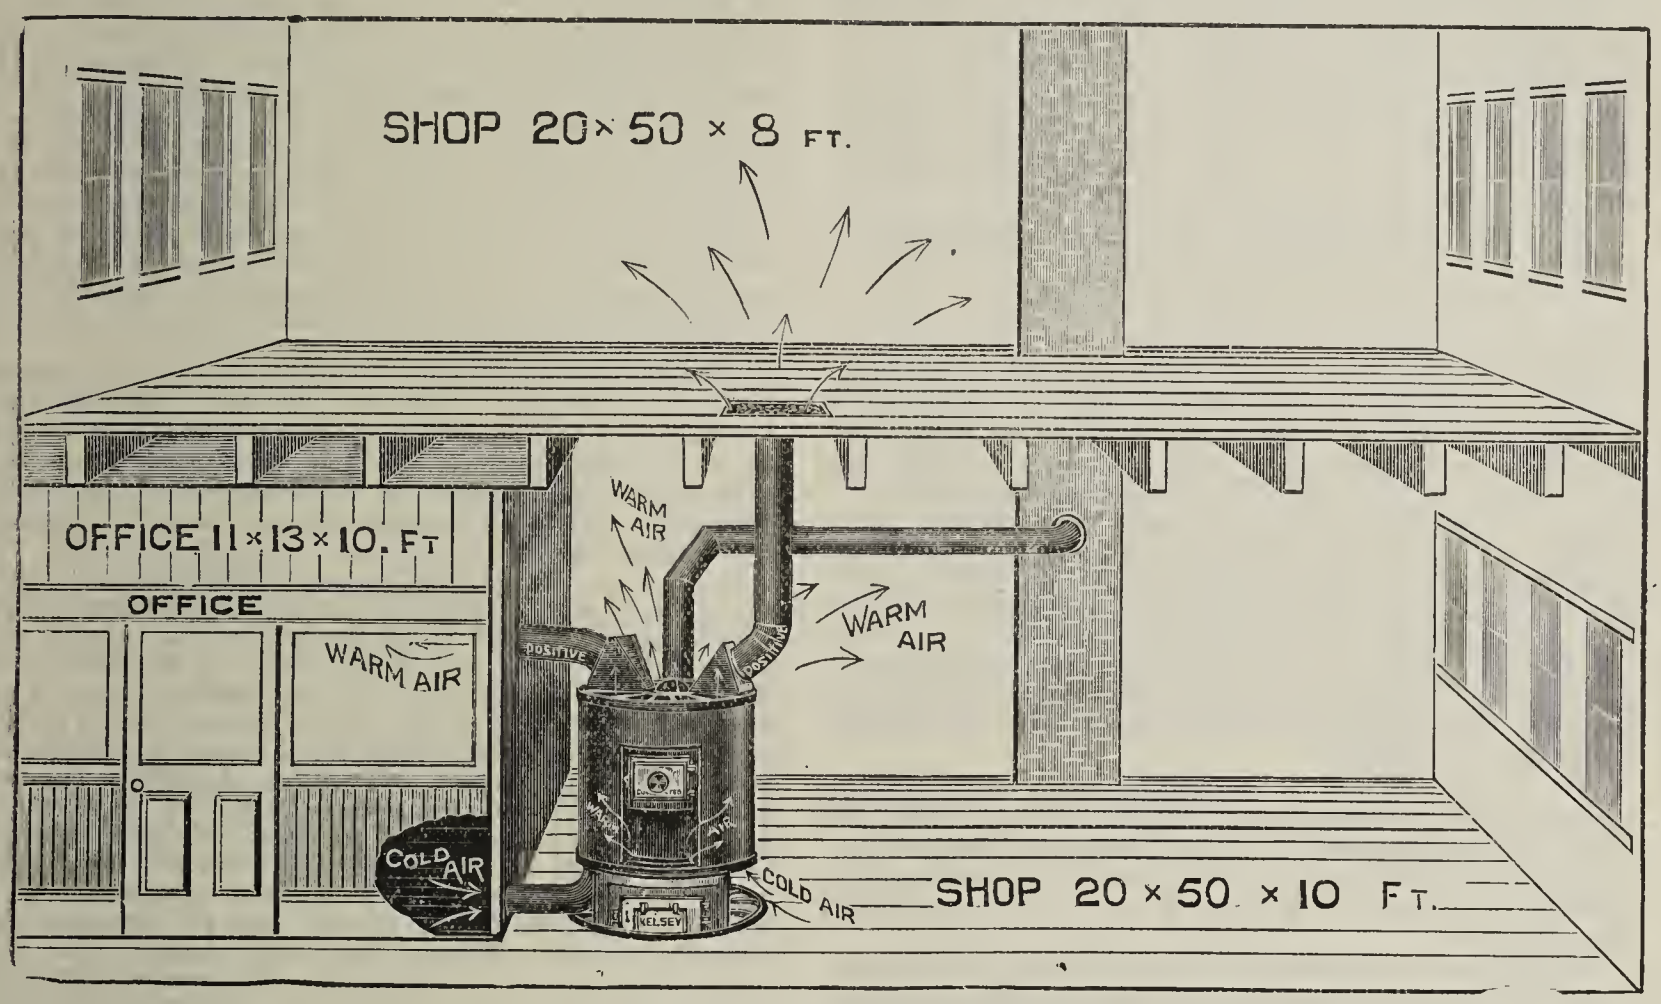
Besides his connection with the stove interests, Mr. Abendroth was prominently identified with practically every public enterprise looking to the advancement of Portchester. In 1863 he assisted in the organization of the First National Bank of Portchester, and was one of its directors for many years. In 1865 he, with several others, secured the charter and organized the Portchester Savings Bank, being elected its president, which office he held until the time of his death. He was also president of the town for four years, besides taking part in various minor organizations. He was the prime mover in the establishment of the Portchester Water Works, and was one of the directors. In fact, it may be stated that Mr. Abendroth was largely instrumental in the building of the town of Portchester. He was a member of the Fulton Club and of the American Yacht Club.

In 1843 he was married to Miss Anna Maria Fraser of Jersey City, N. J., who, with three daughters and two sons, survive him. The funeral services were held on Tuesday afternoon at St. Peter's Protestant Episcopal Church, Portchester, N. Y., in which Mr. Abendroth was a vestryman, the pallbearers being Dr. Norton J. Sands, John Voorhis, Geo. W. Quintard, John W. Lounsbury, Wm. E. Ward and Jordan L. Mott, who represented the various directories and associations of which Mr. Abendroth had been a member.

W. S. Hull.

Wm. S. Hull, superintendent of the Bridge & Beach Mfg. Company, St. Louis, died on Thursday, the 27 ult. He suffered from an attack of *grippe*, which later developed into pneumonia, which was the cause of his death. Mr. Hull was born 56 years ago in Stuyvesant, N. Y. He served in the Union army during the war. In 1877 he came to St. Louis and entered the employ of the Bridge & Beach Mfg. Company, as foreman of the foundry. Later he was made superintendent and became a stockholder in the company. The Bridge & Beach Mfg. Co., in speaking of the deceased, said:

"There is nothing we could add in praise of the character and nature of our departed friend that would not be fully justified by the facts. He was a man of few words, thoroughly reliable and straightforward, a conscientious Christian gentleman in all that the term implies, and to a degree seldom found he won and merited the confidence and esteem of all who knew him. Abstemious in his habits, upright in his dealings, and gentle in his manner, a harsh word was never known to pass his lips, still his control over the several hundred men under him was wonderful. He ruled them by love and not by fear, while at the same time he entered into their lives as only one who is thoroughly humane and kind to his fellow men could. Under a reserved exterior he had a warm heart, and many of the men who worked under him for many years could hardly restrain their emotion as they quietly laid down their tools, when the sad news of his death was received on Thursday morning, and silently left the foundry. To the officers of the Bridge & Beach Mfg. Company he was not only their superintendent, but their friend, and the shock of his sudden death was hard to bear. The memory of his many good deeds and kindly actions will linger with us for many years."



At a meeting of the Bridge & Beach Mutual Aid Association the following resolution was adopted :

Resolved, That in the sad and unexpected death of William S. Hull the members of the Bridge & Beach Mutual Aid Association have lost a faithful friend and conscientious associate, a man whose subordinates respected and honored as a superior, and loved and cherished as a faithful friend. Gentle in his manner, honest in his convictions, straightforward in all his dealings, we sincerely mourn his loss, and tender our heartfelt sympathy to those who were nearer and dearer to him than we.

A Positive Air Delivering Furnace Plant.

The difficulty of securing under all conditions a positive flow of air to some of the rooms connected with a furnace is well known. A method of overcoming such a trouble is described in a letter received from L. R. Lewis, Cortland, N. Y., which we give below, with the sketch accompanying the letter:

Thinking some readers of *The Metal Worker* may be interested in knowing what may be accomplished with hot air heating in the way of absolutely warming various portions of a shop or other building, I submit the sketch and following descriptive matter of results I have attained in this direction. I have placed on my lower shop room floor a No. 14 Kelsey warm air generator, made by the Kelsey Furnace Company, Syracuse, N. Y., erected complete, without the outside galvanized iron casing. In this way the cold air on the floor has free draft and circulation up through the hollow, corrugated sections forming the fire pot and combustion chamber of the heater. My office is a tightly partitioned off portion of the southwest corner of my lower shop room. The heater is located about 5 feet from one corner of the office partition. I have placed a positive cap attachment over two of the hollow corrugated sections above referred to, and connecting this positive cap with a 10-inch round tin pipe to a register face located in side partition of office, about 5 feet above floor, and introduce into the office such a constant flow of heated air as to make it comfortable at all times. To remove the cold air from the floor of this pocketed office room I have provided a return pipe back to the heater, taking the cold air through a register face located in the partition near floor. For heating my upper shop room, occupying the entire second floor of my building, a room 20 x 50 feet, I have capped three of the hollow corrugated sections with a positive cap attachment, and use a 12-inch pipe to conduct the heated air direct to the second floor room, and by this means it is always thoroughly heated, assisted as it is by heated air from first floor, which arises through a single open stairway near rear part of shop. The shop on first floor is thoroughly warmed by the heated air being freely delivered in it after passing through the hollow corrugated sections not capped. The radiant heat from the heavy steel casing also assists in making comfortable the first floor shop room. Thus it will be seen that with this heater, without even the expense of an outside galvanized iron casing, I am heating a separately partitioned off office room, a large shop room on level with the heater, and a shop on the second floor. I have never used over 4 tons of coal any season. This is the fifth winter the heater has been in use and it is as perfect to-day as five years ago.

A Positive Air Delivering Furnace Plant.

ODD PLATES.

The latest card distributed by Isaac A. Sheppard & Co., Philadelphia, Pa., in the interest of their serviceable book, "Hints About Heating," is decorated strikingly in black and yellow. A somewhat gayly dressed young lady from the State University of Illinois adds to the charm of the announcement, which is to the effect that "Hints About Heating" has been adopted by the university as a text book in its Department of Architecture.

The Cleveland Foundry Company, Cleveland, Ohio, set forth the merits of the Puritan Wickless Blue Flame Cooking Stove in a neatly printed pamphlet, which has just been issued from the press. The manufacturers state that after two years of patient experimentation they have succeeded in "perfecting an Oil Stove which burns kerosene oil without a wick and makes a blue flame the same as gas or gasoline without smoke or odor." The point is also made that it is so constructed that it will burn gasoline without alteration, is extremely simple in construction and "a perfect operating Stove with either fuel." The claims made for the Stove are set forth at considerable length, numerous illustrations being given to elucidate some of the more complicated features. Various styles of the Stove are presented, together with a line of Ovens for use in connection with them; also Puritan, Triumph, Defiance and Model Lamp Stoves, Extension Tops for Lamp Stoves, Ovens for Lamp Stoves, Broilers, Sad Iron Heaters, Registers, &c. The company state that they also manufacture Puritan Oil and Gas Heaters, Puritan Gas Ranges and Puritan Hot Plates, for which separate catalogues are issued. The pamphlet under consideration is printed in green ink and bound in colored paper covers printed in red and black.

A transformation is going on in the interior of the Chicago warehouse of the Excelsior Steel Furnace Company, at 38 and 40 West Monroe street. New platforms

are being built, bins are being enlarged and additional ones constructed in order to make room for the very much larger stock of Furnace Fittings and other goods which the Excelsior people propose to carry during the coming season. An immense Register rack is also assuming shape, and another large rack for taking care of cut lumber for crates is being put up in the basement. Space is also being provided for the new line of Sectional Wall Pipe, which the company will place on the market about March 1, a stock of which is now being manufactured.

The Kelsey Furnace Company, Syracuse, N. Y., will be represented this year in New York and Pennsylvania by E. H. Bradley, in Ohio, Indiana and Michigan by A. Hopkins and in the New England States by M. J. Kelsey.

Graff & Co. of Pittsburgh, Pa., have recently leased the eight-story building 817 Liberty avenue, that city, the structure covering an area 20 x 110 feet. The building is modern in all respects and the company intend to take possession the present week.

The annual meeting of the stockholders of the Syracuse Stove Works, Syraucse, N. Y., was held on the afternoon of Wednesday, January 26, when the following directors were elected: Francis Kernan, Joseph F. Kernan, William S. Doolittle, N. E. Devereaux, S. G. Finck, William T. Baker and W. H. Landers. At a meeting of the Board of Directors the following officers were elected: President and treasurer, Francis Kernan ; vice-president, S. G. Finck, and secretary and manager, W. H. Landers.

The Mount Penn Stove Works of Reading, Pa., resumed operations in all departments on Monday of last week, having been shut down temporarily for the purpose of making some repairs and taking annual account of stock.

The Dighton Stove Lining Company of Dighton, Mass., recently held their annual election, choosing Stephen H. Pierce president. The directors elected were Stephen H. Pierce, George H. Horton, W. Z. Witmarsh and G. C. Francis.

J. F. Hawken has been appointed general superintendent of Bridge & Beach Mfg. Company's foundry, to fill the vacancy caused by the death of W. S. Hull. Mr. Hawken entered the employ of the company 22 years ago at 17 years of age, and has a thorough knowledge of foundry practice, having worked as molder, stove mounter, then foundry bookkeeper; has been assistant superintendent for several years, and is eminently qualified to fill the position of general superintendent. Joseph T. Dugdale, for over 20 years past president of the Western Stove Company of St. Louis, has severed his connection with that company and has been appointed foundry foreman and assistant superintendent of the Bridge & Beach Mfg. Company.

The Hudson Stove Works of Hudson, N. Y., will be represented the ensuing year by Ed. H. Lisk, who will travel in the interests of the company in Eastern New York and Massachusetts, and Frank T. Panderson in Central, Northern and Western New York, Vermont and New Jersey.

The Chicago & Erie Stove Works, John Depinet and John Liebel, proprietors, Erie, Pa., are now running full blast, the company having taken up the manufacture of Invincible and Superb Helper Steel Ranges where the old concern left off.

The Illinois Steel Company.

Some interesting information is given in the financial news department of a Chicago daily relative to the Illinois Steel Company, as follows:

"The Illinois Steel Company are steadily improving their financial condition. The note for $1,500,000 given a year ago fell due Friday, and the company had no trouble in taking care of it. A third of the principal had been paid off during 1897. About one-half of the remainder was paid at maturity, and the balance, about $500,000, was renewed on easy terms. The company have been enjoying a large increase in business. but not all of these funds came from that source. They owned a large amount of stock in the Western Coke Company of Pittsburgh, and they recently made an advantageous sale of $850,000 of that stock. They received $400,000 in cash, and the balance is to be paid in installments. It will be observed that the deferred payments on these securities will take care of the bulk of the sum still due on account of that $1,500,000 note.

"It is asserted the Steel Company will in no way weaken their position by the sale of the coke stock. Possibly the sale may be taken as an indication that the company are counting on being able to produce their own coke from Illinois coal, as the result of their long series of experiments, which are said to have resulted in a practicable process for coking the coal of this State. The Steel Company have further improved their position by transforming the large supply of ore on hand last year into cash. It is assumed the company will not soon be caught again with such a large supply of raw material on hand, and this will result in a large saving in interest."

How English Houses are Heated.

In a late number of the *Engineering Magazine* is an interesting article on "European Systems of House Heating," by J. L. Saunders, from which we quote as follows:

The average English boiler seems to be constructed with but little consideration for the amount of fuel it will consume, and its grate and heating surfaces seem to be proportioned, not according to any set rules or ratios, but purely by guesswork. Many a boiler manufacturer of Great Britain, if asked the size of the grate surface or fire surface of his boiler, or its rating in proportion to its grate and fire surfaces, would look in astonishment and ask the purpose of the question. In many cases, indeed, he could not tell. With but very few exceptions the boilers made in Great Britain are of wrought iron, either welded or riveted, and are made in one piece, requiring to be brick set. Almost invariably this setting is done according to the individual idea of each heating engineer or heating contractor. The boiler manufacturer does not have any particular design for setting the boiler bought from him. Thus it may be seen how vague are the statements of the rating of a boiler, as this depends a good deal on how it is set.

Nearly all the manufacturers make the same style of boiler, the only difference being that each has his own name. The only competition is in price. But within the last few years some manufacturers have begun to produce and push patent boilers of their own, using as strong arguments for their special type its advantages in construction, style and heating power in comparison to fuel consumption. A few years will no doubt witness vast improvements in the boilers for heating systems in Great Britain. Most of the new boilers put on the market at present are of the American style and do not require to be brick set; they are called independent boilers, but they are made of wrought iron.

The British people are somewhat prejudiced against the cast iron boiler, for just what reason it is hard to tell. No doubt one reason is that cast iron boilers so far produced in Great Britain have been cast in one piece, have been very heavy because of the thickness of metal, and may easily be broken because of unevenness of expansion and contraction, as well as unevenness of thickness. It is asserted, also, that if a boiler is of wrought iron, made in one piece, there is less likelihood of leakage than in a cast iron sectional boiler which has to be put together with many joints. This is a point open to discussion. Although there is this prejudice in England against cast iron boilers, it is no doubt dying. I have used a number of American cast iron boilers in recent contracts, and several firms are using and selling American cast iron sectional boilers in Great Britain to day. In fact, there is one English firm that is putting on the English market a cast iron boiler of American manufacture, though sold under another name. Although the larger number of boilers in use in Great Britain are of wrought iron, either brick set or independent, both classes show great variety in type, style and mode of construction—especially in the arrangement of flues, cross tubes and narrow flues. The greatest objection to the independent boiler is that, as a rule, it has no covering, and therefore is giving out a great deal of its heat where it should not. Indeed, the commonest fault with British boilers is that they are great fuel consumers.

The low pressure hot water system is the one most largely used in Great Britain, but its chief application is to the heating of schools, churches and public buildings. Very few residences are heated in any way except by the open fire place, although of late years far more of the owners of large residences and mansions are putting in some one of the newer heating devices, using it, as a rule, as an auxiliary to the open grate, which holds its own because it ministers to the natural love of the sight of an open fire and the maintenance of good ventilation. Low pressure steam is but little used, as it is often considered to give too high a temperature for the heating of buildings. Another reason may be that its installation is not well understood, some very bad results having been produced. The two-pipe system is used, and the principal trouble has been that the returns have not been properly taken care of, with the result that water hammer has run riot. The one-pipe system is but little known, and the British architect is rather a difficult person to convert to new ideas. There are a few firms in Great Britain who are now doing considerable steam heating, using one-pipe work; and very good work indeed they are doing, for there is no question that, when the Briton goes in for good work, he does the very best. The fan system (or plenum, as it is called in Great Britain) has only of late come into use, and only in large public buildings, but it bids fair to become prominent. It is installed in Great Britain in a manner somewhat different from that prevailing in America; more often than not low pressure hot water is the heating agent instead of steam. Instead, however, of making one large heating chamber, from

which the warmed air is blown through tubes to the upright flues and thence to the different departments in the building, the heating surface is subdivided and the small units placed at the foot of each individual flue and cased in. A brick tunnel leads from the fan around the building (under the ground floor), and from this tunnel the air is supplied to each stack of heating surface and regulated at the bottom of the separate flues. There are, of course, many ways of installing the fan system and of regulating the supply of warm fresh air and of taking out the foul air. Where low pressure hot water is the heating power a gas engine is used to drive the fan.

The high pressure hot water system (known as the Perkins system) was at one time very largely used in Great Britain, but of late is less often installed. In this system the boiler is simply a coil constructed of very heavy wrought iron pipe and incased in brick work. From this coil are run strong 1-inch pipes with ⅝ or ⅞ inch bore. The circuit is generally continuous, with no valves and no means of shutting off any part of the apparatus; the heat must be either on or off for the entire building. In some cases, however, there are several circuits with valves and by-passes to each circuit. The pipes are put together in a very strong manner, for they have to withstand a heavy pressure. The joints are connected by right and left hand couplings. The joint is not made by tightening on the threads. The ends of the pipes are made one convex and the other concave, and the process of tightening the couplings butts the two ends of the pipe together. The same kind of joint is made with all fittings, and the fittings are all made of wrought pipe of heavy gauge; where bends (or elbows) are required the pipe has to be bent by the use of a fire. The system is run at a very high temperature and, as it is entirely sealed up with but a small air chamber or air cushion, the pressure is very great. The principal objection is the unevenness of temperature, caused in the following way: When the fire is on the water does not circulate slowly, as in a low pressure system, but stands still until a high temperature is reached and then goes through the pipes with a rush. As soon as the fire drops the circulation stops and the heat soon dies down.

The use of hot air heating in Great Britain is very small; in fact, about the only system used is the Grundy, and that principally in churches and schools. It is different from the practice in America, which commonly involves the use of a furnace with tin flues.

The systems of low pressure hot water heating in use are much the same in both countries, the three principal being the rising system, the drop system and the one pipe system. In the first the flow and return are duplicates one of the other, and the mains run side by side, or one above the other, in the basement cellar or in trenches below the ground floor, branches rising from these mains. In the drop system a main riser is taken to the highest point of the building and a main run around the top of the building, and from this main are taken drop pipes which supply the heating surface on their way down, the flow and return to the coil, or radiator, being from the one drop pipe; then all the different drop pipes are gathered into a main return pipe below the ground floor and returned to the boiler. The one-pipe system consists of one large main, in basement or cellar, which main is of the same size throughout. Its highest point is at its exit from the boiler, and it has a gradual fall all the way till it enters the return. This one pipe is used for both flow and return, the flow branches leaving the top and the return branches entering at its side.

Although the systems are much the same in both countries they vary in detail. All three systems have been more fully developed in America. The rising system is most frequently used in Great Britain, the other two systems named being less often met, although I have put in several since my return to England. As to style of work, America is far in advance, but the large demand for heating and the great competition account for the superior quality of American work. The demand for heating systems has been comparatively small in Great Britain, as the country has been satisfied to go on in its old lines; but, as the demand increases, improvements are made and some very fine systems are now being erected. Indirect heating, for example, which until very recently was hardly known, has been introduced in several large and handsome residences, the work being of the very best class. The indirect stacks are incased in chambers constructed of the finest glazed bricks, so arranged that access can be had for cleaning. The registers are of solid bronze metal of Tuttle & Bailey's best manufacture. Several strong principles which have been allowed to govern the erection of heating plants in Great Britain have prevented the work from presenting the most pleasing effect. One of the most prominent is the prevailing use of cast iron pipe, heavy and clumsy in appearance; it has to be adopted in many cases for the reason that the water is so bad that it destroys or fills up the wrought iron pipes in a very short time. This has limited the demand for wrought iron pipe, especially in sizes more than 2 inches in diameter, and, as a natural result, the prices of all the larger sizes are very high. No doubt, to an American, a very peculiar appearance would be presented by a heating job wherein the mains were of cast iron pipe in lengths of 9 feet, with spigot and socket joints calked together with either rust joint or red and white lead and spun yarn; nevertheless a great part of the work in Great Britain is done in this manner. Again, much of the heating surface is constructed of coils made of cast iron pipe, 2 inches and upward in diameter, put together in the manner described above. In greenhouse work cast iron pipe is always used, and, as a rule, the joints are made with india rubber rings, known as india rubber expansion joints. Another point affecting heating plants in Great Britain is that comparatively few of the buildings have basements under the whole house. This makes it very difficult to get in mains, and the result is that the mains are made as short as possible, and the different rooms are heated by running long coils from room to room, making long circuits with short mains, to avoid very heavy expense in making channels, trenches or tunnels below the ground floor. At one time there were but few radiators in use in Great Britain, the heating surface being usually of cast iron pipe and cast iron coils; but now the public is beginning to desire them and architects to specify them. But the Briton has little desire for decoration. It is generally his request that the radiators be put out of sight as much as possible. There is no doubt that the heating business in Great Britain is improving very much, and that the class of work is growing better every year and patterning more after American practice; but no doubt it will be some time before buildings are heated throughout and each room controlled by a thermostat.

Packing Goods for Shipment to the South American Republics.

From C. Dolge, who has charge of the American warehouse at Caracas, Venezuela, it was learned that much delay and displeasure is experienced by both shipper and consignee in shipping goods to the South American Republics. This is due to the ignorance of the shipper regarding the packing rules and regulations in vogue in the various countries.

As the volume of trade between this country and our Pan-American neighbors increases these complications will also multiply. To prevent this as much as possible *The Metal Worker* has secured a copy of these rules.

Marking.—There is no restriction whatever placed on marking in any of the countries, with the exception of Colombia, Ecuador, Honduras and Nicaragua. In these four countries it is necessary to be restricted to one uniform mark for each consignee. Two marks will require two sets of bills of lading.

Numbering.—In Brazil, Chili, Honduras, Peru, Uruguay and the Argentine Republic, each package, piece, &c., must bear one individual number, each differing from the other.

Bolivia, Colombia, Costa Rica, Cuba and Porto Rico, Ecuador, Guatemala, Hayti, Mexico, Nicaragua, Paraguay, Salvador, Santo Domingo and Venezuela provide that packages of the same kind may be numbered alike. Do not mix two different kinds of packages under the same number.

Weight and Measurements.—In Bolivia, Chili, Colombia, Costa Rica, Guatemala, Hayti, Honduras, Paraguay, Peru, Salvador, Santo Domingo, Uruguay, Venezuela and the Argentine Republic, it is required that gross and net weight and measurements of liquid and dry goods be given in metric system for each package. Hayti does not insist on metric system. Ecuador, Nicaragua and Cuba and Porto Rico require only gross weight for each package. They use metric system. Brazil and Mexico require gross weight of package, net weight of parcels inside of package, and actual weight of the goods, also measurements of liquid and dry goods for each package, in the metric system.

Contents.—Only one kind of merchandise can be packed in one package sent to Argentine Republic, Brazil, Bolivia, Cuba and Porto Rico, Ecuador, Peru, Salvador and Venezuela. For Colombia, Costa Rica, Guatemala, Hayti, Honduras, Mexico, Nicaragua, Paraguay, Santo Domingo and Uruguay packages may contain several kinds of merchandise packed together. The weight and measurements of each must be supplied. For Chili several kinds of merchandise may be packed together, but there is no restriction as to the supplying of the weight and measurement of each.

Charles F. Iseminger, the oldest member of the Philadelphia City Council in point of service, died on January 29. Mr. Iseminger was born in 1826 and in 1850 engaged in the plumbing business with William R. Shepherd and continued in that line of business until his death. He was an active volunteer fireman and for 21 years was treasurer of the Marion Hose Company. He was a member of the Historical Society of Pennsylvania.

TRADE REPORT.

METAL MARKET.

Pig Tin.—The market has been rather quiet throughout the week, owing partly to difficulty in moving stock because of the storms and partly to the fact that deliveries on previous purchases are supplying the wants of numerous consumers to a considerable extent. However, prices are holding up remarkably well. London prices have varied in a slight degree only, but show a fraction advance for the week. Retail business has been of fairly large proportions, and small lots of Straits from jobbers' hands are generally quoted at about 14½c. per lb. Statistics posted on 'Change show the visible supply on the 1st inst. to have been about 31,130 tons, against 29,855 tons at the beginning of the preceding month and 32,332 tons a year ago. The spot stock in the United States, exclusive of the Pacific Coast, is placed at 3210 tons and the quantity afloat at 2250 tons. The month's increase in visible supply is due to larger European stocks. The shipments from the Straits during January were heavy, including 2100 tons to Great Britain, 1350 tons to the United States, and 1200 tons to the Continent.

Copper.—The export movement is still good and serves to keep the market quite firm, despite the fact that home consumers still buy very sparingly. Sales by jobbers were merely moderate and inquiry not of any large proportions. Dealers' prices for small lots from stock rule at 12¼c. per lb. for Lake Ingot and 11¼c. for Ansonia Grade Casting Copper. It is figured out that the exports from the United States last month were 9571 tons of fine Copper and 1189 tons of Matte, or the equivalent of 10,225 tons of fine Copper all told, against 9066 tons in the corresponding period last year. The European visible supply was cabled as having been 29,740 tons on January 31, against 31,080 at the middle of the month, and the January deliveries were placed at 17,400 tons.

Sheet Copper.—Sales show some improvement and there is more inquiry, but the volume of current business, all told, is not large. This is normally a dull season in the cornice trade, however, and little beyond buying for present reuirements is looked for. The outlook is favorable, nevertheless, for a bigger business than last year, as the amount of projected building of the kind in which Copper plays a part is quite large. Prices are still unsettled, and the market for Sheet Copper is an open one. Dealers quote anywhere from 14c. to 16c. per lb. basis for small lots.

Pig Lead.—Wholesale prices have weakened under the weight of continued indifference on the part of large consumers and moderate business in other quarters, together with somewhat freer offering. In the retail trade dullness still reigns supreme. Sales are limited almost entirely to small lots for current use. Dealers quote American Pig in small quantities at 4⅛c. per lb.

St. Louis advices indicate an extremely quiet market. Consumers appear to be pretty well supplied and are not willing to pay prices named by holders.

Lead Pipe and Sheet.—The demand for these materials is very tame. Jobbers in this section quote Pipe at 5½c. and Sheet at 6½c. per lb., subject to the usual trade discount.

Spelter.—Business of only fair amount has been effected, and the demand at present is slow, Eastern consumers buying in a hand to mouth way only. Prices are held quite steady, however. Good Western brands in small lots from store are quoted at 4.40c. to 4.50c. per lb.

St. Louis advices are as follows: Spelter is without any feature of interest. Producers appear satisfied with the price at present prevailing, and do not appear to be making any special efforts to get higher figures. The demand is only moderate.

Sheet Zinc.—Sales are of a routine character and the demand moderate. Prices have not varied, jobbers quoting 600-lb. cask lots at 5⅝c. to 5¾c. per lb., and smaller quantities at 6⅛c. to 6¼c.

Antimony.—The demand continues fair and prices for small parcels from store remain at about 7¼c. for Japanese, 7½c. for Hallett's and 8½c. for Cookson's.

Nickel.—Sellers quote small lots at 38c. per lb.

Aluminum.—The demand for this metal is referred to as good. Prices are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots. is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c., and special Casting Alloy. containing over 80 per cent. pure Aluminum, used in place of Brass, 35c per lb.; 100-lb. lots, 30c.

Tin Plate.—A slight improvement was reported over last week on orders for American Cokes for delivery within the next two or three months, but, as a whole, the business effected was of only fair amount, while the prices at which recent contracts were put through are understood to have been very low. Offerings for both spot and forward deliveries were rather more free and the market, as a whole, showed further indications of weakness. The negotiations now going on between the manufacturers, looking to a combination or consolidation of interests, undoubtedly tend to keep the larger consumers out of the market for the present and tend to unsettle the trade to a large extent, more especially as the proceedings in the matter are shrouded with much mystery, and many rumors and conjectures are current. The idea prevails in some quarters that the projected combine is likely to go through, while others in the trade do not regard it very seriously. In either case there is a disposition on the part of both jobber and consumer to hold off until something definite is known about the matter. The retail trade in this quarter was rather dull, as is usual in the last and first days of a month, but jobbers report a fair run of small orders. Severe weather has also hindered the business to a considerable extent during the past week. Jobbers' quotations show no appreciable change. Small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows, but these rates are not uniformly maintained: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3 50; do., 95 lbs, $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates remain quiet and prices are largely nominal.

Sheet Iron.—Some good sized orders for Black and Galvanized Sheets for nearby and early future delivery are reported to have been placed with the mills, dealers and consumers being evidently apprehensive of higher prices. Makers, however, prefer in most cases not to book for extended deliveries, as lower prices are thought to be almost impossible, while changes in the other direction are encouraging. In some few cases good sized orders have been booked at a satisfactory advance for deliveries covering the first half of the year. The local jobbing demand is of fair volume, though prices at which retail sales were made were almost invariably low. Small lots from stock are quoted at about 2.35c. to 2.40c. for No. 27 Common Black Sheets, and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: A good demand is still in progress for both Black and Galvanized Sheets. Some manufacturers of both are so well sold up they are practically out of the market. Inquiries are still being received for extended deliveries from largest buyers. Heavy Sheets are perhaps not quite so firm as Light Sheets, but mill shipments of No. 27 Black, standard brands, are strongly held. Small lots of Black Sheets from stock are quoted at 2.30c. to 2.40c. and Galvanized at 80 and 2½ per cent. off.

Old Metals.—The market is decidedly firmer, with an improved demand for Scrap Copper and Brass in car lots at an advance of about ¼c. per lb. The demand for export is better and there is an active inquiry from both home and foreign buyers. Scrap Iron is also generally strong, with a larger demand in some lines. Holders' ideas are still above those of consumers, however, and this tends to restrict the volume of business effected. Dealers in this city and vicinity are paying about the following rates for moderate sized lots, delivered here.

Heavy Copper	per lb. 9¼c.
Light and Tinned Copper	per lb. 8¾c.
Heavy Brass	per lb. 6 c.
Light Brass	per lb. 5 c.
Lead	per lb. 3¼c.
Tea Lead	per lb. 3 c
Zinc	per lb. 2½c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.

Wrought Scrap Iron, per gross ton.....	$10.50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton.....	5.25
Burnt Iron, per gross ton.....	5.00
Tin Plate Scrap, per ton.....	3.75

THE IRON MARKET.

So far as Pig Iron is concerned, the markets in the leading distributing centers continue in a nervous condition, created by the doubt whether consumption can cope with the current heavy output. The sanguine have been punished so severely and so frequently during the past few years that very few have the courage of their convictions. Nor is the season of the year favorable to the development of a buoyant feeling. Nothing would carry more weight than a falling off in the make, but that is not likely to come at an early date, while the belief is quite general that approaching spring will considerably increase the requirements. A very large tonnage, in the aggregate, of Charcoal Iron has been placed at very low prices.

In Steel Billets the situation is clouded to some extent by the determined efforts of powerful interests to get the market into shape for large purchases for delivery during the second quarter of the year.

The demand for Finished Material is very satisfactory in some branches.

In the Wire trade the leading manufacturers have got together and have decreed a moderate increase in prices. The great consolidation is reported as progressing favorably. The auditors have completed their work, and their reports now go to England for review by a firm of accountants there.

Pig Iron.—Quite a fair amount of sales of moderate lots have been made in the New York district at close prices and there has been some business in New England. An order for 1500 tons for a New England concern went to an Alabama producer, while the sale is also reported for 1898 delivery of 7000 tons of Virginia Iron to a Connecticut plant. There is some inquiry for export. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $10.75 to $11.25; No. 2 Plain, $10.50 to $10.75. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.75; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

No improvement can be noted in the Philadelphia Pig Iron trade. A great deal of Pig Iron is being consumed, but new orders are comparatively scarce, and as prices have been weak and irregular for some time past there is nothing in the situation to encourage buying, except to cover requirements in the immediate future. If, however, the underlying conditions are as favorable as they seem to be, it will not be long before prices begin to stiffen. Meanwhile general quotations for seaboard delivery are about as follows, with the usual rebate of freight differences at points south or west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $10.75 to $11.25; No. 2 Plain, $10.50 to $10.60.

The Chicago Pig Iron producers report their sales still keeping up to shipments. A number of good contracts were placed during the week, and further inquiries are in the market. The Southern sales agents have done very well, and it is claimed that all the weak sellers who recently disturbed quotations to some extent have now changed their views and are occupying a firmer position. The sales reported have all been made at full prices. We quote for cash as follows :

Lake Superior Charcoal.....	$11.50 to $13.00
Local Coke Foundry, No 1.....	11.50 to 12.00
Local Coke Foundry, No. 2.....	11.00 to 11.50
Local Coke Foundry, No. 3.....	10.50 to 10.75
Local Scotch, No. 1.....	11.50 to 12.25
Ohio Strong Softeners, No. 1.....	12.00 to 12.25
Southern Silvery.....	11.25 to 11.50
Southern Coke, No. 1.....	11.00 to 11.25
Southern Coke, No. 2.	10.35 to 10.60
Southern Coke. No. 3.....	10.10 to 10.30
Southern, No. 1 Soft.....	10.85 to 11.00
Southern, No. 2 Soft.....	10.35 to 10.60

In the Pittsburgh district the consumption of Bessemer Pig Iron by Steel interests is very heavy, and recent large purchases made are insufficient to take the present heavy output, with the result that a good deal of Iron is being piled. The present condition of the Pig Iron market strongly indicates that production will have to be restricted before much improvement can be expected. Foundry Irons are dull. We quote, f.o.b. Pittsburgh: No. 1 Foundry, $10.40 to $10.50 ; No. 2 Foundry, $9.90 to $10 ; Bessemer, $9.75 to $9.90, the lower price being for prompt Iron.

The market for Pig Iron in the Cincinnati district in a general way continues satisfactory. The consumption of Iron is holding up, and the amount of inquiry justifies the expectation that it will continue. Nearly all of the larger buyers, who are now inquiring, are doing so in a cautious and indirect manner, giving the idea that they are still parring for further concessions. While it is believed that the larger furnaces, especially in the Birmingham district, are not shading the quotations given in this issue, yet it is intimated that some "outside" smaller concerns are granting concessions even on this basis. The situation in Northern Irons remains unchanged. Quotations are as follows, f.o b. Cincinnati :

Southern Coke, No. 1.....	$9.75 to .....
Southern Coke, No. 2.....	9.25 to .....
Southern Coke, No. 3.....	8.75 to $9.00
Southern Coke, No. 1 Soft.....	9.50 to .....
Southern Coke, No. 2 Soft.....	9.25 to .....
Southern Coke, Gray Forge.....	8.75 to .....
Southern Coke, Mottled.....	8.50 to .....
Ohio Silvery, No. 1.....	12.75 to 13.00
Ohio Silvery, No. 2.....	12.00 to 12.25
Lake Superior Coke, No. 1.....	11.00 to 11.50
Lake Superior Coke, No. 2.....	10.50 to 11.00
Tennessee Charcoal, No. 1.....	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The movement in Pig Iron in St. Louis is confined to moderate quantities for immediate delivery. Prices are fairly well maintained, although there are some furnaces who are evidently anxious for business and are making prices accordingly. Active buying is expected to take place soon, and prices will doubtless stiffen somewhat. The production of Pig Iron continues to be enormous, but the general feeling is that consumption will continue to increase so that no surplus stocks will be on hand to tend to depress prices. We quote as follows for cash, f.o.b. cars St. Louis :

Southern, No. 1 Foundry.....	$10.25 to $10.75
Southern, No. 2 Foundry	10.00 to 10.25
Southern, No. 3 Foundry.....	9.75 to 10.00
No. 1 Soft.....	10.00 to 10.25
No. 2 Soft.....	9.75 to 10.00

CHICAGO REPORT.

Scrap.—Business is much better. Cast Scrap is still very scarce. Old Metals are quite active, especially Copper. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap.....	$7.00	....
Machinery Cast.....	7.50	....
Malleable Cast.....	6 50	....
Stove Plate (free of burnt).....	5.50	....
Burnt Iron and Grate Bars.....	3.75	....
Sheet Iron and Hoops.....	3.00	....
Plow Steel and Breaking Stock.....	5.00	....
No. 2, such as Shovels, Hoes, &c...	2.50	....
Old Boilers—whole (Iron).....	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes.....	5.50	....
Cast Borings.....	3.00	....
Turnings.....	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy.....	....	9½c.
Copper Bottoms.....	....	8¾c.
Copper Clips.....	....	9¼c.
Red Brass.....	....	8 c.

Outside Tubing.....	....	3½c.
Rubber Hose.....	....	1 c.

Anthracite.—The demand has improved materially, owing to the severity of the weather. The ruling prices of carload lots of 12 tons minimum are as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill.....	$5.00	$5.25
Milwaukee, Wis.....	5.00	5.25
Kansas City, Mo.....	7.00	7.25
Council Bluffs, Iowa.....	7.00	7.25
Lincoln, Neb.....	7.15	7.40
Sioux City, Iowa.....	7.50	7.75
Aberdeen, S. Dak.....	8.25	8.50
Dubuque, Iowa.....	6.30	6.65
Madison, Wis.....	6.50	6.75
St. Paul, Minn.....	7.50	7.75
Burlington, Iowa.....	6.50	6.75
Des Moines, Iowa.....	7.00	7.25
Davenport, Iowa.....	6.30	6.65
St. Joseph, Mo.....	7.00	7.25
Leavenworth, Kan.	7.00	7.25
Omaha, Neb.....	7.00	7 25

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver.....	$6.50
Pueblo	6.50
Colorado Springs.....	6.50
Leadville.....	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

The Edwards Sad Iron Company of Camden, N. J., have been incorporated, with a capital stock of $100,000. The company will manufacture implements of metal. The corporators are Thomas Cross Edwards, Joseph L. Harbinson, Harry L. Day and George M. Thomson of Philadelphia, and James Finley of Camden, N. J.

THE HARDWARE TRADE.

With most of the jobbing houses and manufacturers the past month has been on the whole fairly satisfactory, comparing well with the Januarys of preceding years. Many houses report a decided improvement in it over the corresponding month of 1897. Merchants are buying carefully, but their orders are better assorted than they have been and indicate a disposition to stock up somewhat more completely. At the same time the conservatism which has become habitual is evident. There is, however, a better undertone of feeling, and the fact that there is in many sections more money in the hands of the agricultural classes and more work for laborers is having its influence in promoting general prosperity and encouraging enterprise. The most active movement at the present time is in heavy goods, which lie near the raw material, but both jobbers and manufacturers report that Shelf Hardware, Tools, &c., are being called for in fair quantities. Orders as a rule are well assorted, covering many lines and indicating moderate and in some cases low stocks in the hands of the trade. In the matter of prices few changes are to be chronicled. In some lines the desire to sell has caused a slight yielding in quotations, but in most the market is well sustained. A slightly improved condition is perceptible in Nails, Screws, Bolts, &c. The question of department stores and catalogue houses demands increased attention from the trade, as they interfere with both retail and wholesale merchants, making it to be a matter of much importance in some communities as to what course shall be adopted to meet their competition. Manufacturers also are concerned in the subject, as there is a disposition on the part of some merchants to use their influence to prevent manufacturers from selling these houses, whose methods are so disturbing to the regular trade. Most merchants, however, recognize that the matter of prime importance to them in the conduct of their business is to see that their own methods are correct, that unnecessary expenses are cut off, that everything reasonable is done to hold present customers, and that enterprising efforts are put forth to extend trade.

Advices from Chicago.—The demand for Shelf Hardware is rather better than during the middle of January, although the heavy snow in some sections of the Northwest is still exerting some influence in checking trade. City business has shown a decided improvement as compared with January of last year, the volume of such business being easily doubled. Jobbers report a good movement in staple articles, but the demand for Wire Nails is considerably less than it was during the opening months of last year. At that time, owing to very light stocks, trade was abnormally heavy. The demand now, however, is quite up to the average of ordinary years. Bolts, Nuts and small Rivets are stiffer. Rivets are particularly firmer, owing to the scarcity of Rivet Rods. The demand for Heavy Hardware has shown considerable improvement during the past week.

Advices from St. Louis.—The Hardware trade continues in the satisfactory condition last noted. Traveling men are sending in heavy orders and report the outlook more promising than it has been for several years. The seasonable weather at present prevailing has had an excellent effect on cold weather goods. Shovel makers continue in control of the market, although the entrance of the Avery Stamping Company as manufacturers of Shovels is regarded with much interest by the trade. Galvanized Iron and Black Sheets are quite active and in Tin Plate a heavy business is recorded. Mention was made in our last report of the increased demand for Builders' Hardware and Mechanics' Tools, and it is pleasing to note that this condition still exists. Retailers are commencing to take some interest in Plain Wire, Wire Nails and Barb Wire, and as indications point to a consummation of the proposed Wire combination the demand for this class of goods is sure to be heavy. Collections are excellent.

NOTES ON PRICES.

Wire Nails.—The Wire Nail market on the whole is in better condition than a week ago, so far as the matter of price is concerned. The mills generally are refusing to accept orders for delivery after March, but in some cases this is being done. The New York price for small lots from store is $1.70 to $1.75.

Advices from Chicago.—The Wire Nail manufacturers held a meeting at Pittsburgh on Monday for the purpose of correcting some irregularities in prices which had recently sprung up. Inquiries during the past week have been very good and sales have been fair. Jobbers report a better movement in small lots from stock and expect the demand now to steadily increase as spring approaches. They quote small lots from stock at $1.60, but an early advance is expected.

Advices from St. Louis.—The demand for Wire Nails is very good. Jobbers report a satisfactory trade at $1.65 to $1.70, base, for small lots from store.

Cut Nails.—The Cut Nail market is without special feature, the demand being moderate and prices steady. Small lots from store in New York are quoted at $1.30.

Advices from Chicago.—Only a light demand is being received for Cut Nails and prices are unchanged at $1.45 for small lots from stock.

Advices from St. Louis.—The demand for Cut Nails shows some slight improvement, although no corresponding improvement is noticeable in prices. Jobbers are asking $1.45, base, for small lots from store.

Barb Wire.—The indications point to a large business in Barb Wire, and during the past week a number of orders have been placed.

Advices from Chicago.—Manufacturers report a better trade with only light stocks in their warehouses. They are expecting a very heavy demand as the spring trade opens, which may probably result in some difficulty in securing prompt shipments. Jobbers quote small lots from stock at $1.60 for Painted and $1.90 for Galvanized, but these rates are not expected to continue so low with manufacturers maintaining a firm attitude.

Advices from St. Louis.—The movement in Barb Wire is increasing and mills report a heavy inquiry. Jobbers report a heavy trade, and for small lots from store quote $1.70 for Painted, and Galvanized at 30 cents per hundredweight advance.

Screws.—The Screw market is in a more satisfactory condition than for a long time. The manufacturers are referred to as working together harmoniously and maintaining prices with exceptional regularity.

Carriage Bolts, Machine Bolts, &c.—This line of goods is referred to as more regular than it has been since the dissolution of the association. While there has of late been some divergence in the quotations of some of the manufacturers, owing to animated competition, the present condition of things is regarded as much improved, some of the extreme discounts having recently been withdrawn.

Galvanized Iron Range Boilers.—The advance made last week in the price of Galvanized Iron Range Boilers amounted to 10 per cent., and not 5 per cent., as stated in this column of our previous issue. The following are the current retail discounts on these goods:

	Per cent.
Galvanized Iron Range Boilers to and including 52-gallon	75
" " " " above 52-gallon	65
" " " " Extra Heavy, to and including 52-gallon	70
Galvanized Iron Range Boilers, Extra Heavy, above 52-gallon	60

with 5 per cent. extra on standard 30, 35 and 40 gallon Boilers.

Soldering Coppers.—There is some weakness in the market for Soldering Coppers, in common with all manufactured Copper, owing to sharp competition. The current price for these goods at retail is 15 to 16 cents per pound net.

Glass.—The factories are still cutting Glass to fill orders, and it is not probable that they will accumulate an assortment of sizes and quality much under 60 days. The famine caused by the scarcity of Glass during the late fall and early winter has not yet been fully satisfied, so that the demand from factory is quite large. There is a tendency among buyers, however, to hold back orders in hope of lower prices later in the year. Local jobbers still complain of lack of trade. The recent storm and cold weather will probably have the effect of retarding early spring orders, which might otherwise have been placed in the near future. Under these conditions the market continues to show weakness, and although 85 and 5 per cent. is the nominal discount for less than carload lots for Atlantic Coast points, 85 and 10 per cent. discount is obtainable.

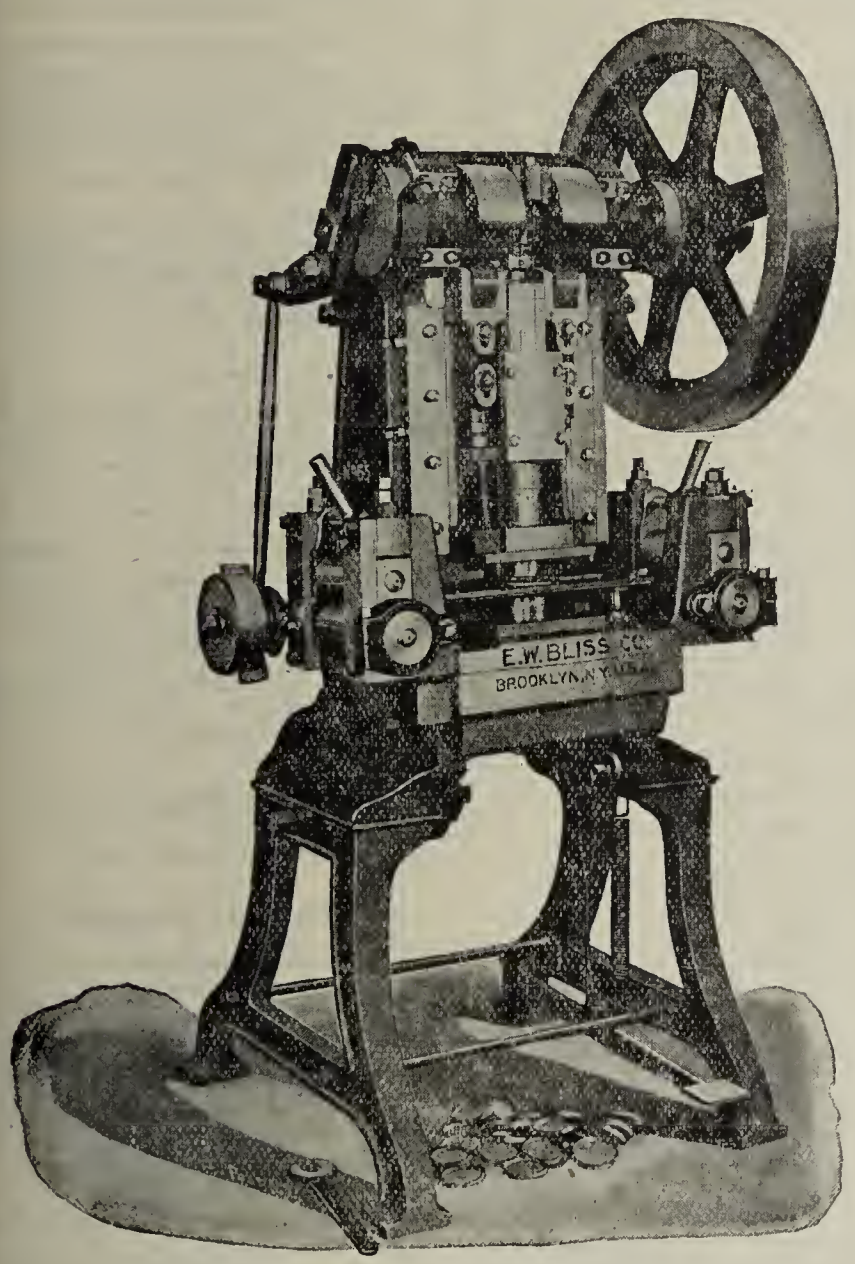
White Lead.—The market has remained in a quiet condition. Corroders are accepting the old list prices for Lead in Oil and for Dry Lead.

Linseed Oil.—The position of the market is quite as strong as it was at the date of last week's review. Raw material has averaged higher in price. Orders have been coming in very fairly, but apparently not to the extent that present conditions and prospects would warrant.

Spirits Turpentine—Buyers' operations have been on a smaller scale, yet quite good in total amount, and prices varied only slightly.

Old Rags, Paper, &c.—The market for Paper Stock has been fairly active, with prices showing little change,

but generally firm. Dealers are paying about the following rates for New York City delivery:



No. 1 White Rags	per lb.	2⅝ to 2¾c.
No. 2 White Rags	per lb.	1¾ to 1⅝c.
Mixed Rags	per lb.	1 c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1½c.
No. 2 White Book Shavings	per lb.	¾ to 1 c
Light Book Shavings	per lb.	½ to ¾c.
No. 1 Mixed Shavings	per lb.	¾ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1 c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to 3/5c.
No. 1 Manila Paper	per lb.	⅝ to ¾c.
No. 2 Manila Paper	per lb.	⅜ to ½c.
Bogus Paper	per lb.	⅜c.
Common Paper	per lb.	¼ to 3/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	½ to ¾c.
Hemp Twine	per lb.	1⅜ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	¾ to ⅞c.

Old Rubber.—A fair demand is noted and prices show no quotable change. Local dealers are paying about the following figures :

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb	4 c.
White Syringes, per lb	4 c.

Double Action Press with Double Roll Feed.

The E. W. Bliss Company, 16 Adams street, Brooklyn, N.Y.,are building a press for the rapid production of shells,

THE BLISS SHELL PRESS

which are cut and drawn from the strip in push through dies. From 60 to 150 may be drawn per minute, according to the size and style of shell. The roll feed is easily adjusted to different sizes of blanks. The feed pawls take their bite on toothless disks by means of a wedge action which permits of an easy adjustment and fine spacing. Both of the upper feeding rolls are provided with a cam lifting device permitting of opening the rolls at any time for stopping or readjusting the strip. The machine is especially designed for drawing paper covers, the strokes being 1⅛ inches (outer slide) and 4½ inches (inner slide) respectively. The bolster has an arrangement for steam heating. The press can be made with special stroke for metal shells, such as burners, ferrules, umbrella trimmings, thimbles, tin goods, &c. For general work it is made with the strokes of 2 inches outer and 4 inches inner slide. The other principal dimensions are as follows : Opening in bed, 6½ inches round ; opening in back, 10¼ inches wide ; distance back from center of slide, 6 inches ; largest blank that may be drawn, 10 inches ; largest punch, 6 inches ; adjustment of outer slide, 1½ inches ; size of balance wheel, 36 x 5¼ inches ; weight as shown, 2200 pounds. These measurements may be modified somewhat to suit special requirements.

F. O. B. our Store, Subject to Prior Sale.

Tinners' Machinery & Supply Co.,
26 Cliff Street, New York City.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"
office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

FOR SALE.

—THE WRONG BABY.—Nearsightedness and absentmindedness caused a domestic tragedy in St. Louis the other day; that is, it was tragedy for a while. Mr. John Smith took another man's baby by mistake. He descended from his car at the wrong corner, and mechanically headed for the fourth house. On the steps was playing a little eighteen-months-old boy. Mr. Smith picked the little fellow up and walked in. He was about to hang his hat on the hall tree when he noticed there was none there. He looked around then, and saw he was in the wrong house. For a moment he hesitated, then beat a hasty retreat. But he didn't stop to look at the baby to see if that was his. He walked out of the yard and down the street, still carrying the baby.

When he reached his home he found his own child cooing on the floor of the hall. He looked at it for a moment, then went back into the kitchen where his wife was attending to supper.

"Hello, dear," he said to his wife, "whose kid is that in the hall?"

"Why, John," she said, and then she stopped, "Why whose baby have you got there?"

John started to say something, stopped, and looked at the yellow-haired infant in his arms. His own child has hair as black as an Indian's. John stared for a moment.

"Why, I don't know," he said.

His wife questioned him, but it availed nothing. He remembered he had taken it from some one's porch, but whose he did not know. His wife became excited. She asked him how he could possibly make such a mistake; she described the sufferings of the poor mother when she missed her child, and begged him to rack his brain and try to recollect where he picked it up. But his brain refused to be "racked," and his wife gave up at last in despair.

"Well, John," said she, "the only thing to do is to take it to the police station. The mother will be sure to go there."

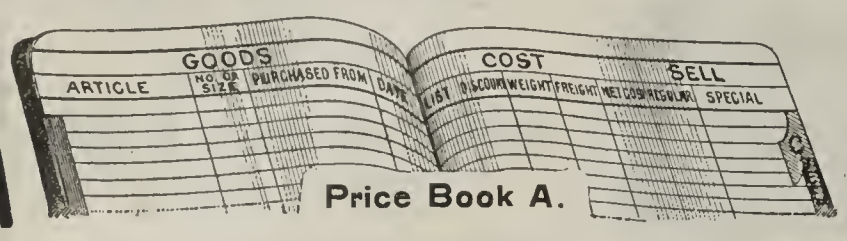
So to the police station Mr. Smith took it, and in due time it was restored to its frantic mother.—*Exchange.*

—YEZ know Casey, the conthractor," said Mr. Dolan.

"Oi do," replied Rafferty.

"Is he what ye'd call reliable?"

"He is the most reliable man Oi iver knew. Whiniver he tells yez anythin' ye kin depind on its not bein' so."—*Washington Star.*



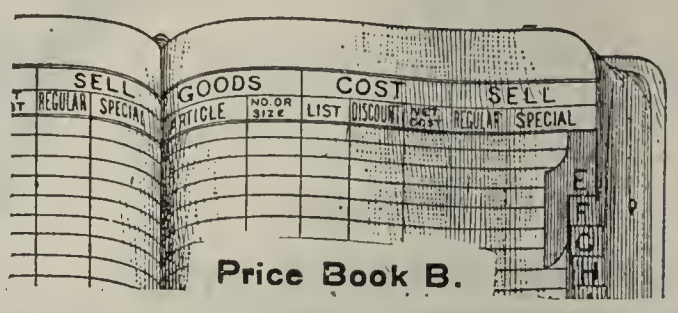
—A MAINE paper tells of a farmer in that State who hired two boys to help him cut his hay, and when the job was finished gave each of them a cent for the work they had performed, and then offered to harness his team and haul the boys home for a cent apiece.—*N. Y. Tribune.*

THE IRON AGE
HARDWARE PRICE BOOKS.

Arranged by R. R. WILLIAMS, Hardware Editor of The Iron Age.

These Price Books are made in a variety of sizes and styles adapted to pocket, store or desk use, and are specially arranged to meet the requirements of the Hardware and Metal trades. They are printed on paper of superior quality and bound in grain seal leather.

A



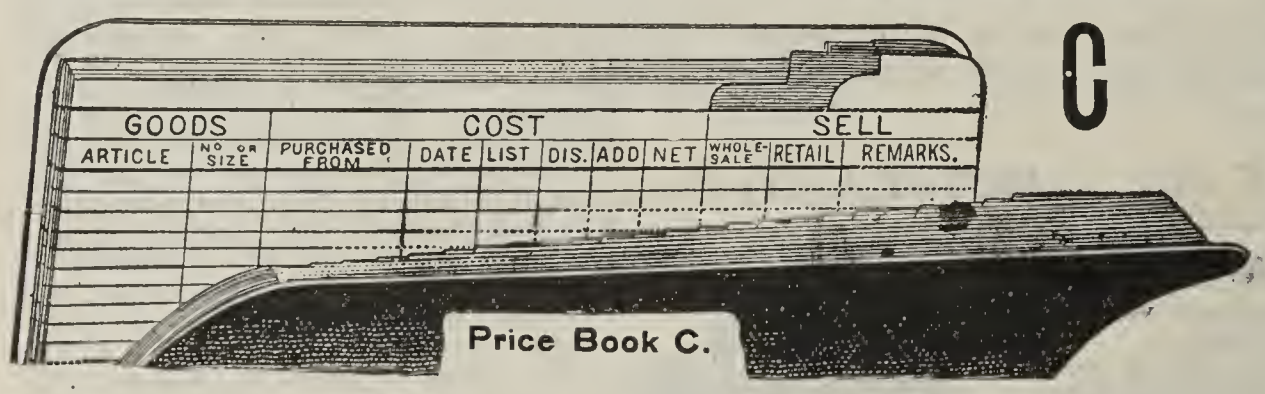
Price Book A.

Columns are provided for the name and number or size of goods, for noting from whom purchased, date of quotation or purchase, list and discount, and for entering freight expenses. Under the heading of selling prices, the regular and any special price or remarks in regard to the goods are given place. ***Size of page, 4 x 7 inches.***

FOUR EDITIONS:

A, 200 pages, - -	$1.00	**A 2,** 400 pages, - -	$1.50
A F, 200 pages with flap,	1.25	**A F 2,** 400 pages with flap,	1.75

B



Price Book B.

In this book each page is complete in itself, and the record of prices does not, as in Book A, run across two pages Thus it accommodates a larger range of goods with much less detail in the record. By the use of familiar abbreviations is sufficiently large for the convenient and concise record of prices. ***Page, 4 x 7 inches.***

FOUR EDITIONS:

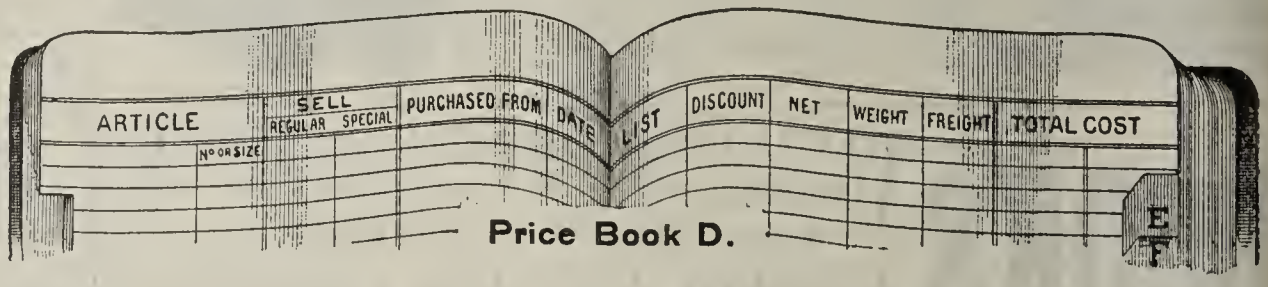
B, 200 pages, - -	$1.00	**B 2,** 400 pages, - -	$1.50
B F, 200 pages with flap,	1.25	**B F 2,** 400 pages with flap,	1.75

C

Price Book C.

The headings in Book C run across the top, in a line parallel with the hinge. The details of weight and freight contained in Book A are omitted, and a single column headed "Add" given for the insertion of freight or other expenses. Under the selling prices space is left for the wholesale price, the retail price, and for remarks. ***Page, 4½ x 7¾ inches.***

FOUR EDITIONS:



C, 200 pages, - - -	$1.00
C F, 200 pages with flap, -	1.25
C 2, 400 pages, - - -	1.50
C F 2, 400 pages with flap, -	1.75

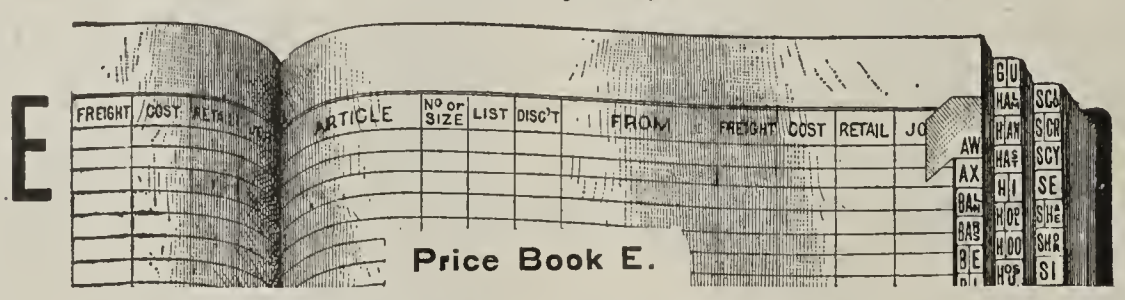
Suitable for desk and store use, and for salesmen on the road. A number of pages at the back of the book are arranged for memoranda. ***Page, 5¼ x 8 inches.***

FOUR EDITIONS:

D, 200 pages. - - -	$2.00
D F, 200 pages with flap, -	2.50
D 2, 400 pages, - - -	3.00
D F 2, 400 pages with flap,	3.50

D

Price Book D.



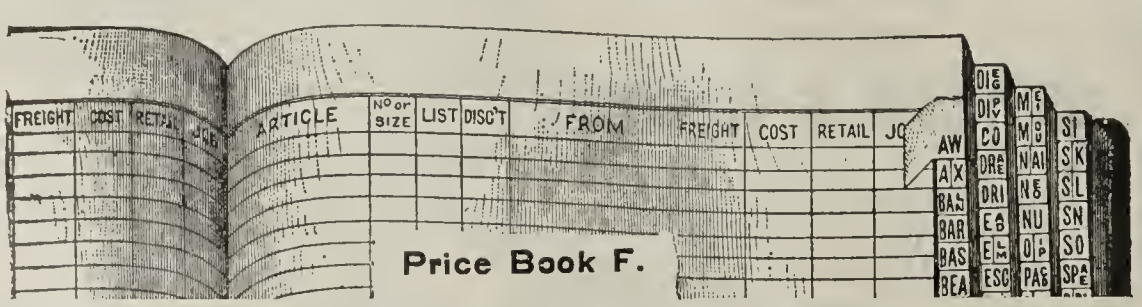
MULTIPLE INDEX PRICE BOOKS.

A special feature of these books is the index, which is arranged with special reference to the classification of Hardware Goods, each index character giving the first two or three letters of the names of Hardware articles. There is an index character to every page, enabling immediate reference to any of the contents of the book. The ease and convenience with which the books can be used is indicated in the following examples, taken from Book F:

For Augers,	turn to	AU	For Chisels,	turn to	CH$^{I}_{U}$	For Iron,	turn to IRO
" Parers, Apple	"	PA$^{P}_{R}$	" Cutlery,	"	CUT	" Irons,	" IR'S

Both E and F are made of Heavy Ledger Paper and strongly bound in grain seal leather.

E



Price Book E.

J. L. PERKINS & CO., - - 243 Lake Street, Chicago.

—A VICTIM of streetcar pickpockets determined to get even with them, so he put into his pocket a pocketbook containing only a slip of paper, on which were written the words: "This time, you rascal, you've lost the reward of your labor." He got into the same streetcar and waited, resolved to have the first pickpocket that meddled with him arrested. Twenty minutes passed and nothing happened, and, tired of waiting, he got out, having assured himself that his pocketbook was safe. He opened it and in place of his white piece of paper was a blue one, which he unfolded, and read as follows: "What a sly joker you are!"—*Tid-Bits.*

Take a bar

of Swedish charcoal iron, hammer it into a sheet of even thickness, take the sheet in your hands and immerse it in a pot of molten tin, and afterwards place it in a sawdust bed to cool, and you have made a tin plate in about the same way that GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made for us. It's an old fashioned way, to be sure, but the resulting plate is also old fashioned; and everybody knows that the old time tin plates on house tops lasted more years than are allotted for the existence of man. There is only one maker of charcoal iron plates in the world, and we handle all that can be sent to this country under our brand name. Write us for sample and prices.

GUMMEY, McFARLAND & CO., Philadelphia.

Iron and Steel, Structural Iron, Galvanized Sheet Iron, "Coe Old Style" Roofing Plate, Corrugated Sheet Iron, Heavy Hardware.

WE wish to call attention to the line of goods for which we are able at all times to quote most advantageous prices.

Our specialty is the manufacture of HIGH QUALITY ROOFING PLATES, and our Brands are known as the standard in their respective grades.

ROOFING TIN PLATE—BRANDS.

"Scott's Extra Coated"	"ABSOLUTELY THE BEST" 47 lbs. coating, and guaranteed to an extent unparalleled in the trade. Net weight, IC, 20 x 28, 240 lbs.
"Triumph Old Method"	Strictly Hand Dipped, Palm Oil process throughout, 38 lbs. coating. Greatly superior to other makers' best qualities. Net weight, IC, 20 x 28, 230 lbs.
"Protection Old Process"	A great favorite; bright clean finish, heavily mottled, 40 lbs. coating. Net weight, IC, 20 x 28, 230 lbs.
"Old Reliable Re-dipped"	Dull oil finish, well mottled, 36 lbs. coating. Very much preferred to the M. F. Brand, which is standard of best quality Welsh plate. Net weight, IC, 20 x 28, 230 lbs.
"Neville Old Style"	Very bright, clean and handsomely mottled, 26 lbs. coating, exceptionally rich in pure BLOCK TIN. Net weight, IC, 20 x 28, 220 lbs.
"Duquesne"	The highest standard of rolled roofing plates, has taken the position in America heretofore occupied by the foreign "Worcester" brand. Full weight.
"Pittsburg"	Next quality to Duquesne, and a favorite with many.
"Raymond"	A medium grade, suitable for ordinary work. Always sold at a very moderate price Full weight.
"Allegheny"	The lowest priced roofing plate we have to offer. You will be agreeably surprised at its quality, taking into consideration its low cost.

BRIGHT TIN PLATE—BRANDS.

"Finest"	The very best Bright Charcoal Tin. Superb coating, perfectly cleaned, closely assorted. "Finest" in name and quality.
"Clifton"	An excellent plate, well coated. "Melyn" grade.
"Furnace"	Medium quality, regular and light weights, also special sizes for Heater Pipe.

"FINEST" and "CLIFTON" brands in IC to IXXXX, 14 x 20 and 20 x 28, and also in many odd sizes.

SYKES IRON & STEEL ROOFING CO., - Chicago and Niles, O.

—SHE had just returned from a visit to Boston.

"Is it true," asked an acquaintance, "that there is an air of culture and educational refinement plainly noticeable in the speech of Boston residents?"

"My dear," she replied, impressively, "even the owls around Boston hoot 'To whom!' instead of 'To who!' as they do in the West."—*Chicago Times-Herald.*

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, **$1.00.**

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

TIN ATLANTA TERNE

The use of Acid Flux has been considered essential to success in making Coke Tin Plates. Atlanta Plates prove the falsity of this, however, as not a particle of Acid Flux is now used in their manufacture. Their softness makes them very easy on Can Makers' dies.

SCHRATWIESER'S METAL LATH WORKS.

PATENT SHEET METAL LATH
THE KEY A DOVETAIL.
110-112-114 Navy St., Bklyn. Tel., 2054 Bk.

—ACCORDING to the *Kansas City Journal,* a Kansas farmer, who could not get harvest hands, put this sign on his fence: "Harvest hands wanted. Hired girl blonde and genial. Cabinet organ music in the evening. Pie three times a day. Three spoonfuls of sugar with every cup of coffee. Hammocks, feather beds or leather divans at your option for sleeping. Rising hour, 9 o'clock in the morning. Three hours' rest at noon. Come one, come all."

Niagara Stamping & Tool Co., Buffalo, N. Y.

MANUFACTURERS OF

Tinsmiths' and Roofers' Tools, Shears, Presses, Dies, and Special Machinery for Sheet Metal Work.

EXCELSIOR SQUARING SHEARS.

These Shears are accurate and durable. The side legs and guides for the upper knife are cast in one piece, thus securing rigid bearings for the cross head, which has wide scraped bearings and gibs with set screws to take up wear. The bed is marked with a graduated scale in $\frac{1}{16}$ inches, and a wrench to take out and replace the knives is sent with each machine.

Adjustment is provided for wear of the knives. The knives are ground on automatic machines—not on a grindstone—which make them absolutely true in cutting edge and seat, assuring a perfect fit to cross head and bed without backing.

The price of the shears includes a full set of front, back, bevel and side gauges—for cutting at any desired angle without the necessity of marking the sheet—also the top shelf.

For Foot and Power Shears of all Sizes
Refer to Catalogue.

DOUBLE TRUSS CORNICE BRAKE CO.,
BUFFALO, N. Y.

Gentlemen:—Enclosed please find N. Y. Exchange for $—— to pay for Cornice Brake sent us about six weeks ago. We never paid a bill for tools where we thought we came as near getting our money's worth as we do in paying you for this Brake. The machine is all right, and all you claim for it.

The Brake is now in a distant part of this state where our men are putting in a job of large square galv. piping. Should it get in a wreck and be lost to us, we would order another just like it at once.

All the boys in the shop are anxious to know when that Brake is coming back. For our use we would rather have this than an iron one. We are, Very respectfully yours, LUCAS BROTHERS.

All Sizes from 3 ft. to 10 ft. Indispensable to Cornice makers, roofers, tinsmiths, furnace men, etc. **Send for our latest prices.**

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. **Terms and Definitions—15 pages.**
II. **Drawing Instruments and Materials —13 pages.**
III. **Linear Drawing—6 pages.**
IV. **Geometrical Problems—35 pages.**
V. **PRINCIPLES OF PATTERN CUTTING—25 pages.**
VI. **PATTERN PROBLEMS (3 Sections) —325 pages.**
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

LYON, CONKLIN & CO.,

BALTIMORE.

THE NEW
IDEAL SLATE DRESSER.

IMPROVED FOR 1898.

Will cut **OCTAGON, HEXAGON, DIAMOND** or any other desired angle, also two sets of circle knives to cut **CONVEX** and **CONCAVE.** For ornamental work will cut and punch any sized slate from 6 to 16 inches wide and from 12 to 28 inches long and has on the bed plates figures to represent the various sizes, so that an inexperienced hand can set the machine to cut and punch to standard gauge. Will pay for itself in working 100 squares of slate.

BLUE FLAME OIL STOVES.

15 POINTS OF SUPERIORITY OF THE "QUICK MEAL" BLUE FLAME OIL STOVES.

(CONTINUED FROM LAST ISSUE.)

6. The "Quick Meal's" Tank has an Indicator which is positive in its action. It shows just how much Oil is contained in the Tank; it is simple, strong and accurate.

7. The "Quick Meal" has all its Joints either riveted and soldered or seamed and soldered, thus avoiding breaks and leaks.

8. The "Quick Meal's" Supply pipes are extra large (twice as large as before) and are connected to the Tank with large Flanges, thereby making Strong Joints.

9. The "Quick Meal's" Supply-pipes are connected to the Burners by "Sliding Joints," making them easily adjustable and removable and absolutely leak-proof.

10. The "Quick Meal" Burners are so constructed that a strong circulation of Air constantly passes around its Wick-chambers, keeping them cool and causing the Burner to go out very quickly after the Wick has been turned down.

JAMES H. McLEAN,
Dealer in
STOVES, RANGES, FURNACES,
112 North James St.

ROME, N. Y., Feb. 8th, 1898.

KELSEY FURNACE CO.,
Syracuse, N. Y.

GENTLEMEN :—

Enclosed please find check to balance my account with you in full to Jan. 1st, 1898.

I have sent you this day a recent issue of the Rome *Sentinel*, in which you will notice, by my advertisement, that I now have 72 different residences in this city heated with Kelsey Generators, and any one of such users would do anything reasonable to aid me in making further sales of same, as they are all pleased with the working of their Heater, and I have never ordered a dollar's worth of repairs from you, during the past five years, for repairing defective parts in your Generator.

Have three or four jobs sold now that will be placed as soon as the cold season is over. Competitors have worked their photograph racket here to their own destruction.

Assuring you of my earnest effort to push the sale of the Kelsey Generator in this city during the year to come, believe me,

Yours sincerely,
JAMES H. McLEAN.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

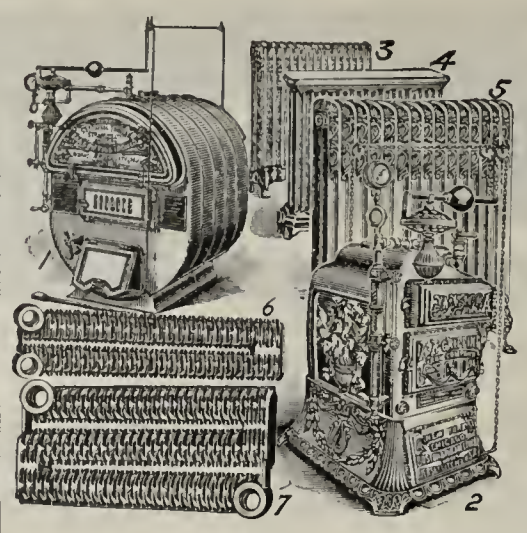
THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.



The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools. Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.

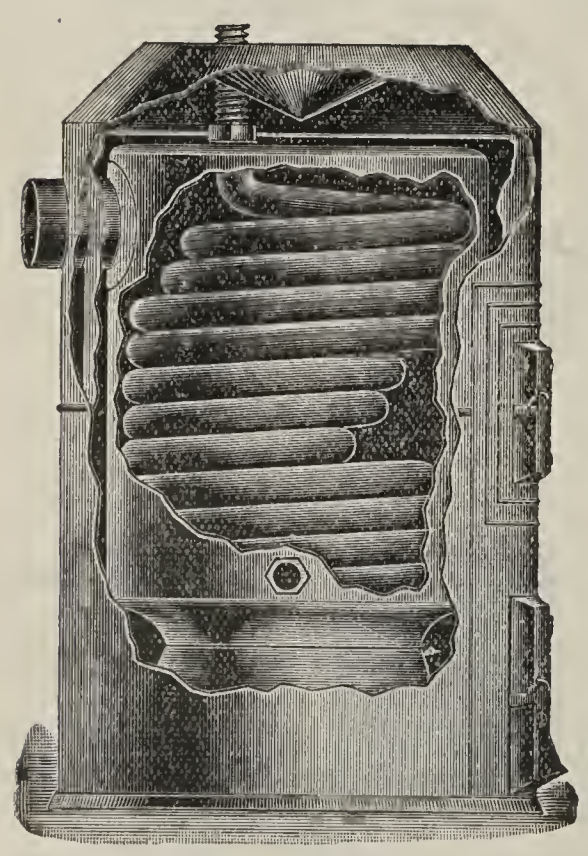
COAX BUSINESS

with reliable heaters. More than 500 dealers in the United States have sold Rival Furnaces during and prior to the past four years of depressed times and are selling them now. They have allowed other

DEALERS

to put in the cheap work and have given their customers reliable furnaces wisely installed and thoroughly efficient in operation. Where RIVAL furnaces have been sold the general tone of the furnace business has been advanced to a higher level. Where they have not been sold the furnace business has been in disrepute. Dealers that have had an unsatisfactory business during the past four years, have had much trouble and little profit, should consider that possibly it is owing to the character of the heater they sell. We want good dealers to sell our



FURNACES,

install them in a good manner, and good satisfaction will result, with increased business at good profit. Our catalogue illustrates and describes the line of heaters we make and on application we will quote right prices.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

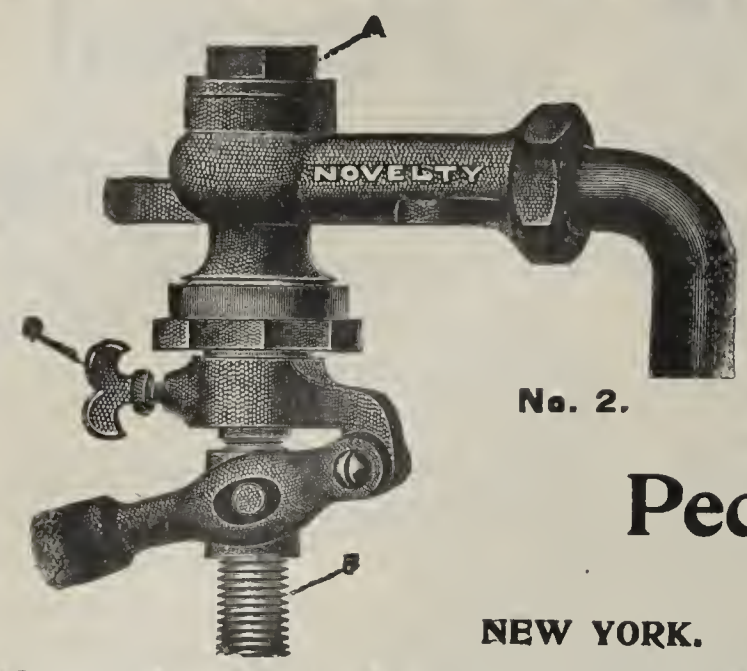
Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.



Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

The Climax Ratchet Stock.

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers.

BOWEN'S AMERICA REFRIGERATORS.

IN NEW DESIGN FOR 1898.

Has Patented Removable Galvanized Ice Compartment, is the Neatest, Strongest, Best and Only Perfect and Practical Ice Compartment Made.

It also has a Separable, Removable Porcelain-Lined Water Cooler, found in no other.

All parts are accessible for cleaning with the least trouble.

No weak attached bottoms to become bent and out of order, as is the case in similar old style devices.

By our superior construction the lowest temperature, quickest drainage, driest air and best circulation, with the least consumption of ice, is obtained in the shortest possible time.

These claims are not mere assertions but are based upon actual tests.

Our new exterior designs for excellence in finish and workmanship are acknowledged by all who have seen them as being the leaders and without a rival.

Our trimmings are of the latest designs and manufactured especially for our use.

The walls are lined with charcoal sheathing, and filled, including bottoms, with mineral wool, the best non-conductor known to science.

Also fitted with center removable shelf rest to accommodate parted shelves for convenience in storing jars, etc.

No old style goods carried over, all new and quick sellers.

Dealers can make no mistake in the purchase of these refrigerators. Send for sample and investigate our claims.

—WANTED HIS SEAT ANYWAY. — A gentleman had left his corner seat in an already crowded car to go in search of something to eat, leaving a rug to reserve his seat. On returning, he found that, in spite of the rug and the protests of his fellow passengers, the seat had been usurped by one in lady's garments. To his protestations her lofty reply was: "Do you know, sir, that I am one of the directors' wives!"

"Madame," he replied, "were you the director's only wife I should still protest."—*From an Exchange.*

This is the only complete work on the subject.

It gives practical suggestions in regard to the arrangement of the store—office, shelving, counters, racks, bins, sampling, window display, etc., etc.

It describes the practice of Hardware merchants in all parts of the country, and many different methods of accommodating and displaying leading goods.

Illustrations and detailed descriptions with measurements are given, so that Hardware merchants can readily adopt the methods described in the volume.

This book with its mass of practical and detailed information will be of great service—

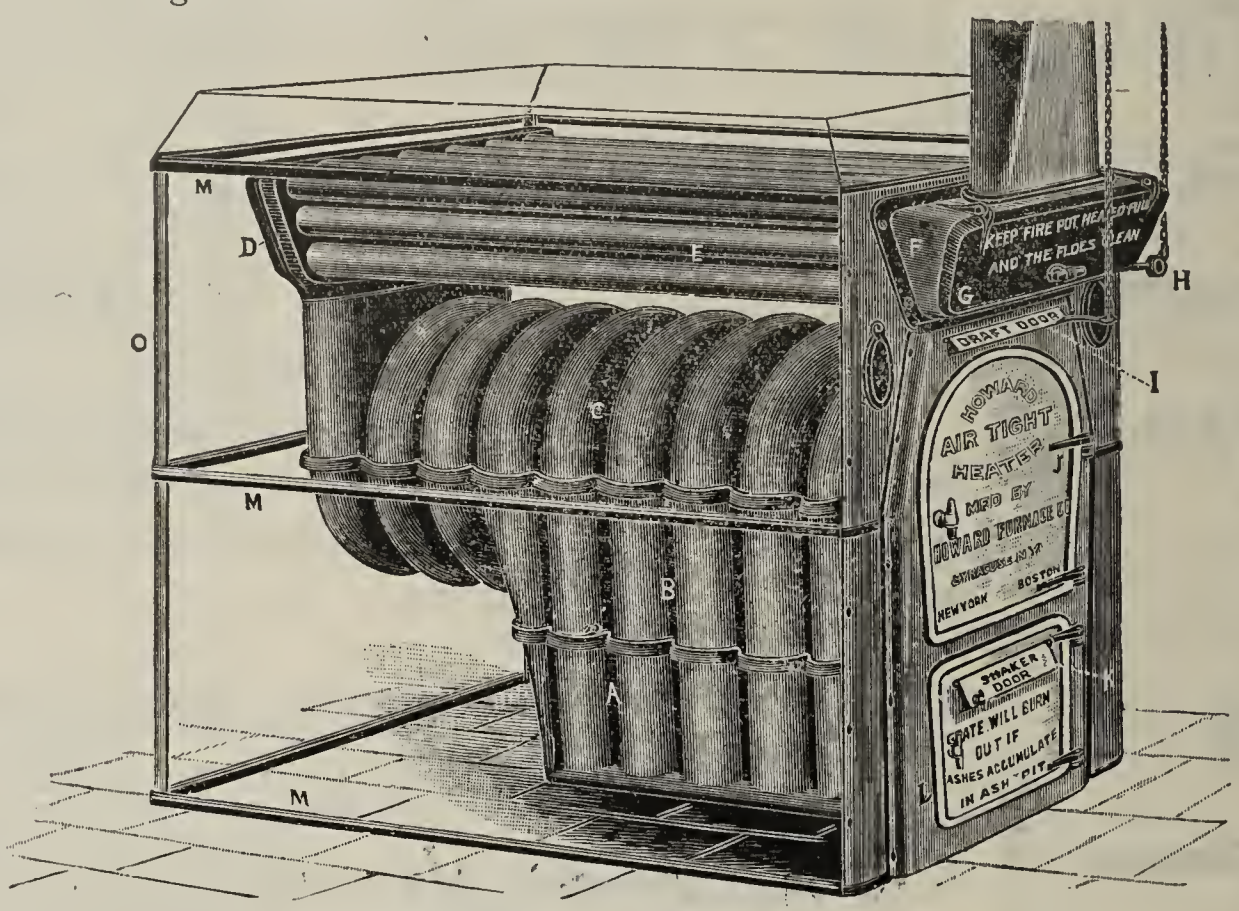
To progressive Hardwaremen who are desirous of improving their stores;

To those who are intending to open new stores;

To those who want information as to the best methods of displaying and accommodating any given class of goods;

To those who wish to know how other merchants arrange their stores;

To those who are interested in the question of window display;



To those who are extending their business in any direction;

To those who desire practical suggestions in regard to the arrangement and sale of the different Hardware articles.

The Business Situation.

The business movement continues unusually active, with a volume greater for the season than in any previous year. This is indicated not alone by the convincing statistics of bank clearings, railway earnings and exports, but also by the reports of individual merchants and manufacturers all over the country. Spring trade is setting in unusually early, and activity reigns in almost all lines. In some sections the distribution of merchandise is still impeded by the condition of the roads, but the effects of last week's storms are passing away with the return of more open weather. The leading manufacturing industries are all busily employed, with the exception of the New England cotton mills, which are still crippled by the strike. A significant sign of expanding trade is given by the growing business in commercial loans, which shows a considerable increase over former years. New York bankers report a remarkably good demand for money from their customers in all parts of the country, with indications pointing to continued extensive loaning in the future. The easy money rates now ruling, which promise to prevail through the spring, and the existence of an abundance of loanable funds in the banks, are entirely favorable to such a development. The New York banks now hold nearly $35,000,000 of surplus reserve, and a similar condition prevails in other money centers. The low record of business failures is a very encouraging feature of the situation. *Dun's* report showed a decrease of failures in January of about 300 in number, compared with previous years, and in liabilities 43 per cent. compared with last year, 62 per cent. compared with 1896, 32 per cent. compared with 1895, and 68 per cent. compared with 1894. The stock market this week was unsettled by another of its periodical Spanish war scares, based on the introduction of a Cuban belligerency resolution in the Senate and the sensational De Lome incident; but the market maintained its underlying strength and values held their own remarkably well. There has been a record breaking demand for bonds, with sales averaging about $6,000,000 a day and a decided appreciation in values. Last month's total of bond transactions, $93,078,500, was larger than ever before known, showing that money long idle is again seeking profitable investment. In pig iron the apprehensions of an overstocked market have been relieved by some very heavy buying by large interests, and the price of Bessemer pig has been advanced 40 cents a ton at Pittsburgh. The metal market shows no noteworthy change, although tin and spelter are firmer. Retail trade is picking up in all quarters and collections are reported as generally satisfactory.

Geometrical Drawing for Pattern Cutters.

We call the attention of those of our readers who are at all interested in pattern cutting to an article elsewhere in this issue by the author of the "New Metal Worker Pattern Book," on the value of geometrical drawing as exemplified in the case of the pattern for a bifurcated pipe. The article has been carefully prepared, and is written in very condensed style, and will need, therefore, strict attention in reading, or, properly speaking, studying; for it must be borne in mind that the difficulties of pattern cutting are not mastered at a glance, but can only be resolved by painstaking effort. The subject of drawing treated in this article is one that has received altogether too little attention from the pattern cutters, and the young men especially who are ambitious to excel in this line will be amply repaid for giving it studious attention. If in connection with it any question arises, or any point seems obscure, we should be very glad to have our correspondents write us freely, and we will then explain any points that may have been indistinctly stated and amplify wherever the article has put the subject in too brief and condensed a form.

The Use of Possibles.

BY FOSSIL.

We have all heard the expression, "Make a spoon or spoil a horn," used figuratively in regard to an intent or action whose result was doubtful, and the phrase has been taken to mean what may be called an experimental perseverance which is not sure of making a spoon, but will not be satisfied with any other disposition of the horn. It would be wrong to have, for a failure in making, only the alternative of marring, because if discarded for the original purpose the horn may become useful in some other way, and he who is economically wise will seek for some method to utilize his failure. It has been said that everything will become useful if kept long enough, and this is in a degree truthful, for the seeming exceptions grow less in number under the transformations of chemistry and the adaptations of invention. Care of the specials and probables is expected and common, but there may be a lack of the attention which should be paid to possibles in view of their undetermined value. The faculty of seeing that which is not seen, as a sculptor does the statue which lies hidden in a block of marble, is not found in superficial observers, neither do the capabilities of things appear to those who take only a special and confined view of them. When Lord Timothy Dexter of eccentric memory shipped warming pans to the West Indies it was considered a very foolish venture by those who saw in the warming pan nothing but a warming pan; but when the consignee sold them readily for molasses ladles there was a change of opinion. Discovery and invention are nearly related, the former being senior; and he who has eyes to see possibles will be most likely to have brains to use them.

THE LETTER BOX.

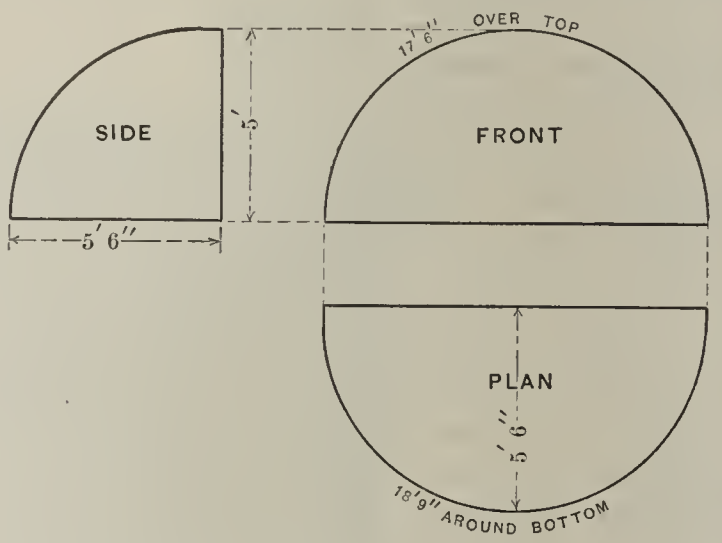
Power of Centrifugal Pump.

From F. E. A., Shawneetown, Ill.—The city of Shawneetown is protected from the overflow of the Ohio River by a levee on three sides, extending to the hills at the back. When the river is up and the sewers are closed several hundred million gallons of water accumulate in the flats in the lower part of the town. The Board of Aldermen purpose putting in a pump, as you will see by the accompanying clipping, where it is stated that a centrifugal pump 18 inches in diameter, with a capacity of 1,000,000 gallons per hour with a 200 horse-power engine, is to be employed. I am under the impression, however, that they have overrated the capacity of the pump. Haswell, page 290, puts the capacity (maximum) of an 18-inch pump at 12,000 gallons per minute. This, however, is a different pump. The suction pipe is to be 26 feet long, and the pump will have to lift the water 22 feet. If there is any way to ascertain the amount of water the proposed pump will take out in a given length of time, please let me know through *The Metal Worker*. You will see by your list that I have been a subscriber almost from the start. I get a great deal of valuable information from *The Metal Worker*, and in this instance I don't know where else to apply for it.

Answer.—The statement made in Haswell's book as the experiments of M. Tresca in France 36 years ago do not represent the best practice of to-day, and we do not find our correspondent's quotation of 12,000 gallons (maximum) for an 18-inch centrifugal pump. Tresca's experiment with an 18-inch pump with 30 horse power gave a flow of only 2025 gallons per minute at 33 feet hight. The most economical work of an 18-inch centrifugal pump is quoted at from 6000 to 11,000 gallons per minute, requiring about 2.4 horse-power per foot lift, or, for 22 feet, say 53 horse power. Suction and discharge pipes 18 inches in diameter. The greatest capacity of an 18-inch pump quoted by makers is 22,000 gallons per minute, or over 13,000,000 gallons in a 10-hour day. At 45 per cent. efficiency of pump and pipe system this output will require 206 horse-power from engine, and a velocity of 650 revolution per minute for the pump. The suction pipe should be 24 inches in diameter and the force pipe 18 inches in diameter, with as few bends as possible, and such as are used should be of long radius. The efficiency of a centrifugal pump increases with its size.

The formula, according to Fink, for the diameter of the suction and discharge pipe of a centrifugal pump is:

$$d = 0.36 \sqrt{\frac{Q}{\sqrt{2g \times h}}}$$



d = diameter of the pipe in feet.
0.36 = a coefficient.
Q = quantity of water in cubic feet.
$2g$ = twice gravity = 64.4.
h = the whole hight of discharge.

Then for the case of 1,000,000 gallons per hour = 2222 cubic feet per minute, at 22 feet hight, the equation figured will be $0.36 \sqrt{\frac{2222}{\sqrt{64.4 \times 22}}} = \sqrt{1416.8} = 37.63$, and $\frac{2222}{37.63} = 59$, and $\sqrt{59} = 7.68 \times 0.36 = 2.76$ feet, or say 33 inches, diameter of pipe. If the suction takes place on one side, or by a single pipe, the inside diameter of the wings should be 1.2 diameter of the pipe, or 39.6 inches; the outer diameter should be 2.4 d. or 79 inches. Its peripheral velocity should be $1.25 \sqrt{2g \times h}$, or $37.63 \times 1.25 = 47$ feet per second, or say 142 revolutions per minute. The efficiency of this, if constructed in the best form with peripheral areas equal to the area of the pipe, should have a power efficiency of over 50 per cent., and require nearly 200 horse-power to raise 1,000,000 gallons 22 feet high per hour.

Such a pump is recommended for a permanent plant for drainage purposes. For the convenience of intermittent work it should be located at as low a level as can be protected from accidental flooding.

A Roof Area Problem.

From A. T. S., New Jersey.—I would like to know how to figure the area of a roof of which I send a sketch. It is, as you will see, roughly speaking, a quarter of a

A Roof Area Problem—Fig 1.—Side, Front and Plan Views.

globe or sphere. Fig. 1 is a front, top and side view with the dimensions.

Answer.—The data given by the correspondent are not sufficient to make the calculations without assuming that the figure is a portion of a sphere. Making this assumption the problem is reduced to determining the radius of the sphere, the area of a quarter of a sphere and deduct-

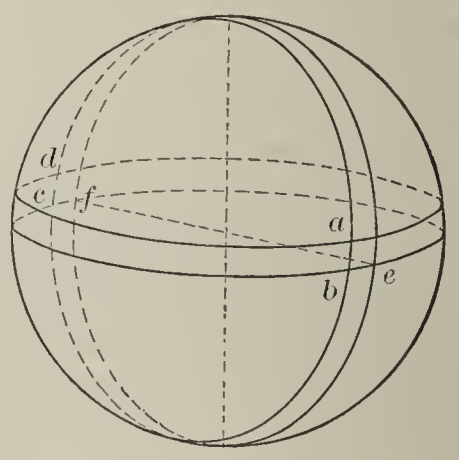


Fig. 2.—General View of Sphere.

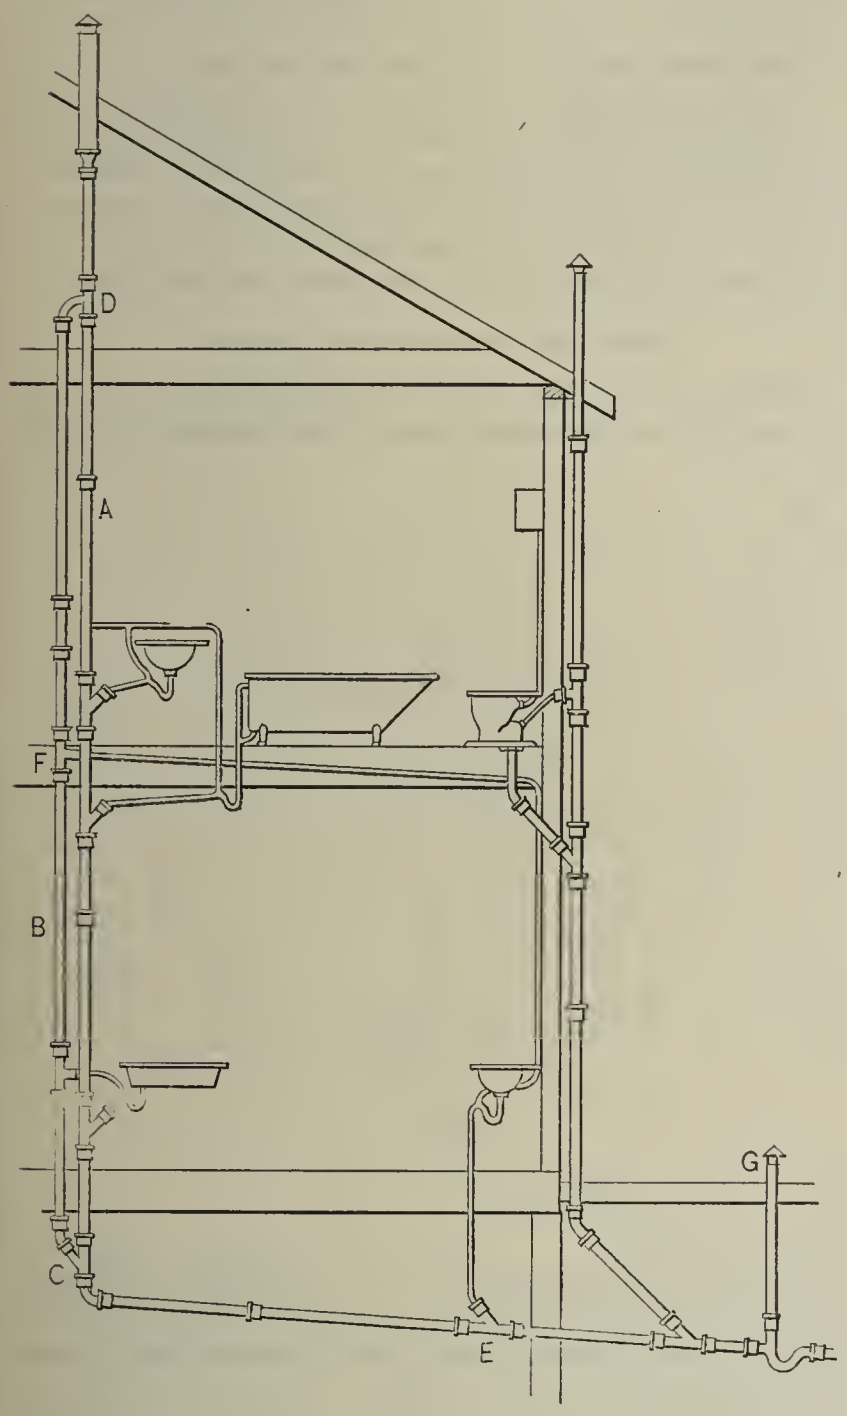
ing therefrom the areas of the two portions of zones, Fig. 2, A B C D and E B C F, which we will consider as cylindrical in order to facilitate and simplify the calculation. The radii of the two circles whose arcs and versed sines are given are determined from the known relation of these three dimensions and are for the arc of 17½ feet 7.09 feet, and for the arc of 18¾ feet 6.92 feet. The radius of the sphere will be given by the expression, $R^2 = 6.92^2 - (R - 5)^2$; hence R = 7.3 feet.

The area of the one-quarter sphere will be $3.14 \times 7.3^2 = 167$.



The area of the portion of zone $a\,b\,c\,d = (7.3 - 5) \times 18\frac{3}{4} = 43.25$.

The area of the portion of zone $e\,b\,c\,f = 3.14 \times 7.3\,(7.3 - 5.5) = 41.25$.

The sum of these two is equal to 84.50, which is the net area to be deducted from 167, and which leaves for the area of the roof in question 82.5 square feet.

A Defective Plumbing System Remedied.

From Oliver Twist.—The piece of plumbing shown in the sketch of "C. R.," Merced, Cal., in *The Metal Worker* of December 18, will be interesting to many readers. The features of locating the soil pipe stack upon the outside of the house is something that his brethren of a cooler climate never have the pleasure of doing. "C. R." is quite right when he claims that some parts of the work are insanitary. The bath overflow is bad, leaving a free passage of sewer gas into the room. The connection of the bath

A Defective Plumbing System Remedied

waste to the heel of the lead bend is not to be commended, and the placing of the main trap at the foot of the soil pipe stack is not very good practice. The sketch sent herewith is intended to show how the system might be brought nearer the standard called for by the plumbing regulations of most cities and yet be as near the original plan as possible. Keeping this in mind we find it necessary to vent all traps, using pipe of a size equal to the diameter of the waste, say for the bath 1¼ inches, basin 1¼ inches, sink 1½ inches and water closet trap 2 inches. Our vent stack, B, must be of suitable size to carry the combined areas of what we connect to it; in this case a 3-inch pipe would be a good size. We need a foot connection, C, to return any condensation in the vent to the waste. Our vent stack may run separately through the roof or may connect to the waste pipe above the highest fixture, which is done at D, and before going through the roof the pipe must be enlarged to at least 4 inches. By turning the bath around we are able to connect to waste stack instead of closet bend, and as there is no room for the trap above the floor we prefer to put it below the ceiling, where it is always accessible, connecting the overflow and vent as shown. This vent is carried above the top of the basin, so that in case of stoppage they would not act as waste pipes. The basin waste on the ground floor is connected with a ⅛ bend and Y branch at E, and is vented into a tee at F, but if preferred could be run into the soil pipe stack above the closet. The fresh air inlet G and trap would be better if kept 25 feet away from the house, and as the cap is removable any large objects stuck in the trap can be easily taken out through it. Turn to *The Metal Worker* of December 18 and notice the difference between the connections of the soil pipe with the sewer; the Y branch shown gives the sewerage a good deflection in the right direction, and the closet trap is vented through a 2-inch pipe into the soil pipe. The reason for enlarging the vent before passing through the roof is to prevent the outlet from being closed by frost, and is probably unnecessary in the balmy climate in which our friend "C. R." lives.

A Puzzling Case of Rusty Tin.

From H. T. D., Friendship, N. Y.—Please give me through *The Metal Worker* your opinion as to the cause of the rusting out of the gutter from which the inclosed sample was cut. This tin is one of the best known heavily coated terne plates. It was put onto our high school building two years ago, and was given a coat of paint. The tin where it was not rusty seemed to be well preserved and the paint was intact. The section that was rusted out lay in the bottom of the gutter. The right side of the inclosed sample was next to the boards and the rusty side was exposed to the atmosphere.

Note.—The sample sent us by our correspondent is a very disreputable looking piece of tin plate. It is corroded completely away in spots, and the greater part of the surface is affected by rust. He states in his letter that it was painted, but, if so, all traces of it were carefully removed from the sample sent us, which does not show any remains of a coating of this kind. As a matter of fact, tin laid in the position he speaks of ought to be coated once a year to keep it in the best condition. There are different possible explanations of the trouble in this case. One is that by some mistake a single sheet of poor tin got in among the lot, for there are some spots in the small piece that we have that look almost as if the sheet had been imperfectly cleaned of cinder, consequently it would not take the coating properly and would prove to have little durability. Another explanation is that the particular part of the gutter where the rusting occurred was a receptacle for leaves from adjoining trees, which collected in it and retained the dampness, which would be apt to corrode any metal near it. Furthermore, in the case of oak leaves—and we have heard it stated with alder leaves also—there is an acid brought out in the presence of moisture that has a very corrosive effect, and it would be difficult to get any plate to withstand the action. If our correspondent learns certainly what the cause of the trouble was, we should be glad to have him write us again

The Ferracute Machine Company of Bridgeton, N. J., are one of the firms who have kept busy during the dull times. They have gradually increased their force, and now are employing about 130 hands, and have recently enlarged their works. They shipped a short time ago to a firm in Ohio a press weighing 37,000 pounds, and which was about 8 feet long by 5 feet wide by 10 feet high. It was used with special dies for forming up conveyor troughs. The Ferracute Company have equipped their die shops with the most recent and improved machines, and have a large force of skilled workmen.

The Frank Kneeland Machine Company, Pittsburgh, Pa., have booked an order for the rolls for the new plant of the Old Meadow Rolling Mill Company, Scottdale, Pa. The Lloyd-Booth Company, Youngstown, Ohio, will furnish shears and lathes to the same concern and Lane & Bodley, Cincinnati, Ohio, a 36 x 60 Corliss engine.

SHEET METAL WORK.

Importance of Geometrical Drawing to Pattern Cutters.

BY GEO. W. KITTREDGE.

In replying to many of our correspondents who have requested solutions to pattern problems, *The Metal Worker* has had frequent occasion to refer to the necessity of a more thorough knowledge on the part of the pattern cutter of the principles of geometrical or linear drawing.

AN INQUIRY

of this class came to hand recently in which the correspondent desired to know how to develop the complete patterns of two double pieced elbows of which he inclosed sketches. Closing his inquiry he said: "How are the miter lines A B to be found, and how are the various pieces to be laid out so as to insure a perfect fit throughout?"

The usual correspondent simply asks how to obtain the patterns of this or that, but the above question: "How shall I obtain the miter lines?" implies the writer's inability as a draftsman. The inclosed sketches reproduced in Figs. 1 and 2 show what are really two cases of the

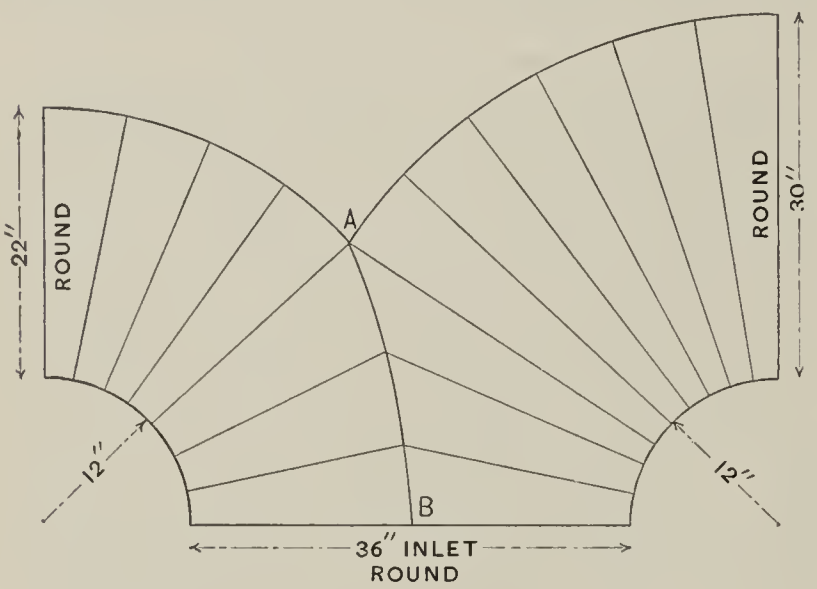


Fig. 1.

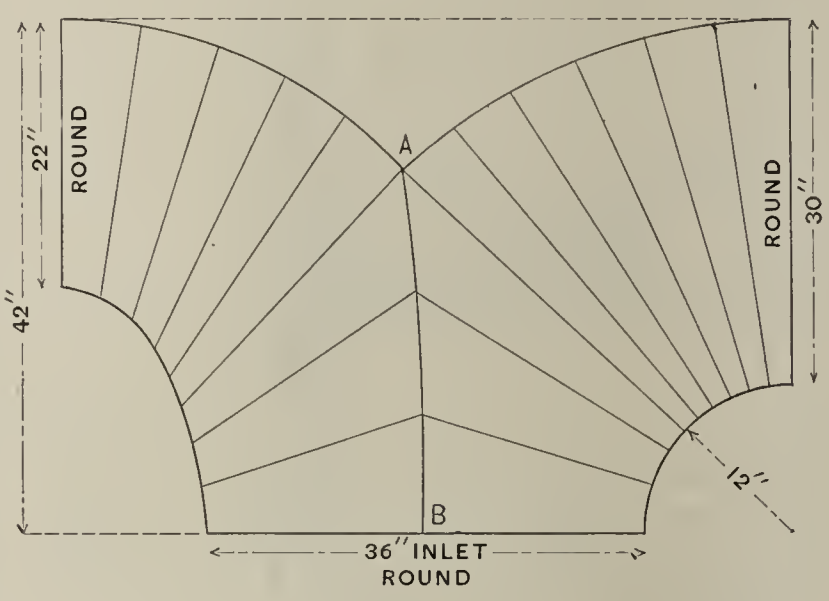

Fig. 2

Reproductions of Original Sketches Accompanying Inquiry.

same problem. In Fig. 1 the two smaller pipes are placed in the same horizontal line at the throat, while in Fig. 2 they are in line on the back. In either case the problem with which the correspondent has to wrestle is one of draftsmanship rather than of pattern cutting. With two carefully completed elevations and a plan of the desired elbows, as specified in either of the above sketches, at hand, no doubt any fairly intelligent pattern cutter would have little difficulty in working out the patterns.

We take the opportunity afforded by this inquiry of impressing upon the pattern cutter the necessity of familiarizing himself with the principles of geometrical drawing. Pattern cutting is simply an adaptation of the principles of linear drawing to the development of sheet metal forms. That particular branch of linear drawing with which the pattern cutter has to deal is properly termed orthographic or right line projection. In accordance with its principles all the points of any one view or elevation are determined with accuracy by means of parallel lines projected from one or more other views (elevations or plans).

Thus the draftsman begins the construction of his principal view from given specifications and proceeds to project therefrom as many other views as possible, or as he finds necessary to arrive at the results desired. In the evolution of such a set of elevations and plans new facts are often brought to light as the work progresses which were unknown at the outset, and which as soon as obtained render their share of assistance in obtaining the final results. Such a course, supplemented by the fund of knowledge which comes with experience on the part of the draftsman, will often accomplish wonders.

The above problem furnishes such an excellent opportunity of illustrating the application of the foregoing suggestions that we will undertake to describe the complete operation of constructing the necessary plans and elevations and of laying out the patterns for the above, as far as necessary, beginning with the conditions as given in Fig. 1.

BEGINNING THE PRINCIPAL VIEW.

First draw any horizontal line indefinitely, as C D of Fig. 3, upon which set off at convenience the distance E F equal to 36 inches, the desired diameter of the inlet. From the points E and F set off 12 inches in either direction upon the same line, thus locating the centers G and D, from which the throat curves are to be struck. Now erect perpendicular lines from the points G and D indefinitely. From G and D as centers, with a radius of 12 inches, describe arcs from E and F cutting the perpendiculars just drawn in the points M and K. From M and K set off respectively 22 inches and 30 inches upon the vertical lines, obtaining the points N and L. From D as center, with the radius D L, describe an arc, L A, indefinitely; and from G as center with G N as radius, describe another arc, cutting the first one in the point A. This completes the general outline of the side elevation.

Since three pipes of different diameters are to be joined, it is evident that there must be some gradations in the width of this elbow at the various points of its course.

OTHER VIEWS REQUIRED.

It will therefore be necessary to construct either a plan or an end view, or perhaps both, upon which to establish such gradations and to measure widths when necessary. The plan may be begun at once, and all of the views which it is deemed necessary to construct should so

far as possible be carried along together, all points in any one view being projected into the other views as soon as obtained. Since both halves of the elbow, when divided by a vertical longitudinal plane, are supposed to be alike, half of the plan or end view will be sufficient for all purposes. Therefore draw C¹ D¹ parallel to C D and at any convenient distance away, as the center line of a plan From each of the points G, E, F and D drop lines vertically, cutting C¹ D¹ at G¹, E¹, F¹ and D¹, and continue them indefinitely below. Bisect E¹ F¹, obtaining the point B¹, which will become the center from which to describe the semicircle E¹ H F¹, representing the half plan of the inlet or largest pipe.

DETERMINING THE MITER LINE BETWEEN THE ARMS.

In drawing the miter line or line representing the junction of the two arms of the elbow, as seen in the side view, and in determining the shape of the opening which it represents as it would appear if seen from either end, the pattern cutter will have to be guided by his general knowledge of intersections and the shapes derived therefrom. Were the two pipes of the same diameter throughout their course, and brought or mitered together in the general manner indicated in the drawing, the position of the miter line would result from the simple operation of bringing together two sets of lines emanating from corresponding points in their respective profiles. If, again, one pipe being larger than the other, both be continued without change of diameter as before through the several pieces composing the elbow, the position of the miter line upon which the two would intersect would be the result of a similar operation. But since the two branches or elbows are required to unite so as to form a third pipe of a specified larger diameter than either, the problem consists in the devising or designing of a transition composed of several pieces which shall begin at A with a junction of the two smaller pipes and finish at E F with a perfect circle representing the larger pipe.

In this part of the work the draftsman will have an opportunity to exercise the powers of his imagination in forming a mental idea of the approximate shapes of the several intermediate pieces necessary to accomplish the transition, working upon the supposition that if he can form an idea of the general shape and dimensions of the several parts he will have little difficulty in placing the different views of them upon paper.

CONSTRUCTION OF A MODEL.

In the failure of his powers of mental conception he could be materially aided in his work, should he care to take the trouble, by the construction of a model. An inspection of the drawing, as thus far constructed, will show at once that those portions of the branches from A to N and A to L will be the same as ordinary pieced elbows. Suppose now that these parts have been made in the usual way, and have been placed relatively in the positions which they are to occupy in the finished work. Let the constructor now cut out a disk of any material and place the same in the position shown by E F of Fig. 3, then, taking moist clay or molders' sand, proceed to fill in the space E P A Q F between the approaching ends of the elbows and the disk at the base, shaping it so as to meet the curves of the throats at either end and gradually reducing its width or thickness as it rises till it meets the circles at A P and A Q. A model so constructed will give the general shape of the transition, upon which the several pieces of which it is to be constructed must be so outlined tha they may be made by simply cutting and bending the metal.

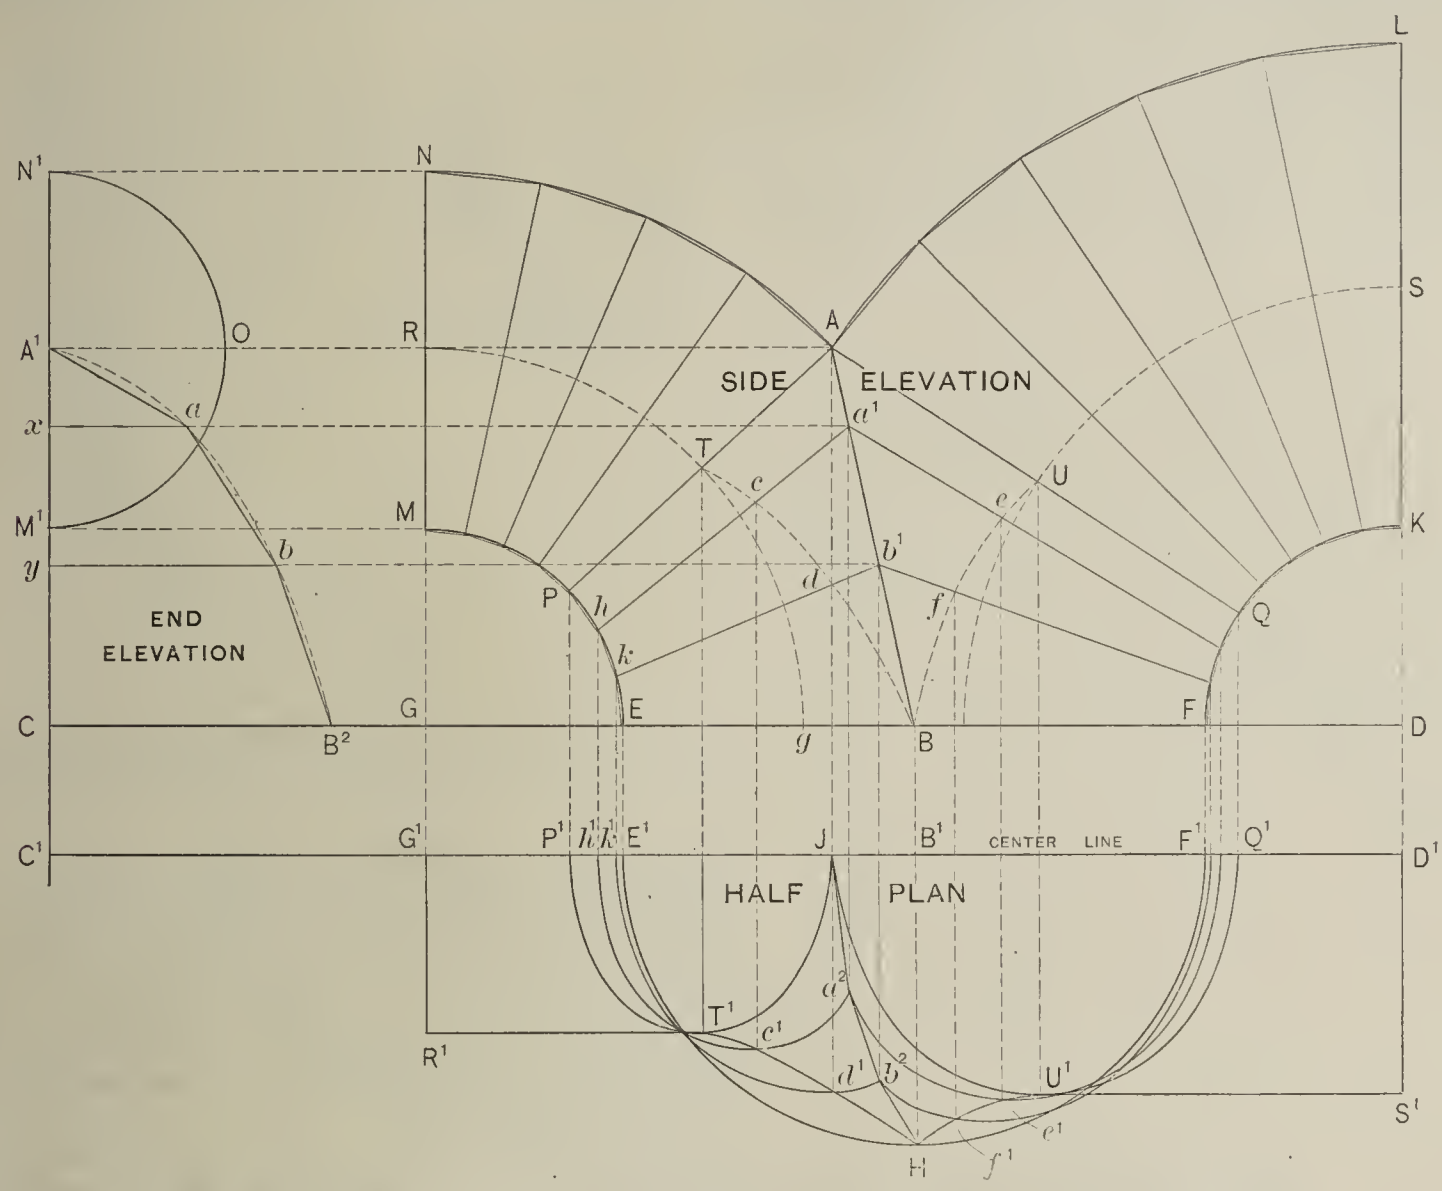

Fig. 3.—Completed Drawings of Double Elbow Shown in Fig. 1.—One-eighth Full Size.

METHOD OF PATTERN CUTTING TO BE EMPLOYED.

Sooner or later in the solution of every problem in sheet metal work the question of the method of developing the patterns arises. Is it a miter or miters between continuous or parallel forms? Are the pieces portions of regular tapering cones, or are they irregular tapering forms, in which case triangulation must be resorted to? An inspection of the drawing as thus far developed, or of the model if it has been constructed, will show that those parts constituting the transition must be developed by the methods of triangulation, and that therefore their outlines may be drawn arbitrarily in accordance with the judgment of the draftsman, provided that they are not so drawn as to involve hammering or stretching of the metal.

To proceed then with the drawing in the light of the above conclusions, the miter line A B may be drawn straight from A, the point of least or no width, to B, the point of greatest lateral diameter or width of the united elbows. To be sure, it might be drawn from A to a point to the right or to the left of B if there were any reason for so doing, or it might be drawn with a general curve composed of as many straight lines as there are intersecting pieces on either side, but such a course would only complicate matters to no purpose. The line A B, representing as it does the junction of two pipes while appearing straight in this view must necessarily have a profile when viewed from the end. An idea of the shape which it represents could be obtained by cutting away one portion of the model described above by means of a thin bladed knife or a wire held taut and passed from the point A down through to B, the middle of the disk at the base. To obtain this line without the aid of the model it will become necessary to construct an end view of the junction, as shown at the left in Fig. 3.

THE END VIEW.

Draw any vertical line, as C N^1, representing the center line of the proposed view. Project the point A upon this line by means of the dotted horizontal line, as shown at A^1, and from C set off on the horizontal base line one half the width of the largest pipe—that is, make C B^2 equal to 18 inches. A line drawn from A^1 to B^2 will then represent one-half the opening between the two branches of the elbow. This line, so far as the requirements of triangulation are concerned, might be drawn perfectly straight between the two points. But here the knowledge or experience of the draftsman must be called into play. Any one who has seen two straight pipes mitered together so as to form a Y, or has cut any oblique miter upon a cylinder, knows that the shape of the opening so produced is elliptical. It is therefore advisable that the line A^1 B^2 should approximate a quarter ellipse in shape, as shown by the dotted line in the end view.

This end view may be completed as far as desired, making it an elevation of the end nearest which it is drawn. Therefore project the points N and M horizontally from the side elevation to the center line of the end elevation, as shown at N^1 and M^1. Bisect the distance N^1 M^1, locating the point A^1, which by mere accident or coincidence falls at the point representing A of the side elevation. From A^1 as a center describe the semicircle N^1 O M^1, representing one-half the opening at N M to receive the 22-inch pipe. Lines from O toward B^2 may afterward be drawn to complete this view if found necessary.

DIVIDING THE ELBOWS INTO PIECES.

The next matter to be determined will be the number of pieces of which the elbows shall be made, and the drawing of the divisions upon the elevations in accordance with the same. The number of pieces will, of course, be determined in accordance with physical requirements; material to be conveyed, friction, &c. Having determined this, first draw lines from A toward G and D, as shown by A P and A Q. The portions A N M P and A L K Q thus become the equivalents of ordinary pieced

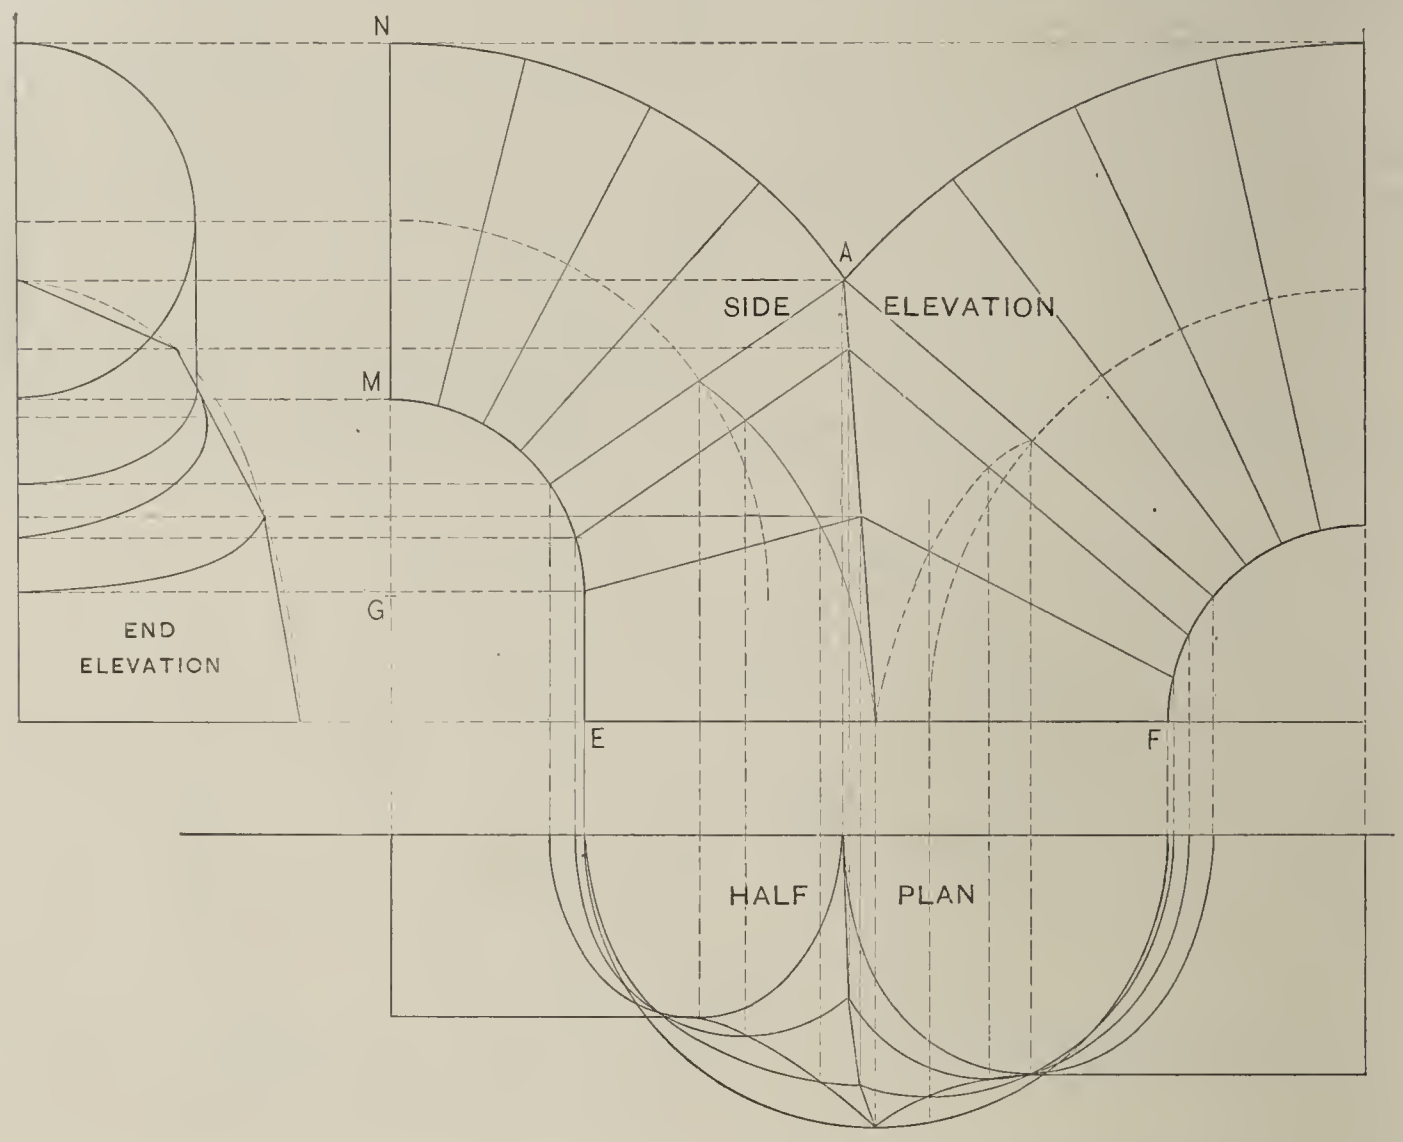

Fig. 4.—Completed Drawings of Double Elbow Shown in Fig. 2.—One-eighth Full Size.

elbows, and the arcs A N and A L being unequal, may each be so divided into equal spaces that the spaces in both shall be approximately alike. Thus it will be seen that if N A be divided into four equal spaces and A L into five, they will be nearly alike in both. From the points of division assumed in N A and A L lines may now be drawn toward G and D to the throat lines, as shown. Now connect adjacent points upon the arcs, both of the throats and the backs, by straight lines, thus completing these parts of the side elevation.

In continuing the division to the part forming the junction, the points of division corresponding to those already assumed on the backs of the pieces will have to be established upon the line A B; but as A B represents a curved line it will be better to fix the points of division upon its representative A^1 B^2 of the end elevation. Two points upon A B, dividing it into three spaces, will be found sufficient, since three equal spaces upon each of the remaining portions of the throat lines P E and Q F will result in an approximate equality of spaces in M E and K F respectively. Therefore the points *a* and *b* may be so taken upon the curved line A^1 B^2 that the space A^1 *a* will be the shortest and *b* B^2 the longest of the three. Connect the adjacent points by straight lines, as shown. By making the spaces shortest where the curve of A^1 B^2 is

quickest, or of shortest apparent radius, the resulting broken line will more nearly approach the curved line which it takes the place of than if the spaces had been made equal. The points a and b may now be projected upon the miter line A B of the side elevation, as shown at a^1 and b^1, and straight lines drawn from each to the corresponding points of division upon the arcs P E and Q F.

In the thus completed side elevation the two upper sections of the transition piece lying adjacent to the lines A P and A Q have the appearance of being no wider at their backs than at their throats, but a moment's reflection or a glance at the end elevation will show that the distance of the point a^1 from A is equal to a A^1 of the end view, and that it is therefore greater than the back width of any of the other pieces except those between it and the line E F. One might easily have made the mistake of dividing the line A B of the side elevation into three equal spaces had the end elevation, showing the shape of the section on A B, not been drawn. This liability to error is, in fact, shown in the crude outlines of the original sketches given in Figs. 1 and 2.

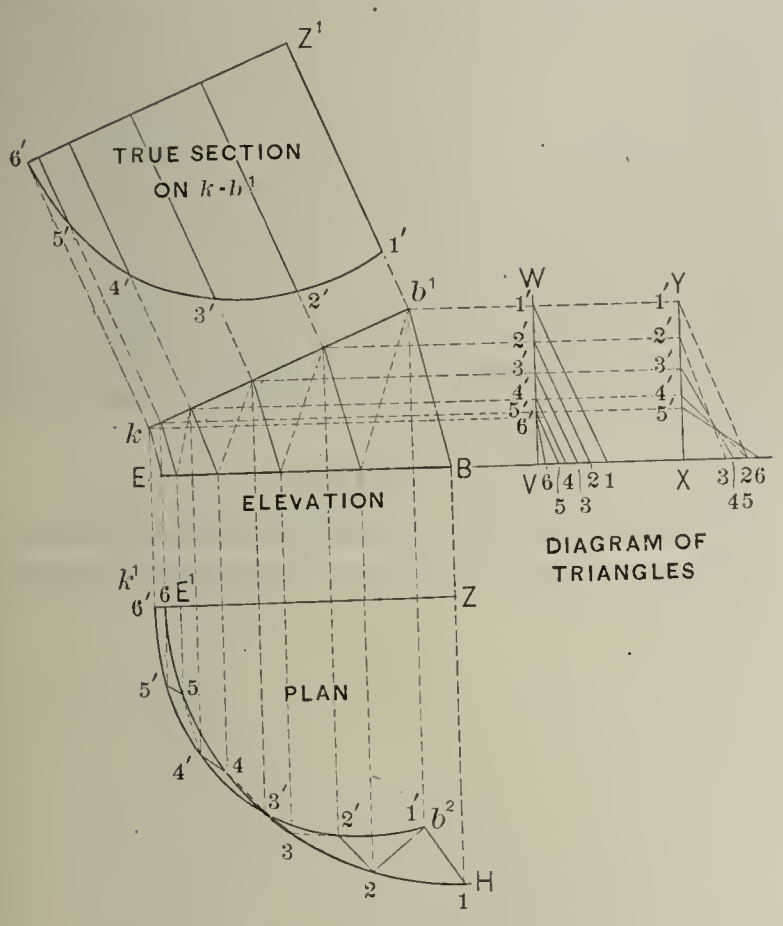

Fig 5.—Elevation, Plan and Section of First Piece, E k b^1 B, in Left Side, Duplicated from Fig. 3, Showing Method of Triangulation.

COMPLETION OF THE PLAN.

We may now turn our attention to the completion of the plan, upon which must be obtained a view of each of the several miter or joint lines between P A Q and E F, including the line A B. The positions of the points in A B upon the plan are obtained simply by projection and

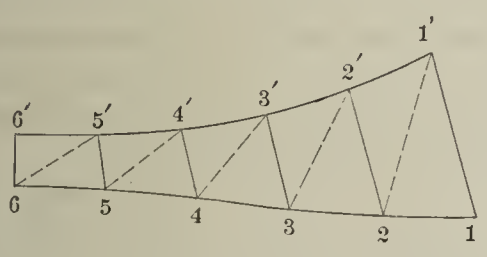

Fig 6.—Half Pattern of Piece Shown in Fig. 5.

measurement. The point A being upon the longitudinal center may be dropped at once to the center line of the plan, as shown at J. From each of the points a^1 and b^1 also drop lines to the center line, carrying them indefinitely beyond or below. Upon each of these lines respectively set off from the center line the distances a x and b y of the end elevation, as shown by a^2 and b^2. The point B being upon the circumference of the largest pipe may be dropped upon the semicircle representing the same in the plan, as shown at H. Connect the adjacent points obtained in this operation by straight lines; then the broken line J a^2 b^2 H will be the plan of the line A B of the elevation.

No further drawings will, of course, be necessary in obtaining the patterns of those portions between P A Q and the outlets. It will be advisable, however, to represent them in the plan on account of their relationship to the middle and more intricate portion. Therefore drop vertical lines from M and K through the center line of the plan, and make G^1 R^1 and D^1 S^1 respectively equal to the semidiameters of the outlets M N and K L. From R^1 and S^1 draw lines parallel to G^1 D^1 indefinitely toward the center of the plan.

The next operation will be to obtain upon the plan a projection of the circles P A and A Q. First bisect the lines representing those circles, as shown at T and U. Since T and U represent points of extreme projection or points of greatest transverse diameter, vertical lines may be dropped from them, cutting the lines drawn from R^1 and S^1, as shown at T^1 and U^1; also drop lines from P and Q cutting the center line of the plan at P^1 and Q^1. Then P^1, T^1 and J become three points of a semiellipse of which P^1 J is the minor axis; and likewise J, U^1 and Q^1 are three points of a semiellipse of which J Q^1 is the minor axis. These semiellipses may be drawn upon the plan by rak-

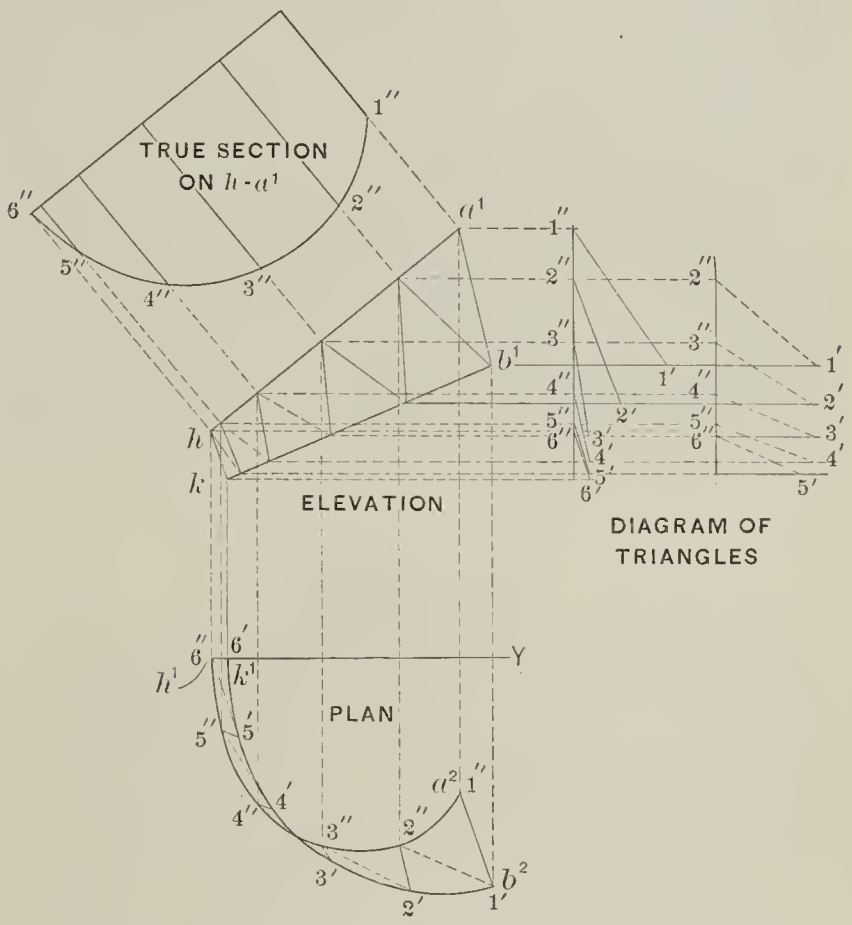

Fig 7.—Elevation, Plan and Section of Second Piece, k h a^1 b^1, in Left Side of Fig. 3, Showing Triangulation.

ing, by trammel or by any method most convenient which will result in true elliptical curves.

Having now drawn the plans of the circles constituting the upper and lower sections of the transition portion of the elbow, it remains to fix upon the plan the sections upon the two intermediate joint lines in each side or branch. Inasmuch as the method of triangulation admits of working to assumed outlines, the draftsman is here thrown upon his judgment as to the shape of and the best method of obtaining these sections. This can be accomplished by first establishing the principal points of the curves and then drawing them by eye so as to form in each branch a gradual transition from the circular profile of the small pipe to one-half the circle of the large pipe or inlet. The first points to be determined are those of greatest thickness or transverse diameter in each. The point of greatest transverse diameter in each of the joint lines in the smaller branch pipe is, of course, at the intersection of each with an arc drawn from G as center and with G R as radius, that of P A being at T. This arc continued intersects the line E F at g. But as the greatest transverse diameter of E F is at B the points c and d must

be assumed so as to deflect this line at T toward B. Having determined the points of greatest thickness upon these lines the question next arising is, What shall be the distance across the sections at these points? This must, of course, be determined upon the plan, where T^1 represents the point T, and H the point B. The most reasonable solution to the question seems to be to draw a line in continuation of $R^1 T^1$, curving it out to reach the point H. The line $R^1 T^1 H$ will then be a plan of R T B of the elevation. Lines dropped vertically from c and d of the elevation, intersecting this line at c^1 and d^1, will then locate the desired points in the plan. Next drop lines from h and k to the center line of the plan, as shown. Then h^1, c^1 and

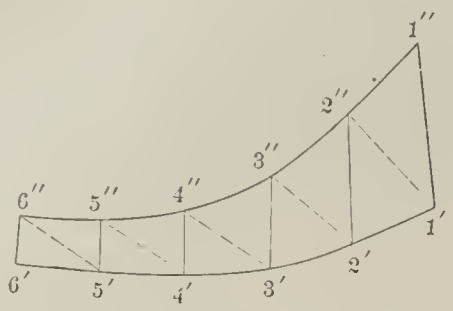

Fig 8.—Half Pattern of Piece Shown in Fig 7

a^2 are three points through which a curve, elliptical in character, must be drawn, establishing a plan of the line $h\ a^1$ of the elevation. In the same manner a like curve drawn through k^1, d^1 and b^2 will answer as a plan of the line $k\ b^1$.

The points and curves in the right half of the plan are obtained by a similar process, which is all shown by the lines of projection and the reference letters.

Should it be desired the projection of all the curves now shown in the plan could be obtained upon the end elevation by a process similar to that just gone through in obtaining the plan, simplified, however, by the fact that no questions of design can there arise, the position of all important points having been already established in drawing

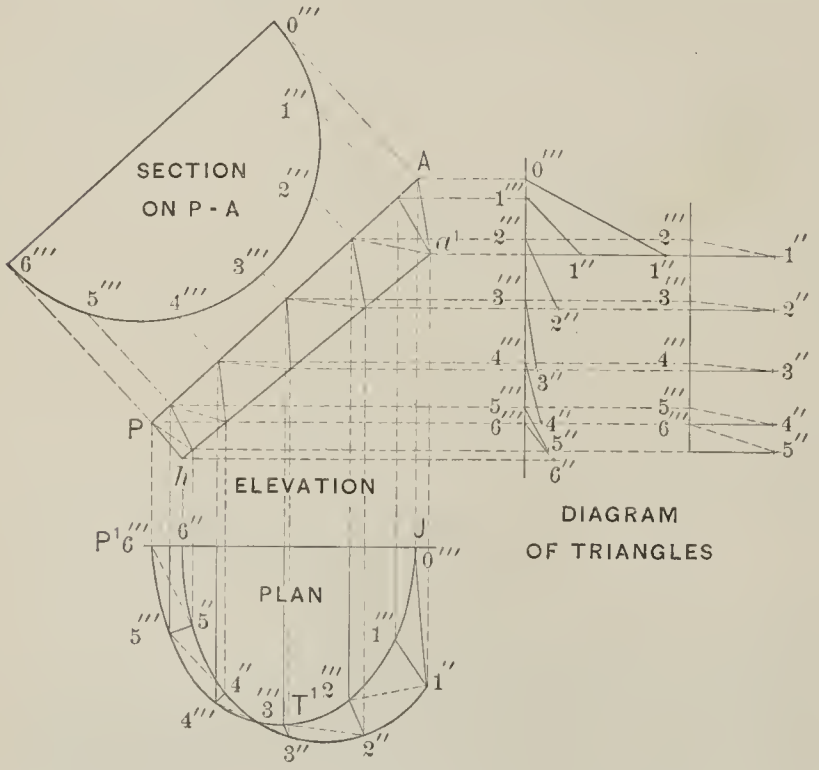

Fig 9.—Elevation, Plan and Sections of Third Piece, h P A a^1, in Left Side of Fig. 3, Showing Triangulation

the plan. Likewise the projections of the circles represented by the joint lines between A P and N M could be obtained upon both the plan and the end view by the method employed in obtaining the semiellipse P^1 T^1 J from the line P T A. These operations, however, would only be valuable as a lesson in drawing, as they are in no way necessary to obtaining the patterns.

In preparing drawings of our correspondent's second case, the original sketch of which is shown in Fig. 2, the methods employed in the foregoing demonstration are equally applicable. The completed drawings of the same are given in Fig. 4, in which corresponding points in the several views are connected by the lines of projection The conditions of the two cases are so nearly alike that the reader will have no difficulty in applying the demonstration given above to this case. The sketch shown in Fig. 2 differs from that in Fig. 1 principally in the fact that the two outlets are in line at the back, which gives a longer throat line to the smaller pipe than in the former case. While our correspondent has drawn this in his sketch somewhat elliptical, we have confined the throat proper to a quarter circle whose center is at G, Fig. 4, as in the former case, thence carrying the line vertically to the point E. This keeps that part of the elbow from A to N a regular pieced elbow, as in the former case, and simply modifies the shapes of those pieces lying between A and the line E F. Of course the throat line could be made a continuous curve from E to M if desired, but at the expense of much more labor in obtaining the final patterns.

The necessary drawings having been completed, it will be advisable before attempting to develop any of the patterns to make separate new drawings, each of which shall include the plan and elevation of one of the pieces, which shall be in all respects duplicates of the outlines already obtained, and placed conveniently near together, thus facilitating the subsequent operations by avoiding the confusion of lines which would result from performing them all upon the one elevation.

THE PATTERNS.

In Fig. 5 is shown a duplicate of the piece E $k\ b^1$ B of Fig. 3, there indicated by the same letters, below which is

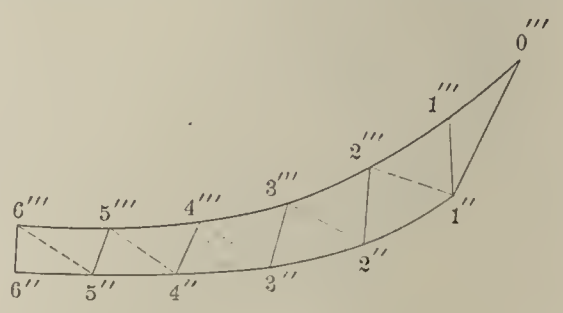

Fig. 10 —Half Pattern of Piece Shown in Fig. 9.

its plan traced from Fig. 3, in which E^1 H is a plan or true section on the line E B of the elevation, and $k^1\ b^2$ is a horizontal projection of the line $k\ b$ as traced from the line bearing the same letters in Fig. 3. Each of these curves constituting the plan of the piece may now be divided into the same number of equal spaces of convenient size, and numbered correspondingly, as shown by the small figures. Points of like number must be connected by solid lines, and the four sided figures thus produced must be subdivided diagonally by dotted lines, as shown. The triangulation thus produced may be seen to better advantage upon the elevation, the points upon the upper and lower bases being obtained in that view by projection from the corresponding points of the plan, all as shown by the vertical dotted lines.

The true lengths of the several solid and dotted lines thus obtained in both plan and elevation are to be obtained by the method usual in all similar operations—that is, by considering them as the hypotenuses of triangles whose altitudes are obtained from the elevation and whose bases are these lines as they appear on the plan. This operation is shown in the diagram of triangles at the right, in which the hights of the points in the vertical lines V W and X Y are obtained by projection from the elevation, while the horizontal distances between corresponding points are obtained by measurement from the plan; the hypotenuses being drawn give the true distances across the pattern, which is given in Fig. 6.

The lengths of the spaces upon the lower line of the pattern are obtained from E^1 H, the plan of the lower base of this piece. To obtain the lengths of the spaces upon the upper line of the pattern, however, a true section on $k\ b^1$ must be obtained as shown above, since it is evident that distances measured upon the oblique line are greater than the horizontal distances as given upon the plan. This section is obtained by the usual operation of raking from

the line of the upper base as given in the plan, viz.: Draw lines from each of the points in $k\ b^1$ at right angles to the same, intersecting the line 6′ Z^1 of the section which is drawn parallel to $k\ b^1$. The distances of the several points in the developed curve from the line 6′ Z^1 are the same as those of corresponding numbers in the plan from the line 6′ Z.

In Fig. 7 is shown the duplicate drawing of the second piece of the left portion of the elbow with its plan, diagram of triangles and the true section of its upper base. In drawing its plan, $k^1\ b^2$, the line of its lower base may be traced and transferred from Fig. 5, with its points as there used, instead of being obtained from the original plan. The true section obtained in Fig. 5 becomes the true profile of the lower base of this piece, therefore the stretchout of the lower side of its pattern, shown in Fig. 8, may be taken from the true section in Fig. 5. The points in $k^1\ b^2$ from which this section was derived are thus located at once in the plan in Fig. 7 by the transferring above alluded to and form the basis of the triangulation. The subsequent work of developing the pattern of this piece is exactly similar to that employed in obtaining the first piece.

In Figs. 9 and 10 are shown the necessary drawings and pattern of the third piece. The true section obtained in Fig. 7 becomes the true lower base of this piece, while the true upper base is a semicircle whose diameter is A P of Fig. 3. While the true projection of this semicircle in the plan, as shown by $P^1\ T^1\ J$ of Fig. 3, is according to geometrical rules a perfect semiellipse, it is better to obtain the same in Fig. 9 by the operation of raking, so dividing the same that the points and spaces used may also be used in connection with those of the lower base $h\ a^1$ for the purpose of triangulation. It will be noticed that one more space has been taken in the upper base of this piece than in the lower on account of its greater length, and that the triangles have been so arranged that the apexes of two come together at the point 1″. By this treatment the triangles so produced are more nearly equilateral, and can therefore be more accurately constructed in the operation of laying out the pattern than if they were very scalene.

TINSMITHING FIFTY YEARS AGO.

The article printed in *The Metal Worker* February 5, entitled "Tinsmithing Fifty Years Ago," and giving a New England list of day's work, has brought out the following letter from John Brett of Millington, Mich.:

I notice in *The Metal Worker* of February 5 an interesting account of the list of day's work for assorted tinware from a brother tinsmith, John D. Ottiwell, and it pleases me very much to hear from one of the old boys. I was an apprentice (a cub) in the fall of 1849 and served four years at the trade and then one year under instruction at coppersmithing. Now what brings out this communication is the wish to take a little exception to the list given by Mr. Ottiwell, or, rather, to show the difference in the lists as used in different parts of the country. We then, as piece workmen, worked what was called the "Yankee" list of day's work, as follows:

LIST OF STOCK COMPRISING A DAY'S WORK AT SEVENTY-FIVE CENTS PER DAY.

3 ovens, large, Dutch.
4 ovens, small, Dutch.
14 14-quart open pails called dish kettles.
20 10-quart open pails called dish kettles.
30 6-quart open pails called dish kettles.
12 10-quart covered pails.
16 6-quart covered pails.
20 3-quart covered pails.
24 2-quart covered pails.
24 2-quart saucepans.
20 10-quart pans if bottom was pieced.
24 10-quart pans with 12 x 12 tin for bottom.
36 6-quart pans.
48 2-quart pans.
48 3-pint basins.
72 1-pint basins.
20 large strainers.
24 small strainers.
16 1-gallon coffee pots. (Not sure about this.)
20 3-quart coffee pots.
80 large candle molds.
100 small candle molds.
20 punched lanterns.
8 square glass lanterns.
Elbows 50 cents a dozen.
Dripping pans 50 cents a dozen.
Boilers 50 cents a dozen.

We made everything with pit bottoms and out of 10 x 14 tin and straightened out our No. 7 wire. I have had 50 cents and 37½ cents each for tea kettles made with raised breast and cover. I have known the price of piece work to be at the rate of 67½ cents, about a day's work, and I have had 88 cents. The above is not complete, but some of the old boys will recognize it, and I should like to hear from some of them.

Employers' Association of Roofers and Sheet Metal Workers.

A call has been issued by President George Hayes and is being sent out by Secretary James R. McAfee for a meeting of the Employers' Association of Roofers and Sheet Metal Workers of Greater New York and adjacent cities, to be held at the rooms of the Building Trades Club in the Townsend Building, Twenty-fifth street and Broadway, on Friday evening, February 18, at 8 o'clock. It is expected that at this meeting the reorganization will be completed and the members will sign the roll and consummate their membership. Among the other business that will come up will be the election of a second vice-president and action on the report of the Committee on Constitution and By-laws. The nomination of the Executive Committee will be confirmed, and the articles of incorporation will be received. A full attendance of all who are interested in these trades is invited.

FLASHINGS.

The regular monthly meeting of the Iron and Steel Sheet Manufacturers' Association was held in the Conestoga Building, Pittsburgh, Pa., on Tuesday, February 8, with President J. G. Battelle of Piqua, Ohio, in the chair. There was quite a large representation, but nothing but routine business was transacted. The manufacturers referred to the present demand for Black Sheet as being quite heavy for the season and larger than for many years. Indications point to an exceptionally large volume of business in the next two or three months.

The Cleveland (Ohio) Union of Tin, Sheet Iron and Cornice Workers at a meeting last week voted to make a demand for a uniform scale of wages this spring. At present there is said to be no uniform scale of wages for these trades in force in Cleveland. Wages are at a rate of from 20 to 35 cents an hour on an eight-hour day basis. The eight-hour day is said, however, not to be very well maintained. The men have decided to demand that on the first Monday in April a uniform scale of wages shall go into effect in the city, with a minimum of 25 cents an hour, on an eight-hour day, and that for work overtime double pay be received.

Nimmo & Keech have succeeded to the business of W. C. Nimmo & Co., 32 South Calvert street, Baltimore, Md. The new firm are devoting their attention to Tin Plates, Roofers' and Tinsmiths' Supplies generally, and are now carrying a full lines of these goods.

The next meeting of the Western Foundrymen's Association will be held at the Great Northern Hotel, Chicago, at 7.30 p.m., Wednesday, February 16. A paper on "Mechanical Changes in Mixtures of Cast Iron," by Eugene W. Smith, will be presented. The paper read at the last meeting by Major Malcolm McDowell on "The Value of Metalloids in Cast Iron" created such interest that its further discussion was desired, and it will again come before this meeting.

Lucius Hart, for many years engaged in the metal business at Burling Slip, New York City, succeeding to the business established by his father, died suddenly on February 6, at the Hotel Vendome, New York.

HEATING AND PLUMBING.

A UNIFORM METHOD OF FIGURING.

When two men are figuring up the estimate of cost for doing a given piece of work it is not natural to suppose that one man can do it for one-third less than the other. Such a discrepancy in their figures is due rather to a lack of uniformity in the methods of figuring or a neglect on the part of the person who is making the figures to include all in his estimate that belongs there. A valuable lesson can be learned from the methods of computing cost adopted by the National Association of Stove Manufacturers. All who are members of the association calculate their cost in the same way on forms that have been decided by the association to be best adapted for the purpose. In some States also a well organized movement among the master plumbers has been made to secure a uniform method of figuring on plumbing contracts. The report from plumbers in those States is that their customers are securing a better class of work, a higher class of materials and the cost is not materially increased, while the plumber is receiving a profit on his work where heretofore it has been difficult to make both ends meet at the end of the year. It has been noticed by the trade that where these methods are in existence the plumbers are more prompt in meeting their bills.

Each year a number of new men enter into the various lines of trade, and many of them have had little previous training in mercantile business. They are equipped for the venture only with the practical information which they have gained in an apprenticeship of several years and in working as journeymen. The impression has existed in the minds of those who are already established in the trade that they were not called upon to educate these men in business methods, and as a result the trade generally has suffered from the new men making prices lower than they could really afford owing to their inexperience. It would seem to follow, therefore, that those tradesmen who work in unison, who work through builders' exchanges or other trade organizations should, as a matter of protection to themselves, bring to the notice of these new men the systems of figuring and the items of expense in carrying on business which they have found must be included in all the calculations of cost to make the business successful. If this is done the erratic methods of arriving at cost which contribute so much to the demoralization of trade would gradually be supplanted by better business methods, and when the prices are profitable the tradesman can afford to do for his customer a better class of work, and all interested would be benefited, from the manufacturer who sells the goods to the owner who finally uses them in his property.

Piping Old Houses for Acetylene Gas.

Since the discovery of acetylene a number of manufacturing companies in different cities and towns throughout the country have put apparatus for the generation of this gas on the market. These machines have been most popular in suburban and country districts where no artificial gas supply is available. In these places many of the houses, stores and other buildings have not been piped for gas, and the problem which confronts the suburban plumber and gas fitter is the piping of such houses without disfiguring them or making too much trouble for customers. It is necessary to pipe the house thoroughly without cutting the plaster. In many instances the walls are papered, and if the plaster were cut through it would be impossible to match the paper, or if the paper could be matched the difference in the color would disfigure the wall. In some cases sales have been lost from the fact that the labor of moving furniture and taking up carpets has been looked upon as too great, and that the advantage from the acetylene gas light would not be sufficient to pay for the trouble. To avoid cutting the plaster in the side walls some gas fitters have run polished brass pipes up from the floor to the point where a side light was necessary. In piping these old houses there is room for a considerable amount of skill to be displayed by the gas fitter in reaching the desired points without inconvenience to the householder.

This new demand for gas piping in old houses is, in fact, only a renewal of the problem that is met with in the introduction of gas from street mains in old towns. In many instances there has been no attempt to hide the gas pipes, and little attention has been paid to making their appearance pleasing. If exposed piping is used there is no reason why its appearance should not be pleasing to the eye. Brass pipe and fittings can be used, and having a high finish will be in keeping with the other furnishings even if their being in open sight may seem strange at first. It is claimed that the piping need not be so large in size for acetylene gas, which will be in its favor where it must be exposed.

English Practice in the Warming and Ventilation of Technical and Art Schools. *

BY D. M. NESBITT, LONDON, ENGLAND.

All will agree as to the positive necessity of thoroughly grappling with this question. It is not enough to have an inlet here and an outlet there and trust to natural ventilation. The authorities are now becoming alive to the fact that they can ask (and expect to obtain) that a definite temperature be maintained and that a certain volume of air shall be propelled into and out of the various rooms.

In the chemical department of science schools not only the vitiation of the air from the congregation of many people in one room, but also the noxious smells caused by the various experiments, have to be taken care of.

The system which best fulfills the requirements is a mechanical one, and is a combination of the plenum and vacuum systems. The whole of the fresh air required for the building is preferably taken from four sides of an independent tower, so that whichever way the wind is blowing the effect of the wind shall be the same; also, air taken in at such a point is less liable to contamination.

It is often difficult, however, to separate the air inlet from the main building; it may then be treated as an offset from a main wall, with openings in three sides, or again, a tower may be put up in connection with a lower part of the building and the air drawn down it. A very excellent air inlet was found in connection with an apparatus erected by Mr. Sylvester years ago at the Mickleover County Asylum, and which apparatus has since been turned into a mechanical system with very marked success. On the top of a tower, say 30 feet high, a cowl is fixed which moves round so that its mouth always faces the wind.

The fresh air on being drawn down the intake enters a large chamber, the sectional area of which should be at least three times greater than the area of the inlet shaft. The object of thus opening out the space is to form a settling chamber for the particles of dust in the air, and also to obtain a large area of filtering material. Across this chamber the screen is fixed, which is formed of a rough open material, cocoa fiber, or jute. In connection with the screen a long brush is fixed, which is balanced and fitted with two handles, so that it can be readily drawn up and down the filtering material. The use of this brush is twofold: 1, By drawing it up and down a few times the dust particles are brushed off the screen; 2, the water is made to spread equally over all the

* This paper was prepared by Frank Ashwell, late partner of Mr. Nesbitt, by whom it has been revised and edited and supplemented with explanatory notes. The paper was read at the New York meeting of the American Society of Heating and Ventilating Engineers, Jan. 25-27, 1898.

filtering surface. Patents have recently been taken out for moving the brush very slowly up and down the screen by power, and also for very slowly revolving the filtering material, as the same time passing it through a bath of water, which, for some purposes, may be conveniently charged with a solution of disinfecting material. A supply of water is provided for the screen from an automatic flushing tank, which can be regulated to discharge its contents at stated periods as found necessary, according to the weather. In dry, dusty weather the screen is always kept damp. Easy access is arranged to both sides of the screen. Care is taken in arranging to take away the waste water that there is no connection with the drainage system. The fan is fixed on a wall parallel with the screen. It is thus equally fed with air, and, as a consequence, runs with less power and less vibration or noise. As to the mode of driving the fan, by far the greater number of fans are driven by gas engines, and they are, no doubt, economical and convenient, but they cannot be said to be the ideal means of driving fans for the plenum system, for three reasons: 1, Irregular running; 2, nuisance from smell, and 3, noise.

The third is a serious difficulty, as unless great care is taken there is sure to be some noise. The fan is always driven on the delivery side, so that the pressure of air through the belt race will be into the gas engine room, whereas, if driven on the suction side, the smell would be drawn in by the fan.

In some technical schools a steam engine is required for experimental or other purposes, and high pressure steam has to be carried on the boiler; in that case all the exhaust steam from the engines can be used in the winter time for warming the building. But the ideal driver for a fan is the electric motor, which is coming more and more into use; it is perfectly regular, under immediate control, the regulation of the speed being simple within certain and sufficient limits; perfectly noiseless and free from smell, and though not so economical as the steam or gas engine is, for the small power required and advantages in other ways, an economical machine.

The question of electric lighting and the power for same in large institutions is very cloely allied to the warming and ventilating question, as in cases where the light is generated on the spot the whole building may be warmed and supplied with hot water with the exhaust from the engines. This is being most effectively done, especially for asylums and large kindred buildings.

Low pressure steam for buildings of such a size as technical schools has established its claim as the simplest and most economical means of getting the necessary heat. A boiler or boilers, according to the size of the building, is fixed preferably 6 to 8 feet below the level of the fan chamber. If it is possible to put the boiler down at the level above indicated a "gravity return" arrangement of pipes to the different batteries hereinafter mentioned may be secured. On this plan all the water of condensation from the batteries and pipes will automatically return to the boiler, and little or no waste of water will result. It is often impossible, owing to the nature of the ground, or the position of drains, to put the boiler house down to so low a level as has been indicated; in that case a very efficient and reliable mode of returning the water of condensation may be used, viz.: In the engine or motor room, 2 feet below the level of main trunk, is fixed an automatic return water pumping apparatus consisting of a steam tight vessel, called the "receiver," 5 feet long, 2 feet in diameter, to which is attached a small duplex pump. The return pipe from the heating system is connected to the top of the receiver; the pump draws the hot water from the receiver, forcing it into the boiler, so that no water whatever is wasted. Within the receiver is a float which is in communication with the steam supply to the pump. As the water rises or falls in the receiver the steam to the pump is turned on or off, the water in the receiver being thus automatically returned to the boiler. The pump can be operated either by steam from the boiler or by a belt from the power shaft.

From the delivery side of the fan a main trunk is formed in fair brick work with struck joints, so as to catch as little dust as possible, the trunk being not less than 6 feet to 6 feet 6 inches high, and in width proportionate to the amount of air to be passed. There are no projections to impede the current of air, and all corners are rounded. It is preferable to arrange for the fan to deliver the air in a straight line under the building, or it is often convenient for the trunk to make a circuit around the building. Chambers formed in brick work are taken off the main trunk to receive the heating surface, from which vertical flues ascend in the walls to the various rooms. These vertical flues are formed in the brick work and are made as smooth as possible. It is an admirable plan to build them in glazed brick work so as to reduce friction to a minimum and prevent any possibility of dust accumulation, though the possibility of retaining any dust in a vertical flue is not great, yet too great care cannot be taken to keep everything in the plenum side of the apparatus clean and sweet, as it represents the lungs of the whole building. The trunk should also be lighted.

From a stop valve on the boiler a pipe is carried into the main trunk and run the whole length or circuit, as the case may be, gradually getting smaller as the branches are taken off to the various batteries; the pipe is run at the highest level and arranged with fixed points for draining the condensed water into the return, and also, where necessary, provision is made to take up the expansion. The main return pipe is run in much the same way, gradually getting larger as it approaches the boiler and as branches come into it from the batteries. This pipe is run as close to the floor as convenient, and is connected up to a non-return valve in the boiler or to a connection on the receiver before mentioned.

It will have been noticed that no warming of the air has been done up to this point except that which is due to the main steam and return pipes. All the warming is done in chambers directly under the vertical flues rising to the various rooms.

It may be well to point out here that the principle of this system is very different to that of warming the air at a central battery near the fan and blowing the air along small ducts as a high speed, or even of that where the air is moved at a slow speed in large trunks, but partially warmed at a central battery and extra warming and control of temperature done by small batteries at the base of the vertical flues. The nearer the heating surface can be placed to the space to be warmed the better and more economical results in coal consumption will accrue.

Owing to the necessity of having such large trunks to allow access for cleaning and inspection, and also to pass the necessary quantity of air at a slow speed, the cooling or condensing surface is very great, a strong point against warming the air before it enters the trunk; again, by having the main trunk as the cold air supply any particular room can be cooled in a few minutes and a simple mode of regulating the temperature of any room to the greatest nicety can be employed, as hereinafter explained, without in any way altering the volume of air supplied. Every one is aware of the influence which the position of a room and state of the wind has upon its temperature; the plan of dividing the batteries of heating surface to take groups of rooms gives every opportunity for control of temperature by air mixing, but, more than that, by arranging the batteries with steam valves only so much of the battery as is required to warm the rooms need be filled with steam, and thus fuel may be saved. The battery chamber in which the air is dealt with before it ascends the flues into the various rooms is formed in two chambers, hot and cold, divided by a concrete slab. In the upper part of this chamber the heating surface is fixed, made of hollow cast iron sections with gills cast on. These are bolted together in rows, arranged in such a way that they are readily disconnected and drawn out for cleaning. The several rows are connected together by an arrangement of a header valve, which gives steam to either two or three rows, according to the regulation required. The valve is arranged in such a way that only one connection with the main steam pipe is required at the front end, the water of condensation flowing into the return pipe through the same connection. This is an exceedingly simple and effective fitting and works admirably. An air valve is fixed on each row of sections. The bottom half of the chamber is the cold part. The vertical flues start out of the cold chamber and also have an opening from the hot air chamber. Across the flue at this level a shutter valve is fixed, which either shuts off the warm air, allowing cold air to pass up into the rooms, or shuts off the cold air, allowing all warmed air to pass up the flues. Intermediate positions of the shutter give a mixture of the warm and cold air. By means of this shutter, then, any grade of temperature, within certain limits, can be obtained in any particular room, independent of any other, and this by actuating the one shutter. It is advisable that a damper be fixed at the base of each flue to shut off the air from rooms not in use or to regulate the amount to the various rooms.

For cleaning or repairs access to the chambers can be obtained through doors which are provided. Where a school or building is large enough to require the constant attendance of a caretaker the regulation is put into his hands, telephone connection being made from the various departments to the engine or motor room; but where the school is a small one and the caretaker has other duties which take him away from the apparatus for long periods the regulation of the shutter is effected from the rooms. It has been found from practical experience that the former plan is the most effective, and the best results are obtained from the apparatus. Where the question of expense is not one of grave consideration thermometers fixed in the rooms, but registering the temperature in the main trunk, are used very effectively.

Having fully considered the means of obtaining a supply of air and also the means of warming it and its regulation, the question now comes as to its introduction to the various rooms. The air is introduced 9 feet from the floor, with a maximum velocity of 7 feet per second, 5 feet, however, being preferable. So far as is practicable the air is passed into the rooms on the warm side, the

point of extraction being on the same wall at the floor level. In the case of a long room two inlets are used, one at each corner, with one outlet in the center. The same flue in different parts of its length is used for supply to one story and as a discharge from another above, the two parts being carefully separated. On no account is one flue section used to deliver air into two rooms, but in extreme cases the discharge flues are not so perfectly separated throughout their entire length. The discharge flues are arranged to extract from about the floor level as well as at the ceiling level. A shutter is provided at the ceiling opening which allows the discharge from the top or bottom of the room, or partly from both, but in no case can the opening be shut. The apportioning of the flue areas to each room is based on the air supply required for the maximum number of occupants and their work. The apportioning of the flue areas to each room is based on the air supply required for the maximum number of occupants and their work. For reasons of policy, rather than to satisfy hygienic requirements, the amount of air per occupant is fixed at not less than 1500 cubic feet per hour per occupant for lecture theatres, art school rooms, mechanics' shops, &c.; for chemical laboratories, 3000, and organic chemical laboratories, 4000, if possible. The flue areas are computed for an air flow of from 5 to 7 feet per second.

As far as possible it is considered advisable to conduct the extraction flues from the point where they terminate in the roof to a central tower of such a hight that its action shall not be dominated by any other building. Care is taken that the sum of the areas of the outlet openings on two sides of the tower equals the area of the cross section of the shaft. In cases where it is not possible to get a high extraction tower, or where a considerable length of horizontal trunking is necessary in roof, back flaps of a light material are fixed so as to avoid all possibility of back draft by reason of temporary or excessive wind action, or the disturbance of the system's action by the stopping of the fan, opening of windows, &c.

On no account whatever is connection permitted between the extraction from the chemical department and the general extraction from the rest of the school. The great aim in designing the extraction from this department is to prevent the possibility of smell and fumes getting into the other departments of the school. The following plan has proved perfectly satisfactory: At a convenient position in the roof space a chamber of brick or wood, well tarred, is formed. A fan, say 24 to 30 inches in diameter, according to the amount of air and fumes to be extracted, is fixed with a vertical or horizontal shaft, as is most convenient structurally, the air extracted by the fan being blown into the outer air through a dormer or tower. The fan is, as far as possible, constructed of copper and driven by an electric motor placed outside the chamber on the suction side. The means of starting and stopping the fan is operated from the room of the head of the chemical department. All extraction flues from the chemical department are carried into the fan chamber above mentioned. The areas of the openings from the chemical rooms are in excess of the areas of the inlet flues from the plenum system, so that by proportioning the flues this way there will be a slight pull into the room when a door is opened, which would not be the case without the fan and if the extraction flues were of equal area. A good rule is to proportion the extraction flues through the draft closets and tables, so that their combined area will equal the combined area of the inlet flues from the plenum, and to provide, besides, extraction flues in the walls whose combined area is equal to half the area of the inlet flues. Thus, in the event of some of the draft closets being closed, an increase of extraction area over inlet will still be maintained. In the chemical department it is wise to arrange for the ordinary extraction (as in the cases of other departments) for top and bottom extraction, and, besides, fit each extraction opening with a shutter to regulate or wholly close it if desired. If one large extraction flue can be arranged to take the benches, draft closets, and deal with the ordinary ventilation as well, an excellent result is obtained, a direct opening into the flue from the top and bottom of a room being made, which should be fitted with a valve for regulation. As it is necessary to run flues from the tables, which are in the center of the room, the floor is made deep enough to take a main extraction trunk formed of glazed earthenware trough covered with glass into which the small flues from the tables and draft closets run at an angle in the direction of the air current; this main trunk may be graduated according to the number and size of flues taken into it. Its area, however, due to being horizontal, is in excess of the sum of all the small flues. In some cases it is convenient, instend of running this main trunk under the floor and up the wall in one vertical flue, to divide it into two or more, one down each side of the room and running up the wall in two flues. These vertical flues are of earthenware, the square section used being more convenient for constructional purposes than a round one. The vertical flues on reaching the roof are carried into the fan chamber before mentioned, care being taken that the areas are not reduced at any point. The ordinary extraction from the room is taken up directly to the roof and connected to the fan chamber.

There are several arrangements for draft closets, those at the Medical School, Leeds, Leigh Technical School, and the Rutherford College, Newcastle-on-Tyne, all being good. The arrangement at the Massachusetts Institute of Technology, in Boston, however, commends itself as being admirable and to thoroughly meet all requirements. The following is a description of the arrangement by Professor Woodridge: "Within the hood is an inclined diaphragm of such width and placing as to leave a slot 3 inches wide along the whole front of the hood. Its location and inclination serve to protect the hood contents from injury by the falling of *débris* from the flue. The hood sash is prevented by stops from being raised beyond a fixed point, such that its lower edge shall be, according to the hight and temperature of the hood, from 4 to 8 inches below the outer edge of the diaphragm. The space between the glass of the sash and the face of the hood is cut off from the hood space by raised sash, so preventing escape into the room of gases, &c., by that means. The use of the diaphragm is apparent in extending and equalizing the current along the entire length of the hood. The direction of inclination given to it and the front location of the slot may not, however, be so apparently reasonable. The aim in the latter arrangement is to concentrate the discharge current along the line of most natural escape of warmed gases from the hood into the room, since all gases to escape must pass this line, which would not be true of a similar slot at the rear of the hood. The inclination given to the diaphragm is slightly upward from rear to front, that the initial upward movement may not be completely and abruptly broken, so forming a deep stratum of fumes which might then escape at the lower part, because beyond the reach of the effective action of the discharge current, or else might cool and settle or be forced down along the rear walls at a point remote from the heating burner, and so escape."

The warming of entrance hall, corridors and lavatories is done by direct radiation, fed by a steam main separate from the main which serves the batteries, as it is convenient and advisable when the school is not occupied to keep the place aired and free from freezing of the pipes in the lavatories.

In the case of board schools the question of warming

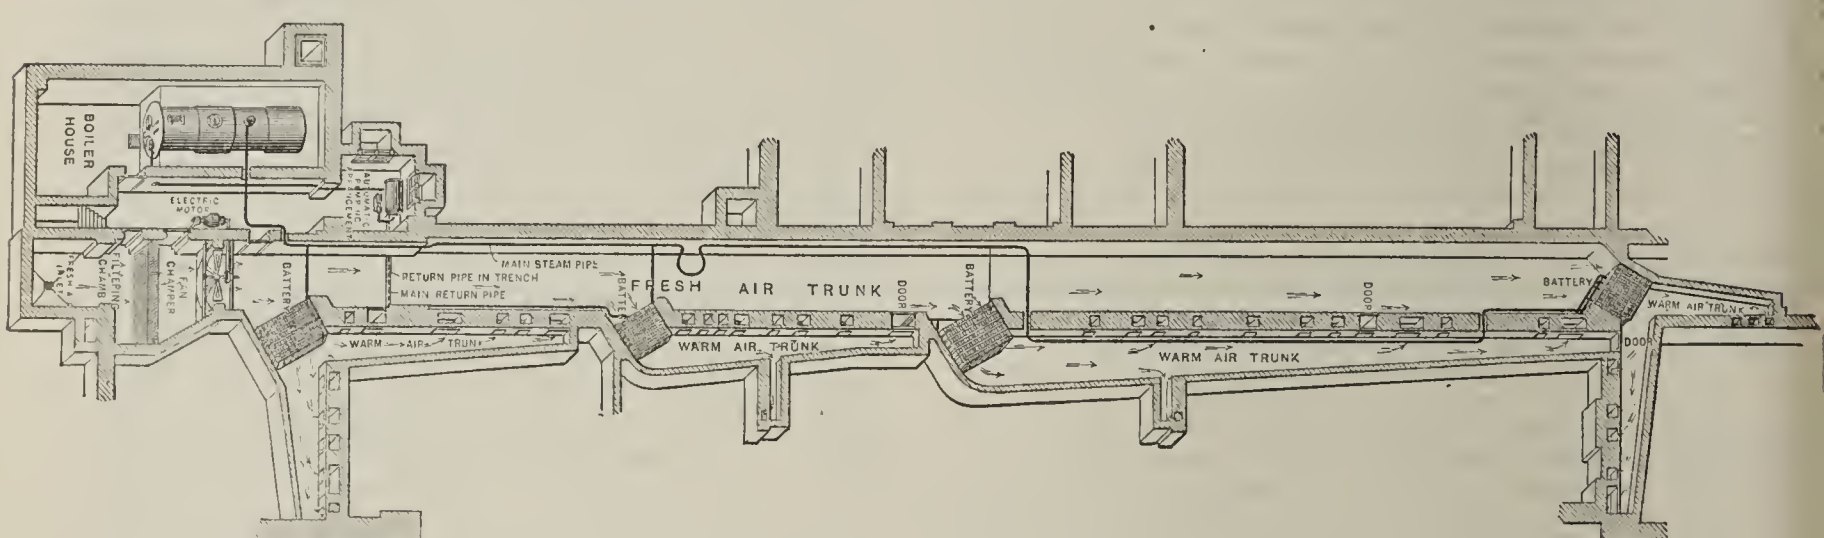

FIG. I.—ISOMETRICAL PLAN VIEW OF BASEMENT OF LEICESTER TECHNICAL SCHOOL, SHOWING POSITIONS OF BOILER, PUMP, FAN, BATTERIES, FLUES, ETC.

and ventilating the assembly halls is one that needs special treatment and may be incidentally mentioned here. Owing to the large cubic space for the number of children, except when used for assembling, some direct radiation is placed in the room. In this way the room may be warmed without the aid of the fan and without displacing the large amount of cool air with warmed air from the plenum, a feature of great convenience, it then being possible to warm the room for Sunday or other purposes, when it is inconvenient to run the plenum system. The radiators are supplied with air from the plenum, so that even when the fan is not running they draw in a fair quantity of air. When the fan is running sufficient air supply is allowed to give each child, say, 1000 cubic feet per hour.

For art schools there is sometimes furnished a conservatory that requires warming, which may be done by hot water circulation, the water being warmed in a heater, within which is a steam coil, the flow and return pipes being taken from the heater in the usual way. As the conservatory usually requires some heat when the main heating apparatus is out of use and the boiler is not required for any other purpose than warming, it is convenient to put in a little separate gas heating boiler for the conservatory.

Having dealt with and described a typical system for warming and ventilating a technical and art school, a few words may be said as to the theory of the methods here adopted. This may especially be the case in view of the somewhat frequent challenging of the reasonableness of one of the methods—viz., the system of downward ventilation—and the confusion of ideas, if not ignornace of the facts, which have in some instances marked the discussion of this part of the subject. Experience and careful observation have made clear the fact that the amount of air required in schools and other crowded rooms to keep the atmosphere reasonably pure must be determined by the number of persons to whom the air is supplied, and that the maximum seating capacity must be the basis. This is the only sound scientific ground from which to start, for it will support all cases, from those in which a large gathering of people is the only source to be allowed for to one where the number of persons present bears only a small proportion to the special causes of impurity. Let us take as an example a class room 26 x 25 x 15 feet, holding 60 pupils. To calculate the amount of air required it is necessary to know how much air each pupil will vitiate, and fix on a standard of purity. For all practical purposes the amount of CO_2 (carbon dioxide) is sufficient as a test of the purity or impurity of the air of a room, as the organic matter and micro organisms in the ordinary case follow the amount of CO_2.

In a town, from which source the air supply for the school has to be obtained, the amount of CO_2 contained is four parts in 10,000. An adult in health emits 6 cubic feet of CO_2 per hour; this is equal to six parts in 10,000, making, with the four parts contained in the fresh air, ten parts in 10,000. The question now comes as to how much fresh air is required to dilute the above to bring it down to contain such an amount of CO_2, &c., as will make it healthy to breathe.

Dr. Parkes places the standard of purity at six parts in 10,000, 4000 cubic feet of air per occupant per hour being required to bring it to this standard. It is generally accepted, however, that if the standard of purity can be maintained at seven or eight parts of CO_2 in 10,000 a satisfactory result is obtained. To obtain this result about 2000 cubic feet per occupant per hour must be allowed. The room above mentioned contains 10,000 cubic feet; therefore, taking the amount of air per occupant at 2000 $\times$ 60, then 120,000 cubic feet is the amount of fresh air required per hour to keep the room comparatively sweet; thus a total change of air of the room is required 12 times in the hour. If only 30 students occupied the room the change would then be six times per hour, but in all cases the calculations should be made and the size of flues fixed for the largest number of occupants likely to use the room. The area of inlet and outlet flues to give the above results would require, allowing a velocity of air travel of 6 feet per second, just over 6 square feet for 60 students, and if for only 30 students, 3 square feet. Now the question to be solved is as to how this large amount of air is to be introduced and withdrawn without unpleasant drafts, so as to give the best diffusion, and this brings us to the question of the position of the air inlet and outlet. The movement of air through a room for the purpose of ventilation should be in one mass and of uniformity in direction and in velocity. If the incoming air can be given such movement the vitiation will keep increasing from the inlet to the outlet, the quantity of vitiated air in the room will be reduced to a minimum and also the time of its retention and the limit of space occupied by it.

In the case of the top entrance of the warm air at 8 to 9 feet high, the action fulfills all the points laid down in the last paragraph. The air in entering rises to the ceiling, diffusing as it approaches the cooler outside wall and window; it then begins to descend slowly and uniformly to the floor and is drawn off by the extraction flue at the floor level. Again, the warm air has by this means of introduction an opportunity of losing some of its heat by contact with the cooler walls and windows before it is inhaled, instead of being breathed at its highest temperature. Again, the warm fresh air admitted above the heads of the occupants is made to circulate throughout the room before it reaches the outlet; there is a constant movement and mixing of the air, a perfect diffusion, and the fresh warm air is brought to the face to be breathed before it sweeps the body. It will thus be seen how important it is, if the best results are to be obtained, that the inlets and outlets should be properly located. In laying down a rule as to the positions of the inlet and outlet in technical schools, as in every other building, all the special conditions must be taken into account, and there are cases, no doubt, where the inlet and outlet may require to be placed in positions other than those indicated. This especially applies in cases where gas is used and special vitiation other than that from the occupants takes place. Now that gas is being so universally displaced by electric light in technical schools, special provision for the vitiation from gas need hardly be considered.

The plenum system has many points of advantage when compared with others in which the heating surface is placed within the rooms to be warmed, and in which the fresh air is introduced directly into the rooms, or through the heating surface. They may be summarized as follows:

1. No heating surface in the rooms; therefore no useful space occupied.

2. With direct radiation, if sufficient heating surface for the coldest weather is fixed in the rooms, then in moderate weather the rooms are overheated, whereas with the plenum system at least three grades of temperature can be secured in the arrangement of the heating surface without any complication, besides which the air mixing is another means of control of the temperature.

3. No risk of freezing, which is a frequent cause of trouble with the ventilating or direct-indirect radiator, especially when hot water is used and the air supply has not been shut off during the night.

4. With a careful and intelligent attendant no more fuel is used than with an ordinary heating apparatus.

5. Owing to the air being introduced at one place and there cleansed, the amount of dust is found to be much less with buildings fitted with a plenum system. Experience in buildings where the system has been at work over three years points to the fact that less cleaning and painting is required than with other systems in which the air is introduced all over the building.

6. In summer it has been found that the rooms can be kept cooler with this system, due to the cool walls of the trunk reducing the temperature of the inflowing air.

7. All pipes and heating surface being fixed in the trunk, no cutting about the building is necessary, and in case of repairs they can be readily got at without entering the rooms.

8. The question of first cost is undoubtedly a most important one, and no discussion of the subject would be complete without the matter being mentioned When comparing the cost of two different modes of warming and ventilating the same building great care must be taken to place the two schemes on the same basis as to the purity of air supplied, the quantity, the regularity, the convenience of working, &c. If this is not done the results obtained will be utterly useless and misleading; but whenever this is done and all the circumstances taken into account, the extra cost of the plenum is a very moderate amount. As far as the actual apparatus is concerned, it has been found from estimating certain buildings that the plenum costs considerably less than a radiator scheme on the same basis with equally efficient extraction, but the extra cost of builders' work in forming trunks more than covers this. Surely, however, if it can be proved that the plenum system will do, and is doing, what is claimed for it, the small extra cost is not worthy of consideration. Hardly less important than the character of the instruction which our children and adults receive are the physical conditions under which that work should be done. It is quite unreasonable and unfair to expect the best work from our scholars in rooms in which the air is loaded with impurities, and it is even worse in the case of the teachers. The teachers have to spend their lives in the schoolrooms, the children only a few years. The head master of one of the board schools in Leicester, in which the plenum system is installed, puts the matter very well. He says, in April, 1893: "For keeping the air pure and at a uniform temperature the plenum system of warming and ventilation is most effective. During the past 15 months—the period school has been opened—the absences of teachers from illness have been reduced by one-half. All the teachers testify to the absence of headaches which they formerly felt under the old conditions." When using the term "old conditions" the head master refers to former experience in schools that were not properly ventilated.

Concerning other methods of warming and ventilation, one of which it may be necessary to adopt where the

plenum system cannot be installed, it must be clearly understood they should not be condemned; the great point to aim at is to adopt some definite system which, as far as structural and local considerations will allow, will fulfill the essential requirements.

The foregoing paper on "English Practice in the Warming and Ventilation of Technical and Art Schools" was prepared by my late partner, Frank Ashwell of Leicester, but was never presented before any of the learned societies in this country, owing to Mr. Ashwell's sudden death last December (1896). I do not think Mr. Ashwell claimed anything very original in the paper, and to some of you, who have given much study and thought to the subject of warming and ventilation, it may appear a mere "primer" to such a subject, but in England, where the literature and practical experience in good warming and ventilation are limited, I consider Mr. Ashwell has added much to the existing facts already known in a clear and concise manner, as is shown in this paper.

The paper covers much ground which has already been covered by others, but it is essential to state clear and unmistakable facts when it is borne in mind that it is written for an English audience. I do not pretend to criticise the paper at any great length. I shall leave that for the members to do, and will merely touch upon its salient points, and endeavor to explain our reasons and conclusions for adopting such practice in England. It must be remembered that we in this country have kept to the large air duct system, with low pressure for propelling the air into the buildings. We have tried the forced blast system in one or two asylum buildings, which answer very well, but preference leads me to the former practice where practicable. I mention this here because the paper referred to is written entirely on the assumption of the low pressure system.

Air Filter.—An important feature in a well equipped warming and ventilating installation is a filter for the removal of the impurities contained in the atmosphere of our large towns and cities. Several patents have been taken out for such devices, but to my mind there is still an open field for a good filter arrangement. The most recent one that has been tried in England is composed of "washed coke breeze," over which is passed a stream of water, either continuous or intermittent as desired. Although I have not tried one myself I have heard good accounts of this one. The filter referred to in the paper has been practically abandoned, owing to the cost of working and repairs.

Exhaust Steam.—The utilization of exhaust steam where combined plants are used has been very carefully considered during the past few years, and it is possible to show great economy from such a combination. It is seldom carried out in schools, as the conditions under which the schools work are very different to those in other buildings, but I have often used the exhaust steam from the electric light engines and warmed my large buildings, such as asylums, &c, with it, showing much economy in working.

Lighting of Trunks.—I quite agree with the author that the main air ducts should, whenever practicable, be lighted, and, by preference, with electricity.

Air Supply.—The amount of air which the author gives, 1000 cubic feet per child per hour, will, no doubt, not meet with the approval of many members, but it must not be forgotten that in England we are only beginning to "feel our way" in warming and ventilation, and I trust that when the question becomes more popular and better understood in the British Isles we shall also be able to give our pupils 30 cubic feet of air per minute, as in Massachusetts and other parts of the States, or even more. But cost plays an important part in good warming and ventilation, and when you speak to an architect as requiring an inlet flue 24 x 14 inches (for a classroom for 60 children) and a similar one for exhaust purposes, he gets positively alarmed and begins to tell the poor warming and ventilating engineer that that will never do, as he will not be able to get the school built under the "limit"—viz., £10 per head, or $50. Again, we have to contend with the automatic warming and ventilating engineer, who simply sticks an outlet (so called "air pump") of some hideous design on the apex of the roof and thinks the job complete; the principle is "so simple" and "so very cheap" that many architects gladly adopt this plan, so that they may be allowed a greater sum for ornamentation, or some kind of "bauble" to be fixed on the main *façade*, so that future generations who may be educated at this wonderful "haven of education" may bless him—forsooth, most likely the rising generation will censure him for spending the public funds in such a ruthless fashion and omitting the most essential feature of the school building—viz., its lungs.

Circuit Pipe.—The "circuit pipe" is much used in installations. It is simple to erect, works noiselessly and with no trouble whatever. It is necessary, however, to have the pipes of large diameter. The author of the paper deserves, I think, all the credit that can be given to his memory for the persistent advocacy of the plenum system. No man strove harder than he to obtain a good firm footing for the plenum system in England, and to-day we can see success written in large letters over his name in this particular line. He was too modest to take credit for much of his work, and left it to others to do the "shouting," but one of the finest memorials that can ever be raised to his memory is the installation of the plenum system at the Nottingham Borough Asylum, nearly 12 years ago. There have been installations carried out before this one in England, I know, but never has a system been carried out on such lines as this one, and it is the envy of all medical superintendents who inspect it. Working, as I did, with the late Mr. Ashwell for close on 13 years, I can say that whatever he took in hand to do himself he did conscientiously and well.

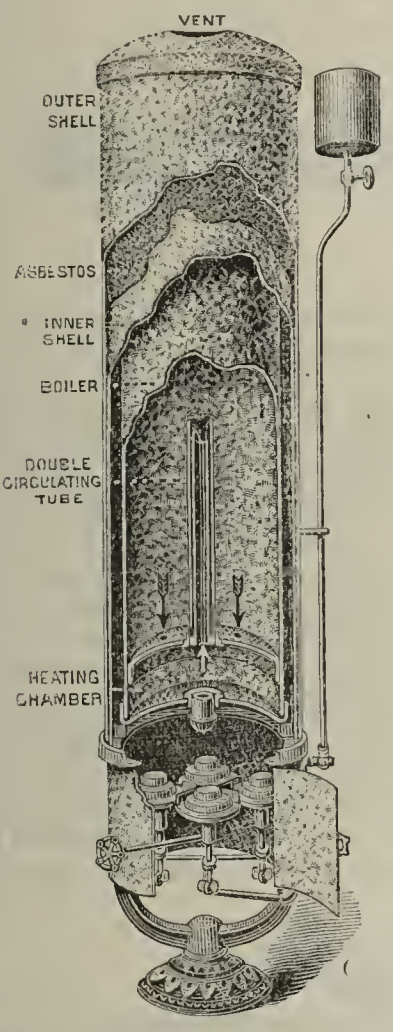
Number of students not determined.

I again have pleasure in making my acquaintance through this paper with many dear old American friends, to all of whom I tender every good wish and Godspeed.

Since the forgoing paper was prepared I have made some tests at the Leicester Technical School, a copy of which, showing the results obtained, is given herewith. In Fig. 1 is presented an isometrical drawing of the basement of the school, showing the position of the boiler, batteries, flues, &c.

The Gorton Boilers for Greenhouses.

The Gorton & Lidgerwood Company, 96 Liberty street, New York City, are receiving very encouraging reports from places where their boilers are used for greenhouse heating. It is customary among greenhouse men in cold weather to visit their heating systems during the night to replenish the fuel and see that the fire is in proper condition to keep up the temperature. The side feed feature of the Gorton boiler obviates this necessity, the fuel being added to the fire through the openings at four different points in the boiler, and there is capacity for the storage of sufficient fuel to run through the night, this being pointed out as a very decided advantage. These side feed pockets are so arranged that the fuel is gradually fed to the fires as in a self feed stove. The fuel being added at four different points, moreover, leaves, it is said, a bright burning fire in the center of the fire pot, so that the benefits of a surface burning construction are secured. By this means whether their boilers are used for steam or water the florist and his men find that it is perfectly safe, even in the coldest weather, to arrange the fire at night so that it will need no attention until morning, and that steam will be kept up for heating the house or water will be heated for circulation so that no risk is taken. A plant where notable success has been secured is in the greenhouse of Robert M. Schultz, at Madison, N. J., where one of their large boilers with a capacity for 2200 square feet of surface is reported to be doing excellent work



A New Master Plumbers' Association in Baltimore.

As the result of a circular sent to the master plumbers in Baltimore, Md., not members of the Master Plumbers' Association, a well attended meeting was held at Grand Army Hall, on East Baltimore street, on Tuesday, February 8, for the purpose of forming a new association for mutual protection and the obtaining of certain rights and privileges which, it is claimed, are withheld from them.

Addresses were made by Wm. McAllister, who called the meeting to order, Davis L. McCahan, John A. Wilson and F. O. Singer, explaining the objects and necessity of concerted action. Arrangements were made to effect a permanent organization with F. O. Singer as temporary president, Chas. Wagner, secretary, and Wm. McAllister, treasurer.

A Gasoline Water Heater.

The success which has attended the introduction of the Iron Clad gas water heater has brought to the Iron Clad Mfg. Company, 24 Cliff street, New York City, many inquiries for the same apparatus to be heated by gasoline. In the accompanying illustration we present a cut of their water heater and boiler arranged for heating by

A Gasoline Water Heater.

means of a gasoline burner. The burner is of the single generator type and made with four burners, so that the entire number or only one burner may be used as desired. The burner is arranged so that it can be swung out from underneath the boiler for lighting or any other attention that may be necessary. In order to provide against the possibility of accidents in filling the tank with gasoline it is so arranged that the tank cannot be filled until it is dropped down from a perpendicular to a horizontal position. This operation shuts off the burners and puts out the fire, so that should any gasoline be spilled there is no danger of a conflagration. This burner has been fully tested by the company, and it is pointed out that there is no difficulty in heating water quickly at a somewhat less cost than it can be done with gas. Boilers arranged with this burner can be furnished in different sizes to meet the requirements of small or large families, and are adapted for being heated with a water back during the season when a fire in the range is used. A new circular is being issued by the house giving full particulars about this device.

The S. W. Owens Heater Mfg. Company succeed the C. R. Meres Mfg. Company, at Norwalk, Ohio. Mr. Owens has purchased all the patent rights for manufacturing the Duplex heaters, and Mr. Meres will continue with the company as the spuerintendent of the factory.

San Francisco Plumbing Ordinance.

A letter dated February 3 from John L. E. Firman, San Francisco, Cal., states : "It is with great pleasure that I have to inform you that our plumbing ordinance regulating the manner of doing plumbing work in this city has been finally passed by the full Board of Supervisors, and has been signed by his Honor the Mayor, and is now law. I have but just now been given authoritative information, which I make haste to forward to you. You will please accept our sincere thanks for the encouragement and aid rendered. You bid us be of good cheer since our cause was worthy, and we trust that we have not been, and never may be, unworthy of your esteemed sanction."

New Orleans Master Plumbers.

The Master Plumbers' Association of New Orleans, La., includes the following houses among its members : J. H. Aitken & Co., A. Aschaffenberg & Co., M. Briedy, M. Birtel, J. D. Burghardt, W. T. Flood, F. J. Gormley, C. C. Hartwell, L. M Leo & Co , L. Luderbach, M. T. Murphy, J. S. Gaiennie & Co., Manion & Co., New Orleans Railway & Mill Supply Company, Limited, J. A. Reynolds, A. J. Thiberge, P. H. Quinlan and J. E White.

The association has now been in existence three years and is working systematically to secure better plumbing in the city. The officers for the year are :

President, L. Luderbach.
Vice President, Martin Manion.
Secretary, C. A. Hartwell.
Financial Secretary, W. T. Flood.
Treasurer, J. E. White.

The association is now endeavoring to secure the enactment of an ordinance to control and regulate plumbing work.

Minnesota State Plumbers.

The annual convention of the Minnesota State Association of Master Plumbers will be held in St. Paul, Minn., at the Capitol Building on February 16 and 17. The headquarters of the delegates will be at the Metropolitan Hotel. Representatives of the Executive Committee of the National Association of Master Plumbers are expected to be present and representatives of the State Association have been sent to Chicago for the purpose of consulting with the National officers, who will be invited. On the 17th a banquet will be given at the Metropolitan Hotel. The arrangements for the convention and banquet are in charge of a committee composed of John Dwyer, chairman, and Messrs. Hudner, Keys, Bailey, Prendergast, Gerber and Black.

The Use of Water Meters.

In Philadelphia, where there is some trouble experienced in obtaining a proper supply of water, an attempt is being made to prevent the waste of water by the use of meters, to which some objection is being made. In commenting on this the *Ledger* makes the following observations : There should be no more opposition to water meters than there is to gas meters, and there would not be if the people were as well accustomed to the one as to the other. Their use is based on the same principle, and while there may be some difference in their application, since water is a necessity while gas is not, this is not enough to invalidate the principle. The use of water meters should be made compulsory and universal. It is true that water must be supplied to some persons who cannot pay for it, but it should be measured in every case and the question of free delivery settled by itself. Measuring the water and paying for it are distinct questions, and need not be dealt with as inseparable. The use of meters is demanded as the only means to stop waste. At least half the water supplied to this city is wasted, and the waste not only costs as much money as the amount used, but it impairs the quality of the whole by withdrawing the water from the reservoirs before it has time to purify itself by subsidence. The introduction of meters would be the quickest way of affording relief in the water difficulty, and while it would not solve the problem it would help to preserve the health and comfort of the people while waiting for a pure water system to be selected and installed.

CANADIAN MASTER PLUMBERS.

The semiannual meeting of the Executive Committee of the National Association of Master Plumbers of the Dominion of Canada was held in Montreal on February 3 and 4. There were present Joseph Wright of Toronto, president; William Smith, vice-president, of London, Ontario; William Mansell, secretary, of Toronto; William Stephenson of Winnipeg, Man.; J. McKindly, Ottawa; Joseph Lamarche and P. J. Carroll, Montreal. Messrs. Borton, Perrier and Doody, representatives of New Brunswick and Nova Scotia, were prevented from attending on account of the great snow storm blocking all the trains. J. W. Hughes, past national secretary, and J W. Harriss, president of the Montreal local, were appointed to represent them at the meeting.

Much regret was expressed at the absence of O. Picard from Quebec and W. M. Briggs, Jr., treasurer, who were both detained by illness. A number of sessions were held at which important business in connection with the welfare of the trade was transacted. A large meeting was held in the rooms of the Builders' Exchange of Montreal, between the Executive Committee and the wholesale dealers and manufacturers. After a discussion of matters of mutual interest a committee of manufacturers and dealers was appointed for conference with the Executive Committee. The supply house representatives were from James Robertson & Co., Thomas Robertson Company, the Gorton-Masson Company, Warden, King & Son and the Steel Clad Bath Company of Toronto, the representatives of the Master Plumbers' Association being Joseph Wright, W. Smith, James McKindly, William Stephenson, Joseph Lamarche, P. J. Carroll, J. W. Hughes and J. W. Harriss. At the joint meeting of these two committees a number of matters were adjusted to the satisfaction of all concerned.

One feature of interest discussed was the amalgamation or affiliation of the Dominion association with the United States association, and also with the master steam fitters of the United States. President Wright will shortly visit Chicago on this important business.

The master plumbers of Montreal entertained their visitors and the wholesale dealers and friends at a banquet held at the Queen's Hotel in the evening. J. W. Harriss, the president of the Montreal local, presided, at his right being Mr. Wright, and at his left Mr. Stephenson. J. W. Hughes was called upon by the president to propose the toast to the visitors and humorously remarked that though he had a fair knowledge of two languages he found it difficult to command sufficient words in both combined in which to welcome them. Mr. Hughes referred also to the pleasant relations existing between the wholesale and retail trade and the value that such gatherings had in advancing sanitary matters. Among the representatives of the wholesale supply firms who were present and spoke were Lieutenant-Colonel Massey, H. R. Ives, W. H. Wall, H. H. Lamontagne, James Robertson, W. Robertson and J. H. Moore of Boston. The banquet, which was a most successful affair and formed a fitting termination to the proceedings, was under the charge of a committee comprising P. C. Ogilvie, F. Hortan, J. Watson, P. J. Carroll, Thomas Moll, Alfred Paquin and L. Lamarche.

H. R. Lincoln of Worcester, Mass., and W. E. Duquet of Boston, Mass., have formed a partnership to carry on a steam and hot water heating business, with office on Vine street, Worcester, Mass.

The Brackin Pipe Wrench.

The Brackin Mfg. Company of Cleveland, Ohio, are placing on the market the Brackin pipe wrench, the construction and operation of which are shown in the accompanying illustrations, of which Fig. 1 is the tool complete and Fig. 2 the four working parts in proper combination, indicating the distribution of strain. As is known, a pipe wrench is frequently used for bending pipe and for other purposes where its strength is severely tested. One of the objects of this invention is to provide a pipe wrench having a stationary jaw with a yoke firmly secured thereto and provided with a movable drop jaw and so constructed that the fulcrum or bearing of the movable jaw will occur at that point of the wrench where the stock is the strongest. The makers in constructing this tool, we are told, have made durability and strength a prime feature. The jaws and pawl are drop forged from tool steel, special attention being given to tempering. The yoke and lever are drop forged from machinery steel. The surface of the lever which comes in contact with the end of the pawl is case hardened, and the fulcrum rivet in the under side of the arched portion of the yoke is tempered. All parts are interchangeable. The stationary jaw, shown in Fig. 2, fits securely on the lever, and as the strain is upward forms a lock joint. In turning a pipe the movement of the pawl is downward, making practically another similar joint. This formation and arrangement of parts relieves the yoke, shown in Fig. 1, of strain. Adjustment is readily made. By means of the pawl thumb piece, shown in Fig. 1, the teeth are disengaged, and the jaw being released can easily be moved in or out. To operate in close quarters or to adjust for a smaller pipe it is only necessary to push on the lever, resting the jaw on the floor or against the pipe, when it adjusts by the ratchet movement. This method shows how easily the wrench can be used with one hand. The object of the pawl thumb piece is merely to disengage the ratchet teeth. It bears no strain, Fig. 2 showing the strain is on the pawl, and not on the disks in the side openings of the yoke. This is said to be demonstrated by taking the four working parts, without yoke and rivets, and placing them on a pipe in proper position, as in cut. The grip is as secure, we are advised, as if the yoke and rivets were in place, the parts remaining intact and turning the pipe. Having a sensitive fulcrum, locking of the wrench upon a pipe is made impossible. It secures a firm grip, will not plane the pipe and releases its hold readily. A sidewise turn of the lever or a light pressure on the end of the jaw will free the wrench from the pipe. Crushing is prevented by the upper end of the movable jaw stopping when it strikes the top of the yoke. The wrenches are made with a bright finish throughout or with parts japanned.

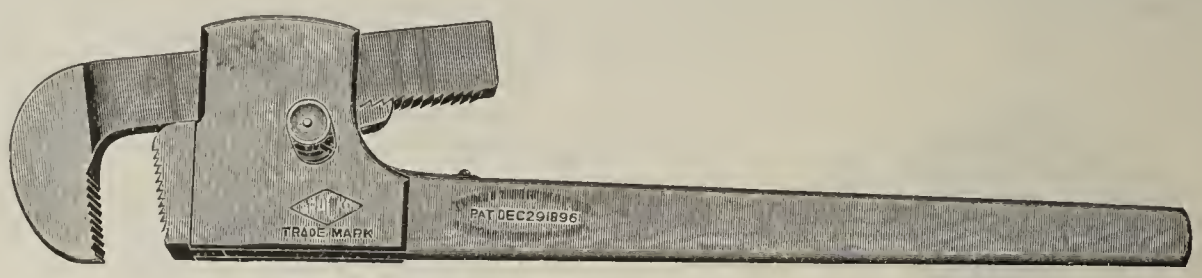


Fig. 1.—Brackin Pipe Wrench.

Fig. 2.—Working Parts.

NOTES.

Bills have been introduced in the Legislature of Massachusetts, one for the appointment of additional boiler inspectors and another for protecting dealers in furnaces against buyers on mortgage.

A protest signed by 38 master plumbers of Rochester, N. Y., has been filed with the authorities at Rochester, N. Y., against the removal of all trench inspectors from the city government. The protest states that the plumbers are well satisfied with the rules established in connection with this department, because it places all plumbers under the same restrictions and all work must be properly performed. They also state that inspection of this class of work is a means of having all underground work performed as it should be.

Increasing business has necessitated that W. A. Case & Son, jobbers of Plumbers' and Engineers' Supplies, at

Buffalo, N. Y., enlarge their plant. They are about to erect on Washington street a building having a frontage of 80 feet and a depth of 115 feet, and five stories in hight. The building will be in direct connection with their store on Main street. The new building is designed for store and office purposes.

The stationery put out by the Judson A. Goodrich Company shows their trade-mark in a bright red in the corner, and the name and address of the company with the words "High Grade Steam Specialties" displayed in clear and distinct type. Those who are in need of Air Valves, Radiator Valves and anything in the Valve line are invited to correspond with the house at 120 Beekman street, New York City.

We have received from the Steel Bath Mfg. Company, corner Wayne and Congress streets, Detroit, Mich., a very handsome circular of their new Duplex Copper Lined Tinned and Planished Bathtub. It is printed on fine paper in three colors, the picture of the tub being in black on a buff ground surrounded with a scroll design. The circular describes the Duplex as a sheet metal bath lined with copper, which is deposited directly on the steel by the electrolytic process. This process is said to be the latest method adopted for coating sheets and tubes with copper. It is further claimed that it is an absolute guarantee as to purity. The electric current acts as a refining agent. The circular points out that by this means a superior bathtub is produced at a very low figure. Correspondence is solicited from those who wish further description and particulars.

Mr. Fuller has sold out his interest in the plumbing business of Rockwell & Fuller, at Sandy Hill, N. Y. The business will be continued by Mr. Rockwell.

Sawyer & Dean, manufacturers of Plumbers' Specialties, Haverhill, Mass., have recently made a large extension to their nickel plating plant.

J. T. Corcoran has taken one of the new stores on High street for his plumbing business at Brockton, Mass.

Patrick Murphy has opened a plumbing and tinsmithing shop on Pitkin street, Burlington, Vt.

W. R. Armstead has purchased the plumbing business of E. Hogan & Co., 417 South Fourth street, Leavenworth Kan.

The Supreme Combination Water Heater Company have been incorporated at Bayonne, N. J., with a capital stock of $50,000 to manufacture Water Heaters. The incorporators are John H. Coe of Paterson and William H. Vreeland and Frank H. Hobbs of Bayonne.

C. A. Jaynes, who is well known in the Steam Supply trade in New York City, is now representing Stanley G. Flagg & Co. of Philadelphia, Pa., with an office in the St. Paul Building in this city.

Erwin W. Newhard has bought the plumbing business of John Hanes, 21 South Sixth street, Allentown, Pa. He has taken John Seagreaves as a partner, and the new firm will be known as Erwin W. Newhard & Co.

The Illinois Malleable Iron Company, manufacturers of Plumbers' Supplies, Chicago, whose works are on Diversey avenue and the Chicago & Northwestern Railway, suffered some damage from fire on the 3d inst. The roof was ignited by sparks from the cupola, but it was fortunately extinguished before it had gained much headway. The loss was about $1000.

The Kellogg-Mackay-Cameron Company, selling the American Boiler Company's Steam and Hot Water Heaters, 84 Lake street, Chicago, have received plans for heating an office building at Melbourne, Australia, on which the architects desire them to bid The request is for steam and hot water so that a choice can be made.

The L. Wolff Mfg. Company, Chicago, Ill., have bought of Sprague, Smith & Co. for $49,000 the ground and buildings at Carroll avenue and Robey street, on the southwest corner of that intersection. The buildings will be added to the plant of the company in the manufacture of Plumbers' Supplies. The purchase comprises a frontage of 123 feet on Robey street and 125 on Carroll avenue. The building is of brick and stone and is five stories in hight.

The Ruud Mfg. Company of Pittsburgh, manufacturers of the Ruud Instantaneous Water Heater, have removed their offices from 32 and 34 Ohio street, Allegheny, to 214 Wood street, Pittsburgh, where the concern have opened offices and will also keep a full line of Water Heaters of the above type.

Henry B. Francis, Plumbing Inpsector of Camden, N. J., in his address before the convention of the associated health authorities of Gloucester County, at Woodbury, N. J., on "House Drainage and Plumbing from an Inspector's Standpoint," said: "Plumbers should sustain the inspector in his work; but, unfortunately, many of the plumbers attempt to elude the inspector by various subterfuges. All plumbers should be made to pass an examination before a Board of Examiners, composed of the members of the Board of Health, thereby protecting themselves from would be plumbers, who are a menace to the health of any community. A great portion of the malignant diseases in the large cities, where the sewerage systems prevail, are due to improper construction of sanitary arrangements, often because of the ignorance of the plumbers, and in many cases because of neglect or a mistake."

Health Commissioner McShane of Baltimore, Md., after conferring with a committee from the Master Plumbers' Association, has placed in the hands of Mayor Malster a revised plumbing ordinance which he asked to have adopted as soon as possible. The Commissioner says: "We have improved and rearranged the regulations in connection with the Master Plumbers' Association in order to provide scientific and modern sanitary plumbing. Our principal care has been to prevent sewer gas and noxious odors from getting into dwellings from old fashioned drain pipes, and this will be done by a system of traps. Plumbing in old buildings is often deficient in this respect, especially in blocks of houses not conforming to the same level."

John M. Tate has leased one of the new brick store buildings at 320 Third avenue, Pittsburgh, and will use it for his plumbing business.

The Patterson Generator Company of Batavia, N. Y., have sold to the Monroe Furnace Company of Monroe, Mich., the right to manufacture their acetylene gas machines in Michigan. It is said that the company will immediately manufacture 2000 machines, and will push the sale of them in their territory.

The meeting of the Connecticut State Association of Master Steam and Hot Water Fitters will be held in March at a date that has not been finally determined. Those who are interested in this field should file notice of their desire to be present with S. E. Dibble, 639 Grand avenue, New Haven, Conn. All who are engaged in the heating contracting business are invited to attend.

J. Denby, Jr., who is in the plumbing and steam fitting line at Sanford, Maine, will be glad to receive catalogues from manufacturers and jobbers of Plumbers', Tinners' and Steam Fitters' Supplies.

The Metal Worker acknowledges the receipt of an invitation to attend the social evening and smoker given by the Master Plumbers' Association of Newark, N. J., at Achelstetter's Hall, 844 Broad street, on February 16. The committee in charge has procured good talent and music to enliven the occasion.

A letter from Oliver Schlemmer, Cincinnati, Ohio, informs us that the O S Distributing Fittings are included in the specifications of the United States Government for heating barracks. This is looked upon as a specially good recommendation by Mr. Schlemmer. He also reports that when the roughing in season opens up with the plumbers a good business is expected for another of his specialties, the Temple Vent Fitting for house drainage systems.

Stewart & Keerl are a new plumbing firm at 1718 Main street, Marinette, Wis., having purchased the plumbing branch of the business carried on by Watson Bros. & Hitchcock.

The Thomas A. Lane Company of Manchester, N. H., are very much pleased with the result of the test of the heating and ventilating system which they placed in the High School Building in that city. On Monday, February 1, the mercury dropped to 22 degrees below zero during the night, yet when the school assembled at about 8 o'clock in the morning the temperature throughout the building stood at 70 degrees.

The A. R. Bailey Mfg. Company have been incorporated at New York City to deal in Water Stills and Sanitary Specialties. The company have a capital stock of $300,000 The directors are Samuel B. Benn, C. B. Pierce, B. H. Newell and George E. Poulson of 32 Nassau street, New York.

Huey Brothers of Boston Mass., have opened an office in charge of W. J. Sutherland, 127 Worth street, New York, where they are engaged in a heating contracting business, and make a specialty of school house work. They have recently secured the contract for heating two new school houses at New Rochelle, N. Y.

Hull, Camp & Co., 127 Worth street, New York City, report a good business in the Range, Boilers and Expansion Tanks made by W. B. Scaife & Co., Pittsburgh, Pa. They are also carrying a stock of the varied line of Steam Specialties made by the Clarence E. Van Auken Company of Chicago. They are giving special attention to filling orders for Air Valves promptly.

F. A. Wendell, Beverly, Mass., has been awarded the contract for plumbing five stores in the Quimby Building at Boston.

TIN PLATES.

Tin Plate on the Pacific Coast.

The Custom House records show that the amount of foreign tin plate entered for consumption at Pacific Coast ports in 1897 dropped to something over 250,000 boxes. The actual imports last year were 29,945,204 pounds, valued at $715,904, as compared with 37,226,304 pounds in 1896, a falling off of 7,281,100 pounds, or about 67,417 boxes. As the consumption of tin plate on the Pacific Coast in 1896 was considerably below the average, the sharp falling off in 1897—a year of fairly large consumption—from the figures of the previous year, illustrates the fact of the gradual appropriation of the Pacific Coast market by the domestic manufacturers of tin plate, which became so pronounced last year.

Nevertheless, the impression prevails that it will be some time yet before the English product is entirely superseded by the American in that region. Bearing on this subject, the following remarks of a correspondent at San Francisco, Cal., are of interest:

In the article of tin plate, Albion seems to hold the fort despite the brisk competition from the American side, as witness the large importations of the past year. The duty here is a most effectual protection to the American article, as it permits increasingly large quantities to come across the Rocky Mountains, and has been the main cause of the low prices that have prevailed for such a long time. No doubt great inroads will be made on the foreign article. But the tin plate destined for the British Columbia canneries will continue to come to San Francisco from England, and as the salmon pack of the colony is increasing at a great rate our imports from England will always be of considerable volume.

The Tin Plate Consolidation.

The committee which is endeavoring to consolidate the tin plate interests in this country held a meeting in New York last week. The committee of four appointed by President D. D. Reid of the Tin Plate Manufacturers' Association met with representatives of four of the largest New York tin plate merchants. This committee consisted of President D. D. Reid, *ex-offieio*, who also represents the American Tin Plate Company of Elwood, Ind.; R. S. Quay of the Monongahela Tin Plate Company of Pittsburgh, C. A. Robinson of the La Belle Iron Works of Wheeling, W. Va., and Warner Arms of the Falcon Sheet & Tin Plate Company of Niles, Ohio.

It is understood that the meeting was of the utmost importance, especially as far as the merchants are concerned. The working plans of the committee and a proposition were laid before them. This latter, it is reported, was to the effect that if the four concerns represented wished to co-operate with the proposed consolidated company they would be expected to contribute one-third of the expense of the undertaking. A protest was entered on the part of the merchants, but the committee left them to understand that were this proposition not taken advantage of the combination could be formed among the mill owners, regardless of the New York merchants.

As the situation now is, the consolidation may either be formed between the mill owners and these four New York merchants or simply among the mill owners, irrespective of the dealers.

One of the four merchants when seen by a representative of *The Iron Age* stated that a movement similar to the one on foot would doubtless be brought to a successful issue in the near future, but that the plans on which the present committee was working would require considerable modification before they could be operated successfully.

Many in the trade look on the consolidation as far distant and claim as a justification for their belief the fact that some of the mills which are most conspicuous in the movement and which would be most affected by its formation have taken a sufficient amount of orders to employ their mills until July next and are now booking orders to be delivered during the last few months of this year. One of the large mills offered last week to sell upward of 50,000 boxes of tin plate to be delivered at any time between the placing of the order and next December.

The combination if effected will doubtless have a tendency to raise prices, and if an early consolidation were under way these mills would know of it and would not be quite as anxious to book future work as they apparently are.—*The Iron Age.*

SCRAP.

There was a much more cheerful feeling in the metal trade this week. All the metals have improved in tone and prices have developed an upward tendency. Only Tin Plates are left in the rut, out of which no lever seems strong enough to lift them. Uncertainty about the projected consolidation of interets in this line is held responsible for the continued depression in Tin Plate prices and the absence of large buying.

Special Treasury Agent Bunn of Boston, Mass., has recently returned from a trip to the Maine coast, where he went to look up alleged cases of the smuggling of Tin Plate for use in fish canning at Eastport and other places. An English schooner laden with Tin Plate, was seized a few weeks ago, but Mr. Bunn believes it will be the last one under the present conditions, for the inducements to smuggle English Tin Plate into this country have been reduced to a minimum by the production here of Tin Plate of superior quality, which can be sold with profit to the manufacturer at a comparatively small advance over the first cost of the English article. The Maine consumer can now purchase American Tin Plate from New York and Eastern dealers at about $3 per box of 80 pounds, whereas the English article costs about $2.50, without the duty. Thus it is cheaper to buy the American product, which is equally satisfactory with if not better than the foreign. The Tin Plate smuggling industry therefore seems to be a thing of the past in this country.

A firm in Glasgow, Scotland, are about to start a factory for the manufacture of Tin tea chests, or rather tea chests of Terne Plate, with a capacity of about 1,200,000 cases a year. The top and bottom of the chests are of wood, lined with thin metal, and the body is made exclusively of steel coated with a mixture of lead and tin. Ingenious machinery has been devised for turning these chests out in large numbers with the maximum economy of time and labor.

At a recent meeting of the stockholders of the Laughlin Nail Company, Wheeling, W. Va., a resolution was passed to extend the life of the corporation 50 years to 1948.

Joseph Skewis, Sr., lately superintendent of the Buhl Steel Works, Sharon, Pa., has been appointed superintendent of the New Castle Steel & Tin Plate Company's plant, New Castle, Pa.

Local difficulties have caused some trouble among the Sheet and Tin mill operatives at Canal Dover, Ohio, involving a temporary shut down of the mills. Efforts are being made to straighten out the difficulty, which it is expected will soon be adjusted.

We are advised by C. M. Stewart, secretary of the Morewood Company, Gas City, Ind., that a statement recently published to the effect that a bar mill is being added to the company's Tin Plate plant is incorrect. They have had a bar mill in operation for years. Within the last two or three months some rather extensive alterations and improvements have been carried out at the Morewood Works, which probably gave rise to the report.

The trade and navigation returns of Canada, just published, for the fiscal year ended June 30, 1897, show the total value of imports of Tin Plates into the Dominion for the year to have been $918,006, of which $767,280 was received from the United Kingdom and $150,726 from the United States, the last showing an increase over the previous fiscal year of $26,000.

Mrs. Isabella Fitz Randolph Bruce, widow of John M. Bruce, Jr., head of the tin plate and metal house of Bruce & Cook, died at her home in New York City on Wednesday after a long illness, having survived her husband 13 years. Mrs. Bruce had been blind for two years before her death. She leaves a son, the Rev. James M. Bruce of Yonkers, and a married daughter.

THE RETAIL STORE.

Robertson Hardware Company's Store.

The accompanying cuts relate to the Hardware establishment of the Robertson Hardware Company of Fort Dodge, Iowa., and show some of the fixtures, which were furnished by the J. D. Warren Mfg. Company, Chicago, Ill., who are well known as manufacturers of Hardware store fixtures. The main building is 24 x 80 feet, with an L, which gives them 24 x 17½ feet additional space, frontage being thus had on two streets. The company occupy three floors and basement. The first floor is used as their retail salesroom, and the fixtures shown herewith are employed on that floor. Fig. 1 shows a portion of the shelving on the right of the entrance, which extends back to the office, the latter being at the extreme rear of the main portion of the room. In the rear of the wall cases shown in the cut are shelves with drawers, the shelving above the wall cases being the same all the way back. The shelving shown in Fig. 2 is on the opposite side of the room, and extends back to a stairway near the intersection of the L. To the left of this shelving is a wall case, a small portion of which is shown. This wall case extends to the hight of the shelving and contains Nickel Plated and Brass Ware, Family Scales, Lanterns, &c. Traveling ladders on both sides of the room give access to the goods on the upper shelves. Counters are conspicuous by their absence, as two short ones for wrapping are the only ones used. The present method of arrangement is found by the company much better and more convenient than their former plan of having counters on both sides of the store, full length of the shelving.

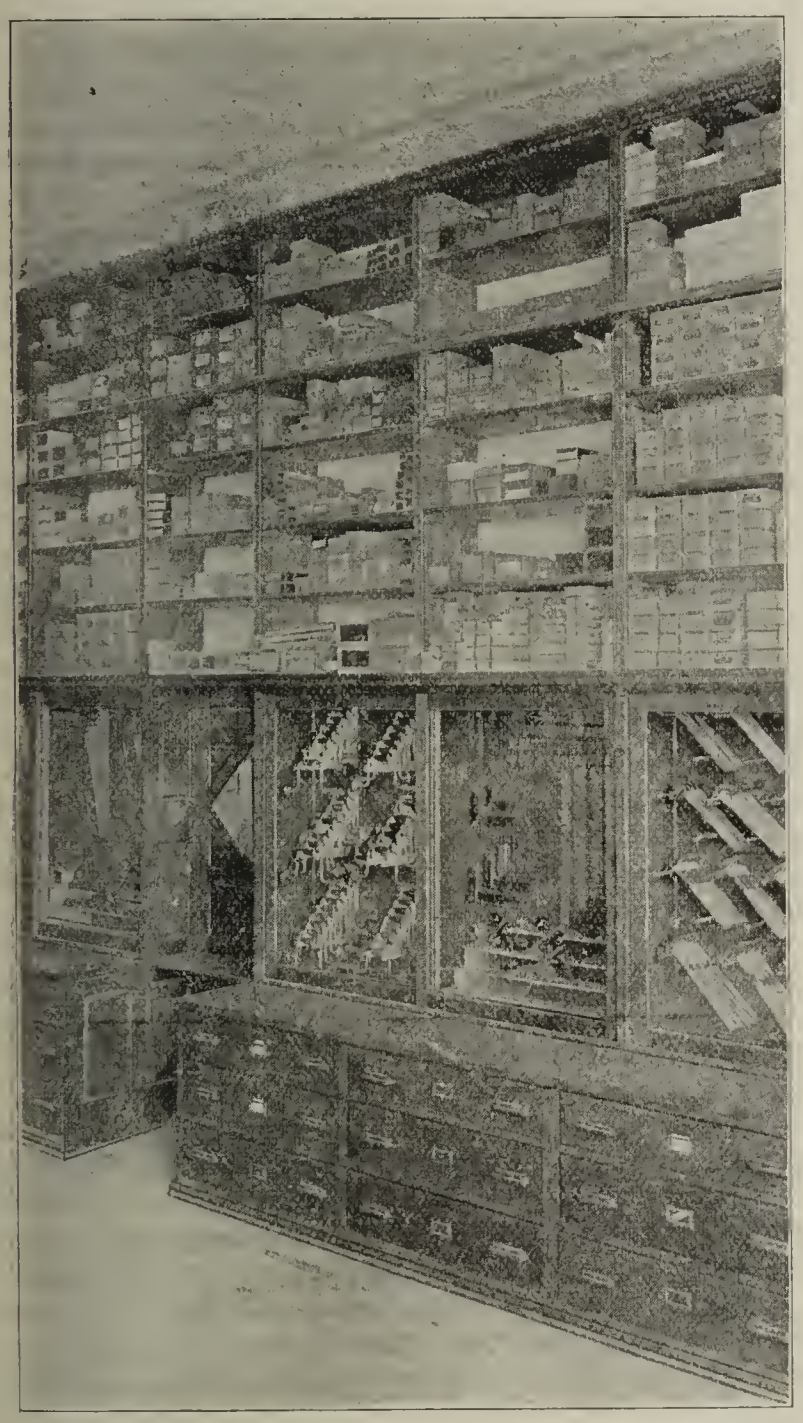

Fig. 1.—Wall Cases and Shelving.

Fig. 2.—Enameled and Tin Ware.

The absence of counters is regarded as giving the store a better appearance, besides supplying a great deal more available space. The company express themselves well pleased with the arrangement and display of the fixtures, and with the improvements are enabled to get along with one clerk less than formerly. The second floor of the establishment is used for the storage of goods in original packages and for wholesale stock generally. This room is fitted up with gallery shelving on three sides, which nearly doubles its capacity. The shelving is used for such light goods as Tin and Enameled Ware, &c. Racks at one end of the room contain Shovels, Spades and Farming Tools. The third floor is occupied by the tin shop, and the stock of Tinners' Trimmings, Tin, Sheet Iron, &c. In the basement are carried Nails, Wooden Ware, Horseshoes, staples and other heavy goods. An elevator runs from the L room in the basement to the third floor. The stock of Stoves is kept in a warehouse located on the railroad.

A catalogue of Lamps and Lanterns, manufactured by George W. Deitz & Co., 243-245 Pearl street, New York City, which is being distributed to the trade, is a pamphlet of 46 pages, and presents illustrations of a great variety of goods made by this concern. At the back of the publication is a price-list of the goods referred to.

THE WISCONSIN RETAIL HARDWARE ASSOCIATION.

The retail Hardware merchants of Wisconsin held their second annual meeting at Milwaukee on the 2d and 3d inst. The names of the new members received since the July meeting are as follows:

C. C. Williams, Waupaca.
Mrs. S. M. Schultz, Medford.
R. W. French & Son, Ashland.
Thos. S. Cunningham, Berlin.
Jenkinson & Fry, Ripon.
Murphy & Kersten, Racine.
A. D. Race, Depere.
Hessell & Lykum, Antigo.
John Sturner, Lowell.
Alfred G. Krovucke, Madison.
Marrott Bros., Baraboo.
A. Schutinsky, Milwaukee.
John Hanegen, Fond du Lac.
Sumner & Morris, Madison.
Krehl & Pick, Madison.

F. W. Marcussen, Platteville.

President John Hughes of Fond du Lac rapped the members to order for the opening session at 3 o'clock. Secretary C. A. Peck of Berlin called the roll of membership for responses, which showed that a very large majority was present.

The first business laid before the association was a communication from the Minnesota Hardware Association suggesting the appointment of delegates to meet similar delegates from Minnesota and North Dakota to organize a Northwestern Hardware Association.

The routine business was taken up, President Hughes opening with some congratulatory remarks on the progress of the association in the past year and the bright prospects for the future. Secretary Peck presented an interesting report of the work done by him, giving statistics of the growth of the association and its business and presenting some facts which showed the practical value of the organization. Very few complaints were received by the secretary against manufacturers and jobbing houses, but all were harmoniously settled.

A committee to nominate officers for the ensuing year was named by the convention as follows: Arthur Heins of Elkhart Lake, D. G. James of Richland Center and Geo. P. Dana of Fond du Lac.

While they were preparing their report Vice-President Andrew Noll of Chilton read the following paper on

The Objects of the Wisconsin Retail Hardware Association.

For the privilege and honor of appearing before you, and for the opportunity of addressing you here to-day, I extend to you my thanks. Probably the most important and certainly the most interesting question with reference to our organization, so frequently asked, not only by the organizers and promoters of this association, but by nearly every Hardwareman of this State, is: "What is the scope and purpose of this association?"

I have oftimes had a desire to be able to answer this question satisfactorily, and as fully and worthily as it deserves to be, yet not until our worthy secretary, Mr. Peck, requested me to prepare a paper upon some subject to be read at this gathering had it entered my mind to discuss with you the aims and purposes of this organization. At first I hesitated, but after some consideration my enthusiasm took complete control of me, for I feel that it is the duty of every member of this association to co-operate and assist each other and to exert their best efforts for the good of our organization.

Article 1, Section 2, of our constitution reads as follows: "The object of this association shall be to promote the interest of and secure the friendly co-operation of Hardware dealers." In other words, our preamble means, as the North Dakota Association expresses it: "To promote the welfare of the retail Hardware trade." Now is this not a large undertaking for about 100 Hardwaremen to promote the welfare of the entire community of over 750 Hardware dealers in this State, and how much easier it would be to accomplish the purposes for which we are banded together if we could by some means secure the good-will and co-operation of each and every dealer within the bounds of this State. With an organization consisting of a vast majority of all the Hardware dealers in this State we would be an organization of importance and strength, and this association, as well as the associations of our sister States, could then pass resolutions in no unmeaning terms and devise ways and means to bring our purposes properly before our jobbers and manufacturers, who thus far have successfully ignored the demands of the Hardware retailer and have preferred the trade of the department store over ours, and I trust that the time will soon come when these jobbers and manufacturers will be obliged to come to us and say: "We make and we sell Hardware, and we want to sell Hardware stores only. Your associations are getting too prominent to be overlooked and disregarded any longer. Come, retailer, join hands with us, and in the future let us all work in harmony to accomplish your great object—namely, to lead the sale of Hardware into its regular channels."

As I have said the first and probably main object of our association is to lead the sale of Hardware into its regular channels, to place it where it properly belongs, and the next important object should be to meet and get acquainted; or, in other words, to create and foster harmony and good-fellowship among the Hardware dealers of this State. The first great obstacle in our way is the existence of the so-called general store in our smaller cities and the department stores in the larger cities; and last, but not least, the manufacturers and jobbers who sell their product and wares to such stores. This, our third meeting, as well as all our other meetings, is not called for pleasure, but for business, and we want all of the Hardwaremen of the State to come here and say: "We are capable of selling the Hardware in our vicinity. We pay our bills as promptly as anybody, and we are willing to mend your old tea kettles, but we want to sell your Hardware as well. We do not need a general or department store in our vicinity, and if we are making too much money let the next man come and start a Hardware store aside of ours, but no general or department store. We do not want manufacturers or jobbers to sell direct to the consumers, and we will not buy a dollar's worth of

Hardware from any jobber or manufacturer who sells his wares to these general or department stores. We denounce the catalogue house with its ruthless advertising as unlegitimate and unfair. We mean what we say, and we want everybody to know it, for we are here for action."

Some of you have no doubt had brought to your attention a circular headed "Reform," sent out by a prominent stove house since our last meeting in July, 1897, and which read as follows: "It is to be hoped that some effective way will be found to remedy the evil which department stores are working. In some States the retail merchants have banded together and agreed with each other that they will not buy of any wholesale concern selling these houses. Not only do these department houses greatly injure the merchants who confine themselves to one legitimate line of goods, often driving them out of business entirely, but they reduce the value of property, the owners of stores being unable to rent them at anything like a fair price. If merchants will confine their purchases to and urge the sales of only such goods as the manufacturers refuse to sell to easy payment department stores and catalogue houses, it will go a long way toward remedying the evils which such department stores now work, and all should do this much in the way of helping. For years this house has refused to sell its goods to this class of houses, and is the only stove manufacturing concern which has hitherto maintained this policy, therefore they deserve the encouragement and cooperation of the exclusive Hardware and stove merchants."

Now our next important object is to create and foster harmony and good fellowship among the dealers of the State. Henry C. Webber of Detroit said to the Hardware Association of Michigan on February 12, 1896: "My first advice is to meet and get acquainted. You will quickly learn that the one or the other is not as bad as you thought he was, and good fellowship will quickly root, and sociability of a business character, and later friendship. Cast off all suspicion, for suspicion is the lie to imagination, not always, but in many instances. If you have cause for grievance get together and settle your differences; it must terminate to mutual benefit, and where is the best place? At your meetings."

This brings me again to one of the points which I have before mentioned. We must devise some plan as the result of which we can get at least three-fourths of the Hardwaremen of the State to come here in order to accomplish anything. If the majority of them do not need or rather do not want such an organization as we now have, let us determine this without delay and adjourn forever to-day, but if they do want an organization of this nature, and the experience and the history of the past justifies me in saying the interest demands an organization of this nature, then they must come here to our meetings. I now believe that the only way to get them together or to join will be to imitate our neighbor association of Minnesota, to engage an officer of this association to go and see every one who is outside of the association to-day and induce him to join us. Pay the officer a fair salary, and thus enable him to do the work properly. The members who come here regularly understand our object fully and appreciate the importance of the work before us, and I have no doubt live up to the rules and regulations of our association, but I say to you in all sincerity that our usefulness and importance depend upon the enrollment on our list of members of at least three-fourths of the dealers in this State. I express the fond hope that we may accomplish our purpose, and that every member of our association will exert the best effort within him to co-operate and assist us in the laudable enterprise.

Election of Officers.

The Committee on Nominations recommended for reelection the entire list of officers, as follows:

President, John Hughes, Fond du Lac.
Vice-President, Andrew Noll, Chilton.
Secretary, C. A. Peck, Berlin.
Treasurer, W. H. Hay, Oshkosh.

Members of Executive Committee, in addition to the foregoing: C. E. Dewey of Kenosha, A. H. Sheldon of Janesville and D. W. Ramsay of Madison.

The committee's report was accepted and the officers were unanimously re-elected.

E. K. Rand of Manitowoc read a paper on Unity Among Dealers, which was followed by a paper by George P. Dana of Fond du Lac on The Retail Hardware Business.

Secretary C. A. Peck of Berlin read a paper on Credits, and, after accepting an invitation from the stove manufacturers and other business men of Milwaukee to attend the Alhambra Theatre, the convention adjourned.

Thursday morning President Hughes called for an expression of opinion relative to instructing the association's delegate to the Northwestern Hardware Conference. He hoped that a strong association could be organized, composed of the retail Hardware merchants of Wisconsin, Minnesota and North Dakota, employing a paid secretary and going in vigorously to correct notorious trade abuses. Secretary Peck said that so far but little complaint had been made in Wisconsin against the operations of catalogue houses, who were particularly active in Minnesota and the Dakotas. The annual dues had been kept low because it had not been thought necessary to employ a secretary's whole time, and perhaps the members of the Wisconsin association would not be willing to raise the dues for that purpose. The discussion closed with no instructions given, leaving the delegate to act upon his own best judgment.

Traveling Salesman Pier, representing the Favorite Stove & Range Company, was called on for remarks, and made an excellent address laudatory of associated movements among merchants.

Department Stores.

A discussion of department store competition was opened by Secretary Peck, who asked the question, What are we doing? While opposed to boycotts, he said that all things being equal, he is in favor of patronizing manufacturers and jobbers who do not sell to department stores. He asked for complaints from members when they found manufacturers and jobbers selling to such stores, and an earnest effort would be made to have such trade stopped.

Mr. Watson of Marinette said that in his opinion department stores had done some good, although they had cost him considerable money, because they had brought the Hardware merchants together. He believed that in the smaller towns in which department stores were operated much benefit could be accomplished by all the Hardware merchants watching the bargains advertised by such stores, and whenever an article in the Hardware line was used as "bait" to immediately put out placards advertising a sale of the same goods at a lower rate. The department store bargain is thus deprived of its drawing power, while customers are attracted into the Hardware stores, where perhaps they can be induced to buy better goods. In his locality the department stores are becoming popularly known as "bait stores," because people are finding out that the advertised bargains are simply being used for bait.

Mr. Miller of Genoa Junction explained his method of fighting department stores and catalogue houses. Being but 65 miles from Chicago, he is obliged to meet this competition continually. He keeps the catalogues of these houses on hand, and whenever he can do so he shows his customers that he can furnish the same goods enumerated in the catalogues at the same price or cheaper. He had always found that he could meet catalogue prices if his customers would buy the grade of goods advertised, and gave instances showing that these prices are often higher than those of the retail merchant. He also made a strong argument in favor of changing the system of selling mowers, binders and other agricultural implements for manufacturers on commission, claiming that they should be bought by a merchant in a regular way and sold at his own price.

On motion of R. C. Murdock of Brodhead the secre-

tary was directed to appoint a member in each county to act gratuitously in soliciting new members.

On motion of C. A. Haertel of Waukesha it was decided to hold a meeting in July at Oshkosh, the date to be fixed by the Executive Committee.

An amendment to the by-laws was introduced by E. K. Rand of Manitowoc, providing for the election of an additional member to the Executive Committee, to be a resident of Milwaukee, the amendment being laid over for final action at the next meeting.

A resolution was adopted thanking the managers of the Republican House for courtesies extended, and the trade and daily papers for their assistance in making the meeting a success.

The convention then adjourned.

The Utility Steel Basket.

In the accompanying illustration we show the Utility steel basket which is being put on the market by the Kieckhefer Brothers Company, Milwaukee, Wis. The basket is made in two sizes, to hold one bushel and one bushel and a half. It is made of refined smooth steel, and is furnished either japanned or galvanized. It is pointed out that it is strong and water tight and is said to be everlasting. It is adapted for measuring or handling grain, vegetables or coal, for feeding stock or for carrying water.

The Utility Steel Basket.

Catalogues Wanted.

The branch house at Savannah, Ga., of Charles A. Conklin & Co., Atlanta, manufacturers and dealers in metals, stoves and house furnishing goods, was destroyed by fire February 6. Messrs. Conklin & Co. write us that they would appreciate receiving catalogues and price-lists from manufacturers of hardware, tinware and house furnishing goods, forwarded by mail.

MEMORANDA.

The Rochester Stamping Works, Rochester, N. Y. were specially represented by D. A. Lewis at the second annual meeting of the Wisconsin Retail Hardware Association, held at Milwaukee on February 2 and 3. The concern prepared an attractive exhibit in a parlor of the Republican House, where samples were shown of Rochester Silver Nickeled Ware, comprising Tea Pots, Coffee Pots, Tea Kettles, Baking Dishes, Chafing Dishes, Water Pails, Pitchers, Wash Boilers, &c. This ware is made of heavy sheet metal, copper or steel, brilliantly nickeled.

The Canadian trade returns for the fiscal year ended June 30, 1897, just published, show imports of Stamped, Japanned, Galvanized and Enameled Ware into the Dominion from the United States during the year to have been of the value of $65,058. Tinware of the value of $66,951 was also imported from this country in the same period.

The W. H. Sweeney Mfg. Company, Brooklyn, N. Y., made an interesting exhibit of their goods at the Republican Hotel, Milwaukee, Wis., for the benefit of the members of the Wisconsin Retail Hardware Association, who met in that city for their second annual convention on February 2 and 3. The display, which was arranged by J. C. O'Neil, covered Tea Pots, Cups and other articles in sheet metal, including a great variety of Carpathian Trays. These are untarnishable Trays in pleasing patterns, making an excellent substitute for silver at a remarkably low price. They have always been imported until the past year, but are now being successfully manufactured in this country.

At the second annual meeting of the Wisconsin Retail Hardware Association, held at Milwaukee on February 2 and 3, Gross & Jacobs, hardware merchants, Stevens Point, Wis., exhibited a Sheet Iron Drum or Radiator of new design, for heating an upper room by utilizing the waste heat from a smoke pipe. Two drums are used, one being placed above the other, with tubes connecting them. Heat is not only radiated from the drums and tubes, but openings through the drums enable additional air to be heated and circulated.

J. W. Hellman has purchased the stock of W. C. Furrey, late president of the W. C. Furrey Hardware Company, Los Angeles, Cal., and is now sole proprietor of the business, continuing it under his own name. He intimates that the business will be reincorporated shortly with increased capital. The line of goods handled comprises Shelf and Heavy Hardware, Stoves, Tinware and Plumbing Materials.

Bering-Cortes Hardware Company, Houston, Texas, are now comfortably settled in their new establishment, which was completed several months since. The building is 72 feet wide and 125 feet long and three stories in hight. On the first floor is carried the retail stock of Shelf Hardware and Tinware. The office, 20 x 30 feet, is in the rear of this floor. The building stands on a corner, and on the side next to the street they have a receiving room, 20 x 30 feet. On the second and third floors, which are reached by an electric freight elevator, as well as stairs, is carried their wholesale stock of Hardware and Tinware. They also have a basement, 25 x 50 feet, in which they carry their surplus stock of such goods as Strap Hinges, &c. Heavier goods received in carload lots —Stoves, Barb Wire, Nails, Agricultural Implements— are stored in their warehouse, which has railroad facilities, and from which they do their shipping in this line. The company's business is principally wholesale, though a considerable retail business is done. They have three traveling salesmen, who cover Southern Texas and Louisiana.

Bailie & Stephens have opened up a new Hardware store at Bedford, Iowa, carrying Hardware, Stoves, Buggies, Implements, &c. The members of the new firm were formerly clerks in the Hardware line, one having had ten years' experience and the other seven years. Their store is in a new brick building. The room is 44 x 70 feet, with a handsome plate glass front. It is lighted with electricity.

Walton, Starks & Co., Saranac Lake, N. Y., have purchased the retail stock of Chas. Wood, Lake Placid, and will hereafter run a branch store at that point. At Saranac Lake both a wholesale and retail business is done. The firm's stock includes Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Lumber, Sash Doors, Brick, Lime, Cement, &c. They also have a Tin, Plumbing and Heating shop. They advise us that they would be pleased to hear from manufacturers and jobbers with copies of catalogues and other printed matter issued to the trade.

Geo. H. Stibbs, engineer and contractor for Hot Water, Hot Air and Steam Heating Apparatus, 50 Church street, Hartford, Conn., desires us to invite the trade to send him catalogues relating to Bicycles and Supplies.

A press dispatch from Colorado Springs, Col., reports the gold production of the Cripple Creek district during the month of January, in round figures, at $1,200,000. The production of gold in the Cripple Creek district is steadily increasing and the mining companies operating there are one by one being added to the list of dividend payers. It is expected that the 1898 gold output will far exceed any previous record.

A contract has been placed by the Standard Oil Company for building at the John Roach Shipyard at Chester, Pa., the largest tank steamer ever constructed. She will be 364 feet in length, 48 feet beam and 23 feet draft. The vessel is designed to carry oil in bulk.

The British Minister to Bulgaria has reported to his Government the passage by the Bulgarian Sobranje of a new law for the compulsory establishment of trade guilds. Under this law all persons, whether natives or foreigners, must become members of a guild if they wish to work in Bulgaria at any of the trades.

The Harlan & Hollingsworth Company, Wilmington, Del., have secured a contract to build a large steamship 275 feet long, 41 feet beam and 22 feet depth of hold, for the Virginia & Carolina Chemical Company. The vessel will be supplied with inverted direct connecting surface condensing triple expansion engines with a 42-inch stroke. The boilers will be steel with a working pressure of 160 pounds. The boat is to be completed within six months.

STOVE TRADE NOTES.

CHANGES IN STOVES.

BY REMINISCENT.

From what the closing years of the present century indicate it seems almost certain that the next will open with stoves in vogue such as were discarded many years ago. This may not be news, but it will afford an excuse for an interesting search into the past. Along about 1875 the ambitious farmer was replacing his old air tight surface burner or gas burner, or down draft or oval cast top and bottom wood stove with what he was led to call a morning glory. This applied to all kinds of stoves that shed glory by having illuminating mica windows all the way around, but applied more particularly to self feeders. It was deemed a great thing to be able to put in coal enough at one time to last all day and all night. The evolution of this stove from a black monster to its highest perfection started an era of pattern making, and the designers ran riot in endeavoring to annually produce something to dazzle the eye instead of bringing out a stove that would run a decade and make money for the foundry. The best features for economy and efficiency, as well as the best interest of the final owner, were lost to view in the struggle to throw the other fellow in the shade, unmindful of the fact that square heating stoves had rendered good service before this shape was presented as entirely new.

In its second advent, however, the square stove is entitled to the credit of having created the greatest stir that has ever been made in the stove trade. It brought a study of the artistic in stove construction, which has left a lasting impression for good. Nevertheless the endeavors to embellish so covered the stoves with nickel, tile, decorations, ornaments and bronzes that its efficiency for heating as compared with the old surface burner deteriorated. The square sheet iron, down draft surface burner had a fast and furious run, and though possessed of merit was supplanted by the glittering soda fountain rivals until hard times crippled the consumer. Then the oak stove came to his relief in price, and not being encased in embellishments its radiant heat was freely shed in his dwelling.

This was followed by the tamale stove, which the old timers recognize as a relative of the oval sheet iron wood stove that was in the mother's room or guest chamber of many houses The tamale of to-day is handsomer than its ancestor, and is being made with many now necessary conveniences and even for burning coal. It has a high efficiency, being made of sheet metal, and with the provisions made in the better grades should prove reasonably durable. The oak stove with its sheet metal body and cast iron fire pot is exactly the same so far as heating is concerned, as types that can be found in the catalogues of the third quarter of this century. With their air tight ash pits and draft slides they provide for the same control over the fire that the sheet iron blower had when fitting tightly on an oval rim which was the mouth of the ash pit in the old air tight stoves.

The oak stove of to-day possesses many of the advantages of the air tight surface burner, and only needs to be made in a full revertible flue form to be a still better stove. It is quite gaudy compared with its ancient prototype, which had only the contrast of the well blackened castings and the glossy Russian iron body to enliven it, but which to my mind lent a dignity to an article that was purchased for the economy and comfort it provided rather than for its imposing elegance. Some may not sympathize with my treatment of their productions, but may nevertheless see in this brief review the trend of the trade at the end of the century to the paths that were opened at a time when economy and efficiency were held in higher esteem than they were later and before forced retrenchment in expenditures was necessary.

The Furnaceman and the Founder.

Indications are multiplying that progress in the manufacture of pig iron and in the production of castings will bring the founder and furnaceman closer together and will prove very beneficial to both. The multiplication of foundrymen's associations in this country during the past few years and their activity has done much to stimulate a desire for improvement. Although some of the papers read have been elementary and a part of the discussions have been crude, wide publicity has been given in the technical press to the transactions of these societies because of their important educational influence. It is not too much to say that many of the quaint conceits prevalent among foundrymen have been swept out of existence, and that there is now a wider and better knowledge of facts and a greater and more intelligent eagerness to progress than there has been. Some of the old prejudices linger with characteristic persistence and there is some justification for it, because enthusiasts have often claimed too much for modern methods.

It is probably not too much to say that progress must naturally come from the founder, because the pig iron producer stands to the former in the attitude of the seller to the buyer, whose requirements he must meet, and even whose whims he must cater to. Under such conditions the furnaceman must be circumspect. Yet it is easy to discern in what direction progress is tending.

One of the most serious embarrassments to the use of chemical analysis as a guide to the founder is the fact that only too often the analysis itself does not really represent a fair average of a lot of iron because the sample is not correctly drawn. Furnacemen know perfectly well that there is a very large variation in the composition of the pigs produced in one cast from the furnace and that it is very difficult to get a true sample. Lately the tendency is developing among furnace managers to interpose a ladle between the furnace and the cast house. In other words, the iron is not tapped direct from the furnace into the casting bed, but is first run into a ladle, from which it goes either to a casting machine or to the pig beds. This means, in either case, that the iron in one cast is thoroughly mixed and that there are not the variations in the individual pigs which are now so common.

It is pretty generally understood now that the grain of a pig iron is determined not alone by chemical composition, but that the rate of cooling has an important bearing, often modifying and sometimes completely overriding the effect of chemical composition. We believe that once the uncertainties as to the actual chemical contents of pig iron in a cast are removed grading by fracture will receive its death blow, and then the expensive method of casting into pig beds and handling in the cast house will rapidly disappear.

Quite a number of foundrymen still hold to the conviction that there is some mysterious effect for good in the sand which adheres to the pig iron cast in the bed. They look askance at the iron cast in a casting machine, which has conquered its position in the favor of the steel maker. On what ground sand adhering to pig iron can possibly be anything but harmful in the cupola it is difficult to understand.

We believe that it will not be long before the old fashioned cast house will be a relic of the past, and that then foundrymen will charge clean iron, with a guaranteed analysis, cast in casting machines from a ladle into which the iron has been run either from the furnace or from large mixers which are capable of taking care of more than one cast.—*The Iron Age.*

Corona Steel Ranges.

The Royal line of Corona steel ranges is the subject of a 20-page pamphlet, bound in paper covers, which reaches us from Bergstrom Brothers & Co., Neenah, Wis. It is in the nature of an illustrated catalogue and price-list, and describes the goods in a way to interest the dealer. These ranges were entirely new last season, and since their introduction have proven very popular with the

trade. The body of the range is made of Wood's cold rolled steel plate, closely riveted and lined with asbestos board to retain and force the heat into the oven and protect the highly finished enamel surface outside. The oven is made in four sections. the oven bottom being of extra heavy steel thoroughly braced, so that it will not warp or buckle. The high closet and high shelf are supported on cast brackets, while the high shelf has a balanced roller door of Russia iron and nickel trimmed. The main top of the range is 28½ inches wide, made in four sections with heavy key plates, which can be readily changed to either No. 8 or No. 9. A false or lower bottom is placed underneath the flue bottom to further strengthen the range body and serve to retain the heat in the oven, while at the same time making it impossible to burn the floor. The standard sheet flue construction is provided. The fire box is oval in form with heavy sectional linings, and for coal it has a duplex grate, while for wood it is provided with a heavy flat grate. These can be removed through the grate door without disturbing the fire box linings. Various styles of the Corona are shown accompanied by descriptive particulars and a tabulated price-list.

The Uses of the Blower in the Foundry.*

BY WALTER B. SNOW.

Under the broad term blower may be classed four types of machines, differing widely in their construction and operation.

1. The peripheral discharge fan wheel with inclosing case.
2. The propeller or disk wheel, discharging its air in lines practically parallel to its axis.
3. The so called rotary blower, with close fitting revolving propellers, and
4. The blowing engine, acting upon the principle of the plunger pump, and capable of producing pressures of several pounds to the square inch.

Of these four types, the second, or propeller type, is absolutely valueless for cupola work, because of its inability to produce the required air pressure; while the fourth, or blowing engine type, is too complicated and expensive for use in the ordinary foundry. For all purposes, except blowing cupolas, the fan blower is the only type which is adaptable. Although the rotary blower is to a certain extent employed for this specific purpose, a clear statement regarding the theory and operation of the fan blower, such as it is here attempted to make, should render evident the predominant advantages of the latter type.

According to the purpose for which they are designed, fan blowers may be classed either as volume blowers or pressure blowers, although one type naturally merges into the other. In either type the fan blower proper consists in its simplest form of a number of blades extending radially, or nearly so, from its axis and presenting practically flat suraces to the air as they revolve. By the action of the wheel the air is drawn in axially at the center and delivered from the tips of the blades in a tangential direction. It is therefore designated as a centrifugal fan, or, more properly, as a peripheral discharge fan.

A volume blower is primarily designed to discharge air in large quantity under low pressure with the minimum expenditure of power. This requires a wide and comparatively slow running wheel. A pressure blower, on the other hand, is designed for the purpose of creating a high pressure, which may be as great as 20 ounces per square inch, while delivering a relatively small volume of air. To this end the wheel must be narrow and operated at high speed.

In operation the peripheral discharge fan sets in motion the air within it, which, acting by centrifugal force, is delivered tangentially at the outer circumference of the wheel. Air rushes in at the axial inlet to fill the space between the blades, in which there is, by the centrifugal action, a tendency to form a vacuum. The degree of this vacuum is dependent upon the circumferential speed of the wheel; and the velocity of the air discharged through an outlet of proper size is substantially equal to that of the circumference of the wheel. The fan case thus virtually becomes a reservoir from which the air escapes through the outlet, the proper size of which to produce the above stated results will be discussed further on.

The velocity with which air escapes into the atmosphere from a reservoir is dependent upon the pressure therein maintained and upon the density of the air. The pressure per unit of area divided by the density per unit of volume gives the head, usually designated as the "head due to the velocity." The velocity produced is that which would result if a body should fall freely through a distance equal to this head. In the case of the flow of water such a head always exists; as, for instance, when a standpipe is employed to produce the requisite pressure. Suppose the head of water to be 50 feet and its weight per cubic foot to be 62.5 pounds, then the pressure per square foot will be $50 \times 62.5 = 3125$, and that per square inch $3125 \div 144 = 21.7$ pounds. Its theoretical velocity of flow from an orifice at the bottom of the standpipe would be 56.7 feet per second, as determined by the formula for falling bodies, which is $v = \sqrt{2gh}$, in which v = velocity in feet per second, g = acceleration due to gravity and h = head in feet, here 50 feet. In the case of air, however, an actual homogeneous head never exists, but in its stead we have to deal with an ideal head which can only be determined by dividing the pressure by the density. As the density of air is so much less than that of water it is evident that for a given pressure the head will be far greater in the case of air. But the velocity of discharge is dependent only on the distance fallen which is represented by the head, whether real or ideal. As a consequence, air under a stated pressure escapes at vastly higher velocity than water under the same conditions. Calculated in the same manner the velocity of escaping air under a pressure of 21.7 pounds per square inch is 1626 feet per second. By the employment of formulæ based upon this theory the elaborate basis tables in the Sturtevant catalogues have been calculated.

In the attempt to force air at a given velocity through a given pipe, it is the province of the fan wheel, if employed therefor, to create within the fan case a total pressure above the atmosphere which shall be sufficient to produce the velocity and also overcome the resistance of the case and the pipe. If, however, the pipe be removed and the fan be allowed to discharge the air through a short and properly shaped outlet, the pressure necessary will, with an efficient fan, be substantially that required to produce the velocity. The method of determining the velocity due to any given pressure has just been explained. From the same formulæ, properly transposed, the pressure due to any given velocity or necessary to its creation may be determined. The pressure thus determined is properly that which it is the purpose of a fan, employed as a device for moving air, to create. The velocity of the fan tips or circumference of the fan wheel which is necessary to produce a given velocity of flow through a properly shaped outlet within the capacity of the fan is substantially equal to the velocity of flow. If, therefore, the peripheral velocity of a given fan is known, the resulting pressure for the production of velocity through an outlet of proper size and shape may be readily calculated.

From the basis formula already employed, as well as from the preceding discussion, it is evident that the pressure created by a given fan varies as the square of its speed. That is. doubling the speed increases the pressure fourfold. The volume of air delivered is, however, practically constant per revolution, and therefore is directly proportional to the speed.

The work done by a fan in moving air is represented by the distance through which the total pressure is exerted in a given time. As ordinarily expressed in foot pounds, the work per second would, therefore, be the product of the velocity of the air in feet per second, the pressure in pounds per square foot, and the effective area in square feet over which the pressure is exerted.

From this it is evident that the work done varies as the cube of the velocity, or as the cube of the revolutions of the fan. That is, eight times the power is required at twice the speed. The reason is evident in the fact that the pressure increases as the square of the velocity, while the velocity itself coincidently increases; hence the product of these two factors of the power required is indicated by the cube of the velocity. The theoretical relations between the revolutions of a fan and the volume, pressure and horse-power are clearly shown by the accompanying diagram. These curves are based upon the facts that the volume varies directly as the speed, the pressure as the square and the horse-power as the cube of the speed. Thus it is shown by the curves that if the speed is doubled the volume is also doubled, the pressure is increased four times and the horse-power becomes eight times greater. The tremendous power expenditure required for even a moderate increase of speed is thus rendered distinctly evident.

In selecting a fan the facts just presented should be borne in mind. It appears to be so simple to secure increased volume by running a given fan at higher speed that the influence upon the power required is frequently overlooked. If the necessary amount of power is actually furnished, its expenditure will entail great loss in efficiency as compared with that required to operate a fan properly proportioned to the work.

In the design of a wheel to meet given requirements it is necessary to make its peripheral speed such as to create the desired pressure, and then to so proportion its width as to provide for the required air volume. Evidently the velocity and corresponding pressure may be obtained either with a small wheel running at high speed or a large wheel running at low speed. But if the diameter of the wheel be taken too small it may be impossible to adopt a width, within reasonable limits, which will permit of the passage of the necessary amount of air under the

* A paper read before the New England Foundrymen's Association.

desired pressure. Under this condition it will be necessary to run the fan at higher speed in order to obtain the desired volume. But this results in raising the pressure above that desired, and in unnecessarily increasing the power required. On the other hand, if the wheel be made of excessive diameter it will become more impracticable on account of its narrowness. Between these two extremes a diameter must be intelligently adopted that will give the best proportions for the specific work it is designed to do.

The actual work which a fan may accomplish must depend not only on its proportions, but upon the conditions of its operation and the resistances which are to be overcome. Evidently, it is improper to compare fans when operating under such conditions that these resistances cannot be definitely determined. The simplest and most natural condition of operation is that in which the fan is operated without other resistance than that of the case—that is, with open inlet and outlet. For proper comparison of different fans, the areas through which the air is discharged should bear some constant relation to the dimensions of the wheels themselves.

It has been determined experimentally that a peripheral discharge fan, if inclosed in a case, has the ability, if driven at a certain speed, to maintain the pressure corresponding to its tip velocity over an effective area which is usually denominated the square inches of blast. This area is the limit of its capacity to maintain the given pressure. If it be increased the pressure will be reduced, but if decreased the pressure will remain the same. As fan housings are usually constructed, this area is considerably less than that of either the regular inlet or outlet. It, therefore, becomes necessary, in comparing fans upon this basis, to provide either the inlet or the outlet with a special temporary orifice of the requisite area and proper shape, and make proper correction for the contracted vein. The fan is thus, in a sense, placed in a condition of restriction of discharge, which it approaches in practice only in so far as the resistances of pipes, passages and material through which the air must pass have the effect of reducing the free inlet or outlet of the fan.

The square inches of blast, or, as it may be termed, the capacity area of a cased fan, may be approximately expressed by the empirical formula:

$$\text{Capacity area} = \frac{D\,W}{x}$$

In which D = diameter of fan wheel in inches, W = width of fan wheel at circumference in inches, x = a constant, dependent upon the type of fan and casing.

The value of x has been very carefully determined by the B. F. Sturtevant Company for different types of fans; but these values must be applied with great discretion, acquired through experience and a thorough knowledge of all the conditions liable to affect the fan in operation. An approximate value of x for general practice is not far from 3, but this is to be used only to determine the capacity area over which the given pressure may be maintained. This is not a measure of the area of the casing outlet, which is always larger than the square inches of blast. As a consequence, the pressure is lower and the volume discharged is somewhat greater than would result through an outlet having the square inches of blast for its area. But the maximum pressure may be realized when the sum of the resistances is equivalent to a reduction of effective outlet area to that of the square inches of blast. Both the volume and the power required will evidently increase with the area of the outlet, being greater with the normal outlet than with that representing the capacity area. But this increase will not be proportional to the area; for the greatest delivery of air and the largest consumption of power will occur when the casing is entirely removed and the fan left to discharge entirely around its periphery.

Although the theoretical considerations which govern the design of fans have here been given, the conditions which exist in any given case must enter into any decision as to the practical dimensions to be given the fan. If volume alone, regardless of pressure, is the requisite, the larger the fan the less the power required. There is a strong temptation, however, for a purchaser to buy a smaller fan and run it at a higher speed; for he sees only the first cost and does not realize the entailed expenditure for extra power. If possible, a fan should never be made so small that it is necessary to run it above the required pressure in order to deliver the necessary volume. To double the volume under such conditions requires eight times the power. Three times the volume demands 27 times the power.

For certain purposes, such as the blowing of cupola furnaces, a comparatively small volume of air is required, but under high pressure. For exhausting, blower boiler fires and the like, the volume required is greater and the pressure relatively less. The former wheel requires to be narrow at the circumference, thus providing for the escape of only a small amount of air When a fan is employed for exhausting hot air or gases, the speed required to maintain a given pressure difference is evidently greater than that necessary when cold air is handled, the difference being due, and inversely proportional to the absolute temperature.

The preceding discussion, relating as it does to theoretical features of design and operation, has of necessity taken on a somewhat abstruse and, I also fear, a decidedly uninteresting character. But its presentation has appeared to be desirable because of its importance. We may now turn to the different types of fan blowers employed in the foundry and consider them in a somewhat more practical manner. First of all is the pressure blower, for blowing the cupola, so familiar to you in the form of the Sturtevant steel pressure blower. The extreme length of the bearings and the special arrangement for keeping them well supplied with oil are among the most important features which have made possible the continued employment of blowers of this make for fully a third of a century with practically and in many cases with absolutely no expense for repairs. The fan wheel is narrow, with tapering sides, reducing to the minimum width at the outer circumference where the air escapes from the wheel into the surrounding case. Numerous curved blades or floats serve, by their continuous action, to prevent the return of this air to the wheel center and thereby

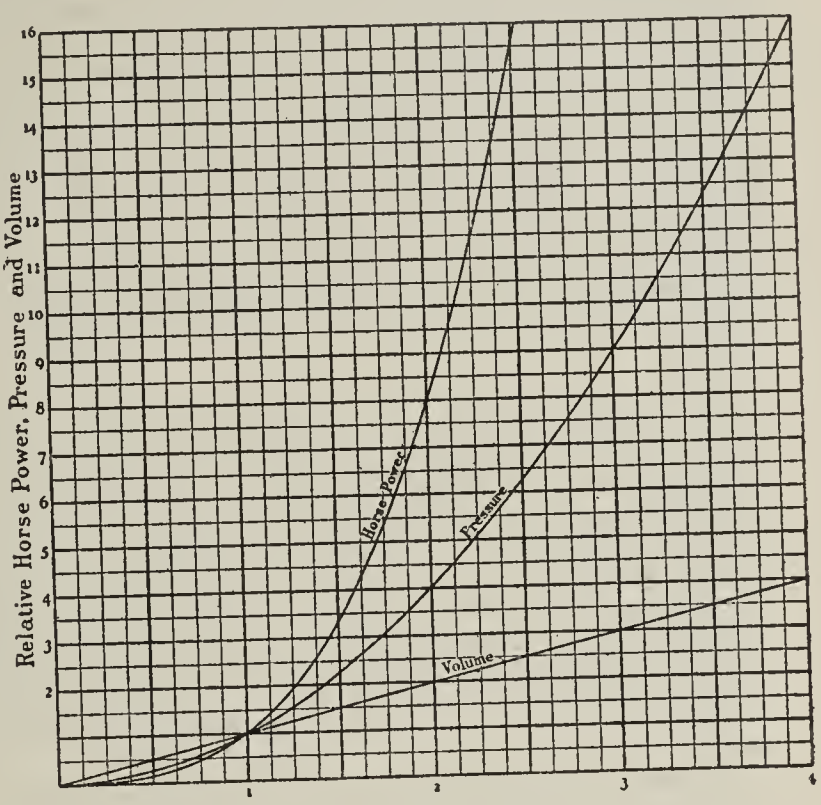

Fig. 1.—Theoretical Relation Between the Revolutions of a Fan, the Volume Discharged, the Pressure Created and the Horse-Power Required.

maintain the pressure due to their tip velocity. From what has previously been said, it must be evident that even a slight change in the width of the tip of the blade of such a narrow wheel must have a marked effect upon the volume of air which is discharged and upon the power which is required to accomplish this result. For this reason blowers cannot be compared by the areas of their casing outlets, but only by their capacity areas, as determined by the proportions of the wheels.

The general application of a pressure blower to a cupola is too well known to require description, but certain features which relate to its efficiency may well be considered here. The proportions of a pressure blower wheel should theoretically be such that its capacity area or square inches of blast shall be practically equal to the free area through the fuel and iron in the cupola, less the influence of the resistances of piping, tuyere boxes, fuel and iron. These resistances are evidently the equivalent of just so much reduction in area, and must therefore enter into any consideration. But it is manifestly true that differences in the length and arrangement of piping in different plants and of size, quantity and character of the charges in the same plant, introduce such variable conditions that it is impossible to design a blower of any type that shall at all times be just exactly proportioned to the work to be done. For this reason the exact power required to operate any given blower cannot be given as an absolute quantity, but can only be determined when all of the conditions are known. It is, or at least it should be, customary in specifying the pressure required to operate a cupola, to refer to that in the wind box. On the other hand, the table of blower speeds presented in the Sturtevant catalogue gives the number of revolutions necessary to produce the given pressure at the fan outlet when its area is within the capacity of the blower. Owing to losses due to transmission, this pressure cannot be maintained at any more or

less distant point, such as the wind box of the cupola, unless the speed of the fan is increased sufficiently to produce an excess of pressure equal to the transmission loss. It is the failure on the part of the purchaser to comprehend this fact and to make due allowance for transmission losses, that sometimes results in too low a pressure at the cupola, and an unjust charge against the blower. Large, straight and short connections from blower to cupola are always imperative if waste of power is to be avoided. If changes in the direction of the piping are necessary, they should be made with as large a radius of curvature as possible. It should be distinctly understood that the power required to operate a fan blower is proportional to the area of discharge. If this area be reduced to zero by the closing of the blast gate, the power will be reduced to merely that due to the friction of the machine and of the air confined within the case. Too often it is claimed by those who ought to know better, that closing the pipe increases the power, but as power is expended only when air is moved, the fallacy of this statement is evident. This fact points to one of the prominent economic advantages of the fan blower, viz., its automatic action. Instead of always delivering a fixed volume of air, regardless of requirements, the fan blower automatically increases the volume as the resistances are decreased. On the other hand, if the fan blower be in operation with a fairly free outlet, in excess of its capacity area, and that free area be decreased, the pressure produced by the fan will immediately rise, thus tending at once to overcome the increased resistance. Therefore, if a certain maximum pressure is known to be required in a given cupola, the fan may be so speeded as to give this at such times as the conditions demand. While at other times, when less pressure or volume of air is required in the cupola, proper manipulation of the blast gate will economize power. Compared with a type of blower like the rotary, in which a certain maximum pressure and volume must always be maintained, and a portion allowed to waste if not required, the economic advantage of the fan blower is evident.

In the matter of first cost the fan blower is, for the same capacity, only about one-quarter as expensive as the rotary blower and weighs on the average only about one-ninth as much. This latter feature is of the greatest importance, particularly in the case of large plants. For with the fan blower expensive foundations and high freight charges are avoided, while the handling of parts for repairs is rendered far easier. In the matter of efficiency under the same conditions, the fan blower has been shown by impartial experiment to be superior, while in general endurance, in lack of danger of breakage and of leakage due to wear it may be fairly claimed to take the lead.

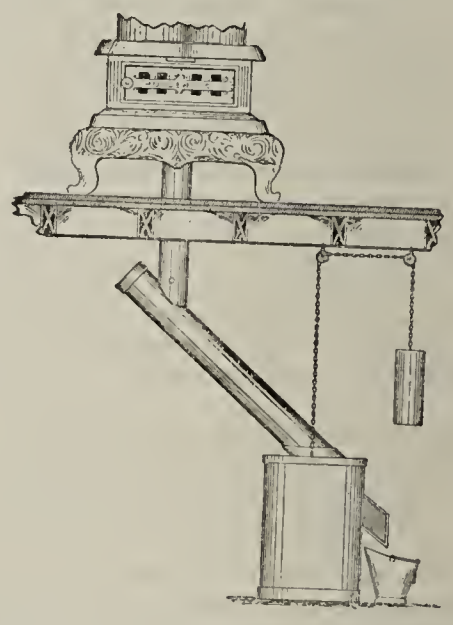
We may now turn to other uses of the fan blower in the foundry—uses in which it has no practical competitor. Employed as an exhaust fan and properly designed for its work, it has found an extended application for removing the dust from tumbling barrels, from emery wheels, and, in fact, for exhausting dust, smoke or objectionable gases from any machine or apartment in which they are generated. For such work the fan is driven at comparatively low speed and proper connection made to the space or spaces from which the objectionable matter is to be drawn. This passes through the fan and thence to any desired place of deposit and is discharged into the open atmosphere.

In the case of the pattern shop, which usually forms an adjunct of the foundry, a fan of this type in the form of a planing mill exhauster is always of advantage for the removal of shavings and sawdust. The width of the wheel in such a fan is far greater both at inlet and outlet than that of a pressure blower wheel. A large volume of air at comparatively low pressure is thus passed through the fan with a minimum expenditure of power.

A similar type of fan on a larger scale is used in connection with a steam pipe heater for the heating and ventilation of the model foundry. By the concentration of all of the pipe in a single heater across which large volumes of air are caused to pass, the amount of pipe is reduced to from one-third to one-fifth of that which would be required if it were strung around the foundry, as in the case of direct radiation. This concentration of the heating surface also serves to reduce to a minimum all possibility of freezing, renders the regulation of temperature as simple as is possible, and presents numerous other advantages. The general form of this apparatus is shown by the accompanying cuts. The heated air is distributed by means of the fan through a more or less extended system of underground ducts with vertical wall flues or of overhead galvanized iron piping. The large quantity of air thus supplied secures adequate ventilation, causes all air leakage to be outward and serves to keep the foundry comfortable and clear of gas and steam during the heat, if cool or slightly tempered air be then supplied.

A similar form of apparatus, designed to deliver air at high temperature, may be employed for keeping cores dry. It is also used for drying flask and pattern lumber, when the quantity is sufficient to warrant the arrangement.

Although the boiler plant in connection with an independent foundry is usually of somewhat limited size, nevertheless the fact should not be overlooked that the fan blower is rapidly usurping the place of the chimney in the production of draft or serving as its assistant in securing desired results. Applied to force the air into a closed ash pit it creates a pressure which makes possible a high combustion rate, the burning of cheap fuel and the attainment of the maximum capacity of the boilers. Employed as an exhauster, through which the gases are drawn, it in addition does away with the necessity of a high chimney. Under either form of application perfect control may be maintained over the draft pressure, and it may be automatically increased or decreased coincidently with a slight fall or rise in the steam pressure, which thus remains almost absolutely constant.



Such, then, are some of the uses of the fan blower in the foundry. Either as a convenience or as a necessity it is ever in demand, and its forms of application are constantly increasing. It therefore stands to-day as a specific type of machine whose general advantages and peculiar adaptability are becoming more and more familiar to every manufacturer and engineer.

False Rumor of Stove Combination.

The trade was startled this week at a report originating in Chicago, to the effect that a combination of important stove manufacturing interests had been effected with a view to advancing prices. The account was most circumstantially worded, giving the names of six prominent stove concerns, including the Michigan, Detroit and Peninsular Stove Companies, and went on to say that the advance would take place within 60 days, giving the amount, &c. How the report originated it is difficult to say, for there appears to be not a word of truth in it, each of the Detroit concerns contradicting it flatly, the Michigan Stove Company branding it as a deliberate lie and asking that a prominent and elaborate denial be given to the malicious and sensational account.

The Campagna Ash Remover and Automatic Sifter.

The trade will be interested in the device illustrated herewith known as Campagna's combined ash remover and automatic ash sifter, made by Eugene W. Campagna, West street, Randolph, Mass. The device serves as an ash remover, and the sifting is done by gravitation. The ashes in the stove are set in motion by a movable damper, operated by a sliding rod and worked from under the stove. On this damper are two small arms which throw the ashes into an inclined chute, and which sifts them

The Campagna Ash Remover and Automatic Sifter.

automatically and delivers them into a metal barrel, partitioned so that one side receives the cinders and the other the ashes. On the side containing the cinders is a small door from which they may be taken daily if desired. The ashes can be emptied when the barrel is full, generally about once a month. If for any reason the sieve is clogged, there is a rod at the top of the inclined chute connected with a spring which by pushing in a few times will remove any obstructing substance.

At the annual meeting of the stockholders of the Yale Gas Stove Company, New Haven, Conn., held last month, it was decided to wind up the affairs of the company and to ask the court to grant a receiver.

ODD PLATES.

At a recent meeting of the Union Relief Association of the Union Stove Works, held at Liberty Hall, Peekskill, N. Y., the following officers were elected for the ensuing year: President, James Tice; vice-president, Philip H. Smith; secretary, Samuel H. Tate; treasurer, Edward F. Hill, and assistant treasurer, D. C. Hasbrouck.

The Schuylkill Valley Stove Company of Spring City, Pa., recently held their annual meeting and elected J. Howard Richards president, Henry Eppeheimer vice-president, John W. Gebhart secretary and W. F. Stephens treasurer. These officers, with Andrew McMichael, Thomas G. Taylor and L. L. Eisenhower, constitute the Board of Directors for the ensuing year. The first five named are residents of Spring City, while Mr. Taylor and Mr. Eisenhower are citizens, respectively, of Phœnixville and Reading.

The North Dighton Co-operative Stove Company of North Dighton, Mass., resumed operations in their molding shop on the morning of January 25, and the following day work was resumed in the mounting shop. At the annual meeting of the stockholders George H. Reed, Frank K. Chase, Daniel Crotty, William B. Babbitt, John F. Driscoll, Henry H. Lincoln and Joseph Norris were elected directors. The directors elected George H. Reed president and Frank K. Chase treasurer.

At the annual meeting of the Carton Furnace Company, Utica, N. Y., the following directors were elected: E. A. Carton, W. J. Carton, John B. Jones and S. A. Batley. At a meeting of the Board of Directors E. A. Carton was chosen president and general manager, W. J. Carton vice-president and treasurer, John B. Jones secretary and George W. Jones superintendent of works.

At the annual meeting of the stockholders of the Bloomington Stove Company, Bloomington, Ill., the old officers were re-elected, together with the following directors: William Van Schoick, E. H. Miner, Henry Chrisman, Henry Heyer and Montgomery Evans. The latter is a new member, succeeding his father, J. W. Evans, who was one of the directors ever since the company were formed. The reports presented showed the concern to be in a prosperous condition.

The Portsmouth Stove & Range Company of Portsmouth. Ohio, contemplate increasing their molding facilities by an extensive addition, plans for which have just been prepared. The extension will be made 65 feet east of the end of the present room and extend 100 feet south toward Gallia street. The company are doing a large business and the increased facilities have become necessary as a consequence.

The Rock Island Stove Company of Rock Island, Ill., have recently opened a branch house at Kansas City, Mo., which will be under the management of George W. Blakeslee.

The annual meeting of the stockholders of the Co-operative Stove Company of Bloomington, Ill., was held at the office of E. M. Hamilton on the evening of Tuesday, January 25. After listening to the report of the superintendent, the following directors were elected: H. Capen, E. Hamilton, John W. Hayes, George F. Parker, A. C. Hamilton, E. C. Hewett, George Brand, Sr., C. A. Hamilton, E. E. Donnelly, Frank Riegger and Otto Seibert. At a subsequent meeting the directors elected John W. Hayes president, E. E. Hewett vice-president, E. M. Hamilton secretary and Arthur C. Hamilton treasurer and superintendent.

We are indebted to the Peninsular Stove Company, Detroit, Mich., for a copy of their little leaflet called "The Peninsular," the first number of which appeared in January, and which, we understand, they intend to publish every month. It is a little four-page publication measuring 5 x 6½ inches, and has a good deal to say in the interest of the Peninsular Furnaces, Stoves and Ranges. We have no doubt that any one desiring to see a copy of this little journal or to get it regularly can do so by addressing the Peninsular Stove Company.

At a recent meeting of the stockholders of the Portsmouth Stove & Range Company, Portsmouth, Ohio, Frank V. Knauss, Lewis W. Baker, W. Scott Todd, Lewis M. Knauss and Edward J. Corson were elected directors for the ensuing year. At a subsequent meeting of the Board of Directors F. V. Knauss was chosen president, L. M. Baker, vice-president and W. S. Todd secretary and treasurer.

At the annual meeting of the stockholders and directors of the Excelsior Steel Furnace Company, held recently at the Chicago office of the company, the following officers were elected: President and treasurer, A. W. Glessner; secretary, J. A. Haben; superintendent, A. G. Scherer. The report of the president, covering the business of the corporation for the year 1897, showed a very satisfactory condition of affairs. The percentage of increase in the volume of sales over the preceding year was large, and while prices were very low, and the returns on the invested capital meager, the report showed that substantial progress had been made and the future was considered encouraging.

The trade and navigation returns of Canada, just published, for the fiscal year ended June 30, 1897, show the total value of Stoves imported into the Dominion from the United States to have been $67,406, an increase of $13,000 over the previous year, notwithstanding the increased duty on these articles.

The Quick Meal Company of St. Louis, Mo., have published an interesting little pamphlet of 16 pages, the matter of which has been prepared especially for the woman of the house. It tells her how to save time, work and worry, and how to prepare a Quick Meal and eat it in comfort. It is in substance an illustrated description of the Quick Meal Stove, in which the important features are pointed out, the advantages which it possesses enumerated and directions given for successfully operating it. There are also given a number of testimonial letters from some of those who have used the Quick Meal Stoves. The printing is in colors, and the binding is in attractive covers carrying a *fac-simile* of the company's trade-mark.

Werner B. Heideloff, brother of J. J. Heideloff, of Somerset street, Plainfield, N. J., has constructed an exact representation of the Danville Stove Company's foundry in Danville, Pa., and has placed it in the show window of his brother's store. The model is a complete one in every way. In front upon a track runs a train of cars drawn by a miniature engine which goes by steam. The foundry and other buildings are lighted at night by electricity and look true to life. The display is a creditable one, and is an excellent specimen of the inventive genius displayed by Mr. Heideloff.

The strike which was recently inaugurated at the works of the Mountain City Stove & Mfg. Company, Chattanooga, Tenn., came to an end on the morning of Monday, January 31, when the men returned to work under what is said to have been practically the old arrangement.

The Lehigh Stove & Mfg. Company of Lehighton, Pa., have made a number of important improvements in their works since the first of the year, prominent among which may be mentioned the installation of an electric light plant, which embraces a 10 horse power dynamo, furnishing 125 electric lights scattered through various departments of the several buildings. Other improvements include a new nickeling department, also more room for Stove mounting purposes and a steam heating apparatus. They are, we understand, now working full time with a good supply of orders on hand. Mr. Smith, the superintendent, is enthusiastic about the work, and predicts great things for the ensuing year.

Cook & Van Evera, 171-173 Lake street, Chicago, Ill., favor us with an illustrated folder which they are distributing, calling attention to the Jersey Stoves and Ranges. These are offered in many styles and sizes, some being adapted for coal and wood and others for wood only. The line also embraces the Jersey Steel Range, which is made of the best quality of material, is asbestos lined throughout, has removable duplex grate for coal or wood, and an oven which is thoroughly braced, bolted and ventilated.

A Severe Furnace Test.

In one of the political campaigns a few years ago a New York paper, whose vocabulary had a world wide reputation, referred to one of its disesteemed contemporaries in an indirect way by saying that when the procession passed the latter's office there was a noticeable odor of "underdone sewage." It was a rather bold figure of speech to use, and while it conveyed a very strong impression to the mind, it was hardly an impression that could have been based upon any experience in the life of the writer.

The story is brought to mind by something that happened quite recently in Denver, Col., where in a school house, the furnace of which has been recently repaired, a number of scholars in one of the rooms were made sick by the stench that came up the registers. The newspapers in exploiting the matter said that the furnace was set in brickwork that had been used for cesspool walls. We wrote to Principal J. H. Dodds of the school, and learned from him that the newspaper reports were grossly exaggerated, that the bricks had not been used in a cesspool, but had, however, been formerly used in the construction of the walls of a system of dry closets. These bricks had become saturated with urine, and although they had not been in use for three years the heat of the furnace caused them to send forth fumes, which got into the school room, making a number of the pupils sick. The mistake was made by a man employed to do the work, and as soon as the Board of Education learned of the condition of things the school was closed and the offensive bricks were removed and replaced with clean material.

TRADE REPORT.

METAL MARKET.

Pig Tin.—There has been gradual but steady improvement in prices for Straits Tin, despite the heavy shipments from Singapore last month and somewhat heavier arrivals here. The latter have amounted to 440 tons since the beginning of the month. About 2700 tons, as far as can be learned, are in transit to the United States, but a good portion of this was sold prior to arrival, with no small part going almost directly into the channels of consumption. Wholesale prices have stiffened about ½c., and there has been a corresponding advance in retail quotations. Small lots from store now sell here at 14½c. to 15c. per lb. Dealers report a fair current volume of business, with inquiries indicating a considerable consumption, present and prospective.

Copper.—Purchases by the export trade have been fairly large, and still serve to counterbalance the natural effect of what may be considered phenomenal American production. In any event, wholesale prices are held up firmly and the retail market has a stronger tone also, although sales have been of merely an ordinary type. Dealers' prices for small lots from store rule at 12¼c. per lb. for Lake Ingot and 11¼c. for Ansonia Grade Casting Copper.

Sheet Copper.—The improvement in this department continues. Gradually, but slowly, business is expanding, and orders are coming in more freely. Prices display more firmness and there is an absence of the radical cutting which demoralized the trade awhile ago. The outlook is regarded cheerfully in the trade, as inquiries point to a probable large consumption of Sheet Copper this year. Dealers' quotations are by no means uniform, but 15. per lb., basis, is probably a fair average rate for small lots from stock.

Pig Lead.—Considerable effort has been made to give the market a stronger appearance, and to a certain extent it had somewhat encouraging effect. Evidence is wanting, however, that the larger consumers have purchased otherwise than in a very conservative way, and there is no sign of remarkably lively interest on the part of jobbers. There has been some speculative inclination, but only small actual ventures. In a retail way business shows a slight improvement and dealers are more encouraged, but prices have not changed from recent low quotations. Small lots of American Pig from store sell at about 4⅛c. per lb

St. Louis advices are as follows: Pig Lead has been quite active during the past week, and prices are decidedly firmer. Consumption is showing a steady increase and higher prices are anticipated.

Spelter.—Offerings at exceptionally low prices that were made during the fortnight preceding the week under review have been withdrawn, and the indications are that really cheap lots are not easy to obtain at the moment, despite the large and growing production. A firmer tone is apparent in the retail trade, where sales have been somewhat more free, and jobbers' prices are strong at 4½c. per lb. for small lots of good Western brands.

St. Louis advices are as follows: Smelters are nearly a unit in maintaining recent prices and report a heavy trade. There is no apparent effort being made to advance prices, and no change in prices is anticipated.

Antimony.—Business of very fair volume is passing in a jobbing way and prices for small parcels are firm at 7¼c. for Japanese, 7½c. for Hallett's and 8½c. for Cookson's.

Nickel.—Sellers' price for small lots remains at 38c. per lb.

Tin Plate.—Alone among the metals Tin Plates show not the least sign of improvement. The market has been extremely quiet, only a scattering business of no special importance having been effected. It is understood that a number of large consumers are waiting to place their orders, but are disinclined to do so until they can learn something more definite about the outcome of the consolidation negotiations now on foot. The uncertainty engendered by the recent meetings and consultations of the manufacturers' committee with makers and leading dealers tends to make buyers nervous about placing contracts at the present time, notwithstanding that the prices offered by some of the mills for present and forward deliveries are as attractive as they have ever been. The rumors floating around regarding the plans of the consolidation projectors are many and various, and the subject is one of interested discussion in the trade. It is known that the committee of four are still working actively to bring the scheme to a successful issue, but their mission to New York last week does not appear to have had any satisfactory results, so far as the local dealers are concerned, and the center of their operations has now been transferred further west. The ideas of the committee are understood not to have met with favor here, being regarded as too magnificently grand for the "effete East." Nevertheless, the plans proposed are enthusiastically supported by a large section of the mills and there is a strong feeling that the plans of consolidation will ultimately be carried out, with material modifications probably. It is a curious fact, however, that some of the interests supporting consolidation are among those that are offering their product for extended delivery at remarkably low prices. To this extent their faith is certainly not shown by their works. There is a fair amount of retail trade passing, but it is not time to look for much activity in this line yet. The prospects, however, are encouraging. Jobbers' quotations show no appreciable change. Small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows, but these rates are not uniformly maintained: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., 3.40 to $3.50; do, 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates remain quiet and prices are largely nominal.

Sheet Iron.—The demand for Black Sheets from mill is quite large, and prices are reported to be firm. Many mills are so well booked up for some time to come that they are not inclined to enter any more orders, believing that they will be able to get more money for their product within the next month or six weeks. There is a heavy demand for Galvanized Sheets also, some mills being practically sold up for the next two months. Spot orders are becoming harder to fill. Local jobbers report a moderate demand for both Black and Galvanized Sheets, with no radical change in prices, although cutting is not so common as heretofore. Small lots from stock are quoted at about 2 40c. for No. 27 Common Black Sheets and 75 and 10 and 5 per cent. off for Galvanized.

Chicago advices are as follows: Excellent orders are being entered by some concerns both for Black and Galvanized. Prices seem to be firmly held on Black Sheets. Manufacturers of Galvanized Sheets have been attempting to advance prices. Jobbers are firmly holding small lots of Black Sheets from stock at 2.30c. to 2.40c., but Galvanized Sheets are in abundant supply in the hands of some jobbers and sales of small lots are made as low as 80 and 2½ to 80 and 5 per cent. off.

Old Metals.—The demand for Scrap Bars and Copper for export remains good, and domestic consumption is on a fairly liberal scale. Scrap Iron is moving slowly, as buyers' ideas of values and those of sellers show considerable divergence. Dealers in this city and vicinity are paying about the following rates for moderate sized lots, delivered here:

Heavy Copper	per lb.	9¼c.
Light and Tinned Copper	per lb.	8¾c.
Heavy Brass	per lb.	6 c.
Light Brass	per lb.	5 c.
Lead	per lb.	3¼c.
Tea Lead	per lb.	3 c.
Zinc	per lb.	2½c.
No. 1 Pewter	per lb.	8 c.
No. 2 Pewter	per lb.	4½c.
Wrought Scrap Iron, per gross ton		$10 50
Heavy Cast Scrap, per gross ton		9.25
Stove Plate Scrap, per gross ton		5.25
Burnt Iron, per gross ton		5.00
Tin Plate Scrap, per ton		3.75

The Enterprise Boiler Company, Youngstown, Ohio, now manufacture galvanizing kettles, build galvanizing plants and also erect complete outfits for tinning cast iron. Their process for galvanizing is referred to as making it possible for those who have a limited amount of work to do it themselves at a very low cost. The Enterprise Boiler Company are also manufacturers of boilers, stand pipes and heavy plate work of all kinds.

THE IRON MARKET.

The event of the week has been the purchase by a leading Pittsburgh interest of considerable blocks of Pig Iron. Our Pittsburgh correspondent places the quantity at 70,000 tons, but there is a well founded report that the quantity is close to 130,000 tons. Another very large interest is known to be in the market, whose requirements amount to about 100,000 tons in spite of their own very heavy production. Although independent furnace interests in the Central West are known to have accumulated a good deal of Bessemer Pig during the past few months, it looks as though the whole Central West may be pushed for Iron later in the year. That seems the conviction among some of the largest consumers themselves.

Under the purchases referred to the market for Bessemer Pig in the Valleys has advanced to $9.50, with some holders demanding higher prices.

Judging from the prices at which Southern Irons have been pressed for sale lately, the market needs some good tonic. Whether a "gentleman's agreement" among the Alabama producers will supply it remains to be seen. Virginia, Eastern Pennsylvania and other districts have been competing at a lively pace lately, and thus far have shown no disposition to modify their tactics.

In Lake Superior Charcoal Iron the fight is raging still, with the result that the low figures made are tempting buyers, so that a considerable business has been done. In some instances $11 at Buffalo has been shaded.

Steel Billets continue quiescent, but a stronger tone has developed since the upward movement in Bessemer Pig. The smaller consumers are crowding deliveries, but the large buying interests are still maneuvering for position.

The volume of business in Plates, Bars, Sheets and Wire shows signs of expansion. If spring, with its swelling tide of orders, follows its usual course, then there may be some good hope for better prices.

Pig Iron.—The New York market continues in an unsatisfactory condition, particularly so far as prices are concerned. The volume of buying is quite good, but the tone remains weak. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $10.75 to $11.25; No. 2 Plain, $10.50 to $10.75. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10 25 to $10.75; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

In the Chicago Pig Iron market local producers report a satisfactory volume of business and prices are firmly maintained. Orders offered at even slight concessions are stated to have been refused, as producers are so well supplied with orders that they feel thoroughly independent. Good prospects are reported for a continuance of the demand. Southern sales agents have also had a good trade during the past week, with more inquiries in hand. It is expected that prices on Southern Irons will be advanced 25c. per ton this week. The Birmingham producers have held conferences recently and are reported to have come to such an agreement. We quote for cash as follows:

Lake Superior Charcoal	$11.50 to $13.00
Local Coke Foundry, No 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.35 to 10.60
Southern Coke. No. 3	10.10 to 10.30
Southern, No. 1 Soft	10 85 to 11.00
Southern, No. 2 Soft	10.35 to 10.60

Philadelphia advices indicate no improvement in the Pig Iron situation at that center. A considerable amount of Iron is being taken in one way or another, but efforts that are being made to push sales is evidence that holders are not meeting with the demand that they would like to have. There has been a great deal of irregularity during the past week; in fact, uniform quotations no longer exist—what one man's prices may be is no rule for another. There are no signs of immediate recovery from present conditions, but by the end of the month the chances are that the demoralization will have run its course. Some good sized lots have been taken, including a sale of 1500 tons of Schuylkill Valley Iron for the Pacific Coast, which is quite a new departure. Prices are hard to quote, but the usual range for seaboard deliveries are about as follows, with the usual freight differences at points south or west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $10.75 to $11.25; No. 2 Plain, $10.50 to $10.60.

The market for Bessemer Pig Iron has been stiffened in the Pittsburgh district by the purchase of a large block of Iron by the Carnegie Steel Company. Quotations are as follows, f.o.b. Pittsburgh: No. 1 Foundry, $10.40 to $10.50; No. 2, $9.90 to $10; Bessemer, $10.15.

Business in Southern Pig Iron in the Cincinnati market has been a trifle duller throughout the past week than during the week previous. Sales of and inquiries for round lots have been discontinued pretty sharply. There is a run of small and medium orders, which, on the whole, is fairly satisfactory and which if continued would leave but little room for pronounced grumbling. Buyers, however, are showing a decided disinclination to lay in stock, and are as a rule buying only with the view of providing for actual necessities. Local authorities think that higher prices are out of the question at present, and that the most that can be done is to hold the market firm on present basis. The market for Northern Irons has been fairly active with no material change in price-lists. We quote, f.o.b. Cincinnati :

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.25 to 9.50
Southern Coke, No. 3	9.00 to 9.25
Southern Coke, No. 1 Soft	9.50 to 9.75
Southern Coke, No. 2 Soft	9.25 to 9 50
Southern Coke, Gray Forge	8.75 to ....
Southern Coke, Mottled	8.75 to .....
Ohio Silvery, No. 1	12.00 to 12.50
Ohio Silvery, No. 2	11.50 to 12.00
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal. No. 2	11.50 to 12.00

The volume of Pig Iron business in St. Louis during the past week has been quite satisfactory. Some fairly large lots have been taken, but it is intimated that prices were shaded to secure the business. It is peculiar that prices should weaken, especially as stocks are lighter than they have been for many months, and in addition many furnaces sold up several months ahead. Until the furnaces looking for business have their order books filled, however, any improvement in prices seems out of question. We quote as follows for cash, f.o.b. cars St. Louis :

Southern, No. 1 Foundry	$10.25 to $10.75
Southern, No. 2 Foundry	10.00 to 10.25
Southern, No. 3 Foundry	9.75 to 10.00
No. 1 Soft	10.00 to 10.25
No. 2 Soft	9.75 to 10.00

CHICAGO REPORT.

Scrap.—A lively demand is in progress. Large sales have been made. Cast Scrap is hard to get. Yard dealers' buying prices are as follows, Chiago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7.50	....
Malleable Cast	6 50	...
Stove Plate (free of burnt)	5.50	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8¾c.
Copper Clips	....	9¼c.
Red Brass	....	8 c.
Yellow Brass	....	6¾c.
Light Brass	....	4½c.
Pipe Lead	....	3.10c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—Trade is fair. The ruling prices of carload lots of 12 tons minimum are as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	7.00	7.25
Council Bluffs, Iowa	7.00	7.25
Lincoln, Neb	7.15	7.40
Sioux City, Iowa	7.50	7.75
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.65
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6.75
Des Moines, Iowa	7.00	7.25
Davenport, Iowa	6.30	6.65
St. Joseph, Mo	7.00	7.25
Leavenworth, Kan.	7.00	7.25
Omaha, Neb	7.00	7.25

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

The Baldwin Locomotive Works of Philadelphia have chartered a steamer to carry 22 locomotives to Finland.

THE HARDWARE TRADE.

The Hardware market presents few new features this week. The demand is setting in apparently a little earlier than usual, and more business is doing in heavy goods, which are moving in fair volume for the time of the year, and also in general Shelf Hardware. The weather and the condition of the roads have in some sections interfered somewhat with trade. Prices are without important change, but in some lines the market is stronger than it has been. Collections are generally referred to as giving little cause for complaint.

Advices from Chicago.—Jobbers report a fair movement of Shelf Hardware, but the volume of business is probably affected by the soft weather, which is making country roads almost impassable. Orders for future delivery are being booked freely for Poultry Netting, Wire Cloth and similar goods, but advance orders for Refrigerators and some other House Furnishing Goods are rather slow. A better movement has taken place in Tinware, especially small goods. A marked improvement is felt in Aluminum Ware, following the recent slight reduction in price. Excellent orders have been received for such goods from the Pacific Coast for Alaskan prospectors. Gold Pans are still in heavy demand for this trade, and Aluminum Gold Pans are now being called for. A striking feature of recent business has been the number of orders which have been received by Hardware jobbers for new stocks. They state that more orders of this kind have been received in the past 30 days than for a long time previously. The conditions are apparently deemed propitious for new ventures in the Hardware business.

Advices from St. Louis.—The Hardware business during the month of January was extremely gratifying, and the volume of, business for the present month gives promise of being quite as heavy. Reports from traveling men continue to be satisfactory and give promise of a continuance of the present activity. The territory tributary to St. Louis is in excellent condition. Dealers report a plenitude of money in the hands of their customers, and state that buying is much heavier at this season of the year than usual. Prices, while they do not show any material change, are, generally speaking, firmly maintained, and while there are no advances to note, yet on the other hand cut prices are few and far between. Collections are excellent.

NOTES ON PRICES.

Wire Nails.—Since the advance announced in our last issue the Wire Nail market has been characterized by a firm tone and a somewhat increased volume of business. With the progress of the season the trade are naturally buying a little more freely, and those whose stocks are low have been stimulated in placing orders by the strength of the market and the higher prices now in force, with the prospect of another advance next month if the plans of the manufacturers are carried out. The New York price for small lots of Wire Nails from store is $1.70 to $1.75.

Advices from Chicago.—Trade in general shows a marked improvement. The spring demand now appears to have set in, judging from the reports of increased business in every direction from jobbers as well as manufacturers. Orders are said to show no tendency to speculate, being for quantities which indicate a legitimate demand. The Chicago jobbers are selling small lots at $1.60, but will evidently have to mark up their prices at an early day.

Advices from St. Louis.—The prices agreed on by the manufacturers at the recent meeting in Pittsburgh are being firmly maintained. Mills report a heavy trade. Jobbers are busy, and quote $1.65 to $1.70 for less than carload lots.

Cut Nails.—The Cut Nail market is in substantially the same condition as a week ago. Small lots from store are quoted at about $1.30.

Advices from Chicago.—Nothing new has occurred in Cut Nails, small lots being still sold at $1.45.

Advices from St Louis.—The demand for Cut Nails is fairly satisfactory, but the prices at present quoted by some mills indicate that they are looking for business. Jobbers ask $1.40 to $1.45 for small lots from store.

Barb Wire.—The Barb Wire market has a decidedly firm tone and the higher prices recently determined upon by the manufacturers are well maintained.

Advices from Chicago.—A very good demand is reported by manufacturers and jobbers, showing that the regular spring demand is now beginning to be felt. Manufacturers occupy an exceedingly good position for advancing prices, as they have absolutely no stock on hand and the demand is steadily increasing. Jobbers have not yet advanced their prices on small lots, although it is probable that this will be done during the coming week. The St. Paul and Minneapolis jobbers have advanced their prices 10 cents, to correspond with the manufacturers' price.

Advices from St. Louis—The demand for Barb Wire is heavy and has set in earlier than usual. Mills have no large stocks to draw from and jobbers, as a rule, are only moderately well supplied. Farmers who have deferred buying Wire for the past two or three years are now in position to purchase what they need, and the increased business which the mills are enjoying is pretty good evidence that these orders are now being placed. Jobbers report a large trade and quote Painted at $1.70 and the usual advance for Galvanized.

Smooth Wire.—The market for Smooth Wire is steady and firm at about $1.35 for small lots from stock.

Shot.—As a result of the condition of the Pig Lead market, the Eastern Shot manufacturers have reduced their quotations on Shot, naming, under date February 7, the following prices, subject to a discount of 2 per cent. for cash in ten days, and the usual discount in ton lots:

Drop Shot, sizes smaller than B, per 25-pound bag	$1.17
" " " " " " " 5 " "	.30
" " B and larger sizes, per 25-pound bag	1.42
" " " " " " " 5 " "	.35
Buck Shot, per 25-pound bag	1.42
" " " 5 " "	.35
Chilled Shot, per 25-pound bag	1.45
" " " 5 " "	.35
Dust Shot, per 25-pound bag	2.00
" " " 5 " "	.50

Glass.—The Glass trade is devoid of new features, and lack of business is one complaint of local jobbers. It is reported from factories that demand continues good, but the promptness with which orders are filled would indicate that the supply was fully commensurate with requirements. The trade look with more or less distrust upon the stability of present prices, as is evinced by the holding back of orders. Merchants appear to think that as these are association prices they are not likely to stand in the face of limited consumption. The discount of 85 and 10 per cent. is still obtainable in small lots in the local market.

White Lead.—There has been about the full average business in both Lead in Oil and Dry White Lead, but no unusual movement and prices remain stationary, since there is no serious opposition to the leading consumers nor influential change in the market for base materials.

Red Lead.—Red Lead, of both domestic and foreign make, is steady at prices that have prevailed for some time past, and there is quite good general movement for the season.

Linseed Oil.—Prices are very firm, in sympathy with the high cost of seed, and crushers are very indifferent sellers at current prices, which barely cover the cost of production.

TRADE NOTES.

The title of the Great Western Can & Machine Company of San Francisco, Cal, has been changed to the Great Western Can Company, Incorporated, and the offices of the concern have been removed from 139 First street to 3 California street, San Francisco. Charles Josselyn is general manager.

The Architectural Stamping Works, Grand Rapids, Mich., make an announcement in our advertising columns this week that will be of interest to the trade. They call attention to their Architectural Sheet Metal Work, Ornaments, Statuary, Steel Ceiling, Brick and Rock Face Siding, Metal Spinning, &c. A catalogue giving full information about their line of goods will be furnished on application.

Covert Mfg. Company, West Troy, N. Y., refer to the volume of their business last year as having exceeded that of any in their history, and that as they make it a rule to execute orders if possible within 24 hours of receipt they will run nights to keep pace with the demand from February 1.

The Asbestos Sad Iron Works, at Stoughton, Wis., are reported to be daily turning out 300 sets of Finished Irons, employing over 40 men in their manufacture.

Henry W. Johns, president of the H. W. Johns Mfg. Company, New York City, died on February 8, at his home Park Hill, Yonkers, N. Y., aged 61 years.

A Madrid dispatch states that the cost to Spain of the Cuban war from February, 1895, to the end of 1897 is officially estimated at $240,000,000, besides the arrears due from the Cuban treasury, which amount to $40,000,000.

Peck Bros. & Co.

The business of Peck Bros. & Co., New Haven, Conn., which passed into the hands of a receiver March 14, 1896, will be sold at public auction on the premises, in New Haven, March 2, and, it is thought, will be bid in by the stockholders. During the receivership the business has prospered, and up to January 1, 1898, about one-half the total indebtedness of $600,000 has been paid off, leaving about $300,000 yet to be settled. The 1898 inventory is said to have shown assets of about $630,000. The capital stock being $600,000, and outstanding debts about $300,000, it is estimated that the stock is worth fully 50 cents on the dollar. There is therefore some inducement for the stockholders to pool their interests and raise enough money to buy in the plant, stock, book accounts, good will and name at the sale on March 2.

The British Sheet Iron Industry.

The sheet iron manufacturing industry of Great Britain, which hitherto has had its center in the South Staffordshire, or Midland, region of England, known as the "Black Country," is reported to be gradually shifting its base. It is found that the production of comon sheets for galvanizing purposes, being an almost exclusively export trade, can no longer be made remunerative in a district so far removed from the seaboard as South Staffordshire, and little doubt is felt that in a few years South Wales will become the great center of this industry. The price at which common black sheets are now selling in England is said to involve a loss to the Midland producer of $1.50 to $2.50 a ton, reckoned on the basis of the present cost of fuel, labor and pig iron. The result is that the sheet mills in the Black Country are shutting down in all directions, and only those concerns who make iron and steel sheets of superior quality for special purposes are able to run their plants at a profit. This tendency of the British sheet iron industry to seek the seaboard is materially hailed with satisfaction in South Wales, where it is likely to furnish a welcome field of effort for some of the capital and labor which has been displaced by the decline in the tin plate trade of that region. Llanelly, the erstwhile tin plate capital, is already coming to the fore as a center of sheet iron manufacture, and at other places in the neighborhood sheet mills are being erected or are in contemplation. So it is, as ever, an ill wind that blows no one any good.

The Caracas Warehouse.—It is expected that on or about March 26 the warehouse which the National Association of Manufacturers is establishing at Caracas, Venezuela, will be opened. This warehouse will be for the purpose of exhibiting permanently goods of American manufacture. There will be present at the opening officials of the Venezuelan Government, prominent South American merchants, and several manufacturers from the United States. Rudolph Dolge, the association's special commissioner to Venezuela, is now in Philadelphia at the association headquarters, completing final details. He will leave for Caracas on the steamer "Venezuela," sailing Saturday next. It is the general opinion among the large manufacturers in this country that much good will be accomplished by this warehouse, and about 60 manufacturing concerns of prominence have already secured space. This number will, doubtless, be increased considerably as soon as the house is opened. An American manufacturer who has very successfully invaded the South American field with his goods said to-day: "American manufactures are very much in demand in the Pan-American countries, and the warehouse system will furnish a good opportunity of bringing our goods to them, if properly operated."

We are advised that a company have been formed by P. H. Abernathy, Asheville, N. C., to work some of the mica properties in Mitchell and Yancey counties, N. C. Among the first to be put in operation will be the Sink Hole, Clarissa and Cloud Land mines. The company will have under their control, we are advised, some of the best properties in that section. Their offices and cutting house will be located at Asheville, which will be the distributing point.

The Goheen Mfg. Company, Canton, Ohio, issue a circular giving many testimonial letters referring to the merits of their products. In addition to manufacturing carbonizing coating this firm make a full line of ordinary structural paints, including graphite, iron oxide, carbon, iron ore, asphaltic mixtures and magnetic reds and browns. To any one interested in the subject they will be glad to send their pamphlet giving information on the preservation of iron and steel.

The final step in the water power system at the Falls of Foyers, Scotland, which was undertaken by the British Aluminum Company for the operation of their works, has at length been completed, thus placing the company in a position to greatly enlarge their output of aluminum, for which the English demand is rapidly increasing. By means of the system a continuous 5000 horse-power is produced at the company's factory.

The large plant of the F. A. Walsh Company, manufacturers of packers' tinware and tinning machinery, Milwaukee, Wis., was destroyed by fire on January 22.

The Treasury Department has decided that aluminum exported in the form of sheets, plates, bars or ingots manufactured by the Pittsburgh Reduction Company wholly from imported alumina, reduced by the electrolytic process, is entitled to a drawback equal in amount to the duty paid on the imported material used, less a deduction of 1 per cent.

DETROIT SMELTING & REFINING CO.,
Detroit, Mich.

Special Notices.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"

office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

FOR SALE.

ESTABLISHED 1891. OLDEST—LARGEST—BEST.

Domestic Electrical Work.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down any one without the slightest knowledge of electricity should be able to do the work described.

CONTENTS.

Chapter I.—Simple Bell Circuit.
Chapter II.—Multiple Bell Circuit.
Chapter III.—Various Circuits.
Chapter IV.—Fire Alarms.
Chapter V.—Annunciators and Alarms.
Chapter VI.—Burglar Alarms.
Chapter VII.—Automatic Fire Alarms.
Chapter VIII.—Electric Gas Lighting.
Chapter IX.—Running Wires in Finished Buildings.

PRACTICAL HINTS —ON— JOINT WIPING,

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages.

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, **25c.**

—TROUBLES OF A LIVELY LAD.—A small boy thus philosophizes in *Truth*:

I wisht ma wouldn't kiss me every time she wants to see if I've been smoking on the sly.

Sunday-school wouldn't be so bad if you didn't have to go. I can lick every kid in my class 'cept one, and he don't come regular.

I don't know why, when I run away from school last week and fell in the river, and ma thought I was going to be drowned, and cried, then when I wasn't she went and licked me harder'n anything. I wisht I had drowned.

Ain't it queer how it most always rains on Saturday?

If a feller's mother didn't tell him he mustn't do so many things he wouldn't want to.

I don't like to fight girls. They scratch, an' any way, when you do lick 'em, they always make you feel so bad about it afterwards. They hain't got any sand, 'cept one; she didn't scratch and she walloped me good. Gee! but she's a dandy.

I was good for a week once, and ma she thought I was sick an' give me a dose of castor oil. An' then I was sick, an' I wasn't good no more.

THE NEW METAL WORKER PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given, 75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

Tne opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a compiete

Making a Kick

about the quality of a roof after the work is done and paid for is futile in most cases; but there are some roofers so conscientious that a "kicking" customer is an abomination. If the same amount of time spent by such roofers in pacifying "kicking" customers had been devoted to selling for the roof GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES, the best, and *only* best brand of roofing plates on the market, the sale would have been made and there could be no room for a kick from the hardest of customers, as time and weather do not affect these plates and they cannot fail to satisfy the most exacting householder.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Iron Bars, by the good old fashioned hand methods employed 50 to 75 years ago in making charcoal tin plates, insuring absolute freedom from pinholes. No better plate *is* made; no better plate *can* be made. For roofing or tinware they are unequaled.

GUMMEY, McFARLAND & CO., PHILADELPHIA.

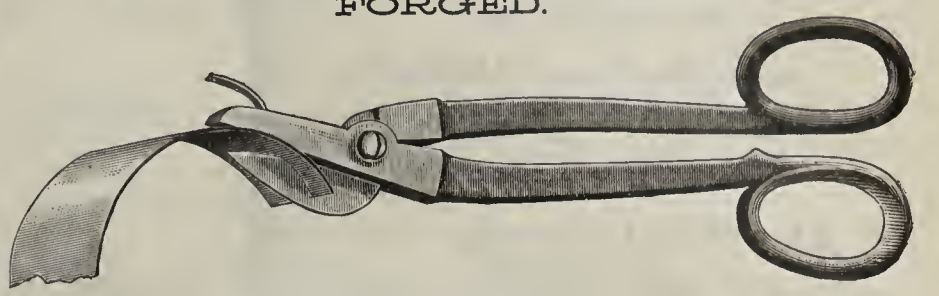
Niagara Stamping and Tool Co., Buffalo, N. Y.,

MANUFACTURERS OF

Tinsmiths' and Roofers' Tools, Shears, Presses, Dies, and Special Machinery for Sheet Metal Work.

NIAGARA HAND SLITTING SHEARS.

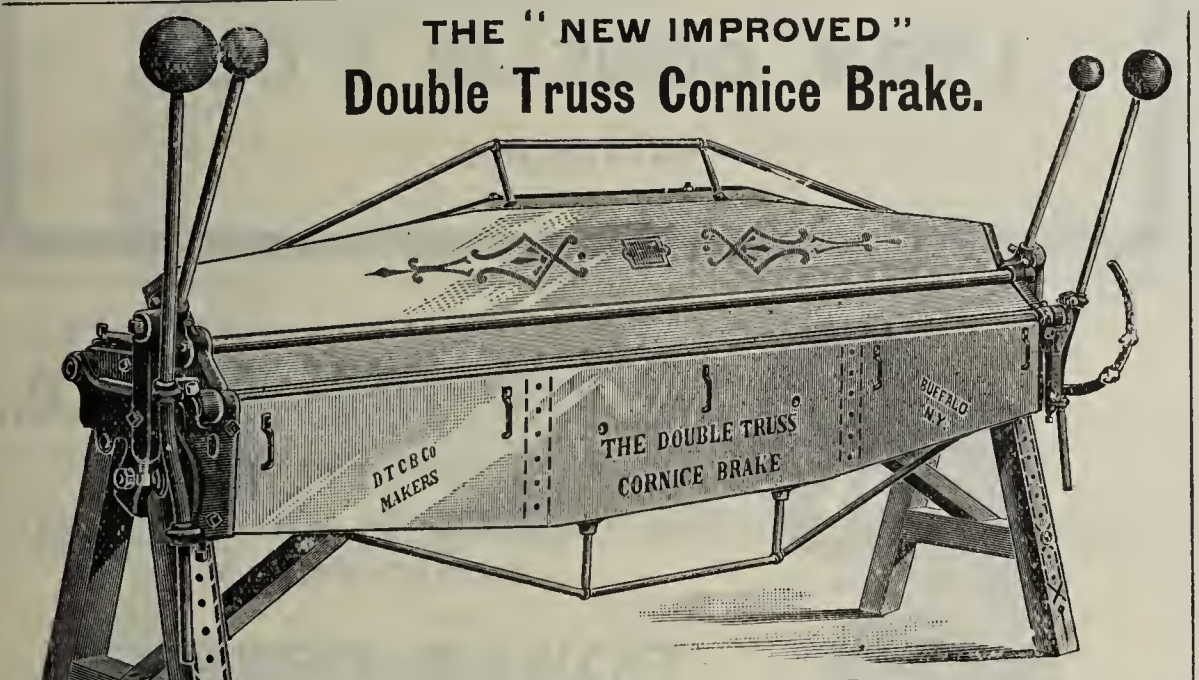


These Shears are distinguished from ordinary Tinners' Shears through the peculiar shape and arrangement of the jaws and handles. The lower jaw is relieved to allow the material to slide backwards freely. Both of the handles remain above the work while cutting. A sheet of any length can be cut apart without trouble and injury to the hands of the operator.

They are especially adapted to cutting apart long sheets, cutting corrugated sheets lengthwise, which cannot be done with ordinary snips, and they are very handy in taking up and repairing metal roofing. Drop forged of best wrought iron and with steel-laid jaws, carefully tempered.

NIAGARA DOUBLE CUTTING SHEARS.

FORGED.



Niagara Double Cutting Shears are made in the most durable manner. The center blade is of solid tool steel, and the outer jaw is laid with tool steel. Both handles are drop-forged of wrought iron.

The Double Cutting Shears were designed especially for cutting apart cylinders of sheet metal. They are also very useful for cutting holes in sheets, cutting off the bottoms of cans, pails, etc., and a variety of other work. The center blade is pointed so as to be readily inserted in the sheet at any point, to start the cut. A narrow strip of metal is cut out, and both edges are perfectly smooth.

166 pages, illustrated throughout, cloth, price, $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

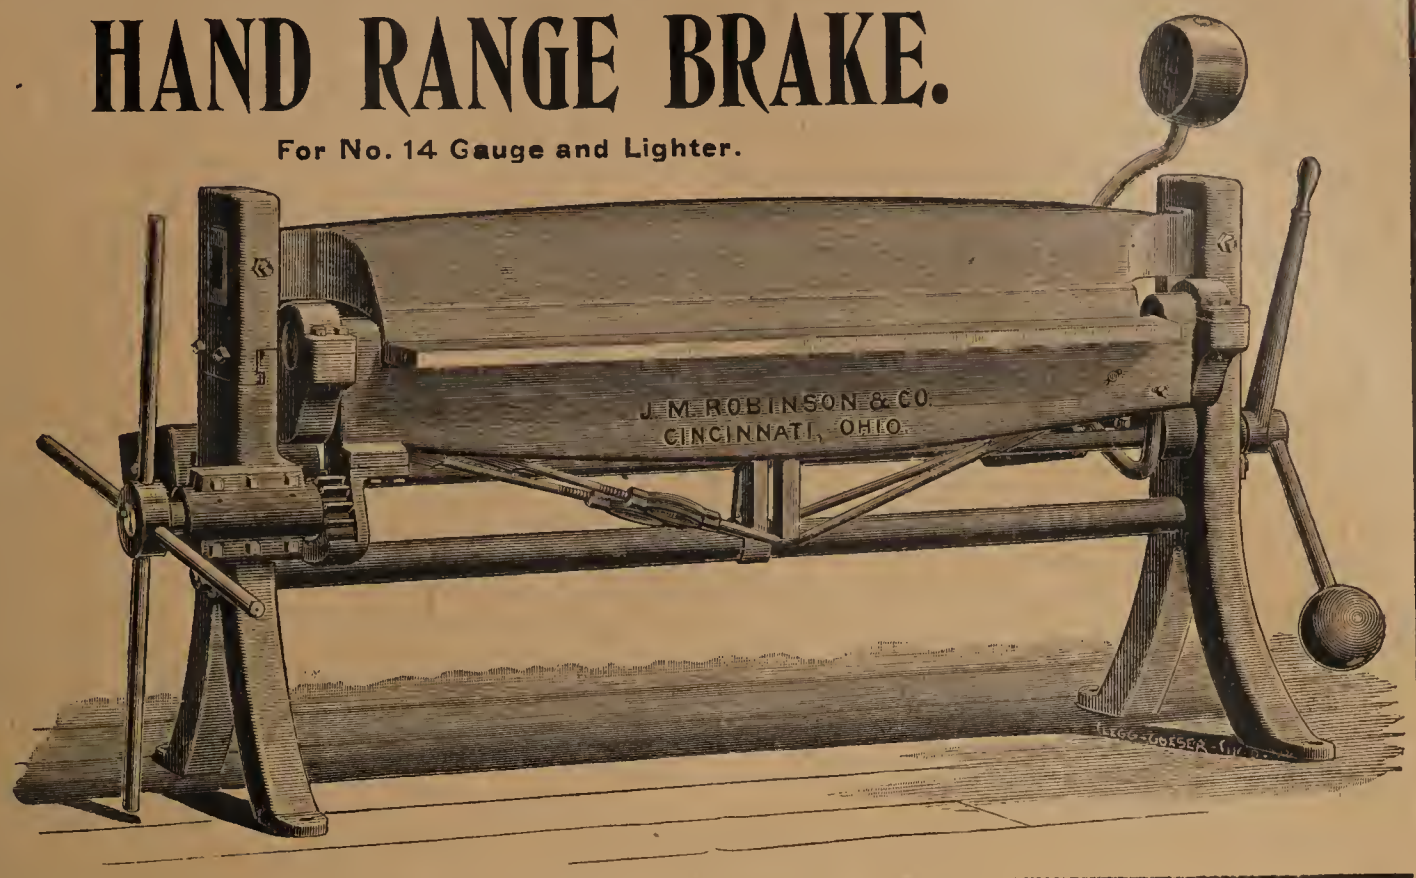
BERTSCH & CO.,
CAMBRIDGE CITY, IND.

—WHAT THE BOY SAW.—The bright boy's mother is cultivating his bump of observation. "Now, Johnny," holding up a picture card, "shut your eyes and tell me what you saw on this card." "A cow, a barn, a horse," rattled off the bright boy, glibly. "What else?" "Nothin'." "Oh, yes; think now, what did you see behind the cow?" referring to the trees in the background. A moment's reflection. "Her tail," shouted Johnny, ecstatically.—*Chautauqua Assembly Herald.*

—STRATEGIC MOVEMENTS.—First Boy—See here! didn't I see you running down street yesterday with Bill Bounce after you, wantin' to lick you?



Second Boy—Y-e-s.

"What did you run for?"

"I—I was only running so as to get him away from home, so his mother couldn't see him fightin'; but by the time he was out of sight of his house we got in sight of our house; and then, as my mother would see me if I stopped to hit him I went in, so as to be out o' temptation!"—*New York Weekly.*

RANGE MANUFACTURERS' 6-FOOT GEARED HAND RANGE BRAKE.

For No. 14 Gauge and Lighter.

Possesses all the features of the power brake made from the same patterns. Bending bar is operated with a pilot wheel, and imparts great power to the bending bar through the medium of spur gearing meshing into segment attached to the bending bar. Send for complete catalogue and discounts.

—This is a composition on temperance, written by a little Georgia girl: "Temperance is more better than whiskey. Whiskey is 10 cents a drink, and lots of it. My pa drinks whiskey. He has been full 113 times. One night he came home late, and my ma went out and cut some hickories and walloped him good. Then she ducked his head in a tub of soapsuds and locked him up in the barn. And the next morning my pa said he reckon he'd swear off."—*N. Y. Tribune.*

—English as She Is Wrote.—Typewriter—I am rapid enough, and understand business forms all right, but I must admit that I cannot spell.

Colonel Waring, the well known street commissioner of New York City, estimates that in 1897, ***$200,000 of coal was thrown out with the ashes into the streets of New York.*** If there is this waste in that city, it exists proportionally elsewhere.

This evil can be in a great measure avoided if proper heaters are installed and care exercised in their use.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.

MY DEAR SIR :

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal.

Very truly,
I. N. EVANS.

Gurney

HOT WATER HEATERS and STEAM BOILERS have proved themselves to be eminently satisfactory to the Trade and Fitter, in general, wherever used.

It shows a ***Bright Idea*** on the part of the fitter when he recommends the use of Gurney Boilers, as he knows they will stand up to their ratings and do all that we claim they will.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice.. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.
" 10. High and Low Pressure Steam Heating and Power Plant
" 11. Exhaust Steam Heating.
" 12. Power Fan or Blower System of Heating and Ventilating.
" 13. Design. Estimate. Specification.
" 14. Dwelling House Heating.
" 15. A Successful Heating Job.

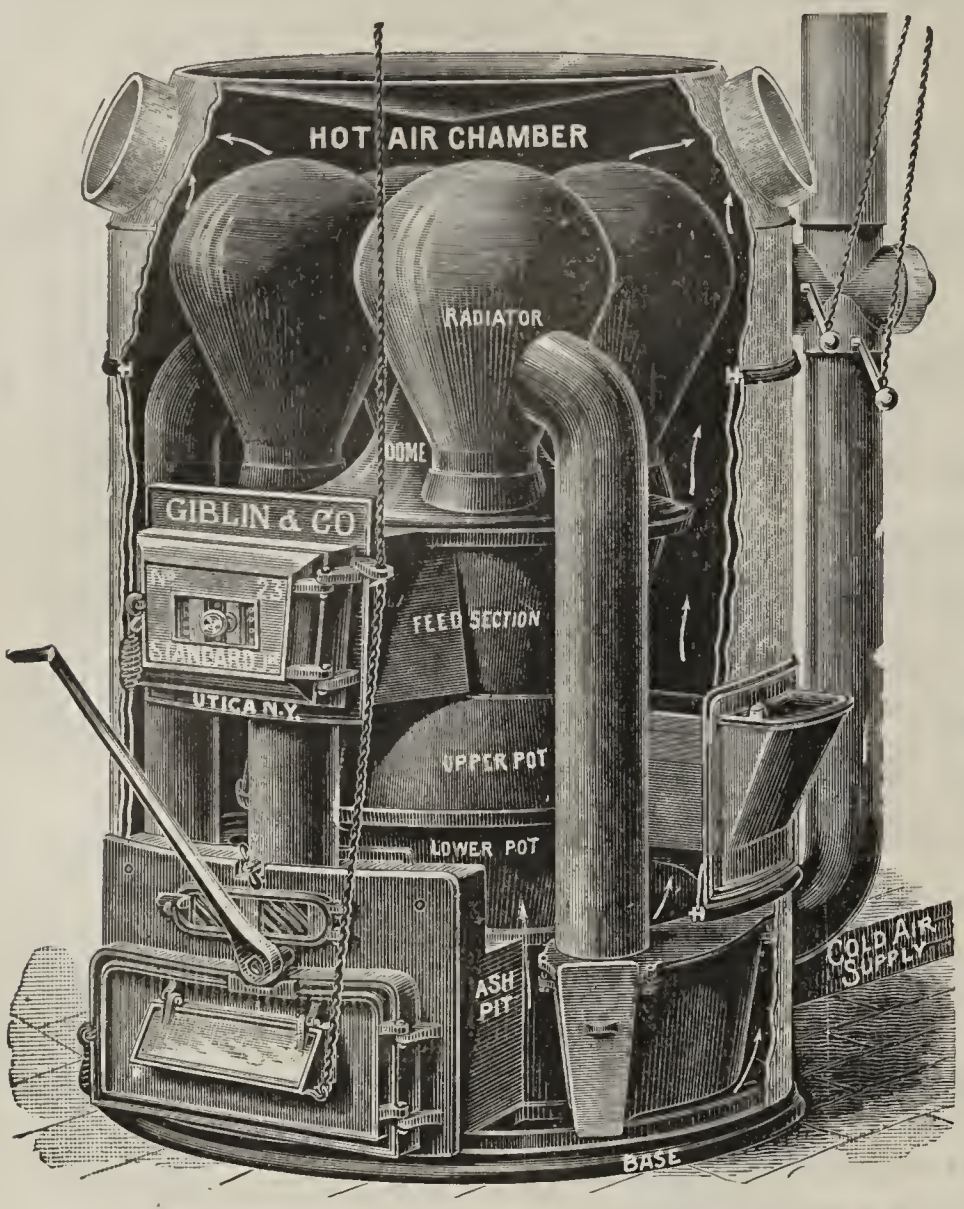
THE METAL WORKER
Stove Storage Receipts.

FOR the accommodation of Stove Dealers who desire to undertake the summer storage of stoves for their customers, we have printed books of Receipts arranged on a new and ingenious plan. The Receipt to be given to the customer is on one side of the page, and on the other side is a Memorandum of the conditions, needed repairs and storage charges agreed to. *Opposite the Receipt* is its Duplicate, and *opposite the Memorandum page* is its Duplicate. When the leaf which has the Receipt on one side and the Memorandum on the other is torn out for the customer, it leaves Duplicate of Receipt and Memorandum on pages facing each other.

This arrangement has the advantage of bringing the two Receipt pages and the two Memorandum pages opposite each other, before the customer's Receipt is removed, facilitating copying and comparison, so that the Receipt and Memorandum given to the customer may *exactly correspond* with that retained by the person who receives the stove for storage.



Substantially Bound in Canvas.

100 Receipts and 100 Duplicate Records, $1.00.

Sent, post-paid, on receipt of price, by

DAVID WILLIAMS CO., Publishers,

232-238 WILLIAM ST. - NEW YORK.

PROSPERITY COMES

to the well equipped furnace dealer, and without an efficient article in the way of a furnace, no matter how prosperous the times are, trouble and loss will result. People who build residences in these times want to know that they have a thoroughly efficient heater and that it is well installed. We have the heaters, and with a combination of these heaters and a skillful, intelligent furnace setter we guarantee satisfaction to every buyer.

DOING FURNACE BUSINESS

year after year at a loss means mistakes somewhere, and prudent dealers will consider whether or not the furnaces they sell have anything to do with their loss.

AFTERCLAPS

in the way of additional time spent in altering furnaces, in making repeated tests to show the working, quickly consume any possible profit that may be made on the sale and turn profit to loss. Our heaters render unnecessary anything after the first cost and the profit can therefore be counted upon for a certainty. No better furnaces are made and our

CATALOGUE

will demonstrate this.

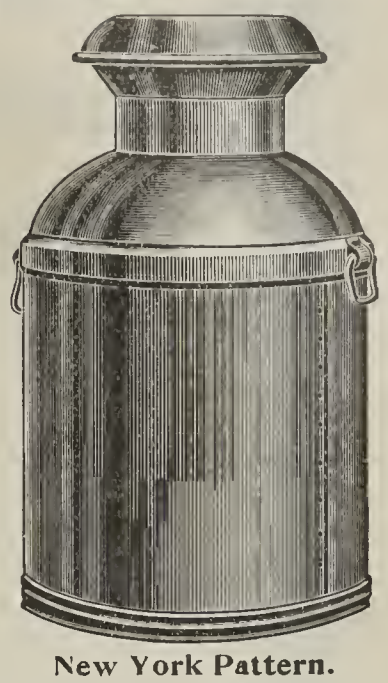
MILWAUKEE R. R. MILK CANS.

A PERFECT CAN AT A MARVELOUS PRICE.

Iowa Pattern.

THIS CAN



is made of heavy wrought steel. The neck and bowl, which is drawn in one piece, is double seamed to the breast, and the breast is double seamed to the body in such a manner as to form a very strong and rigid edge, and is protected by a heavy beveled edge iron band. The body and bottom rest on the O. G. heavy iron bottom band. The can is put together in the black and then double tinned very heavily, making it the strongest, most perfect and durable can on the market.

Watch Your Cues and Figures

The fellow who wants to do business must stir up his customers with a furnace that's built differently from the ones the other fellows sell. He wants a furnace that will stand investigation like ***this*** one, so he can worry his competitors with good working points. There is oftentimes too much similarity with furnaces to make a choice any object except the price. If a dealer makes money in the furnace business he wants goods that look well, which sell easily, and give good satisfaction when used.

PATENTED JULY 13th, 1897.

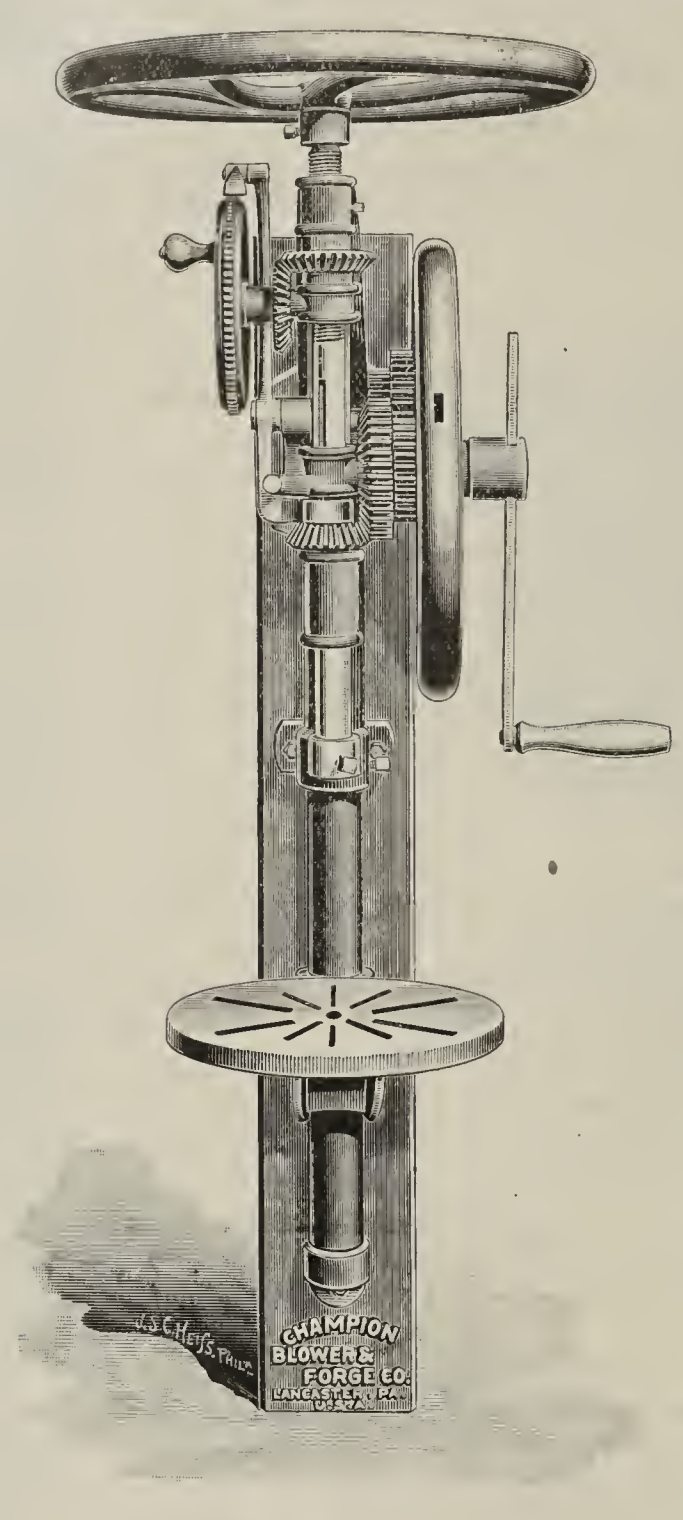
The Business Situation.

Business conditions continue to display a steady and satisfactory improvement. The volume of general trade, as shown by bank clearings, is larger than ever before at this season. Last week's aggregate of clearings was 54.7 per cent. greater than for the corresponding week of 1897, while the month, so far, shows a gain of 44.3 per cent. over last year and 16 per cent. over 1892. Commercial loans show a notable expansion, the demand for money for mercantile and industrial employment being unusually active. Spring trade has already begun to move in various quarters, with an excellent outlook for a large volume, not only in the West but also in the Central and Southern sections of the country. The annual mud blockade, however, in the West and Northwest, is reputed to have set in and this is likely to interfere with the distribution of merchandise for some weeks to come. In the East improvement in trade, while clearly visible, is not so pronounced as elsewhere, while the weather has had a restrictive influence on business in some quarters. A notable feature of the week has been the Leiter corner in wheat, which has sent up the price of the cereal in Chicago to the highest point since 1891. Corn has also advanced nearly 1 cent a bushel. At the same time the export movement of grain continues surprisingly large in the face of the recent advances. A rise of 5-16 cent in the price of cotton imparts a more cheerful tone to the business situation in the South, where the low price of that staple has exerted a restrictive influence on trade for some time past. Railway earnings continue to show steady and substantial gains, which are likely to be progressive. Prices in general display a more definite upward tendency, especially in the iron and steel and metal markets. Only tin plates remain in the rut. On the Stock Exchange, early in the week, there was an active investment movement in the best securities, both by home and foreign buyers, with higher prices, and speculative business asssumed large proportions, helped by the continued ease in money rates. The lamentable occurrence at Havana, however, had a depressing effect in Wall street, and stock values reacted materially in the latter half of the week, owing to the fear of international complications arising from the destruction of the battle ship "Maine."

Fires in High Buildings.



The destruction last week of another so-called "fire proof" business structure in New York City affords an additional illustration of the practical impossibility, under the present conditions, of checking a fire when it attacks the upper floors of a modern "sky scraper." Since business buildings have towered to a hight of over six stories the difficulty of providing adequate fire protection has become almost insuperable. Chief Bonner, of the New York City Fire Department, than whom there is no higher authority in these matters, does not scruple to declare that none of the modern "sky scrapers" are fire proof, and that once a fire gets a good start in one of the upper stories nothing can be done but to let it burn. He holds that it is utterly impossible to fight a fire above a distance of 125 feet. The only remedy that is suggested is the adoption of interior fire plants and the organization of a fire corps of employees to operate them in case of an outbreak. A number of the high modern buildings in New York are already supplied with interior stand pipes and the necessary equipments, but the majority of the owners of such structures are content to depend upon the so-called fire proof construction of the walls and floors, a protection which time and again has been proved fallacious in actual experience. The insurance companies are actively working in this matter, however, and it is not unlikely that pressure will be placed on the Building Department to compel owners of buildings over six stories high to provide their own fire fighting apparatus. It is not merely a question of danger to the building itself and its occupants, but also to the lower buildings adjoining, and to those across the street, when the street is narrow, as is so often the case in the crowded parts of a city. This was proved in the case of the recent fire in Nassau street, when the two buildings on either side of the high structure were burnt out and those opposite were damaged and only saved with difficulty from sharing a similar fate.

Last Saturday the anniversary of Lincoln's birth was more generally observed throughout the country than ever before. Five States already mark the day by law as a public holiday, and it is likely that several others will follow suit before another year rolls round, even if Congress does not in the interval decree its general observance. More and more, as the years go by, does public opinion incline to elevate the memory of the martyr-President to the highest point of honor and reverence. As the figure of Abraham Lincoln recedes into history, the more heroic proportions does it assume and the larger the space it occupies—a true criterion of real greatness. His comparatively brief national career, embracing only eight or nine years, was yet long enough to cover the most critical period in the history of the nation to which he rendered such splendid services. A child of the people, reared in extreme rustic poverty, he climbed the hights of success by sheer force of character until he was chosen by the people to direct the destines of the republic from the highest

place in the nation. His single hearted patriotism, the unassuming modesty of his nature, his sterling honesty, his firmness and self control in the face of immense responsibility and danger, his sympathy with suffering, his passion for justice and his hatred of wrong, his broad charity and thorough humanity, combined with his unexampled common sense, conspired to make Lincoln the highest type of a man and the most complete embodiment of true Americanism. This it is which will ever keep his fame pre-eminent.

Champion Black Diamond Blacksmiths' Self Feed Post Drill.

The accompanying engraving shows the new blacksmiths' drill which the Champion Blower & Forge Company, Lancaster, Pa., are putting on the market. The

Champion Black Diamond Blacksmiths' Self Feed Post Drill

makers state that the illustration shows the construction of the drill to be new in principle and to possess merits. The gearing is designed for easy and quick running, being compounded for the increasing of power. The side fly wheel in connection with the top fly wheel is claimed to be a very practical feature when it is considered that both fly wheels make two revolutions to one revolution of the crank. The second speed, for heavy drilling, is very convenient, and instantly changeable, the change being effected by transferring the crank handle to the side fly wheel. The makers state that the machine embodies the best of material and workmanship, with all bearings ground from solid metal, and that it appeals to all persons wishing a perfect drill and yet unwilling to go to the expense of a cut gear drill. The machine drills to the center of an 18-inch circle, and unless otherwise ordered is furnished with a spindle bored to take in ½-inch shank drills. It drills from 0 to 1½-inch hole, and its weight is 200 pounds. It is furnished for use with power when required.

Felt Mats for Rails.

Engineers and railway men are much interested in the results of tests now being made abroad with mats of felt, which are designed for laying under the rails of street railway lines for purposes of protection and sound deadening. The new mat, which is a German invention, was first exhibited at Leipsic last summer and attracted considerable attention. It is described as made of strong wool, which is thoroughly impregnated with oils, then superficially coated with glue which has been rendered insoluble by the addition of sodium bichromate and formaldehyde, and then very highly compressed to form plates from ⅛ inch to several inches in thickness and of various sizes. They are especially recommended for crossings and bridges, but are desirable for use all along the track, and it is claimed that they tend to prolong the life of the rail by lessening the wear on it. The surface of the mat is said to be so hard that a rail may be placed upon such a piece of matting without cutting into it. In addition the claim is made that by placing the mats under the bed plates, bearings between the joists and other such places in the engine rooms, the noises therein will be reduced to a minimum. The material is known by the name of iron felt. The main question is as to how long the mat will retain its elasticity. Another recommendation for the preparation is that it prevents rotting.

At the annual meeting of the Boston Electrical Club, held last week, a novel feature was introduced in the form of a long distance telephone entertainment. A telephone receiver was placed at the side of each of the 70 members of the club who sat down to the banquet and suspended from the central chandelier was a megaphone. During the evening a number of professional entertainers in New York transmitted songs and humorous talks through the telephone for the delectation of the Boston electricians, and President Chandler of the Postal Telegraph Cable Company, sitting in his library in Brooklyn, N. Y., delivered an address to the diners in Boston. Several other long distance speeches were also made. This plan would give an excellent opportunity for the multiplication of the *post-prandial* oratory of such famous speakers as Chauncey M. Depew, whose services, it is understood, are in such general request for festive occasions that he is forced to decline an enormous number of dinner invitations. By the aid of the long distance 'phone, the genial Doctor, from his library in New York, might charm the ears of thousands of diners with his wit and wisdom at one and the same time, thus saving time, labor and the undue strain on the digestive organs which a steady course of banquets must entail.

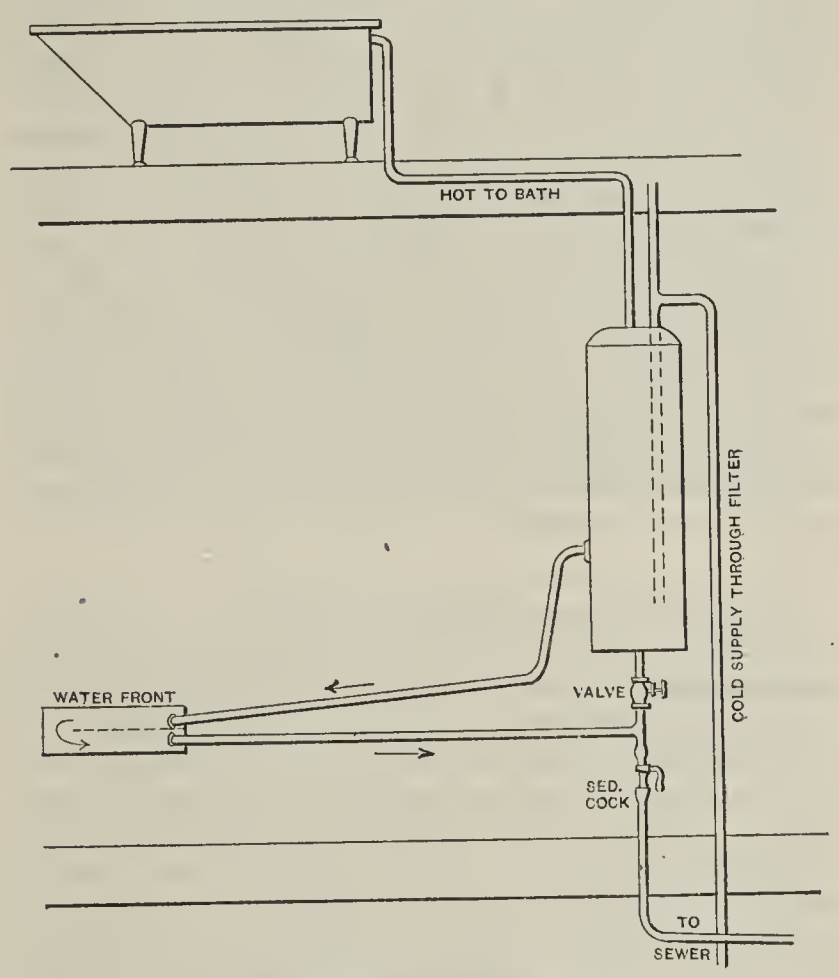
James Cooper, who has been an employee of the American Tube & Iron Company, Youngstown, Ohio, ever since they were started, recently patented a furnace for garbage disposal and has put in a bid to furnish Youngstown with one of the plants. Mr. Cooper has severed his connection with the American Tube & Iron Company to give his entire attention to the garbage furnace. As an indication of the high regard which was felt for him by his fellow employees they presented him at leaving with an elegant writing desk.

Mayor Harrison of Chicago has issued notice to the telegraph and telephone companies in that city that some 4000 overhead wires in the downtown district will be cut down by the city unless steps are taken to place them underground before March 1. The recent storms have proved that these wires are dangerous to life in the crowded business districts of a city. A number of broken wires falling across the trolley wires in Chicago and other cities have caused the death of several horses. In case of fire, the firemen also have to face a danger in consequence of the overhead wires. Mayor Harrison is determined so far as practicable to bury every wire in the city, and so do away with as much of the danger as possible.

F. K. Glidden, president of the Glidden Varnish Company, Cleveland, Ohio, sailed with his family on the steamship "Normannia" February 12, for a three months' trip through Italy and the Orient.

Daniel L. Jones, one of the oldest residents of Williamsburg, Brooklyn, N. Y., died February 11 at his home in that city, aged 92 years. He was born in Wales, but came to this country in 1832. He was engaged in the manufacture of lamps and gas fixtures.

THE LETTER BOX.



Computing Surface Exposed by Pipes.

From W., Milwaukee, Wis.—Please give me through *The Metal Worker* an easy method of finding the amount of heating surface exposed in 1 lineal foot of pipe ranging from 1 to 4 inches in diameter.

Answer.—The circumference of the pipe in inches should be multiplied by 12, the number of inches in 1 foot. This will give the number of square inches in 1 lineal foot, and for the smaller size by dividing the product into 144, the number of square inches in a square foot, the result will be the number of lineal feet that will be required to expose 1 square foot of surface. In larger pipes than 4 inches the product will need to be divided by 144. We give an instance of the method of calculation for 1-inch pipe. The actual circumference of 1 inch pipe is a fraction over 4 1-10 inches. This multiplied by 12 will give a fraction more than 49 square inches. Dividing 144 by 49 it is found that 2 9-10 lineal feet of 1-inch pipe will be required to expose 1 square foot of surface. The size of pipe is determined by internal diameter, and in the smaller size the thickness of the pipe varies very little from ⅛ inch. Adding the thickness of the two sides of the pipe to the internal diameter will give the total diameter. Multiplying the diameter by 3.1416 is a common method of arriving at the circumference. This laborious method of calculating the surface is, however, seldom used, for the reason that tables are printed by the manufacturers of wrought iron pipe, which can be secured on application, and these tables are also given in the catalogues of many of the dealers in plumbers' and steam fitters' supplies. A table giving this information and a great deal more in reference to pipes was printed in *The Metal Worker* of August 17, 1895. From that table we give the following information : To present 1 square foot of pipe 2 9-10 lineal feet of 1-inch pipe are required, 2 3-10 feet of 1¼-inch pipe, 2 feet of 1½-inch pipe, 1 6-10 feet of 2-inch pipe, 1 3-10 feet of 2½-inch pipe, 1 1-10 feet of 3-inch pipe, 1 foot of 3½-inch pipe and 7-12 foot of 4-inch pipe. This information is approximately correct for standard sizes of wrought iron pipe.

Trouble from RustyWater.

From Plumber, Pennsylvania.—We will be grateful for any assistance we may receive in locating the trouble we describe in connection with the sketch of a plumbing system presented herewith. We have a 30-gallon modern copper range boiler in a private residence in our town, and are troubled with discolored and apparently rusty hot water. The boiler is set about 5 feet from the range and is connected to the water front with brass circulating pipes and fittings, as shown. The water front is cast iron, and has been in use only four months. The water in the residence is filtered through a Hyatt filter which does its work beautifully, the water being clear as crystal when it enters the boiler, the filter being located in the basement, as shown. The water is carried to the boiler through ¾-inch galvanized iron pipe, and is delivered near the bottom of the boiler through a tinned copper tube. The water is carried from the boiler to the fixtures through ¾-inch galvanized iron pipe that has been in use since 1885. When the water is cold there is no discolored water from the hot water bibb, the discoloration increasing with the heat, being the worst when the water is hottest ; and then it is so bad that it is ruining a fine enameled bathtub, and the water is almost always extremely hot. In order to be sure of washing the boiler we have placed a stop cock between the boiler and the pipe leading to the water back and another cock below this pipe to serve as a regular sediment cock. By opening the sediment cock and closing the cock above it the water enters the water back through the pipe leading to the side opening in the boiler and passes through the water back, under the partition shown by the dotted line, and out through the sediment cock to the sewer. We have washed the boiler and water back as long as half an hour at a time to remove any accumulation of rust that might be located there.

Trouble from Rusty Water.

Note.—We shall be glad to have our readers who have had troubles of a similar character describe the remedies applied. We are inclined to the belief that the trouble comes entirely from the piping. The boiler could not

The Velocity of Hot Air Furnace Currents.

From J. C. C., Cleveland, Ohio.—We would be glad to learn through the valuable Letter Box of *The Metal Worker*, from the heating trade who are posted, the velocity with which air travels in a hot air furnace system under proper conditions. We assume that a hot air furnace is installed in a proper manner, amply large enough to heat the house in which it stands, with cold air box having an area equal to two-thirds of the entire area of all the hot air pipes running from the furnace. We would like to know at what velocity the air will travel on entering the cold air box in ordinary winter weather without any wind blowing. Also at what velocity the air will be discharged at the different registers under the same conditions. We would also be pleased to have the opinion of *The Metal Worker* on this subject.

Note.—We leave this question for our readers to answer, as we hope information will be furnished which is the result of actual test. There are many engaged in the heating business who have made such tests, and we hope that they will make a free use of *The Metal Worker* in relating their experience and commenting upon it. Our correspondent will find some information on the velocity of air currents in furnace heating systems in *The Metal Worker* Essays on House Heating.

produce rusty water and the method of flushing the water back would overcome any trouble from that source. It has been frequently reported that the galvanizing on pipes does not effectually protect them, and that in some instances the rust is sufficient to entirely fill up the pipe. When a house in which the piping is of galvanized iron is closed for a time and the pipes are left empty it is not uncommon for the first water that is drawn to be discolored from rust. In many instances after the pipes are washed clean no further trouble is experienced. The trouble from galvanized iron pipes rusting is the reason that many plumbers adhere exclusively to the use of lead service pipes. The age of the pipes in question leads to the opinion that the pipes are so corroded that the trouble will be difficult to overcome without replacing the pipes. It will be a simple matter to shut off the water and drain the system, then take out a section of pipe for examination. If badly corroded we would be glad to see a sample.

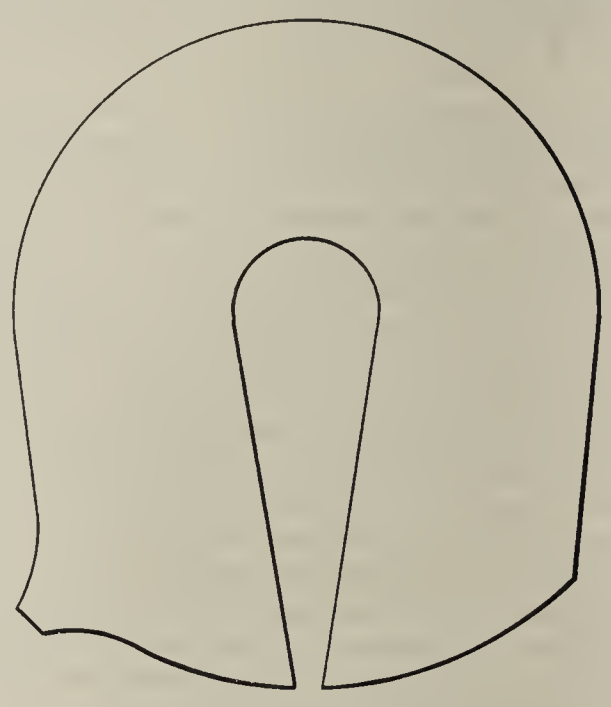
Laying Copper Valleys.

From W. Neubecker, New York City.—Replying to your correspondent "C.," Mansfield, Ohio, whose inquiries appear in *The Metal Worker* of February 5, would say that we are at present doing a repair job on St. John's Home in Brooklyn, N. Y., on which new copper valleys are being placed. I would advise him not to slide separate pieces under the slate, but to make a good job by removing the slates by means of the slate ripper, only removing as many as are required. Then lay in the copper valley as illustrated and described under the title of "Laying Copper Valleys," in the article on "Slate and Copper Roofing on Fire Proof Buildings," page 52, in *The Metal Worker* of December 4, 1897. The valleys should be of soft copper in 14 x 48 inch sheets, laying the slates close so as to show 2 inches of copper valley ; or in other words, let the slates lap the valleys 5 inches. In this manner we have done hundreds of repair jobs with good results.

From Pearl, Newton, Mass.—In reply to "C.," Mansfield, Ohio, in *The Metal Worker* of February 5, in reference to putting in new copper valleys, would say that I would take off the slate and put in valley flashings. If he undertakes to slide the flashings up underneath the slate, they will in time drop out and his job will go back on him. I think an open valley is the best—that is, take off the slate and line your valley with copper 14 or 16 inches wide. Then lay the slate back on the copper 4 inches on each side, leaving an open water course of copper down the center. This is the best way, but perhaps the owner or architect wants a closed valley.

From Jacob Hoover, 337 Reily Street, Harrisburg, Pa.—In reply to the inquiry of "C , " Mansfield, Ohio, in *The Metal Worker* of February 5, concerning laying copper valleys, I would advise him to make four valleys in one piece, say 16 feet long and wide enough to go up under the second course of slate. Have as few cross seams as possible, and solder them on both sides. If the valley is deep make it fit loose so it will have some room to give in cold or hot weather. Two cross bright tin soldered on both sides and a good coat of paint on both sides will make as good a valley as copper. I put one on a house here in Harrisburg 15 or 18 years ago, and it is in good condition yet. I will be very glad if Mr. "C." would let me hear from him.

Paper on a Metal Roof.



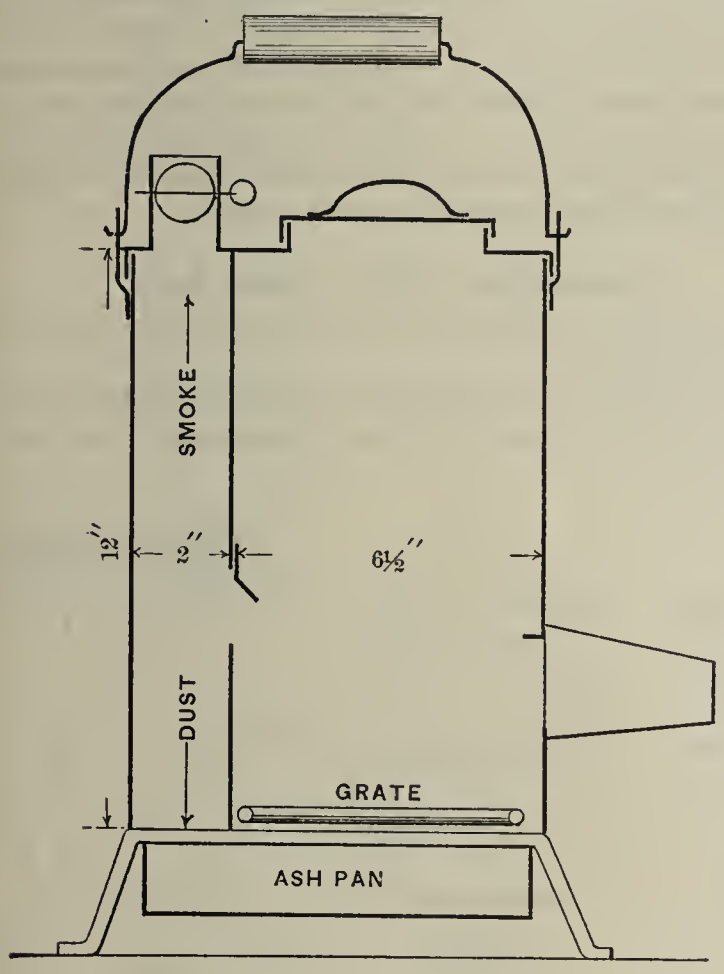
From X. Y. Z., Indiana.—Please tell me through the Letter Box what use paper is under a metal roof. Does it prevent the moisture from accumulating or does the paper absorb the moisture, and if so why will not this damp paper be injurious ?

Answer.—The idea of putting paper or any insulating material under a metal roof is not to absorb the moisture but to prevent the warm air inside of a room or building coming in contact with the cold metal, and thus condensing the moisture upon it. A covering of paper under neath a metal roof being a good non-conductor w main more nearly the temperature of the room than would the exposed metal, consequently the moisture will not be condensed. Our correspondent has often noticed, undoubtedly, the drops that form in summer time on the outside of an ice pitcher. If he will wrap a piece of flannel around that same pitcher he will find that no moisture is condensed, nor will the flannel be wetted.

How to Make a Horseshoe Magnet.

From R. T., Minnesota.—Please inform me through *The Metal Worker* how to make a horseshoe magnet. I desire to make one of special design, and would like to get it as powerful as possible for the size. I inclose a sketch of magnet desired.

Answer.—A permanent magnet of the horseshoe form, as drawn by our correspondent, should be made from a bar of good tool steel of the form like the drawing, and ½ inch think. If a thicker magnet is required, two or more magnets may be made, ¼, ⅜ or ½ inch thick, and drilled with three small holes through each piece to gauge, so as



How to Make a Horseshoe Magnet.

to bolt or rivet them together. Great care should be taken in forging not to overheat the steel—a cherry red is the proper heat—nor should the steel be hammered when the red is fading. When the forging is finished it should be annealed by heating to a full red heat and covered with hot ashes of the fire to slowly cool. When finished and ready to harden, heat in a large charcoal fire, evenly to a full cherry red ; holding the forging in a tongs at the bend, plunge it vertically in a pail of water in which a pint of salt has been dissolved. Finish on a grindstone or by emery wheel or stick, and have the surface perfectly clean. Then heat a flat piece of cast iron to a dull red and slowly slide the piece on to the plate at the bend first, so that that part will become a little hotter than the ends of the magnet. When the ends have become of a light straw color, and the bend slightly deeper in color, plunge in cold water, dry and oil to prevent rust. For magnetizing the horseshoe you will need a strong magnet of a similar kind to use by contact, or use a strong pair of electromagnets in contact with the flat sides of the horseshoe at the ends. In the absence of magnets wrap the legs of the horseshoe with tough paper, then wrap a coil of insulated copper wire, beginning at the end of one of the legs, wrapping closely until the bend is reached, then cross to the opposite leg and wrap it in the opposite direction toward the end. The copper wire when placed in the lamp circuit of any electric lighting system will charge the magnet. An armature of soft iron should be fitted to the end of the magnet, which will strengthen the charge and keep the magnet strong afterwards. Any engineer of an electrical plant will advise as to details in charging the magnet.

Tinners' Fire Pot.

From Warwick, Peterboro, N. H.—In reply to the inquiry of "E. E. H." in *The Metal Worker* of January 22 for tinners' fire pot, I would say that perhaps the one I use will suit him. I made it nearly two years ago when time was cheap and money was dear, so instead of buying it made one like the accompanying sketch. Fig. 1 shows an elevation of the square fire pot which was 7 inches wide and 8 inches deep from front to the back, and the body of it was 12 inches high. Across the back part of the body, as shown in the plan in Fig. 2 and in the elevation, I ran a heavy sheet iron partition, the partition being made of No. 16 iron, while the other parts of the fire pot are made

Tinners' Fire Pot.—Fig. 1.—Sectional View.

of No. 24. I made a suitable opening at the front for the insertion of the soldering irons, and provided a sheet iron hearth for them to rest on and also to prevent the coals from falling out. In cutting the opening in the front for the coppers I cut it 1 inch narrower than I required and then increased the opening by bending this portion inward at the top, as shown in Fig. 1, to prevent the coals from falling out when the irons were withdrawn. I cut an opening 2 inches high and 4 inches wide in the partition at the back of the furnace and riveted above this opening

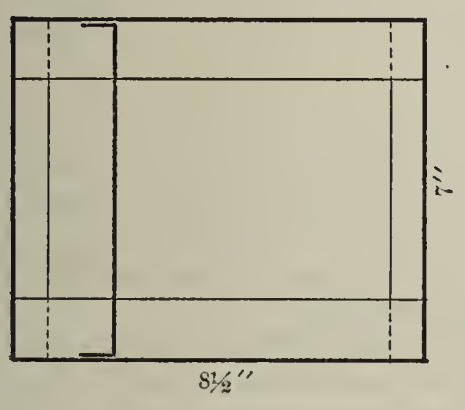


Fig. 2.—Plan at Grate.

a piece of sheet iron bent to an angle to prevent the partition warping inward from the heat. This heavy partition is fitted in very tight so that leakage cannot make the fire burn more freely than is desired. The opening in the partition is 5 inches above the grate. The opening for inserting the coppers is 2 inches above the grate. At the top of the furnace a round cover about 4 inches in diameter is provided for an opening for supplying charcoal to the fire. At the top of the 2-inch flue at the back of the furnace there is a 2-inch round pipe, so that the furnace can be connected with a flue if desired, and in the pipe is a damper so that the draft can be stopped when necessary. The bottom is constructed so that an ash pan slides in and out on ledges provided for the purpose. This ash

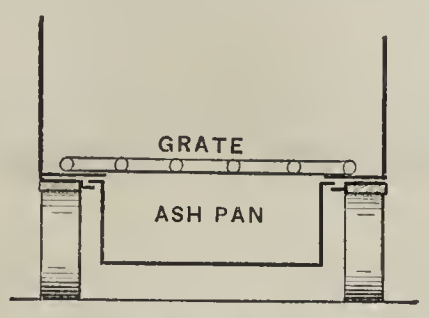

Fig. 3—Showing Method of Supporting Ash Pan.

pan is large enough to catch any dust that may drop down the flue at the rear of the stove. Fig. 3 shows the method of supporting the ash pan. Just above the ash pan a cast iron grate is provided to prevent the large coals from falling into the ash pan. I have found this stove very economical, and made it because I found that my gasoline stove did not heat my coppers, and as I was soldering copper work nearly all the time I found charcoal preferable. I also found that gasoline cost me 12 cents a gallon in the shop, while charcoal costs me but 14 cents a bushel. I can run my stove and get all the heat I want for one pair of 4 or 6 pound coppers cheaper on charcoal than on gasoline. I have used this stove a little on outside work, but as I do not do much outside I am not certain that it is large enough. It serves me well in the shop. The legs for the stove are made of band iron and riveted to the base.

Rating Furnace Capacity.

From O. S., Philadelphia.—Will *The Metal Worker* kindly inform me of a good and accurate way of finding the heating capacity of hot air furnaces for heating with hot air, the grate surface, dimensions of radiator, casings, &c., being known?

Note.—This is a subject which we will be glad to have discussed in *The Metal Worker*, and invite a free use of its columns for the purpose. In the meantime would refer our correspondent to the series of articles entitled "Rules for Proportioning Furnace Systems," which appeared in *The Metal Worker* March 13, March 27, April 17, April 24, May 1, and May 8, 1897.

Recent Examination of Plumbers.

From R. K., Oak Park, Ill.—I have read so much about the plumbers' examination at Milwaukee that I would like to know something of the cause of the failures. I have read about many helpers having passed examination, and some good plumbers failing to pass. The big percentage of failures also attracted my attention, and I would like to know the cause. Is it due to lack of education and knowledge of the theories or a want of mechanical skill and inability to wipe a 4-inch joint? What were the questions? If they could be published, I am sure it would interest many readers besides myself.

Note.—We do not know what questions were asked the Milwaukee plumbers, but if any of our readers can supply answers to these questions or give an account of the ground which they covered we should be very glad to have the information for publication in the columns of *The Metal Worker*.

Prof. Charles R. Richards, director of the Department of Science and Technology at the Pratt Institute, Brooklyn, which includes the trade and manual training schools of that institution, has been appointed to the chair of manual training in the Teachers' College of Columbia University, New York. Professor Richards was graduated from the Massachusetts Institute of Technology in 1885 and was connected with the New York Teachers' College before it became a department of Columbia University.

SHEET METAL WORK.

VARIOUS FORMS OF VENTILATORS.

BY W. N.

Various forms of ventilators which can be made by the sheet metal worker and do not interfere with the patented articles on the market are shown herewith. In Figs. 1 to 4 A A A indicate the braces. In Fig. 5 B is a half circular hood, riveted at C. In Figs. 6 to 10 are shown ventilators composed of elbows and tees and in Fig. 11 what is known as a revolving ventilator, in which A H H revolves on the pivot at E, while C and D are band iron braces riveted to the side of the pipe and through which the rod B passes, extending upward through the braces in the revolving cap at F and J, meeting the glass top E. A wing, A, is riveted to the top, as shown, while H H is cut out of the upper part and forms wings which catch the wind. In Fig. 12 is shown another form of revolving top. A is the revolving top, B the flaring portion to catch the wind, C D is the vertical rod, passing through the braces F, E and H and meeting the glass top J, which is kept in a horizontal position by the braces and metal K. The center rod on the top for the vents shown in Figs. 11 and 12 is filed as indicated at P in Fig. 12. In Fig. 13 is shown a form of ventilator with a closed top, B, and suction pipes at C, D and E. The wind blowing upward at E passes out at H and sucks out the air at F. The wind blowing downward, as at C, draws out the air, as shown by the arrow; no matter how the wind blows no down draft is experienced. In Fig. 14 A represents a section through a railroad car and shows the manner of applying ventilators to the transoms at B and C, an enlarged plan of which is shown in Fig. 15, in which S S represents a plan view of a transom window, in which a box shaped form is placed, made of sheet metal, flanging out on the inside of the car, as shown, having openings at E and D. A damper, C, is placed in this box with a pivot at P.

Now, when the car is going at speed in the direction of the arrow A the wind striking against the damper C, in the direction of the arrow B, closes the damper and keeps the wind from blowing into the car, but leaves the rear of the box at D open. The speed of the train causes a suction, which draws the foul air out of the car, as shown by the arrow D. Should, however, the train go in the opposite direction the damper will close, as indicated by the dotted line, causing the same results.

Tinsmithing Fifty Years Ago.

We have the following letter from John S. Brooks of Brooklyn, N. Y.:

Your Western correspondent, whose letter was in *The Metal Worker* February 12 about tinsmithing 50 years ago, wished to hear from others on that subject. The writer began tinsmith work at Rochester, N. Y., 53 years ago, and the men who worked in assortment shops made the same number of articles mentioned for a day's work at 75 cents per day's work so-called, and did about ten days' work each week. They were obliged to work lively to do that and most of them preferred stated wages of about $7.50 per week. We often got the boss to give us six dozen milk pans or some other lay out and would get through at 4 p.m., but could not keep up so fast through a week, and wanted also to get outdoors for a change, even at roofing or any hard work. Those days are past, never to return. The department store has made the prosperity of the modern tin factory, where a machine for producing the wire ring to hang up a dipper costs more than an entire outfit of the old tin shop. I saw the first circular shears and the double seaming machine, and

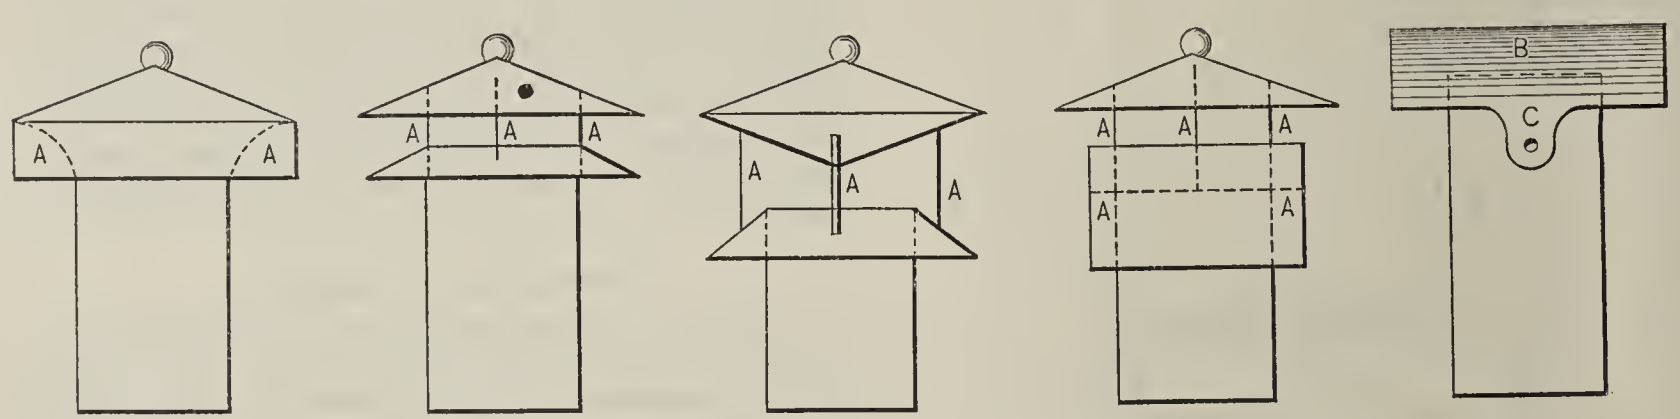

Fig. 1. *Fig.* 2. *Fig.* 3. *Fig.* 4. *Fig.* 5.

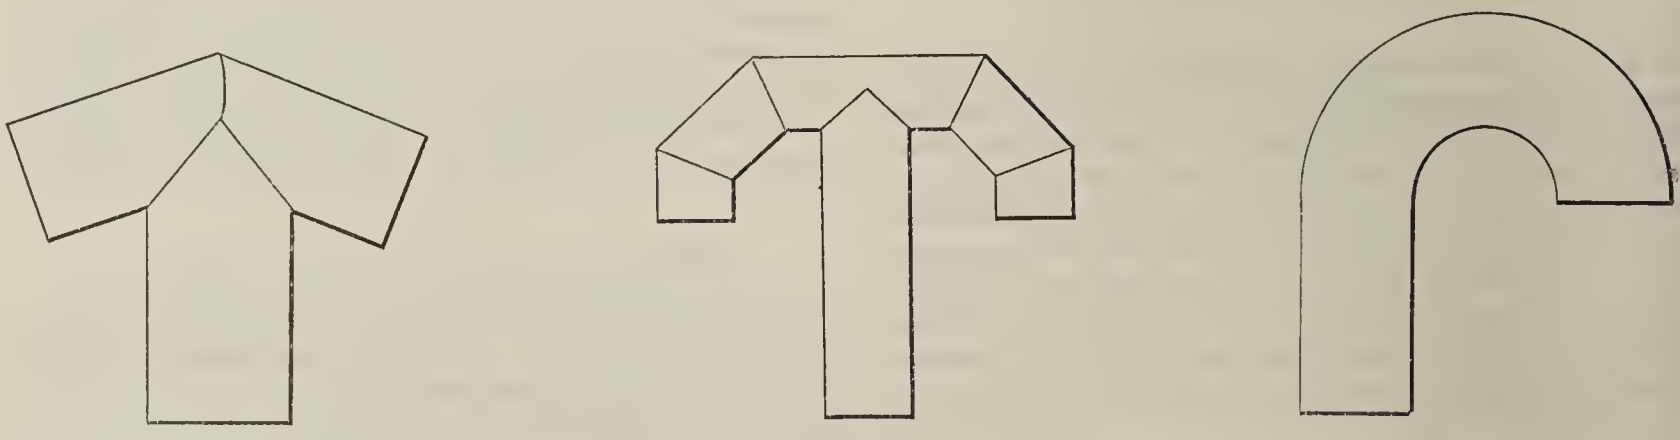

Fig. 6. *Fig.* 7. *Fig.* 8.

VARIOUS FORMS OF VENTILATORS.

it is a fact that very little change has been made in the old set of tinners' machines and tools from that time to this, and many shops now do not have them all, as in 1850. The workmen of that day were very superior intellectually to those of to day, who turn out four times the quantity by machinery. In a visit to Rochester lately I found that I am the only man living out of the ten who made up the firm and workmen of my old shop, and yet I am able to do a fair day's work in any emergency at the age of 68, but I do it without the drawback of stimulants.

Metal Sheathing for Passenger Cars.

At the last meeting of the Master Car Builders' Association, Mr. Appleyard described a passenger car on the New York, New Haven & Hartford, the exterior of which was finished with sheet copper instead of the usual finish of paint and varnish. No paint or varnish was used on the outside of the car body excepting on the roof, platforms, hoods and window sash. This car was put in service January 18, 1897, between New York and Boston, and Mr. Appleyard now advises us that the new finish has given satisfactory results, and that after a year in service the car has quite as good an appearance as when it first left the shop. The *Railroad Gazette* reports that a coach on the same road is now being covered with aluminum bronze and a third with sheet aluminum. The aluminum bronze finish will weigh practically the same as the copper, while the weight of the aluminum will be about one-third that of the copper finish. It is expected, however, that the aluminum covered car will cost more than would a similar car newly painted and varnished, but the difference in cost will be quite small.

The new method consists of covering each piece of wood sheathing, paneling, belt rails, letter boards, &c., with the sheet metal before applying the parts to the car, so that the metal fits tightly the wooden pieces. The sheathing is plated by means of a simple arrangement of rolls. Each piece of sheathing and its corresponding piece of metal is passed through the machine together and comes out ready for use, the metal fitting the tongue and extending into the groove at the sides. The sheathing is applied to the car in the usual manner, the grooved side being driven over the tongue and nailed so that the fastenings do not appear on the surface. The metal surface is not punctured in any place by the fastenings, and all joints are water tight. The numbers and letters on such cars are made of cast brass or aluminum as desired.

As previously stated, the first car turned out was covered with copper, and the cost of this car was about $50 more than it would have been had paint and varnish been used, but its cost was considerably increased because the process was new and the work was done slowly. It is stated that it requires from 800 to 900 pounds of copper to finish an ordinary passenger car, and that the first cost of metal plating cars need not exceed the cost of painting.

A saving can be made by using a less expensive grade of lumber with the metal finish than can be used under paint and varnish, and also with the new process the cars are less time in the shop. Where it requires 28 days to finish a coach under the usual system, the same work can be done by means of the metal plating in 18 days. There is an additional feature of the new system, in that it is not necessary to shift cars from one shop to another, but all the work can be done with the car in one place, thus saving the cost of moving the car in the shops. It has also been found that it costs less for cleaning metal covered cars in the yards than those finished with paint and varnish, while the appearance of the metal is not affected by service, as is the case with painted surfaces.

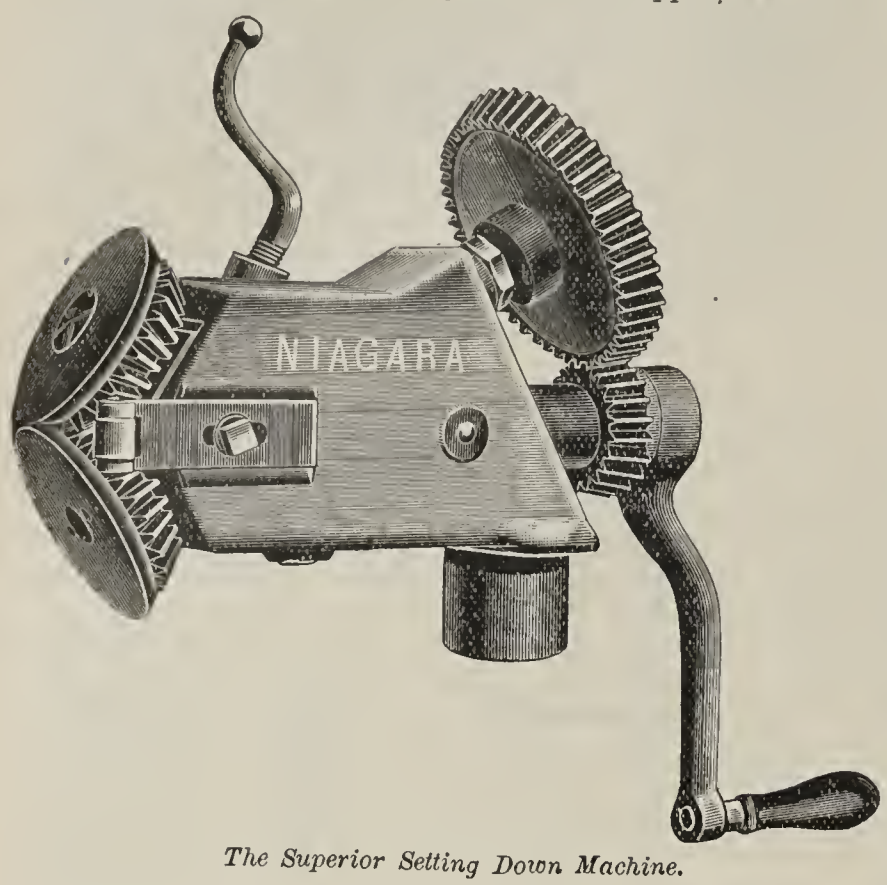
VARIOUS FORMS OF VENTILATORS.

FLASHINGS.

Advices from Chili report an active and increasing demand in that country for Corrugated Iron. It is quite likely, according to local merchants, that some purchases in this line may be made in this country, although the British prices still rule considerably lower than those of the American manufacturers of Corrugated Iron.



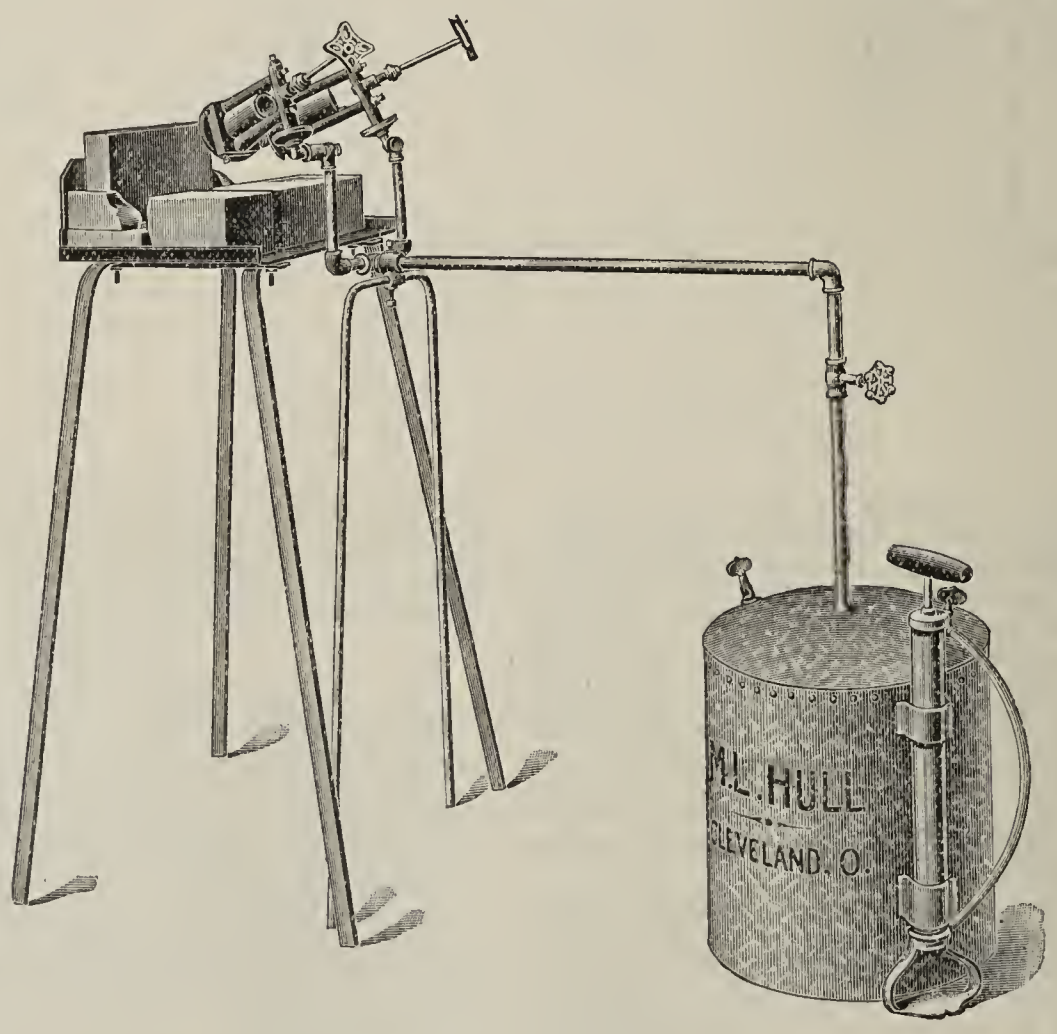
The calendar issued by the Sykes Iron & Steel Roofing Company, Chicago, Ill., and Niles, Ohio, in the interests of their business is decorated with an exceptionally handsome picture in colors, showing the head of a Florentine girl. An unusually rich effect is produced and gives to the calendar more value than usually attaches to publications of this sort.

English trade papers refer to the demand for Corrugated Galvanized Sheets in New Zealand as being extraordinarily active.

The Newark Cornice & Skylight Works, Newark, N. J., have been incorporated with a capital stock of $12,000.

The Superior Setting Down Machine.

The Niagara Stamping & Tool Company of Buffalo, N. Y., are introducing a setting down machine which is intended particularly for heavy work up to 20 gauge. The handle is attached to a shaft carrying a bevel pinion, which engages a large bevel gear mounted upon an inclined shaft. Through this shaft motion is transmitted to the lower face, which is geared to the upper face. The



The Superior Setting Down Machine.

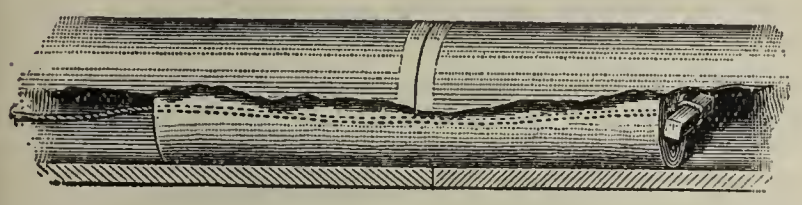
inclined position of the faces permits tipping the work and thereby bending the seam toward the body. This presents a decided advantage in the succeeding operation of double seaming. On both sides of the frame there are adjustable gauges which can be set for seams up to ½ inch wide.

Hull's Improved Brazing Furnace.

The accompanying illustration shows a brazing furnace put on the market by M. L. Hull, Cleveland, Ohio, for which many special features are claimed. In the first place the burner is described as exceptionally powerful, being the same as is used on Hull's assayer's furnace for melting gold and silver. Every burner is furnished with a swivel joint to throw the flame up or down or at any angle. There is also provision made for a side movement to the right and left, thus giving the operator every facility. One burner is said to be sufficient for any ordinary repair shop, though where new work is to be done it is pointed out that two burners will accomplish the object more rapidly. These brazing furnaces can be furnished with one or two burners, as may be desired. A special feature is having the hearth, frame, burners and tank separate. The tank provided holds 5 gallons, tested for strength, and has a 12-inch pump attached. Mr. Hull will furnish this device, leaving the buyer to provide his own frame and hearth if he choses to purchase that way, though he can furnish the whole thing complete. The brick hearth, as illustrated, is formed to leave a pocket in the center for coke, though the burners are said to be so powerful that the manufacturer does not think the use of coke necessary.

Hull's Improved Brazing Furnace

A Large Electric Power House in New York.—Negotiations were completed last week between the Metropolitan Street Railway Company of New York and the General Electric Company for the installation of a $610,000 electric plant. The plant is to be installed in the new power house which the Metropolitan company are erecting at the foot of East Ninety-sixth street and East River, New York. There will be other contracts to follow the one awarded last week, as the traction authorities propose to eventually be able to produce 70,000 horse-power. The contract awarded the General Electric Company includes five 5000 horse-power dynamos. The installation of these alone will make the plant the largest of its kind, constructed for traction purposes, in the world. The new power house will occupy a space of 201 x 279 feet. About one-half of the building will be given up to the coal bin, boilers and conveying machinery. There will be 87 boilers arranged in three tiers, each having a capacity of 400 horse-power. There will be 11 engines of 4000 nominal horse-power, but having a maximum capacity of 6600 horse-power each. The generators, one of which will be connected direct to each engine, will be of the three-phase, 6000 volt alternating current type. President Vreeland of the Metropolitan Company states that bids had been received and accepted for only a part of the equipment.



The first official estimate of the population of the new City of New York has just been completed by the city Health Board It gives a total of 3,438,899 inhabitants, of whom 1,911,755 live in the borough of Manhattan, 1,197,100 in Brooklyn and the remainder in the boroughs of the Bronx, Queens and Richmond. This gives New York about 1,000,000 larger population than Paris, and makes it easily the second city in the world in point of population. Latest statistics give the city of London about 2,000,000 more inhabitants than New York.

HEATING AND PLUMBING.

SOME PLUMBING WRINKLES.

BY R. T.

Neatness in plumbing work is coming more into demand, particularly in lead work. owing to the comparison made by the general public with the nickel plated work that is used in many instances. This forces the plumber to add to his waste pipes, flush pipes and traps by burning on the necessary piece of pipe instead of lengthening the pipe by wiping a joint at the point of connection. This burning is a comparatively simple thing to do when the workman understands how to do it. Some prepare

Some Plumbing Wrinkles.—Fig. 1.—*Lengthening a Waste Pipe by Burning the Joint.*

the pipe by slipping one end into the other, the same as though the joint was to be wiped.

When I burn two pieces of lead together with an iron or soldering copper I prefer, however, to leave both ends square and butt them, having the ends perfectly clean and square and then cleaning the surface of the pipe all the way around about ¼ inch back from the end. After preparing the pipes I place them on a board so that they will lie in a straight line, as shown in Fig. 1. I then endeavor to get a piece of building felt or other heavy paper, and roll it up into a cylinder of just about the diameter of the bore of the pipe. This I insert in the ends of the pipe and bring the ends together. In order to get this paper out of the pipe I cut a piece of wood a little shorter than the diameter, tie a string to it and pass the string through the paper and on through the pipe to the end, so that when the burning is completed it is a simple matter to pull on the string and remove the paper cylinder. This paper cylinder serves to preserve the bore of the pipe in case of the iron being too hot and melting clear through. This, however, need never occur if the work is carefully done.

In order to have a sufficient thickness of lead at the point of burning, I take another piece of pipe or waste and cut it into a strip about ¼ inch wide and clean it bright on all four sides, then give it a coat of clean grease to prevent oxidation and also to serve as a flux. The soldering iron to be used for the work I do not tin with solder, but endeavor to face it with a coating of lead, filing the copper clean and coating it by rubbing it on a brick on which I have previously placed a sprinkling of rosin and of good sharp sand and a sufficient quantity of lead. The sand on the brick has the effect of filing and cleaning the surface so that the lead will adhere, the rosin acting as a flux. Then with the lead strip in one hand and the copper in the other I apply it to the joint, and with the heated iron melt a drop from the strip into the joint of the pipe, holding the iron until the drop and the pipe are thoroughly melted and united at one place. I then turn the pipe over and tack it by the same operation just opposite the first tack. After this is done it is a simple matter to continue on around the pipe. After having burned the pipe together I add more lead to the pipe at the joint by melting it on and fusing it thoroughly with the lead of the pipe. After a sufficient thickness has been provided it is a simple matter to rasp the pipe down to the proper size and scour it with a piece of sandpaper and polish with a piece of felt, so that it is difficult to tell where the joint is made.

In burning I use powdered rosin as a flux, and in order to prevent my fingers becoming gummed with the rosin I constructed a rosin box as shown in Fig. 2, which is made of a trap screw and a piece of tin. The rosin box is about 1½ inches in diameter and 6 inches in length. A ferrule for a trap screw is soldered into one end. The other end is made cone shaped, tapering from the size of the rosin box about 1½ inches back from the outlet to a hole about 3-16 inch in diameter. The cone is soldered to the cylinder forming the box. When completed it is an easy matter to remove the trap screw and fill the cylinder with pulverized rosin. Then in case of tinning fittings or burning on a piece of pipe as described, it is easy to take up the rosin box and deposit rosin at the desired point without waste and without soiling the hands.

In tinning nipples and all of my brass work, instead of tinning it only a sufficient distance back to enable a joint to be wiped I have found it a good policy to tin the nipple clear back to the shoulder. In this way any little sand hole that may be in the fitting is effectually closed, and in many instances I have been saved the work and the customer the expense of removing a defective piece. Like all plumbers I prefer to do lead pipe work, but all in the trade know that iron pipe is being used largely for house service, and with the desire to leave the work so that it can be readily repaired in case of necessity I place unions at such points as will allow parts of the service system to be readily taken down. In supporting pipes I use a pipe hanger which is somewhat more expensive than some are willing to use, but in the course of a few years the saving that will be effected should repairs be necessary will offset the first cost, and if this is explained the customer usually will not object. My pipe hangers are made so that the part which holds the pipe is in two pieces and connected by means of set screws. By the use of unions and this form of hanger a portion of a pipe system can easily be taken down so as to insert a tee for a new branch or to make any repairs that may be desired. By the use of this pipe hanger it is a simple matter to have the pipes

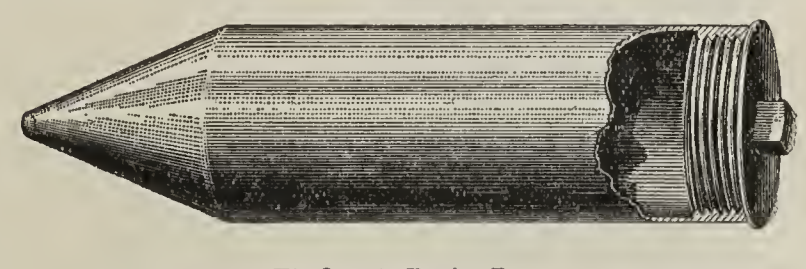


Fig 2.—*A Rosin Box*

perfectly aligned, and they present a much better appearance when in position.

Galvanized iron pipe will become more or less soiled and disfigured, however careful the workman may be in handling and working it, and in order to leave this pipe presenting an appearance equally attractive with the work of the painter or carpenter I have made it a point to give all pipes and hangers, fittings and unions a coat of aluminum bronze. When iron pipe work is done this way it looks as well as a lead pipe job which has been scoured with water and clean white sand or with sandpaper, polished with felt, and all the joints and fittings resoiled and finally covered with a coat of white varnish. To scour pipes and varnish them takes considerable time and labor, and instead of doing it I have in many instances resoiled the fittings and joints and then applied a coat of the silver or aluminum bronze to the lead pipe, much to the satisfaction of my customers.

CONNECTICUT MASTER PLUMBERS.

The eighth annual convention of the Connecticut State Association of Master Plumbers was held in the hall of the Young Men's Club, at New Haven, Conn., on Wednesday, February 16. The convention was called to order by the president, A. J. Clerkin, who appointed J. B. Beegan and J. F. Carr sergeants-at-arms.

S. E. Dibble, president of the New Haven Master Plumbers' Association, made an address welcoming the delegates and introduced the Mayor of the city, who confined his remarks to the benefit the public derived from the intelligent regulation of plumbing work that had been the aim of the plumbing trade, as he had noticed officially. Major Middlebrook then, with a few trite remarks, presented the Mayor with a badge on which was the plumbers' coat of arms—a pot, ladle and round iron. The president then appointed the following committees:

Credential.

E. Mahl, T. D. Barlow, F. A. Carlton, E. A. Creevy, F. A. Curtis.

Membership Committee.

L. D. Mills, J. A. Holland, J. M. Page, T. J. Reynolds, O. D. Sykes.

Auditing Committee.

Geo. S. Bull, A. B. Wilkinson, G. W. Utton, E. A. Kuhnly, F. F. Hitchcock.

Committee on Resolutions.

S. E. Dibble, C. S. Eames, James Ahern, L. H. Mills, J. B. Weiant.

The report of the Credential Committee showed the following members present:

LIST OF MEMBERS.

F. J. Reynolds, Ansonia.
Roberts & Arnold, Bristol.
L. H. Mills, Bridgeport.
H. B. Middlebrook, Bridgeport.
Wheeler & Cook, Bridgeport.
C. S. Eames, Bridgeport.
Green & Logan, Bridgeport.
E. A. Creevy, Bridgeport.
F. & F. C. Booth, Bridgeport.
J. W. Dunn Danielson, Bridgeport.
E. W. Peck, Derby.
C. R. Norman, Danbury.
W. E. Gaylord, Farmington.
Hector Chatman, Glastonbury.
James Ahern, Hartford.
George Mahl, Hartford.
Edward Mahl, Hartford.
James F. Duffy, Hartford.
Thomas Oakes, Hartford.
T. H. Langdon, Hartford.
M. Hogan, Hartford.
Lyon & Son, Hartford.
E. Lawler, Hartford.
Langdon & Daly, Hartford.
J. Mulligan, Hartford.
James Donovan, Middletown.
J. M. Page, Naugatuck.
J. B. Weiant, New Britain.
F. C. Weiant, New Britain.
F. W. Damon, New Britain.
P. J. Tormay, New Britain.
George Rappelye, New Britain.
S. E. Dibble, New Haven.
Clerkin T. McDonald, New Haven.
Rourke Bros., New Haven.
Robert Morgan, New Haven.
P. F. Connelly, New Haven.
John B. Beegan, New Haven.
G. W. Hazel, New Haven.
D. M. Sheehan, New Haven.
A. B. Wilkinson, New Haven.
Curtiss & Pierpont, New Haven.
F. A. Carlton, New Haven.
Robert Liddell, New Haven.
A. B. Sproul, New Haven.
J. A. Campbell, New Haven.
J. F. Clark, New Haven.
J. H. Buckley, New Haven.
J. F. Carr, New Haven.
P. F. Connelly, New Haven.
C. E. Coe, New Haven.
J. M. English, New Haven.
J. E. Igo, New Haven.
D. F. Kelly, New Haven.
Gay & Murray, New Haven.
Theordore Potter, New Haven.
T. L. Root, New Haven.
C. C. Bradley, New Haven.
William Brennan, New Haven.
John E. Igo, New Haven.
Henry H. Guernsey, New Haven.
M. J. Roach, New London.
J. D. Cronin, New London.
J. A. Holland, Norwich.
J. Troland, Norwich.
E. Ellsworth, Portland.
J. W. Fogarty, Ridgefield.
E. A. Kuhnly, Rockville.
H. R. Fay, Southington.
O. D. Sykes, Seymour.
W. F. Symonds, Unionville.
T. D. Barlow, Waterbury.
Disley & Weyand, Waterbury.
M. Clancy, Waterbury.
W. H. Clay, Waterbury.
George Durfee, Winsted.
C. R. Caton.
Wm. McMahan.
Menzies & Menzies.
T. H. Broderick.
M. J. Keegan.
Valentine Weidig.

T. D. Barlow reported for the Sanitary Committee that they had been most attentive to legislation, and recommended that every member assist in having a law enacted at the next session.

S. E. Dibble of the Legislative Committee reported that a plan of action had been devised to aid in securing a plumbing law and advised that literature to educate the public be distributed.

James Ahern of the Essay Committee read an essay on the influence of the association and the trend of its work in the future, which is printed in another column.

James F. Duffy of the Apprenticeship Committee suggested some changes in the report of the former committee and recommended that the report be incorporated into the by-laws, and on motion the recommendation was adopted.

S. E. Dibble then introduced to the convention the president of the Massachusetts State Association of Master Plumbers, T. J. Tute, who addressed the association on the troubles encountered by the plumber as a business man and the benefits derived from the association. He pointed out that to day the plumber was a fitter to fit up fixtures that were made by manufacturers, and that the inspector, who might never have seen or done a piece of plumbing work, but who was specially educated on the theory, was the man who bossed the plumber. The Southern League and its methods and success were explained, and he read a call for delegates to attend a meeting to form a New England League, to be held in Boston, March 10.

E. Mahl, national State vice president for the State of Connecticut, strongly supported Mr. Tute in a short address, urging the desirability of entering into a New England League and the need of more active work in bringing outside plumbers into the association. He urged that the plumbers work and contract only for the owner or architect, and not for a general contractor.

J. W. Green, Worcester, Mass., also spoke strongly in favor of the league movement.

President A. J. Clerkin then read his address, showing

an increase in membership and a prosperous condition of the association.

Winslow Zeliff, Newark, N. J., State vice president for New Jersey, was then introduced to the convention and made a brief address.

John Hickman, Paterson, N. J., member of the National Executive Committee, was introduced and made an address in favor of trade protection, and pointed out that co operation was the means of securing it.

Letters of congratulation and encouragement were read from T. P. Culloton, president of the National Association of Master Plumbers, and from Samuel L. Malcom, vice-president, and members of the Executive Committee.

The report of the treasurer, J. M. Donovan, showed a balance of $482.42 on hand.

A motion by E. Mahl was carried that the president appoint three delegates to attend the meeting in Boston to form a New England League. The president appointed E. Mahl, J. B. Weiant and L. H. Mills.

The convention then went into executive session.

After the executive session the following officers were elected:

President, J. S. Craig.
First Vice-President, F. J. Reynolds.
Second Vice President, Wm. H. Hazel.
Treasurer, James Donovan.
Recording and Corresponding Secretary, George S. Bull.
Financial Secretary, E. A. Creevy.
Executive Committee, J. S. Craig, F. J. Reynolds, W. H. Hazel, James Donovan, George S. Bull, E. A. Creevy and A. J. Clerkin.
Delegates to National Convention, L. H. Mills, E. A. Rourke and George Mahl.

Henry B. Gombers, secretary of the National Association of Steam and Hot Water Fitters, was introduced and outlined the benefits of organization in an interesting address.

E. Mahl invited the members to hold the next annual convention at Hartford, which on motion was accepted.

The convention then adjourned to a banquet served at the Tontine Hotel, where, after a fine *menu* was disposed of, a number of speakers entertained the guests.

THE TRADE.

The manufacturing houses represented were:

Peck Bros. & Co., New Haven, by W. J. Hubbard of Boston; A. J. Purdue, J. B. Hitchcock, C. H. Downes, S. D. Baker, R. S. Thompson, New Haven.

E. S. Wheeler & Co., New Haven, by Wm. E. Morgan, W. Hotchkiss, New Haven.

C. S. Mersick, New Haven, by Frank Hyde, J. Woodruff, New Haven.

F. N. Dubois, New York, by C. W. Frean.

Henry McShane Mfg. Company, New York, by C. Barth, R. H. Maguire, New York.

J. E. Gallagher & Co., New York, by George Steller, New York.

Alberene Stone Company, New York, by J. Stahl, Jr., New York.

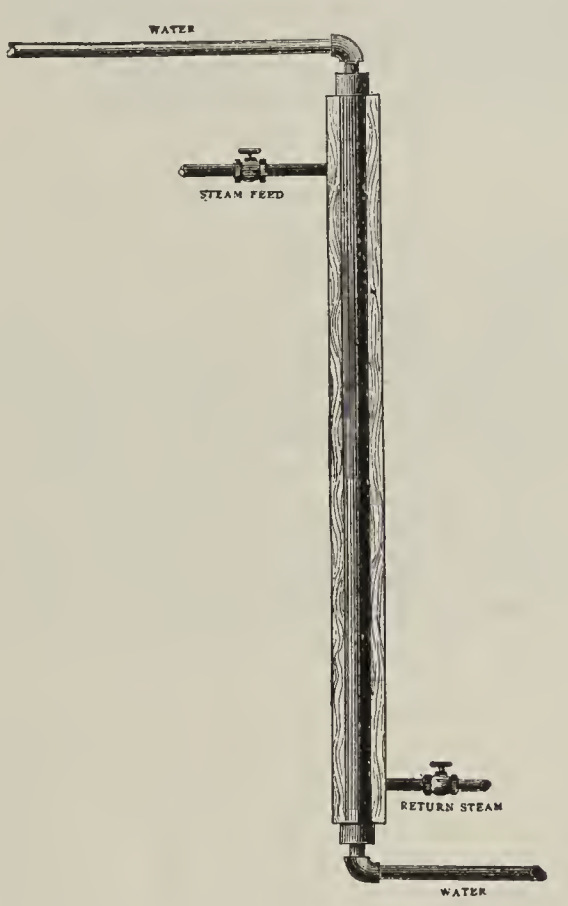
The Care of Steam Heaters.

The boilers in private dwellings, for heating purposes, usually carry only from 2 to 5 pounds of steam, says the Hartford, Conn., *Times*, and unless there is carelessness there is no danger of an explosion. The city water pressure is about 30 pounds to the square inch. Two heating boilers exploded on January 30—one of them in New Britain and the other in Unionville. In the latter case it seems to be admitted that cold water was turned on when there was very little water in the boiler, and the boiler was very hot. Of course, in such condition the inflow of fresh water would be turned to steam in an instant and the pressure would rise at once to hundreds of pounds to the square inch—enough to explode any boiler ever made. Yet hundreds of boilers are "blown up" by that cause. The indicator shows low water in the boiler, and more water is hastily turned on, then away goes the boiler, tearing the house to pieces and usually destroying lives.

When the water in a steam boiler is out or very low, turn the grate of the furnace and put out the fire. Let the boiler become cool before any water is turned on.

Providence Master Plumbers.

The annual meeting and the election of officers of the Providence Association of Master Plumbers occurred February 11. Affairs relative to the trade and in the interest of sanitary plumbing were discussed.



The officers elected for the ensuing year were:

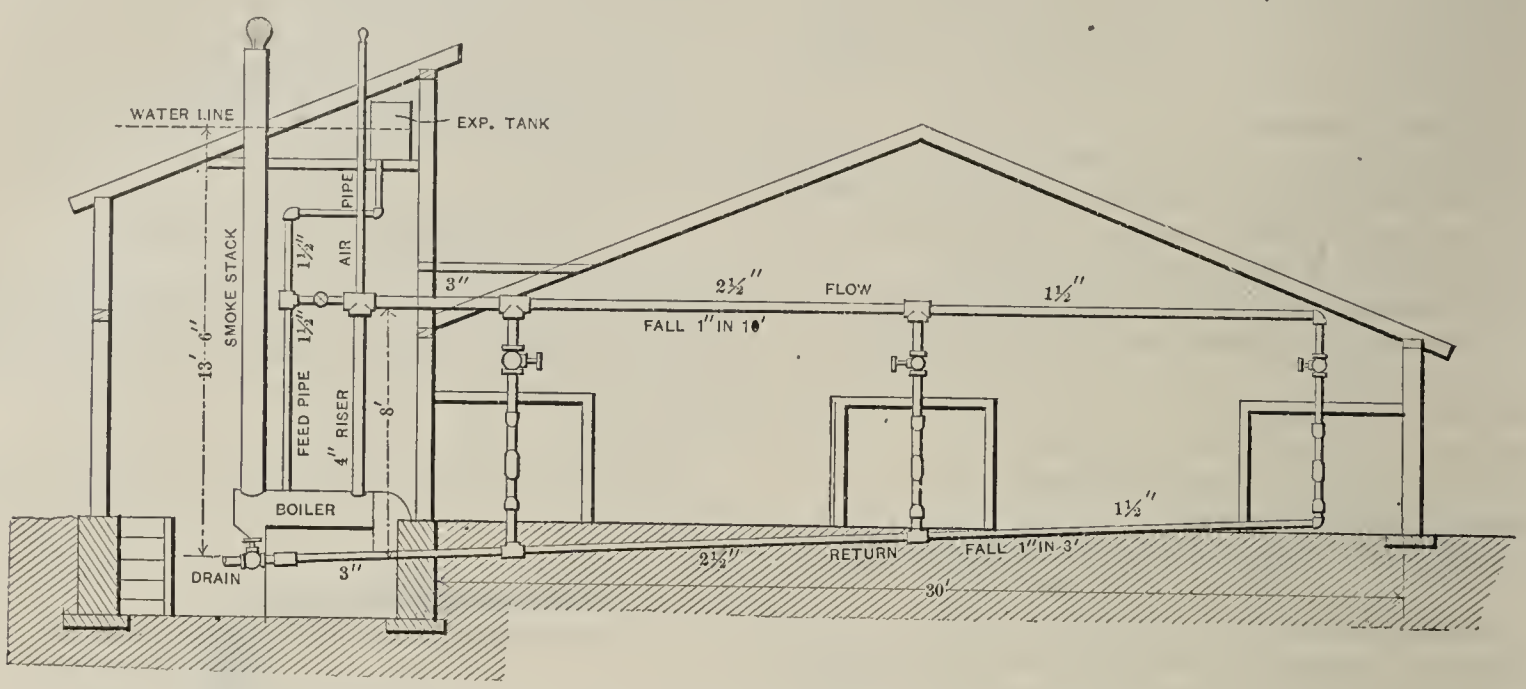
President, Job S. Fuller.
First Vice-President, F. G. Lees.
Second Vice-President, John L. Carey.
Third Vice-President, P. Tierney.
Treasurer, J. B. Manchester.
Recording Secretary, C. P. Brennan.
Financial Secretary, T. G. Burlingame.
Corresponding Secretary, J. C. Conroy.
Sergeant-at Arms, P. O'Connor.

A Serviceable Water Heater.

Wherever a steam system is in use and warm water is desirable for washing or other purposes the water heater described by Walter Wiltshire, in the *Florists' Exchange*, for warming water for sprinkling flowers can be readily made and put in use:

The sketch of water heater shown herewith is a picture of one I have had in use for the past two winters,

A Serviceable Water Heater.



which for simplicity and effectiveness will be hard to beat. Any one who can handle steam fitting tools can put it up. It consists of a length of 4-inch pipe, with a length of 2-inch pipe passed through and connected with a cap at each end. A long thread is made on the 2-inch pipe, which allows the cap to be screwed on to the 4-inch pipe, at the same time providing sufficient length of 2 inch pipe through the caps to connect the water feed pipe. The water being supplied through a 1-inch pipe, it will be easily seen that the water will pass more slowly through the 2-inch pipe, and that's when it warms. The steam is turned on through a ¾-inch pipe conection at the top, and circulates around the 2-inch pipe, returning through the same sized outlet at the bottom.

With 5 pounds steam pressure the water will be heated from a temperature of 35 to one of 65 degrees, giving a continuous supply of warm water for syringing and watering. The cost is not high, the caps being the most expensive parts. If any trouble is experienced in getting the right castings they can be dispensed with and wooden plugs used instead. These answer very well, as the steam causes them to swell and prevents them blowing out, and they are also held in place by the 2 inch couplings.

Thomas E. Crone, manager of the New York office of the Model Heating Company, has moved into new quarters at 127 Worth street.

A Greenhouse Heating System.

A correspondent of *Carpentry and Building*, S. W. Douglass, Ashland, Pa., in a recent issue of that journal publishes an interesting communication relative to heating a greenhouse, his letter referring to previous articles that had appeared in *Carpentry and Building*. The greenhouse referred to is shown in elevation in Fig. 1, where the flow and return mains and branches are indicated, while Fig. 2 is a partial plan. The arrangement of the coils under the beds is shown in Fig. 3. The following extract from Mr. Douglass' communication explains

Greenhouse Heating System.—Fig. 1.—Elevation Showing Piping.

his method of calculating the amount of surface for this greenhouse:

The primary question for our consideration is the amount of heating surface necessary under certain conditions; one cannot guess at the amount necessary and say that 1 square foot will heat 40, 50 or 70 cubic feet of volume of a room or greenhouse like this. We are indebted to W. J. Baldwin for the best formula for working out the actual requirements under different conditions, based on the known amount of cooling effect of glass and wall surface per square foot, walls being taken at about one-tenth the cooling effect of glass. His formula has proven correct. By its use and the conditions presented by the San Jose greenhouse we get at a very close result that is applicable to any other greenhouse or room under similar conditions. Take as follows:

R—represents the amount of radiating surface necessary to counteract the cooling effect of the glass or wall surface.

T—The difference in temperature in degrees Farhenheit desired in the house and the external air.

t—The difference in temperature in degrees Fahrenheit between the temperature of the heating surface and that of the room or house.

g—The number of square feet of glass in the exposed walls with wall equivalent of glass surface.

The formula is $R = \frac{T}{t} g$, in which we have

$T = (60° - 40°) = 20°$. $t = (200° - 60°) = 140°$.

g = Glass roof, $32' \times 65' \times 0.9$ (of whole surface for glass) =	1,900 sq. ft.
Glass windows in side, 132×2	264 " "
Glass equivalent, 2 ends (wood work), $740 \times 1/10$	74 " "
Glass equivalent, 2 sides (wood work), $520 \times 1/10$	52 " "
	2,290 sq. ft.
Or say	2,300 sq. ft.

Then substituting in formula we have

$$R = \frac{20}{140} \times 2300 = 328.5 \text{ square feet}$$

of radiating surface necessary to overcome the cooling effect of the glass, to which ought to be added for that locality 20 per cent. for wind, cracks, holes, &c., and we have $328.5 + (328.5 \times 0.20) = 393\ 2$ square feet or, say, 400 square feet of radiating surface for the San Jose greenhouse.

The volume of this house is about 18,000 cubic feet. $\frac{18000}{400} = 45$, or 1 square foot of heating surface necessary to 45 cubic feet of volume. At zero weather just three times as much would be necessary, or 1 square foot would heat about 15 cubic feet of volume of room. In this locality we are apt to get 15 degrees below zero. We place the San Jose greenhouse under these conditions and substituting in the formula we have $R = \frac{60 + 15}{200 - 60°} \times 2300 = 1775$ square feet of radiating surface necessary, to which must be added at least 20 per cent. for windage, cracks, holes, &c.

$1775 + (1775 \times 0.20) = 2130$; $18{,}000 \div 2130 = 8.4$ cubic feet.

So that 1 square foot of heating surface would only heat 8.4 cubic feet of volume of greenhouse in 15 degrees below zero weather. I may then give for "rule of

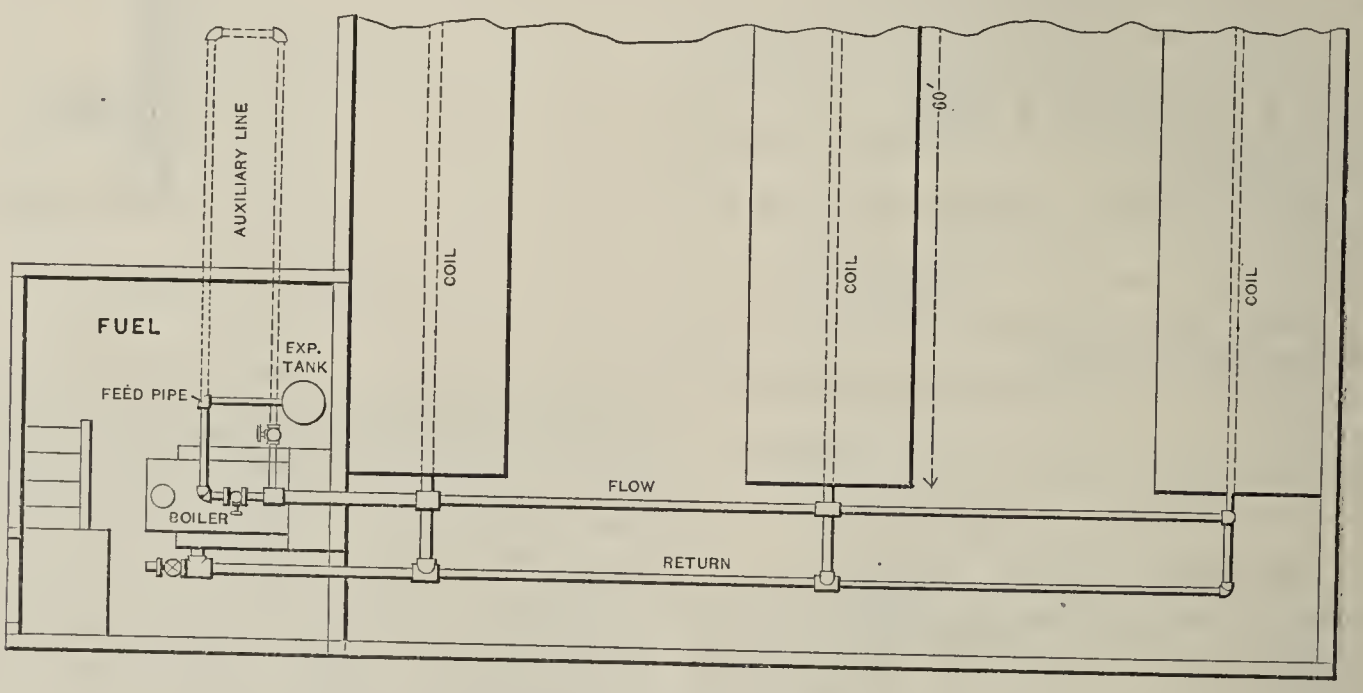


Fig. 2.—Partial Plan, Showing System of Piping.

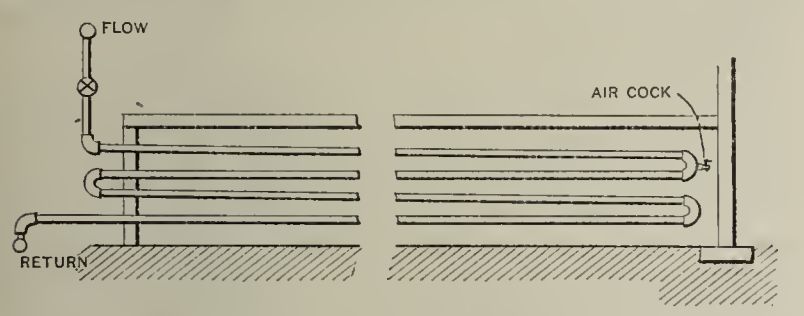
thumb" for greenhouses with all glass roofs, built as this one:

House to be at 60°, external temperature 40°, 1 square foot for 45 cubic feet of vol.
House to be at 60°, external temperature zero, 1 square foot for cubic feet of vol.
House to be at 60°, external temperature 15°, 1 square foot for 8.4 cubic feet of vol.

Having found for the case under consideration that 400 square feet of heating surface was necessary, we next proportion the size of our pipe to maintain a uniform rate of velocity of flow, and I would caution the builder in the use of manifolds, as they divide up the flow, causing more friction, and the branches will never maintain the same velocity. Using manifolds also requires larger mains. Manifolds are all right for steam heat, but for hot water use coils. Place under each bed a coil of 1½-inch pipe, the internal area of which is 2.03 square inches.

3 coils, 4 1½-inch pipes 62 feet long, 744 feet; 2 feet to a square foot of external heating surface.....	744 ÷ 2 =	372 sq. ft. heating surface.
Drops, 1, 3 feet, 1, 3 feet 6 inches, 1, 3 feet 9 inches, of 1½ pipe = 10 3	÷ 2 =	5 sq. ft. heating surface.
Flow and returns each 12.3 feet = 24.6 feet 1½ pipe.....	÷ 2 =	12 sq. ft. heating surface.
Flow and returns each 12.3 feet = 24.6 feet 2½ pipe.....	÷ 1.3 =	19 sq. ft. heating surface.
Flow and returns each 2 feet = 4 feet 3-inch pipe.....	÷ 1.03 =	4 sq. ft. heating surface.
		412 sq. ft. of heating surface in greenhouse.

By means of the sketches and the foregoing we see that the internal area of coils is 2.03 square inches, the drops



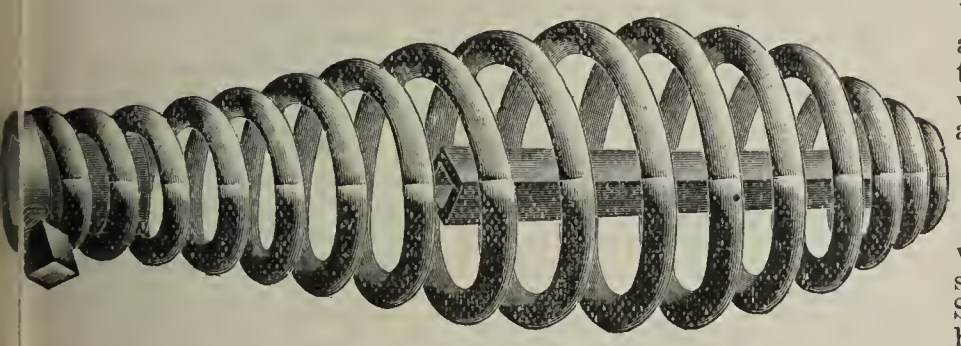


Fig. 3.—Elevation of Coils Under Beds.

the same and the main to supply one coil also the same. The main for two coils is 2½-inch pipe, internal area 4.78 square inches, and the main for three coils is 3-inch pipe of 7.38 square inches internal area. I have placed a 15 gallon tank 12 inches high above the return to boiler, 13 feet to water level when system is filled to this line, giving contents of about 150 gallons. This system will expand nearly 4 per cent., or 5 to 6 gallons; hence the necessity for the 15-gallon tank. I make a 4 inch pipe riser up to hight of 3 inch main and from there out a 1½ inch air pipe. Also attach to the 4 inch riser at this point an independent 1½ inch connection, that can be used for any other purpose desired, as for stable, washing windows, &c., to be shut off, if necessary, by valve, and on each drop place a valve so that any or all of the beds may be heated or shut off as desired without affecting the rest of the system. Thus the areas are proportioned and the flow and return as direct as possible to increase velocity and reduce friction. It is only necessary to put a small air cock on the upper return bend of each coil to facilitate the first starting of the circulation and the system is complete. The independent connection to feed pipe from expansion tank and top of risers makes also a short circuit whereby water can be quickly heated for any purpose, by shutting the valves on each drop, to 212 degrees if desired.

Alaska Soldering Iron Handle.

The Alaska Always Cold handles, made by the Troy Nickel Works, Albany, N. Y., are having a constantly

Alaska Soldering Iron Handle.

widening application. One of the latest uses to which this style of handle is put is illustrated in the accompanying cut, which shows the Alaska soldering iron handle. The spiral is in the usual form of the Alaska handle, but within it is a socket for the end of the soldering iron, while a collar with a set screw holds it firmly in place. It is arranged to fit any iron, and its merits will be readily appreciated by the plumbing and sheet metal trade.

Arkansas Master Plumbers.

A letter from Secretary John M. Dungan, Little Rock, Ark., informs us that President B. J. Dunn, Fort Smith, has issued the call for the fourth annual convention of the Arkansas State Association of Master Plumbers, to be held in Pine Bluff on March 14, and the secretary has sent notices to the members. Those who are in the plumbing business, who are not members of the association, are invited to attend to learn of the objects of the association that they may become interested in its work and become members.

The Attitude of the Master Plumbers Toward Associations, Local, State and National.*

BY JAMES AHERN.

The mission of the association principle, taken in connection with our trade, has been in these later days one of the greatest importance. Plumbers have for years been looked upon as little better than necessary evils, to be universally deplored and condemned, yet, for the lack of more acceptable substitutes, impatiently tolerated. Within a very few years the great principle of Association has worked wonders in removing this not wholly undeserved prejudice from the public mind. Representatives of our trade now meet with that respect and esteem which they may rightly command. United in bonds of fellowship one with another, governed as one body by wise and efficient leaders, they are at least able to take the high place hitherto denied them in the public regard. With increased facilities and opportunities conceded by the manufacturers and jobbers, greatly changed as to their relations with each other, and daily gaining in knowledge and skill, theory and practice, they are in a position to take great onward strides, impossible, undreamed a few years ago. In this brief paper I want to say a word about the relation of the master plumber to these associations, local, State, national, beginning with his first steps into the ranks of the craft. I hope at the end to mention the important movement which has lately taken place in the South and West, the Southwestern League, and its bearings upon the subject in hand.

THE YOUNG PLUMBER.

To begin with, when a young man has adopted the plumbing trade as his honorable occupation in life and has passed successfully through the different stages of apprenticeship, followed by a shorter or longer experience of journeyman, then if he desires to go further and become a master he realizes that to gain this highest point many and varied qualifications are necessary. First, he must have proved himself a good workman. This is absolutely essential. Then he must have honest ambition, urging him on constantly to greater things, with a fixed determination to succeed. Diligent application and strict economy should be the handmaidens of this ambition. Without their help success will always be far off, like a will-o'-the-wisp. He must have a character above suspicion. To begin right is of the greatest importance—to gain that reputation for uprightness and honesty which to a young man starting out means much more than capital, especially as far as credit is concerned. His past history should be creditable in all respects, for when he sets up in business his record is carefully investigated, and then his whole future, to a certain degree, depends upon the favorable or unfavorable report rendered. A reputation is not built up, neither is it destroyed, in a day. Once the young master has started out he should take as his motto, "What is worth doing at all is worth doing well." When he has established himself in suitable quarters and assumed the various obligations imposed by his new position, he should make up his mind to do only first-class work, and if he possesses the other qualifications described above there is no reason why he should not succeed.

ASSOCIATION MEMBERSHIP.

And now, having briefly reviewed the necessary stages which finally make a master plumber eligible, the next step is to join the local association, this leading up to the State organization, then on to the national. The manifold benefits derived from this line of action have been often and eloquently described. Joining the ranks of his fellow craftsmen, he comes into the ranks with them all, and from those longer in the business whose success is assured he will learn much to help him in his own future career. He shares in all the advantages granted to

* Read at the Eighth Annual Convention of the Connecticut State Master Plumbers' Association, New Haven, February 16, 1898.

strength of united numbers—the important concessions made by manufacturers, according to the Baltimore Resolution, receiving that protection now so necessary. He comes into contact not alone with fellow craftsmen of his own city and State, but with hundreds of others all over the country, and bonds of brotherhood and good fellowship are fast knit, to endure for a lifetime. By comparing notes all around, improved methods are discussed and adopted, this profitable interchange of thought being one of the most important gained.

Excepting these and many other benefits from the associations, there are important duties to be performed by the master plumber, young or old. Loyalty goes without saying—earnest co operation, and in regard to all methods proposed or matters discussed, an attitude equally removed from selfishness or suspiciousness, two evils which almost more than any others are most to be feared as dangerous to the highest development and greatest usefulness to organized bodies. The same earnest application to business recommended earlier should find its counterpart in unfailing attendance at all meetings of at least the local association, and, if possible, those of the State. The local meetings especially should be considered of too great importance to be foregone lightly. There is a tendency, unfortunately, too strong among us to stay away, leaving the conduct of affairs to others of a far more conscientious turn. Such a tendency shows a sad lack of that *esprit de corps* absolutely necessary in all organized bodies for the attainment of the best results.

A word about those master plumbers who have refused to have anything to do with our association. Their attitude is a false one throughout. Either they labor under a great delusion in regard to the methods and aim of the organizations spoken of, or else through indifference they neglect to find out for themselves and appreciate as they should all the benefits conferred through the praiseworthy efforts of their brethern. In either case they are content to accept the fruit of other men's labor without paying their rightful share.

INTERSTATE ASSOCIATIONS.

Because a minority of the master plumbers are united and affiliated with the State and National Associations the majority outside in many cases meet with and enjoy undeserved protection, and this is not fair. Something may be done in the near future to remedy this evil. The important movement started in the South and West during the past year has steadily gained ground in spite of early opposition, and here in the North is daily regarded with greater favor. Thoroughly in accord with the National Association, and in all of its provisions showing common sense and sterling justice, this new idea is going to have an immense influence upon the future of the trade. The main principle is to gain from manufacturers and jobbers a promise or agreement not to sell goods to any but master plumbers who are members of the league, provided, however, that they in turn can show a 75 or 80 per cent. membership. The successful achievement of this idea would mean not only the protection which the Baltimore Resolutions already give us, but also protection from each other, by insuring better prices for our work and materials, and this can only be done by maintaining a standard which will allow us a reasonable profit.

As things are now hardly any profit is allowed. Besides the benefit to the plumber, this idea will afford protection to the manufacturers also, inasmuch as one of the resolutions in the constitution of the league provides that " all failure or refusal on the part of members to pay just debts past due on account with the supply house will result in a fofeiture of membership unless satisfactory arrangements are made with their creditors." We will hail with rejoicing the dawn of that better day which will come, when this work has been accomplished successfully. Hitherto we have been well content, after many labors, to make satisfactory terms with manufacturers and dealers ; now, having at last gained this and other benefits, the association has a perfect right to reserve these privileges for her own loyal members. This is what the Southwestern League has been doing and this is what we hope some day to accomplish right here in New England.

A NEW ENGLAND ASSOCIATION

But as yet the time is not ripe. Before we can hope to succeed here as they have succeeded in the South and West in regard to this matter a great deal of preparatory work has to be done. Until we have a sufficiently large number of members to exert the immediate pressure there is little use in trying to pull the measure through. With this end in view it is our duty to enlarge and fortify our ranks as quietly and firmly as possible. Those outside are to be brought in. The weaker brethren already with us, those who have grown lax in their devotion to the cause, should in every way be encouraged and reinvigorated. The rock of dissension upon which so many organizations have struck and gone down seems to be that miserable feeling and jealousy and suspiciousness which should find no place among us. Keeping in mind a clear idea of the real nature of the association—a body organized for the protection of all members alike from common dangers and from this end alone. There seems no reason why feelings of distrust, envy and ill nature should be awakened. Entire confidence and loyal cooperation should rule in all our meetings, and when these are present the discordant elements are put to flight once for all.

In conclusion, the importance of this idea of association in its relation to the welfare of our trade cannot be too strongly urged, neither can the great necessity of loyalty to the duties imposed by this membership be easily overestimated. Future years bring strongest proof of all sound arguments, and it is my firm conviction that it will not be long before the true significance of league association work will have forced itself upon every master plumber in the land. Meanwhile, it remains for us, pioneers, I might say, to keep our honored organization true to their highest ideals, thus helping on the advent of that great day when at last, united in firm and lasting bonds, the Master Plumbers' Association shall stand before us all and rule us, every one—a mighty type of justice, in her hands the unfailing horn of plenty, at her feet unfading crowns of honor.

Massachusetts State Association of Master Plumbers.

The following call, in which especial emphasis is laid on the advantage of forming a New England League, has been issued by President Thomas J. Tute and Secretary Daniel Shannon of the Massachusetts State Association of Master Plumbers:

The nineteenth quarterly convention (including the special meeting) of the above association will be held in Elks' Hall, 24 Hayward place, Boston, Thursday, March 10, 1898, at 10.30 a.m. All local associations are requested to send delegates, and masters engaged in the trade where no local exists are cordially invited to attend. Agreeable to instructions the Executive Committee, in conference with affiliated representatives of New England, launch forth the following platform of principles to govern the operation of the New England League, to wit:

We, master plumbers, representing the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut, are to meet for the purpose of forming a league of the plumbing associations of the States named, and invite all persons engaged in the trade to co operate with us as individuals where no associations exist. Such league is to be known as the New England League of Master Plumbers, the objects and purposes of which are declared to be the following:

We acknowledge allegiance to the National Association of Master Plumbers, and pledge ourselves to promote its interests and spread its influence in the territory embraced by the New England League of Master Plumbers.

Whereas, The jobbers and manufacturers in plumbing supplies in the United States, sending representatives or supplies into the New England territory, recognizing in the New England League a movement one of the objects of which is to build up the commercial credit of its members, and thus reduce the risk of selling goods within its jurisdiction, have already given us trade protection as well as moral encouragement and support, be it

Resolved, That the jobbers and manufacturers in plumbing supplies be requested to use their influence in assisting us to build up and hold the membership of our State association; that they be asked to write kindly letters to our wavering supporters, non-members and all new firms which may hereafter enter into the business; to help us convince such firms and individuals if possible that their best interest lies within our local State, league and national associations; to use their influence with us to convince firms wavering between the retail and plumbers' supply houses to adopt either the one, as signers of the Baltimore Resolutions, or the other, as members of the nearest local association, when so requested by the executive officer of the league; and be it further

Resolved, That the only bar to membership in the New England League, not otherwise ordered in the national constitution and by-laws, shall be persistent and willful failure or refusal to pay just debts past due; that those of our members now in arrears with supply houses for accounts long past due be notified that they must make satisfactory arrangements with their creditors during the fiscal year, under penalty of being dropped from the league rolls should they fail or refuse to settle or make satisfactory explanation; that the New England League of Master Plumbers will not tolerate or support members whose names are blacklisted throughout the Union.

Deploring the existing prejudice of the public which questions the honesty and integrity of our calling, we are resolved to employ every honorable means in our individual and co operative capacity to correct such unjust and injurious estimate. It is our aim to educate the people in a

knowledge of the importance of sanitary plumbing as a health factor, and thereby to elevate the business of plumbing to its legitimate plane. It is our aim to disseminate a knowledge of scientific sanitation throughout the country and encourage its application by the use of the most improved methods and appliances; and to this end it is our aim to secure State and municipal legislation, defining and protecting the business of the master plumber, and securing to the public better health with greater economy. It is our aim and interest to secure honest work and the use of reliable materials. We condemn all subcontract work as dangerous to the credit of the craft and unsatisfactory to the people. We desire to transact business with property owners and architects direct.

We recommend and urge the adoption of a sanitary code governing plumbing in cities and towns not already protected by legislation; to this end we urge local plumbers to sign an agreement to use such code until local legislation is secured, and to bind themselves to work for such legislation. We advocate the use of lead pipe as cold water conductors, because it is the best and most economical, and cannot be satisfactorily worked by unskilled craftsmen, whereas any so called plumber can screw together iron pipe and deceive the public. Lead pipe costs more than iron pipe, but it lasts longer. We do not discourage competition, but invite competent craftsmen into our association.

Make it a criminal offense for a plumber to operate without a license. Require each city and town to have an inspector, and let the office be non-partisan, attained to and operated under the merit system alone. Define master plumber to mean one who employs skilled labor only and has an establishment stocked with goods.

Without law and inspection sanitary science is inoperative, the diploma and license useless; the dishonest and incompetent craftsman makes ruinous competition; bad work and worse material are the results. The skill of the honest workman is discounted and useless. Under law and inspection the conditions are reversed. Material must grade up to a fixed standard; cheap and defective goods are prohibited; only competent workmen are employed. The good plumber will get better and the pretender will go, for on skill and rapidity alone will profits depend. Let the people demand scientific plumbing. Let plumbing fixtures be selected with care, having in mind that the cheapest is not the best. Let plumbing fixtures be intelligently cared for and health risks will be greatly reduced. Do not listen to the argument that it will cost too much and bear heavily on the poor. As a rule the poor rent their homes and the cost of plumbing does not fall upon them; the poor man can no better afford to lose his wife or child than the rich by reason of defective plumbing, but it is he who suffers the greatest danger. Tenement houses are more cheaply fitted than those of the prosperous, and it is more often the poor man who pays the penalty of the incompetent plumber than the rich. Be it resolved that it is the sense of this league that our membership should favor those that sell to members only of this league in cities and towns where members exist.

Now, gentlemen, your duty is clear. Make one more effort to get every straggling master plumber in your local association. Give them all another chance. Pay your dues to your State, league and national at once. Your name cannot go on our official literature until your dues are in the treasurer's hands. We protect our members only. You are not a member until your dues are paid. We must complete the official list before the supply men can possibly know whom to protect. The time has come when the people must know the names of the plumbers in whom they can place confidence. We propose to educate the people We propose to protect and build up the business of the plumber. It is, therefore, essential that they who stand upon the side of right shall be publicly known. When the people know the purposes of our league through the distribution of its platform of principles, the people will simply consider as unworthy of respect and confidence the plumber who refuses to identify himself with a movement inaugurated in the best interests of the people and the plumber.

Success wins the respect of the people, not failure. We have tried the cutthroat competitive policy, and our reward has been public suspicion and distrust, public ridicule and financial ruin. We now offer every honest plumber a business copartnership, which means success in business and public respect and esteem. Which will you choose? There are a few, however, in your various localities who require a house to fall down on them before they begin to realize that something has happened. Give these another chance before closing your locals with initiation fees. There are only a few of them left on the outside. We can afford to be patient and generous. Let every man work now to save some erring brother the inevitable ruin which is sure to follow the public knowledge of his refusal to co operate with business men for prevention of disease and the elevation and dignity of the plumbing business.

Bay City Master Plumbers.

The following is the list of officers of the Master Plumbers' Association of Bay City, Mich., for which we are indebted to Secretary G. H. Burge, 407 Midland street, West Bay City, Mich.:

President, W. H. Sullivan.
Vice President, T. E. Smith.
Secretary, G. H. Burge.
Treasurer, A. Walther.
Sergeant at-Arms, J. Young, Jr.

Mortality Among Plumbers.

There has just been issued by the Registrar-General of England and Wales, says the *Plumber and Decorator*, a voluminous Blue Book dealing with the mortality of men engaged in different occupations, and some very interesting facts are given respecting plumbers. Under this heading, which by the way includes the kindred occupations of painters and glaziers, there were enumerated at the last census 166,135 males above 15 years of age, and during the years 1890, 1891 and 1892 there were registered 7545 deaths among this body. The comparative mortality figure of plumbers at 25-65 years of age—the main working period of life—is 1120, as compared with 1000 for all males.

From lead poisoning these workers suffer severely, the deaths which are definitely returned under this head giving the high mortality figure of 19. It is true that this is small when compared with the enormous mortality of lead workers and file makers from the same cause, but the two latter are the only occupations in which the mortality from this disease exceeds that of plumbers, painters and glaziers. Separate examination of the returns relating to plumbers on the one hand and to painters and glaziers on the other shows very little difference in the liability of these workers to lead poisoning, the difference, such as it is, being slightly unfavorable to plumbers. Many of the workers, however, follow both occupations. Lead poisoning is probably the primary cause of the excessive mortality from gout and from diseases of the nervous and urinary systems. From phthisis, cancer, bronchitis and Bright's disease the death rate of plumbers is in excess of the average.

NOTES.

The situation in Plumbers' and Steam Fitters' Brass and Iron Goods is still somewhat unsettled, but a distinct tendency toward higher prices is noted. A prominent manufacturer of Plumbers' Brass Goods in the East is reported to have withdrawn all quotations during the past week, and it is believed that others are ready to follow suit. The idea prevails in the trade that moderate advances may be looked for all along the line at an early date. Meanwhile business is of small proportions, orders being confined almost wholly to the filling of absolute requirements, which at this season are normally light.

At the meeting of the Master Plumbers' Mutual Protective Association of Baltimore, Md., last week, 101 names were enrolled for membership. A committee composed of W. P. Lenderking, chairman; E. A. McAllister, George S. Walker, J. B. Hagger, Thomas Forrestell, Charles A. Erich, Mr. Herget, Charles Inderiden and William B. Tyler was appointed to wait upon the dealers in Plumbers' Supplies to ascertain if they proposed to recognize the association. The association will meet in G. A. R. Hall every Tuesday night.

Plumbing Inspector Hopkins of Memphis, Tenn., has had an interview with Mayor Williams with a view of providing better plumbing regulations for the suburbs by extending the city regulations to cover the entire territory of Greater Memphis.

The report of Plumbing Inspector Reuben Bemis of Providence, R. I., states that the percentage of defective work found during the past year was 15. This is a decrease from last year. The first year of the department it was 42 per cent. The total number of plans filed for plumbing and drainage during the year covered by the report was 3883, 2785 being for plumbing and 1138 for drains. Of this number 561 were for work in new houses, and 2184 for work in old houses. In 2425 instances connection was made with public sewers, and in 320 instances connections were made with cesspools. The value of the work performed was $368,086.52. The number of inspections required on these jobs was 6656 on plumbing and 1442 on drains, making a total of 8283 inspections; including the examinations of other kinds, 185. The report favors the use of the front wall or intercepting trap.

The National Sunlight Gas Company, Minneapolis, Minn., have found the demand for their Acetylene Gas Generator so great that they have outgrown the capacity of the Miller Sheet Metal Works, 126 First street North,

and are arranging new quarters at 100 First avenue North.

Henry C. Weeden, Boston, Mass., announces that owing to the blizzard he has postponed the entertainment intended for February 1 until February 22, when an increased number of exhibits will be made of Plumbing Goods and additional attractions will be provided and further gifts made. It gives promise of being a gala day for plumbers.

An ordinance to further regulate plumbing has been passed at Nashville, Tenn. It puts in control of a board of plumbing commissioners all plumbing work done in the city and provides an inspector of plumbing, and requires that plans of proposed work shall be submitted to the inspector for approval.

J. H. Bradley & Co., have opened a plumbing showroom and shops at McHenry, Ill.

The McElwaine-Richards Company, Indianapolis, Ind., report a 50 per cent. better business in Steam and Plumbing Supplies and better prospects than at the same time in 1896, and collections are said to have equally improved.

A German plumber in an Eastern city stated tc a Plumbers' Examining Board that he did not understand English well enough to take an examination, but that he knew his business and was going to work, license or no license.

The Weisel Acetylene Gas Company, Bucyrus, Ohio, are just putting their Generator on the market.

E. Percy Johnson has removed his plumbing establishment from 180 East Main street to 19 Market street, Louisville, Ky.

The Board of Health of Greater New York, at a meeting on February 10, abolished two departments of the board, one in Brooklyn and one in Manhattan. That in Brooklyn is the Bureau of Plumbing and Drainage and that in New York is the Bureau of Mercantile Establishments. The new charter provides that the Building Department shall have charge of plumbing and drainage.

Harry Marchant has opened a plumbing shop at Marion, N. Y.

William I. Grady has opened a plumbing shop at 138 Arnold street, Woonsocket, R. I.

The Sullivan Plumbing & Heating Company, Bay City, Mich., have had flattering reports from a large number of customers for whom they have set the Colton-Smead Under-Feed Furnaces. They are also doing a good business with a new Incandescent Gas Apparatus.

The city of Malden, Mass., will receive bids until February 24 for plumbing and heating and ventilating Ward 3 School.

Speaking of the changes produced in iron by the action of the elements, says the *American Architect*, it is singular that the influence of hot water upon brass, so familiar to plumbers, should not have been more thoroughly studied by scientific men. Every one who has had much to do with plumbing fixtures has observed that the washer screws and other small parts of brass hot water cocks and valves become, in the course of years, brittle at the edges. An attempt to take out such a washer screw with a screw driver results in crumbling the head away, the metal being apparently crystallized on each side of the slot ; while other edges, originally sharp, appear rounded, or become so by the crumbling of the metal when handled. We will not attempt to account for this phenomenon, but it would certainly be of advantage to owners of steam pumps, engines and other machinery in which brass is used, as well as to plumbers, to have an investigation made into the circumstances under which it takes place and the chemical or physical character of the change involved.

The new letter head of the Geo. B. Cobb Company, 44 Centre street, New York, is well calculated to make a good impression on the prospective purchaser of a Heating Apparatus. A half-tone engraving of a fine country house adorns the upper corner in blue tint, with "Steam and Hot Water Heating Apparatus for Suburban Homes our Specialty" in red beside it, printed on a rose colored paper.

The New York office of the Niagara Radiator Company, 44 Centre street, has just been refrescoed in two shades of green with a very pleasing effect. Their line of Niagara and Niagara, Jr., Radiators for hot water and steam have been redecorated and Harry Sedgwick, assistant manager of the company, is in charge, prepared to extend a welcome to the heating contractor.

The Beaton & Bradley Company, Southington, Conn., have got out a very handsome sample board showing their Floor and Ceiling Plates in nickel and bronze plate and their Pipe Hanger for the use of dealers handling their goods.

The attempt to organize all the sewer pipe makers of the country in one large combination, to which end negotiations have been on foot for some time past, is reported to have been abandoned. Failure to enlist some of the leading interests in the scheme appears to be the obstacle which stood in the way of its consummation.

A. E. Weiant and Chas. Bromley have entered into a partnership and have opened a plumbing establishment at New Britain, Conn.

J. D. Coover has opened a plumbing shop at 412 Spring avenue, Harrisburg, Pa.

Scatchard & Malone succeed Thomas Scatchard in the plumbing business at Little Falls, N. Y.

H. O. Taylor, who has been in the plumbing business at Danbury, Conn., has opened a plumbing establishment on Elm street near Main, in Bridgeport, and has taken W. D. Nichols into partnership with him. The new firm will be Taylor & Nichols.

The trustees of Rutgers College, New Brunswick, N. J., have decided to conduct examinations and grant certificates in municipal hygiene to officers of local Boards of Health, Sanitary Inspectors, Factory Inspectors, Plumbing Inspectors, and to those who may seek appointments to these positions The examinations will be designed to test the fitness of persons who may be called upon to engage in the execution of the health laws. Examinations will be held on the first Wednesday of the months of March, June and October at the college buildings in New Brunswick. These examinations will be open to men and women. A certificate of competency, signed by the examiners, and bearing the seal of the college, will be granted to each successful candidate. A list of successful candidates will be furnished to the State Board of Health and, on application, to local Boards of Health.

The Wm. S. Haines Company, Philadelphia, manufacturers of the Heintz Steam Trap, have opened a branch office in the Second National Bank Building, Pittsburgh, in charge of Eliot A. Kebler.

The Milwaukee master plumbers who failed to pass the examination now required by the Wisconsin laws have employed counsel and attacked the constitutionality of the act requiring an examination. Proceedings were begun on the 11th inst. in the Superior Court.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D.C., until March 8, for a low pressure exhaust steam heating, mechanical ventilating apparatus, cold and hot water supply, &c., for the U. S. Post Office, Court House and Custom House Building at Milwaukee, Wis., in accordance with the drawings and specification, copies of which may be had from the office of the Supervising Architect, Washington, or the Superintendent at Milwaukee.

The Canning Industry.

The fruit and vegetable canning industry of the United States represents an invested capital of $15,000,000, with an annual trade of about $30,000,000, and employs more than 60,000 persons. It is chiefly carried on in two States, Maryland and New York. The fish canning business of this country is carried on at 100 establishments, in which more than 5500 persons are employed. The value of the canned fish output is $7,000,000 a year. The chief product in this line is in canned salmon, which is mainly put up in the State of Oregon. In the East more than 2500 persons are employed in fish canning in Maine and 700 in Massachusetts. The oyster canning industry of the United States is conducted in less than 20 establishments, which do a business of between $3,000,000 and $4,000,000 a year, employing 3500 persons. Eighty per cent. of this branch of business is done in the State of Maryland.

The Hermann Time Detector Company have been incorporated at Youngstown, Ohio, by W. C. Hine, F. P. Hood, W. K. Osborn, U. C. Greenwood and William Cornelius for the purpose of manufacturing the Hermann watchman's time detector, a machine recently patented for use in registering the movements of a night watchman in manufacturing and mercantile establishments, hotels, banks, office buildings, &c. The claim is made that this device is very simple, doing away with all complicated apparatus, and yet is thoroughly reliable and absolutely proof against interference by dishonest watchmen. Another strong point in its favor is the low cost of installation.

TIN PLATES.

A Suggestion to the Welsh Tin Plate Makers.

That American tin plate makers do not take a fiendish delight in, or even view with indifference, the woes of the Welsh manufacturers, whose business, so far as this country is concerned, they have wrested from them, is proved by the following letter which has reached us from Wm. N. Follansbee of Follansbee Bros. Company, Pittsburgh, Pa., in which he offers them a practical suggestion for a new outlet for their product.:

Apropos of the general condition of the tin plate business in Wales and frequent mention of the desire there for new outlets for this product, it has always seemed very singular indeed to the writer that our English and Welsh cousins have never considered the matter of tin roofing, notwithstanding the fact that they have manufactured and sent to this country so much material for this purpose. It has been proverbial, of course, in the past how densely ignorant the Welsh manufacturers of plates have been of the purposes to which their output has been applied. Before the days of manufacture in this country the writer, when visiting England and Wales in connection with our purchases from foreign works, was surprised at his inability to find a single tin roof. Such a thing was unknown right in the home of the tin plate industry. Following an inquiry as to this condition of affairs, it developed that having always used slate or thatch for roofs as a consequence John Bull was inclined to so continue to the end of the world, adding, of course, "you know slate is so cheap here," although investigation did not show such was the case compared with the cost of tin.

We understand at the present time a large export business is being conducted in this country in sending American slates to England. Of course we want none of the foreign plates in this country, yet a world wide use of tin plates for every purpose possible in the long run must prove beneficial to the entire industry, no matter in what country located. Possibly you can make a suggestion to the Welsh manufacturers that the question of tin roofing in the United Kingdom is worthy of their best attention. To show generally how uninformed they are as to the use of their product, the writer may mention that one of the very largest producers of roofing tins in Wales made the inquiry, "What do you use ternes for in the States?" He could hardly be made to believe that more than an incidental proportion of the quantity of the ternes sent here were utilized for roofing purposes.

Some time ago this matter was agitated in South Wales, and the proposal to try and imitate the use of terne plates for roofing purposes in the United Kingdom was received with some favor. As a start, a new market or other public building in Swansea was, by the efforts of the tin plate makers, ordered to be roofed with tin and, if we remember rightly, the Welshmen went so far as to get a skilled roofer from this country to lay it. A tin plater in the Briton Ferry district was also announced to have put a tin roof on his new cottage. Beyond these instances, we have not heard of the movement making further headway. The conservatism of John Bull, referred to by our correspondent, doubtless accounts in a large measure for the blindness of the British to the merits of tin as a roof covering; but we believe that the extreme humidity of the British climate is regarded on the other side as inimical to the use of metal roofing of any kind. Possibly this may account for their failure to avail themselves of the cheap roofing material which lies so close to their hand. Perhaps some of our Welsh readers will favor us with their views in the matter.

At the annual meeting of the stockholders of the Ohio River Sheet & Tin Plate Company, at Remington, Pa., the following officers were elected: Alex. Saulters, president; W. J. Caskey, vice-president; A. G. C. Rhodes, secretary and treasurer. Directors: Alex. Saulters, Thomas P McDonough, M. Rood, George Wood and Jesse Delo. Auditing Committee: W. J. Caskey and H. W. Pavitt This concern manufacture Black Plate for tinning, having an annual capacity of about 4000 gross tons.

SCRAP.

There has been an almost general advancing tendency in the metal trade, excepting Tin Plate, however, which is selling as low as ever.

The efforts to bring about a consolidation of Tin Plate interests are being continued, but it is understood that one leading concern, while willing to co-operate in putting the industry upon a better basis, are determined to maintain their independence. As the concern in question are one of the very largest in the country and are intimately allied with a jobbing house who form one of the most important factors in the distributing trade, the obstacle their attitude presents to an effective combination is a serious one.

The firm of Saunders, Fielding & Bond, New York City, have dissolved the partnership by mutual consent. The Tin Plate and Metal business of the firm will be continued by F. E. Vivian Bond, under the style of Vivian Bond & Co., at the Coffee Exchange Building, 66-70 Beaver street, New York.

The Shenango Tin Plate Company, New Castle, Pa., have placed an order with the Leechburg Foundry & Machine Company, Pittsburgh, Pa., for 26 36-inch Doubling Shears, four 40-inch Doubling Shears, five 56-inch Roll Lathes and six No. 2 Mesta Patent Pickling Machines. This is said to be the largest order for Doubling Shears ever placed. The Leechburg Foundry & Machine company have sold 25 of their Mesta Picklers in the past 12 months.

The monthly statement of dutiable goods in bonded warehouses at the port of New York shows that 2,510,802 pounds of foreign Tin Plate, valued at $54,515, were so held on January 31, as compared with 3,490,356 pounds, valued at $71,452, on the corresponding date of 1897.

The Lloyd Booth Company, Youngstown, Ohio, are building 126-inch knife Squaring Shears for the Ætna-Standard Iron & Steel Company, Bridgeport, Ohio; the Reeves Iron Company, Canal Dover, Ohio, and the Cambridge Iron & Steel Company, Cambridge, Ohio. They are also completing three 24 inch Sheet Mills for the last named concern.

The exports of Tin Plates from Great Britain to the United States in January last amounted to 8883 tons, as compared with 10,123 tons in the previous month and 8810 tons in January, 1897.

We have received from Riter Bros. & Co., 1022 Race street, Philadelphia, a set of samples of their special brands of American Roofing Tin. These are six in number, as follows: Riter's Guaranteed Hand Dipped, Riter's Roofing, Riter's Extra, Riter's Special, Riter's Lehigh and Riter's York, bearing 46, 35, 25, 20, 16 and 10 pounds of coating respectively. The samples are 7 x 5 inches in size and are attached together by steel rings, a card between each sample giving the name and a complete description of the Plate represented, with prices and other details.

At the recent meeting of the Atlanta Steel & Tin Plate Company, Atlanta, Ind., the following officers were elected: C. A. Ford, president; Theo. D. Morgan, vice-president and general manager; A. G. Walton, treasurer, and E. S. Walton, secretary and assistant treasurer. C. A. Ford, Theo. D. Morgan, A. G. Walton, E. S. Walton, J. G. Dunn, W. D. Parr and A. D. Booth were elected directors. The company's plant has had a very successful run during the past year, turning out a large and satis factory product.

The Tin Plate mill of the Neshannock Sheet & Tin Plate Company, New Castle, Pa., started into operation last week.

Ambrose Beard, Jr., has been appointed general superintendent of the plant of the Star Tin Plate Company of Pittsburgh, Pa.

Another Tin Plate concern in the Swansea Valley, the Ynispenllwch Works of Clydach, South Wales, are reported as going into the manufacture of Galvanized Sheets.

THE RETAIL STORE.

THE MINNESOTA RETAIL HARDWARE DEALERS' ASSOCIATION.

OPENING EXERCISES.

A large and enthusiastic gathering of Hardwaremenfaced President Charles F. Ladner in the United Commercial Travelers' Hall, Minneapolis, on the morning of the 9th inst., when he called the second annual convention to order. The hall easily seats 300, and everA chair appeared to be occupied by members of the Minnesota Retail Hardware Dealers' Association and interested visitors. After a few words of greeting to the assemblage and remarks by Mayor Pratt of Minneapolis and others, Secretary J. W. Clark called the roll of members. The following names were registered:

Ole Fyetstad, Lake Benton.
A. A. Fravaten, Kent.
J. N. Fsyder, Osceola, Wis.
F. H. Casey, Princeton.
Ofenlock & Buel, Kasota.
Hundy Brothers, Long Prairie.
Pattridge Brothers, Kenyon.
Wm. Guir, Ortonville.
Reuben D. Wise, Adams.
Albert Kraus, Minneapolis.
H. C. Esty, Cyrus.
H. Hood, Kinsington.
E. Smith, Minneapolis.
B. Just, St. Paul.
Schlick Brothers, St. Paul.
Thompson & Hobberstad, Lanesboro.
Schlick Brothers, North St. Paul.
J. G. Koffken, Green Isle.
Chris Juni, Jordan.
Bishof & Anderson, Blue Earth City.
Hutz Brothers, St. Paul.
C. H. Casey, Jordan.
Johnson & Johnson, Gibbon.
Gameson & Kraukiema, Montgomery.
Stronks & La Page, Baldwin, Wis.
Wm. O. Paige, Alisten.
P. P. Quist & Co., Winthrop.
Belmke & Oetting, St. James.
N. A. Lilyquist, Winthrop.
Jos. Mason, St. Peter.
C. E. Krause, New London.
A. A. Lindeman, North Redwood.
Vetunn & Clark, St. James.
Olson & Weiske, Belgrade.
C. N. Barnes, Grand Forks, N. D., secretary North Dakota Hardware Association.
John Hammerman, Young America.
J. R. S. Cosgrove, Le Sueur.
J. L. Watson, Wahpeton, N. Dak.
W. G. Hopp, Rush City.
G. A. Lewis, Mankato.
Herman Stege, Nicollet.
C. E. Jenson, Nicollet.
M. Olson, Atwater.
Ole A. Christenson, Atwater.
J. C Stuhlman, St. Paul.
J. F. Vanusek, Montgomery.
Schultz & Masch.
J. A. Wadsworth, Glencoe.
J. E. Nash, Minneapolis.
L. Thielman & Son, St. Cloud.
A. K. Pederson, Appleton.
O. F. Olson, Brandon.
F. H. Retzloff, New Ulm.
Erickson & Lawson, Murdock.
Otto Rood, Minneapolis
Erickson & Hillekson, Wheaton.
John Erickson, Hancock.
S. B. Bartram, Zumbrota.
Lee & Crooks, Benson.
R. L. Warner, Eden Valley.
E. F Munger, Pine Island.
D. W. Marvin. Pine Island.
A. Beersdorf, New Germany.
Wm. Russell, Stephens.
Simmer & Marzolf, St. Paul.
J. F. Wohlhutter, Albert Lea.
H. O. Amunson, Clear Lake, S. Dak.
H. R. Schroeder, St. Paul.
R. A. Schatz, Glencoe.
J. J. Goetzenberger, Minneapolis.
H. Traner, Hutchinson.
O. J. Johnson, Waseca.
Hauser & Tester, Gibbon.
Hunser & Reeke, Fairfax.
Hunser & Parsons, Franklin.
A. C. Vaughan, Minneapolis.
C. W. Kelley, Devil's Lake, N. Dak.
H. Harrington, Fargo, N. D.
E. H. Heins, Renville.
B. F. Heins, Renville.
C. A. Peck, Berlin, Wis., secretary Wisconsin Hardware Association.
Kurl Brothers, New Prague.
Gus Lindemann, Milan.
B. Fielsam, Royalton.
Johnson & Eleston, River Falls, Wis.
L. H. Hornburg, New Ulm.
Aug. Hartelt, Norwood.
C. M. Groschen, St. Bonifacius.
R. B. Hall, St. James.
Ben Clayton, Taylor's Falls.
W. H. Vollbrecht, Hanover.
K. Record, Farmington.
L. P. Albrecht, Glencoe.
Wright & Anderson, Mantorville.
W. H. Tomlinson, Le Sueur.
A. Dahl, Bird Island.
John McMullers, Shakopee.
C. C. Bick, Winona.
A. G. Hunff, Alden.
C. A. Zabel, New Paynesville.
H. S. Cleveland, Minneapolis.
Louis Gewalt, Breckenridge.
Clement Schroeder, Mankato.
How Brothers & Co., Sauk Centre.
Chas. F. Ladner, St. Cloud.
C. W. Bruck, Royalton.
Stremel Brothers, Minneapolis.
H. E. Humphrey, St. Paul.
Weiland & Wade, West Duluth.
D. Y. Butler, Brownton.
Henry Yost, Minneapolis.
E. W. Dunton, Annandale.
J. N. Silow, Clarkfield.
Peterson & Berg, Madison.
L. A. Williams, Pelican Rapids.
Schroeder Brothers, St. Paul.
Anderson & Schock, Cresca, Iowa.
J. A. Peterson, Canby.
Wm. Von Kuster, Litchfield.
Gardner, Warner & Davis, Minneapolis.
Cotrell & Fradenburgh, Faribault.
P. L. Norman, Montevideo.
Chas. F. Vanasek, New Prague.
A. Puck, Dayton.
J. E. O'Brien, Crookston.
O'Brien Brothers, Red Lake Falls.
Evins & Herdliska, Princeton.
Muzzy & Ryan, Wadena.
Houghtaling & Coult, Fairmont.
McKinley Hardware Company, Cottonwood.
Brutsch & Field, Renville.
Evenson Brothers, St. Peter.
A. T. Stebbins, Rochester.
H. H. Oristuhl, Dawson.
H. J. Wartman, Watkins.
H. O. Roberts, Minneapolis.
Geo. D. Parmlee, Rochester.
Cowing, Rombards & Co., Alexandria.
G. Boehm & Son, Minneapolis.
O. F. Peters, Cannon Falls.
Hagstron & Lyser, Lowry.
A. H. Ames, Northfield.
Sabe Zimmerman, Mankato.
E. M. Fairfield, Osakis.
E. A. Moye, Duluth.
F. A. H. Smith, Minnesota Lake.
E. Trahms, Minnesota Lake.
Geo. W. Cahoon, St. Paul.

Following the President's address Secretary J. W. Clark was called upon for his report, and read a very comprehensive statement of the work done dur-

ing the ten months in which the association has had an existence. This report is not only interesting to the members of the Minnesota Association but is also of much value to the Hardwaremen in other States who contemplate the formation of a similar organization, but do not know exactly how to get to work to secure the desired results. Copious extracts are given as follows, the document being too long for its entire reproduction :

Report of the Secretary.

This report contains much detail, but was written to show you the actual work performed and for other reasons that may appear later on in the meeting. These will, perhaps, suggest matters to your mind upon which you may desire to speak.

The movement to organize this association was the result of agitation which had been very general throughout the State for several years. The movement seems to have originated at St. Cloud. At the meeting there arrangement were made for calling the Hardware dealers of the State together at St. Paul, April 29, 1897, when over 200 business men met to devise ways and means of correcting the evils of which they had so long and bitterly complained.

The large number of dealers present and the fact that 60 of them then and there paid their money and became charter members is positive proof that they were gathered together with a firm and steadfast resolution to form the nucleus from which it was believed much benefit would result to the Hardware business of the State. While the number to join at this time was, perhaps, not as great as it might have been, yet it was none the less a record breaker to start with, as will be seen later by comparison.

With the selection of the secretary the association may be said to have been completed and ready to proceed to business. The membership was now 100. The office was located in a commanding position, about as far from the face of the earth as possible. The secretary, on June 7, armed with a little nerve and a large bundle of unanswered correspondence, filled with encouragement, but short on cash, went to work. It being necessary to have as complete a list of retail dealers as possible, this work received attention first. Through jobbers it was learned that there were nearly 2500 dealers selling Hardware in the State. Upon investigating the jobbers were found responsible for this. Their list included well diggers, tin shops, blacksmiths, repair men, junk shops and supply houses. After checking and rechecking several lists and reports, a revised list of nearly 1300 names of retail Hardware dealers was completed.

Preparing the lists of jobbers and manufacturers was slow work, as it was to contain only those doing business in this State. There being no such list published, the only practicable way was to apply to the retail dealers to furnish a list of the jobbers and manufacturers known to do business in this State. This was done ; many lists were received, and much time was consumed in checking them over and recording them, but finally a list of 400 names was completed. As soon as these lists were completed, the work of sending out the above mentioned letter was begun. To the retail dealers a copy of the constitution and by-laws and an application blank were sent. The letters to the jobbers and manufacturers requested them to make reply stating their position relative to the association, a copy of the constitution and by-laws being inclosed that they might understand its nature and object. They were informed that where silence was maintained and no reply made the party addressed would be considered as unfavorable to the association.

Making a list of trade papers, sending them copies of circular letter, writing up membership book, making record book of members by counties, sending out membership cards, transcribing the constitution and by-laws and record of meetings held, occupied the time of the secretary to July 8, when the next Executive Committee meeting was held. The meeting was called to consider the work done and to prepare plans for the future. It was learned that while a great many jobbers and manufacturers had replied favorably to the letter sent them, there were many who had made no reply. In order that there might be no misunderstanding the secretary was instructed to prepare and send a second letter to all the jobbers and manufacturers in the cities of Chicago, Milwaukee, St. Louis, Dubuque, Duluth, St. Paul and Minneapolis. The committee passed upon the letters received from jobbers and manufacturers and instructed the secretary to prepare a list of those favorable and unfavorable. After reviewing work of secretary and considering other matters of the association the meeting adjourned. The secretary found that in the cities above named there were 81 jobbers and manufacturers who had not replied to the first letter sent them; the second was prepared and mailed them at once.

In accordance with the constitution, the president appointed a county organizer in each of the 54 counties wherein there were members. Supplies and a list of all members in their respective counties were sent to them. This was done to facilitate their work, which was expected to greatly increase the membership.

The letters from jobbers and manufacturers were in many cases evasive, and much information was demanded; this entailed a large amount of correspondence. July 15 having arrived (the date specified in the letters to jobbers and manufacturers), a record was made of all replies received ; those favorable and unfavorable to the association were arranged in alphabetical order and pasted in separate books prepared for the purpose. A list containing the names and addresses of 230 jobbers and manufacturers was prepared and sent to all dealers in the State. Of this number, 173 had sent favorable replies, wishing us the greatest of success and in some instances offering financial aid ; of the remaining 57, reported unfavorable, many were so reported because of their not having made reply. The list, in the hands of the retailer, had the desired effect, and soon many letters were received from jobbers and manufacturers seeking information, and several of the most important ones were anxious that a new report be issued at once showing that they were favorable to the association ; many of these letters were very emphatic and in most positive terms agreed to discontinue selling their goods to a certain class of dealers.

About the middle of August another letter and list were prepared and sent to all the dealers, showing the additions and changes made. With the hopes of getting in some new members from those who had attended the first meeting at St. Paul and had not yet joined, 80 of them were sent a special letter. Since then 30 of these have become members.

On August 24 the Executive Committee again met, the work of the secretary since last meeting of the committee was looked over, and general matters of the association considered. The question of the handling of stoves by the different classes of dealers was considered, and a resolution passed ; the secretary was instructed to send a copy to all members. On motion, a resolution was passed allowing all dealers to join the association between September 1 and the annual meeting upon the payment of the membership fee and one-half the annual dues, and the secretary instructed to notify all non-members. On August 31 this stove circular was sent to all the members; the effect it produced proved that many of them were loyal. Much correspondence was the result, and the secretary had the pleasure of meeting many of the representatives of stove dealers, who called to explain, and to have explained, and the end is not yet. The circular letter was sent to all non-members, soliciting their membership. List No. 3 was sent to all dealers in the State. A special letter was sent to the county organizers, urging upon them the importance of having their county well represented.

The secretary at this time started out to solicit membership of the dealers in the twin cities. At St. Paul obstacles were encountered over which the secretary had no control, but at Minneapolis the work was very successful. There being nearly 100 dealers in these cities, much

time was consumed, about 150 visits being made. President Ladner instructed the secretary to advance upon the country, so on October 18 this work was begun. From the 126 dealers called upon 89 new memberships were obtained, being about 75 per cent. The total number of new memberships obtained through solicitation by the secretary was 128.

On June 4 the Executive Committee was again called together by President Ladner. Secretary's report of work done since August 24 was gone over, complaints were considered and the secretary instructed to report several jobbers unfavorable to the association. The following resolution was passed:

Resolved, That it is the sense of this committee that at our next annual meeting a committee of three be appointed to meet a like committee to be appointed by the Wisconsin and North Dakota associations, to consider the advisability of organizing a Northwestern Association of Retail Hardware Dealers, and to formulate by-laws and resolutions to govern the same ; that this committee be subject to the call of the president of the Minnesota Retail Hardware Association.

There are now in the United States the following State associations of retail Hardware dealers:

Indiana Hardware Association.
Kentucky Hardware Association.
Michigan Hardware Association.
North Dakota Hardware Association.
Ohio Hardware Association.
East Tennessee Hardware Association.
Wisconsin Hardware Association.
Minnesota Hardware Association.

In Iowa an association was organized several years ago to oppose the Nail trust and they had plans ready to build a Nail mill. The trust heard about it and dissolved, and the project to build the mill was abandoned. There are other Hardware associations in different States who meet in a social way to exchange ideas and discuss business methods, &c.—sort of mutual admiration societies, but who have not as yet taken hold of the more serious side of business affairs as most of those above mentioned have done. But the movement is spreading. Very recently the New England States have taken up the question, and Pennsylvania will no doubt hold a meeting for the purpose of organizing. Letters have been received from dealers in several other States asking for information for the purpose of organizing. February 7 an old established firm in Texas wrote for full particulars, which will be sent them.

The Ohio Association seems to have been the first to enter the field, organizing October 10, 1894, with 10 members the first year, 20 the second, 65 the third, and they expect 100 members at their February meeting this year. There are 1100 legitimate Hardware dealers in that State. The secretary informs me they propose to make a vigorous campaign the coming year

The Michigan Association was organized July 9, 1895, with 20 members, and they have about 100 now. They have adopted our resolution No. 2 and now propose to carry the war into Africa if necessary.

The Wisconsin Association was organized February 9, 1897, with 40 members, and 61 have joined since. Secretary Peck reports a growing interest by the dealers and expects 50 more to join at their annual meeting. This report was sent to me January 25, 1898. On February 2 they held their annual meeting, and from a letter just received from Secretary Peck they not only received the additional 50 but a number more. As we are favored by the presence of Mr. Peck, I hope we shall have the pleasure of hearing from him on this subject.

The Indiana Association was organized February 24, 1897, with 30 members. A number have joined since, and they are making special efforts to get all dealers in the State to attend their annual meeting February 23 and 24, 1898, at South Bend, and expect to receive many new members at that time. The secretary suggests that all States of the Central West be joined together in the common cause.

The North Dakota Association, the youngest of all, has made a fine record. It was organized September 20, 1897, with 28 charter members. Fifty-seven have joined since, giving them a total membership of 85 to January 29, 1898. Owing to trade conditions existing in that State, and the difference in the constitution and by laws from ours, there are only about 160 retail Hardware dealers who are eligible to membership in their association. Secretary Barnes writes me that they have now about 100 members. As he and President Kelley are also with us I trust we shall hear from them to our advantage. The late increased interest in their association should have a wholesome effect upon us.

It will be remembered that the Minnesota Association was organized April 29, 1897, with 60 charter members. It has since increased its membership over 400 per cent., having to day 330 members in good standing, making it the largest retail Hardware association in the United States. Three of our members are from our sister State of Wisconsin. We have members in every county in the State (where there is a Hardware dealer), with the exception of three. No other association has prepared and sent lists of jobbers and manufacturers to all Hardware dealers in its State as we have done. In doing this it has given us much greater power and influence than otherwise would have been possible in the beginning. Owing to the expense it may be deemed necessary to send reports to members only in the future, and now, having such a large and influential number of dealers as members, this plan can no doubt be adopted with safety. Others will see that it is hardly fair to reap unless they sow, and will probably send in their fees and become members soon.

The financial statement of the association is as follows:

Receipts.

Membership fees from 330 members	$660.00
Dues from 330 members, including $67.50 paid in advance for 1898	926.25
Total receipts	$1,586.25

Disbursements.

Expense of organizing	$149.76
Bond for treasurer	10.00
Office furniture	21.00
Office expense, books, &c	20.55
Postage	114.00
Rent to February 7, 1896	80.00
Printing	105.69
Salary of secretary	800.00
Milwaukee meeting, expenses Mr. Stebbins	21.60
Stenographer	28.00
Expenses secretary soliciting membership	150.18
Postal cards	11.00
Railroad company's joint agent	3.50
Total paid out	$1,515.28
Balance on hand in hands of treasurer	70.97

The next step in this movement is the formation of a similar association of all the regular and legitimate Hardware dealers of the Northwest. The climax of the movement will be such an association of all the regular dealers of the United States. The important business, therefore, is to take the next step, as before indicated, and to take it right.

Wednesday afternoon the election of officers for the ensuing year was the first business disposed of. The list elected is as follows:

President,

Charles F. Ladner, St. Cloud.

Vice-President,

Hon. A. T. Stebbins, Rochester.

Executive Committee,

W. H. Tomlinson, Le Sueur.
C. F. Stremel, Minneapolis.
John Schleck, St. Paul.
James E. O'Brien, Crookston.
J. P. Watson, Marshall.
E. A. Moye, Duluth.
Clement Schroeder, Mankato.

The president and vice-president are members of the Executive Committee by virtue of their office. The secretary and treasurer are elected by the Executive Committee.

C. N. Barnes, secretary of the North Dakota Retail Hardware Dealers' Association, was invited to address the

convention, and did so at some length, expressing his pleasure at the opportunity afforded him of meeting his Minnesota brethren.

Secretary C. A. Peck of the Wisconsin Retail Hardware Dealers' Association, being invited to address the convention, made a stirring speech in which he set forth the character of the work being done in Wisconsin.

B. W. How of Sauk Center read a paper on "Unselfish Loyalty to the Association."

E. A. Moye of Duluth followed with a paper on "The Success of Our Association," and James E. O'Brien of Crookston read a paper on "The Work of the Association."

Thursday Morning.

Resolutions of various kinds were read after the convention had been called to order. One was from the Retail Furniture Dealers' Association of Minnesota, North Dakota and South Dakota asking the members of the Hardware association to pledge themselves to use their best efforts to induce local furniture dealers to join their trade organization. Another proposed an amendment to the by-laws so as to admit implement dealers. Another proposed an amendment to the by-laws including installment houses in the list of objectionable institutions. All were referred to the Committee on Resolutions.

H. Harrington, Fargo, N. Dak., was invited to address the convention and made a brief response, preferring to have President Kelley speak for his State.

S. Zimmerman of Mankato asked for reports by the individual members of benefits derived from the association. He said that grocers in his town were handling small stocks of Hardware, and thought the interference from such quarters should be stopped.

Vice-President Stebbins stated that tinware had been a favorite source of annoying competition in the hands of grocers, but through the efforts of the association this was being stopped.

On motion of H. S. Cleveland of Minneapolis the proceedings were ordered printed and sent to the members of the association.

H. O. Amunson of Clear Lake, S. Dak., advocated a scheme of mutual insurance for the retail Hardware trade, and hoped that it would be taken up as a feature of any interstate association.

E. A. Moye of Duluth, member of the Executive Committee, asked for suggestions for future work.

S. Zimmerman of Mankato pointed out that the collection laws of Minnesota need amending. At present no bills under $10 can be collected by legal process, while property to the value of $20 is exempt. These amounts should be lowered so as to enable a class of debtors to be reached who prove very annoying. He hoped the influence of the association would be exerted to at least cut these amounts in two.

President Clark W. Kelley of the North Dakota Retail Hardware Dealers' Association was at this point invited by the chairman to address the convention. He said the North Dakota Hardwaremen had realized from the organization of their association that they could not do much alone, and so he and his associates had come down to get more help. The only way to accomplish the purposes sought is by uniting the Hardwaremen of several States, and thus bring weightier influence to bear on manufacturers and jobbers to protect the legitimate trade.

On motion of Mr. Fradenburgh of Faribault manufacturers and jobbers present were invited to enter the hall separately during the executive session shortly to be held, and address the convention.

S. M. Davis of Minneapolis read the followig paper, entitled

What Are You Going to Do About It?

Yesterday you listened to some able papers from different view points warning you against possible dangers here and there, urging you to strengthen our organization from every possible point as individual firms—a word of caution here and a call for loyalty everywhere, even at some personal sacrifice, as you shall discriminate in your purchases, favoring those houses which are proving themselves worthy of your trade.

These papers were presented to you by those who have borne the burden of the initial work of this organization. They know better than we do what progress has been made, and if in their judgment they deem it wise to proceed along similar lines another year they should have the hearty co-operation of every individual merchant.

Your enthusiastic re-election of these men yesterday calling them to service without pay for your interests, carries home to each one of you added responsibilities. We've only half the membership we should have. What are you going to do about it? Will you get every man in your town in line, or wait for the secretary to do it? There is no question regarding the issue if every dealer in the State was a loyal member of this association, and when I say loyal, it does not mean the half hearted manner in which we have supported the constitution and Executive Committee the past year. How many times have you placed your orders with a house known to be disloyal to our interests, or have passed over the matter without making the proper inquiry, thoughtless at times and almost criminal at others, making yourself and the association the laughing stock of those who antagonize us. What are you going to do about it in the coming year? Make your confession to yourself and your neighbor for conscience sake, make it as open as the erring church brother in Vermont who got up in open meeting and made the following confession :

Brethren, my conscience compels me to confess that when boiling down my sap this spring I put into the kettle two buckets of water and sold the sugar at the same price as that made from pure sap.

You gentlemen in the country can have many of your battles fought for you by the city merchants, and many of the evils confronting the dealers in the cities you can help correct, but it will demand loyalty and unselfishness on the part of both.

From expressions made by some of the country merchants I fear they do not all comprehend the far reaching and rapidly increasing menace to their legitimate trade in the mail order departments of not only the well-known catalogue houses, but every department store and installment house, all of which, whether they carry in stock or not, offer to deliver practically everything pertaining to a Hardware house unless it be the one item of Nails. What are you going to do about it? Do you patronize them when you come to the city? How will you know what jobbing house or manufacturer supplies them with their goods unless you are in touch through this organization with the city merchants and the secretary of our association?

Again, gentlemen, the manufacturers must reach you through your jobbing house. Now what manufacturers' goods do you want your jobbing house to fill your orders from? Shall it be from the very ones who sell direct to the installment houses and others above mentioned, and the identical manufacturers some of the city merchants refuse to place orders with? Verily not, if you are in loyal touch with our organization. What are you going to do about it? Why, simply decline to receive from your jobber goods manufactured by concerns who through channels already named reach in an illegitimate manner your neighbor and customer in the remotest part of the State. This need not antagonize the jobbers in the least. They know the objects of this association and many of them are in touch with and loyal to us, and we honor them for the stand they have taken. If there are any "black sheep" among them the sooner we know it the better for us and the "wosser" for them.

I am glad to know of one country dealer who was shrewd and loyal enough to decline a bill of goods for the reasons stated.

Now we want to know, must know if we are to succeed, who among such important manufacturers as those of Tin and Granite Ware are loyal to our cause, give them our support and ask our jobbers to do the same. Let the jobbers feel that you would appreciate the transfer of

their dealings to manufacturers who are loyal, and they themselves will readily see that their own interests are better conserved in this mutual protection. Give them to understand that they will be known by the company they keep, and this reminds me of a bit of pleasantry. An Irish neighbor remarked one morning :

"Patrick, you were on a bad spree yesterday."

"Yis, Mr. Ellis, I was. Bless me if I weren't a-lyin' in the gutter wid a pig. Father Ryan came along, looked at me, and says, says he, 'One is known by the company he kapes.'"

"And did you get up, Patrick?"

"No, but the pig did."

We depend upon the jobbers and we are willing to support them, and the more loyal they are to us the greater the volume of trade they may expect. The same is true of the manufacturers. If I read between the lines correctly in all your deliberations, papers and reports of yesterday, we are moving forward toward a combination of Northwestern States and ultimately to a great national organization which shall join issues with organizations of other trades and by legislation or otherwise lift up the standard of legitimate merchandising to a higher plane, bringing about just taxation, eliminating the sweat shop methods of employing girls and boys or even untutored young ladies and young men having no knowledge of their wares, who sell goods like poll parrots, making lying advertisements a crime, then verily shall three great mushrooms that stand at the three only prominent corners for trade, a menace to the peace, happiness and prosperity of all our people, be eulogized in the following language of a classic Quaker. It is related of the English ancestor of a well-known Philadelphia Quaker family that he was quite a learned man, familiar with the dead languages, and that once he went to see one of the great universities. As he was walking about there, his Quaker garb attracted the attention of three of the students, and they proposed to have some fun out of the old Quaker. They stationed themselves where he might hear them. Then one said (in Hebrew), "Here is Abraham." Another said (in Greek), "No, this is Isaac." The third said (in Latin), "No, it is Jacob." Whereupon the old man turned and said to them : "Young men, I am neither Abraham nor Isaac nor Jacob. I am Saul, the son of Kish, sent to seek my father's three asses, and, lo, I have found them."

President Kelley extended a hearty invitation to the Minnesota Hardwaremen to attend the North Dakota convention the following week.

Vice-President Stebbins stated that a bill had been introduced in the last Minnesota Legislature to punish lying advertising, but it was killed, to his surprise, probably because it came up too late in the session. If such a bill is introduced early in the next session it can probably be passed.

The convention then went into executive session for the purpose of discussing matters of a private nature. During the executive session the Committee on Resolutions reported in favor of all that had been referred to them, except the one admitting Implement dealers to membership. The question of forming a Northwestern Association was referred to the Executive Committee with power to act, and a joint meeting was immediately called at 4 o'clock in the afternoon. St. Paul was selected as the place of meeting next year, although the Duluth members extended a warm invitation to the association to visit the Zenith City on that occasion. The convention adjourned to meet in February, 1899.

Northwestern Association Formed.

A meeting of the representatives of Wisconsin, Minnesota and North Dakota was held at the Nicollet House on Thursday afternoon. After a thorough discussion of the situation it was agreed to form the Northwestern Retail Hardware Dealers' Association, to be composed of the members of the three organizations. The presidents of these organizations will constitute the Executive Committee. In view of the greater strength of the Minnesota Association, the president and secretary of that body will also be president and secretary of the joint association. The several State organizations will be continued as now constituted.

NOTES AND COMMENTS.

Charles Lindemann of J. P. Lindemann & Sons, Milwaukee, was in attendance at the convention and exhibited a lively interest in the proceedings.

C. W. Aldrich of Minneapolis, representing the Mississippi Valley Stove Company, Fulton, Ill., took much pleasure in viewing the great organization which he had materially helped to form. Thoroughly unselfish, his services were at the disposal of any one working in the interests of the association.

G. L. Nye, manager of the Minnesota Stove Company, Shakopee, Minn., mingled among the Hardwaremen to remind them that something else than wheat was produced in Minnesota.

The Peninsular Stove Company, Detroit, Mich., surpassed all their competitors in actual outlay to attract the attention of the members of the convention. They fitted up a parlor in the Nicollet House as a sample room, and displayed in it a large line of steel ranges, cast ranges, wood cooks and heating stoves. New patterns were shown, and the interest taken in the display was manifested by the almost constant stream of visitors. The exhibit was in charge of W. L. Nesbitt and C. D. Johnston, who manage between them to cover a very considerable part of the Northwest.

C. D. Pruden of the St. Paul Roofing, Cornice & Ornamental Company spent considerable time in attendance at the convention, meeting old friends and customers.

The following traveling men were observed in attendance at the convention: C. E. Cook, representing Cribben, Sexton & Co., Chicago; H. E. Cook, Eclipse Stove Company, Mansfield, Ohio; F. E. Muzzy, I. C. Montgomery and F. J. Norvell, Simmons Hardware Company, St. Louis; W. S. Wood and J. F. Sigloch, Marshall-Wells Hardware Company, Duluth; C. S. Howard, J. P. Lindemann & Sons, Milwaukee; W. H. Kirk, Cleveland Foundry Company, Cleveland; J. N. Boyd, Belleville Stove Works, Belleville, Ill.; G. L. Horton, H. P. Gallup and N. Geib, Farwell, Ozmun, Kirk & Co., St. Paul; W. J. Moorhead, Hibbard, Spencer, Bartlett & Co., Chicago; F. W. Lucas, Bergstrom Bros. & Co., Neenah, Wis.; R. A. Grim, Michigan Stove Company, Chicago; C. H. Conner, Fuller-Warren Company, Milwaukee.

Indiana Retail Hardware Dealers' Association.

The following call has been issued for the annual meeting of the Indiana Retail Hardware Dealers' Association at South Bend on Wednesday and Thursday, 23d and 24th inst., by M. L. Lewis, secretary, Marion, Ind.:

MARION, IND., February 7, 1898.

Believing that all retail Hardwaremen should be interested in our association for their own welfare, and that the time is now when we should unite, get together and correct at least some of the evils connected with the retail trade, we extend a cordial invitation to you to attend our annual meeting in South Bend, on February 23 and 24.

Send your application at once to the secretary, or join us at the meeting.

This call, it will be observed, is addressed to parties not members of the association, whose co operation in its work is earnestly desired. It is to be hoped that a large accession to the membership will be recorded at the meeting, and that thus the objects which it is seeking to accomplish may be realized.

George William Hoffman, Indianapolis, Ind., manufacturer of Metal Polishes, advises that business in that line has been and is very good, and that the demand is very flattering.

The Ohio Hardware Association.

This association, which is vigorously prosecuting its work, is officered as follows : J. P. Duffy, Greenville, president ; M. B. Talmage, Mount Gilead, vice-president, and John F. Baker, Dayton, secretary-treasurer. The following call to the annual meeting, February 23 and 24, has been issued by the efficient secretary-treasurer :

DAYTON, OHIO, February 10, 1898.

The Ohio Hardware Association will hold its fourth annual session at Columbus, Wednesday and Thursday, February 23 and 24, 1898. The meetings of the association will be held in the spacious assembly hall of the Hotel Chittenden, the session of Wednesday beginning at 2 p.m. and that of Thursday at 9 a.m. The Executive Committee have prepared a programme, which they believe will be of great interest to those who attend the sessions. A number of papers relating to matters of vital importance to the trade will be read by members of the association during the session on Wednesday. On Thursday the session will be devoted to the "question box," and business ideas, methods and management will be discussed.

The committee look forward to the coming meeting as one of the most important in the history of the association, as the papers to be read will be of great interest, and the new feature just introduced—viz., the question box—will provoke inquiries and discussions that must prove helpful to every dealer in our State. The social features have not been overlooked. In the evening of Wednesday occurs the annual banquet, at which some of the veteran Hardware dealers of the State have consented to address us. On Thursday evening we are to be the guests of the Columbus Wholesale and Retail Hardware Association.

A very earnest and cordial invitation is extended to the Hardware dealers of Ohio to meet with us at Columbus, as well as to become members of the association. The need of an association is apparent to all. The Hardware trade throughout the Union is organizing. Several of our sister States have associations that are now a power for good.

There are about 1100 Hardware dealers in Ohio. If all or the majority, were members of our association the abuses and evils that have crept into the trade could be overcome, but this cannot be accomplished except by an organized effort and organizations to be effective must be complete.

The Executive Committee has taken especial pains in arranging the programme for the Columbus meeting, and in securing a large attendance not only of the many prominent Hardware houses identified with the association, but of others in all parts of the State, who have been invited to join the movement. All the indications point to an exceptionally large and successful gathering.

MEMORANDA.

Keen & Hagerty, Baltimore, Md., find the year opening with excellent prospects for their business. They are meeting with a very gratifying demand for their Tinware, Enameled Ware and other products, and their factory is kept busy in all its departments. The firm's New York City manager, A. W. Pritchett, whose office and show rooms are at 101 Beekman street, reports a great run on the S. & B. Galvanized Tubs, which were illustrated and described in these columns when first placed on the market last year. Among the new goods which the firm are manufacturing this year and which are attracting much interest in the trade are Champion Sieves, made in two sizes. Other new goods are in course of preparation and considerable additions are being made to the firm's line of Enameled Ware.

The Griswold Mfg. Company, Erie, Pa., issue their 1898 catalogue in the interests of their well-known Erie Cast Aluminum and Iron Hollow Ware and other goods. It is a very tastefully published volume of 80 pages, in dark green covers decorated with silver lettering and their trade-mark, being the thirteenth annual catalogue issued by this concern, who started in 1868 with a small plant of 5000 square feet that has been increased until at present the floor space amounts to 100,000 square feet. In an introductory note they refer to the merits of the Erie Ware, American Dampers, American Waffle Irons, &c., and point to the great success of their Erie Cast Aluminum Ware, which is made from the best No. 1 aluminum metal. They also refer to Iron Hollow Ware, Gas Ranges, Hot Plates, Heaters, &c., of which they will send a special catalogue to any one who wishes it. In addition to their regular line of goods this firm are prepared to make special aluminum castings of any size and description practical to mold, also fine light gray iron castings. All the goods in the line indicated are illustrated and described with price lists, and at the end is an alphabetical index. The printing is done in a greenish ink, which gives a handsome effect.

A 32-page catalogue is received from Patterson, Gottfried & Hunter, Limited, 146-150 Centre street, New York, devoted to Rubber Goods, including Belting, Hose, Hose Trimmings, Tubing, Packing, Gaskets, Balls, Diaphragms, Car Springs, Wagon Springs, Stair Treads, Mats, Matting, Blankets, Rollers and Wheels. It also shows Shaft Hangers, Collars and Couplings.

The Pike Mfg. Company, 151 Chambers street, New York, are now handling a large line of Domestic Pumice, both brick and ground. It can be had in square bricklets and ovals for toilet use or in bricks 5 x 3 x 2¼ inches. The powdered varieties are put up in 1 and 5 pound packages and in barrels. It is regularly made in 12 degrees of fineness, but any sample of Pumice submitted can be matched. This Pumice is a purely American article, and is offered in competition with the foreign article.

J. A. Hutchings, Kokomo, Ind., dealer in Hardware, Stoves, Tinware, Paints, Bicycles and Sporting Goods, is enlarging his storeroom and also his show windows. A 16-foot plate glass floor showcase is also being installed, as well as raised platforms for the display and accommodation of Bicycles. Other improvements in progress are a new office and vault, which will be in the front of the store.

Andersen & Fritz are successors to S. E. Andersen in the Hardware, Tinware and Stove business in Racine, Wis.

Enameled Trade Specialties.

Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, have added a number of specialties to their large line of enameled goods, some of which are here illustrated. Fig. 1 represents a combination double sauce-

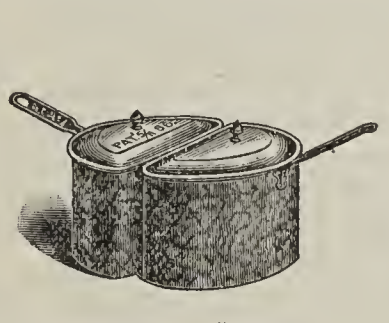

Fig. 1.—Double Saucepan.

Fig. 2.—Triple Saucepan.

pan, each utensil having a capacity of 5 pints. Fig. 2 is an engraving of a combination triple saucepan, each vessel holding 6 pints. They are for use on gas and oil stoves or where economy of space is necessary. They are made only in crystal steel enamel, the body of which is of a grayish color, slightly tinged with olive, presenting a

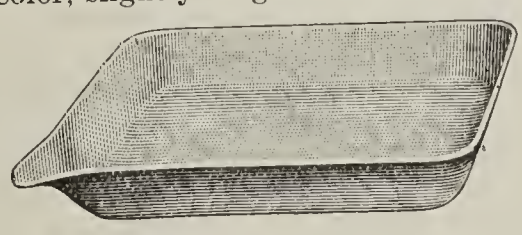

Fig. 3.—Lipped Photographers' Tray.

wave like appearance. Fig. 3 is a view of a photographers' lipped tray for developing purposes. This tray is made in both shallow and deep patterns, each in five sizes —viz., 5 x 7, 7 x 9, 8 x 10, 10 x 12 and 11 x 14 inches measured at the bottom of tray. Fig. 4 shows the form of a chemists' round evaporating dish made in ten numbers varying in diameter from 5 to 26 inches, with capacities

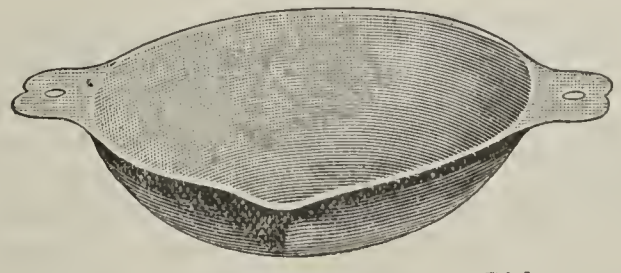

Fig. 4.—Chemists' Evaporating Dish.

from ½ to 28 quarts. The photographers' trays and evaporating dishes are made in flint enamel only, to withstand the action of powerful acids, and are designed for laboratory use.

STOVE TRADE NOTES.

Should Makers Retail?

BY I. N. J.

The question, Should makers retail? is periodically presented to the trade. Sometimes it is in reference to house heating boilers, at other times in reference to stoves and ranges, and again hot air furnaces. Some men engage in the manufacture of boilers so that the goods which they install may be produced at a lower figure, and that they may make a profit both on the manufacture of the goods and in the installation of them. In the sale of stoves and ranges many manufacturers only retail when it is apparent that the responsibilities of the sale cease immediately when the goods are delivered to the owner or to the transportation company. Manufacturers of furnaces, where retailing is done, usually confine themselves to a very limited territory.

Those who are in the same line of business and who do not wish to incur the responsibility of running a shop and employing a corps of workmen hold to the idea that the manufacturer should not engage in competition with the mechanic or artisan who contracts with the consumer. Those who wish to extend their trade on a purely wholesale basis point out that it is unjust to the retail trade for any manufacturing house to compete in the same market, or in fact any market, for the favors of the consumer. Makers who do a profitable business and refrain from retailing altogether present the opinion that if all the trade confined themselves to wholesaling alone just as many goods would be made and sold and the retail trade would place their orders where they had received good business treatment. These wholesalers find many in the retail trade, particularly in the territories where the manufacturers enter into competition with them, who hold the same idea in reference to manufacturers retailing. Some who are in the retail business will not, if they can avoid it, buy goods from houses who do both a retail and a wholesale trade.

In support of the argument that the manufacturers should not sell direct, numerous instances are pointed out where after the manufacturers had secured a good wholesale trade in sections of the country where retailing could not be profitably done they have discontinued their retail business in the locality of their manufacturing plant. It would doubtless be very gratifying to the retailers if all manufacturers would follow such a course. On the other hand, the manufacturer who wants to introduce his goods and to have them give the best results, so that his sales may increase, is very careful in selling them and secures prices that will allow the very best system to be used and employ the best workmanship and materials. If the introduction was left to the trade, with the sharp competition existing, it is argued that the goods would be very slow in making their way.

New Designs in Stoves.

The Western stove manufacturers are making preparations to take advantage of the improving outlook for business. More new goods seem to be contemplated this spring than has been the case for a long time. Hardly a manufacturer can be found who does not speak of new patterns which he hopes to have on the market very shortly. In the next month or two our columns may be expected to contain numerous announcements of this character. The change in this respect is quite marked. Manufacturers who have in past years talked very indifferently about new designs, and expressed themselves satisfied if they could do a fair business in their old goods, taking the position that they saw no inducement to go to much expense for novelties or changes, are now hard at work on something which they believe will catch the trade. The revival of confidence in a considerable enlargement of business this year has thus given birth to new inspirations which augur well for this year. While it is not given to any mortal to see far into the future, the indications are certainly in favor of a great improvement in 1898 over the past two or three years, and we hope that the buoyant anticipations now being indulged may be realized to their utmost extent.

Electricity vs. Gas for Cooking and Heating.

Before the members of the Northern Society of Electrical Engineers, at a meeting held in Manchester, England, W. P. Adams read a paper entitled "A Survey of the Possibilities of Electric Heating and Cooking." He said the advantages claimed for electrical heating and cooking appliances were that they were more economical in point of heat utilized than any other appliances, that they were quite without equal in point of cleanliness and general convenience, that by their use absolutely uniform results could be obtained, and that they were free from such dangers as attend the use of gas cookers, explosions being impossible, and the risk of fire *nil*. As to electric heating, he expressed the opinion that the day was not far removed when more current would be used for that purpose than for lighting. If electricity were supplied for heating purposes, at little more than the bare cost, the suppliers would very soon find that the improved conditions under which they ran their plant would repay them handsomely. Several of the supply companies had adopted the policy of charging for power and heating purposes a price which was actually less than the total works cost, and he regarded this as an enlightened policy, in view of the fact that, assuming the plant used for lighting was employed also for heating purposes, the charge for rent, management, &c., would remain practically the same. The chief difficulties in the way of electric cooking were the rather high first cost of the apparatus and the cost of the current. A common figure for the current used for this purpose at the present time was 3 pence per unit. The ideal to be aimed at was 1 penny per unit. Although it was only possible at present for one or two companies to charge such a figure and cover the bare cost of production, he thought that with a rapidly growing load on supply stations it would soon become general. On the question of the comparative costs of cooking by electricity and gas he said he had obtained figures from a kitchen in which both gas and electricity could be used at will. The household was a small one, consisting of about five persons, and the consumption of electricity was, approximately, 30 units per week when cooking was done solely by this agency. When gas was employed exclusively 1240 cubic feet were used during a week. The cost of the electricity, at 2 pence per unit, was 5 shillings per week, while the cost of the equivalent amount of gas, at 3 shillings per 1000 cubic feet, was 3 shillings 9 pence. Other results which had reached him indicated that the consumption of current might be reduced below the figure given when the appliances were used intelligently and with care. For a small installation, such as that referred to, it might be assumed that a unit per head per diem would suffice for all cooking purposes. This figure would naturally be reduced in larger establishments. The best results would be obtained where there was a slow combustion stove fitted up for the supply of hot water, as the heating of water by electricity was a most uneconomical proceeding, at any rate at present prices. For reasons such as he had indicated, he thought the supply of cooking and heating appliances should be vigorously pushed.

Commenting on Mr. Adams' paper a correspondent of the London *Gas World* writes: "As a member of a firm who are manufacturers of electrical heating appliances, and naturally interested in their success, I feel sure that such statements as those of Mr. Adams can only injure and discredit an industry which fills well a certain limited place. In the infancy of the gas heating appliance trade the same method of exaggeration was carried on, but not to a tithe of the extent. Such as it was, it discredited the whole industry and created an army of unbelievers who

acted as a drag on it for many years. It is to be hoped that history will not repeat itself as regards electrical heating.

"I believe that 1 electrical unit is equal to 1000 watt hours or 3440 British thermal units, which latter is equal to the heating power of 5 cubic feet of coal gas. One thousand six hundred and twenty thermal units will, in theory, raise 1 gallon of water from 50 to 212 degrees F.; in practice, with gas, in small kettles, double this is required. Taking gas at 2 shillings 10 pence per 1000 cubic feet, the cost of this is 1 penny for 6 gallons If all the electrical energy is used, and no waste occurs (a practical impossibility), at the usual 5 pence per Board of Trade unit, it will cost 1 shilling 3 pence to boil 6 gallons of water. It would appear that Mr. Adams ignores the water heating in the electrical arrangement, as the total current expended would not heat half the water required, to say nothing of any cooking. Allowing for one-half the gas being wasted, 300 cubic feet would do the same work as the 5 shillings' worth of electricity (at 2 pence per unit) if none of the latter is wasted, which is impossible; and in addition to the 150 cubic feet of gas allowed for waste, another 940 cubic feet must have been thrown away if Mr. Adams' figures are correct. It would be interesting to know the retail cost of a complete electrical cooking apparatus which would do the work of the gas cooking ranges hired out by the gas companies at a few shillings per annum, say one capable of cooking a complete dinner for ten persons; also the average cost per annum for repairs and renewals, and who is to pay for these."

ODD PLATES.

A new circular is just issued by the Leibrandt & McDowell Stove Company, Philadelphia and Baltimore, showing half-tone engravings of their Loyal Victor Range, which is made in 48 styles and sizes. A feature of the construction is the arrangement by which all the oven plates and internal parts may be removed without taking down the body of the Range. The circular gives full particulars and prices. E. D. Purves is making it the basis for a special tour among the trade.

The Kernan Furnace Company, Utica, N. Y., inform us that they have heated the Universalist Church, at Salisbury Centre, N. Y., with one of their Union Furnaces and that the heating during the recent cold weather was thoroughly satisfactory.

The Bonnet & Nance Stove Company, Quincy, Ill., are reported to have sold the remaining portion of their plant, which was partly destroyed by fire some time since, to the Excelsior Stove & Repair Company. The latter company increased their capital stock from $20,000 to $60,000, to cover their enlarged operations. The Bonnet & Nance Company, it is said, will remove to the vicinity of Chicago and erect a new Stove foundry.

J. Kisterback & Son, Philadelphia, have moved from their former location, 1231 Market street, to more commodious premises, 2002-2004 on the same street. The new location presents excellent manufacturing facilities and allows besides of over 6000 square feet of floor space being available for a display of their well-known Heaters and Ranges, and also of Gas Heating and Cooking Apparatus, Tile Hearths and other goods. T. J. Leary has charge of the business.

H. P. Gingrich, representing the Quick Meal Stove Company, St. Louis, has just returned from a Southern trip. He reports business in a prosperous condition and finds buyers more disposed to purchase liberally than they have been for several years past.

A recent number of the Taunton *Evening Herald* contains portraits, with brief biographies, of prominent city officials of that place. Among them is a notice of George L. Walker, who is treasurer of the Century Stove Company of Dighton. Mr. Walker was born in Dighton, and in 1864, when but 16 years of age, he enlisted for the war, but peace being declared the following year he returned to his native town and took up the trade of carpentering, which he followed for several years, and then turned his attention to pattern making. Subsequently he began the manufacture of Stoves, in which his energy and ability brought him success. In 1894 Mr. Walker was elected to the Board of Aldermen and again in the last campaign.

Charles E. Coleman, Western manager for Eugene Munsell & Co , 117-119 Lake street, Chicago, Ill , has just returned from an Eastern trip, during which he spent a few days with his friends in and about New York City. Munsell & Co. are carrying a large stock of fine quality Mica, both at their Chicago branch and at the home office, 210 Water street, New York City, and are in a position to make prompt delivery of any size on the list.

At the recent annual meeting of the stockholders of the Grander Stove Company of Royerford, Pa., W. S. Price was elected president, John U. Isett vice-president and J. M. 'Lewin treasurer. These officers, with John Flint and Washington Smith, constitute the Board of Directors. After the election the annual banquet was held.

Roberts, Winner & Co. of Quakertown, Pa., after a shut down of two months, are now operating their works four days a week.

The Howard Thermostat Company, 111-115 Water street, Oswego, N. Y., are distributing a small folder illustrating and describing the Howard Automatic Draft Regulator, intended for use on Hot Air Furnaces, Hot Water Heaters, Steam Boilers, Stoves and Incubators. The thermostatic plaque is placed on the wall of a living room and operates solely by power obtained by the contraction and expansion of metals. By means of connections over pulleys which extend down inside the partition to the heater room, it automatically operates the damper connected to the smoke pipe and gives an even temperature. The company are distributing this little folder to all those whom they think are likely to be interested in such a device.

The Deer Lick Oil Stove Company of Chagrin Falls, Ohio, have been incorporated, with a capital of $20,000, by C. S. Bentley, M. M. Norton and L. B. Beers.

The Cincinnati Stove & Repair Company have been incorporated at Cincinnati, Ohio, with a capital stock of $5000.

A. Weiskittel & Son, Baltimore, Md., are getting out a new catalogue of gas cooking and heating appliances and will have the same ready for distribution to the trade very shortly.

Through a misunderstanding of a pronoun we made a statement in the issue of *The Metal Worker* of January 22 relating to the Toledo Stove Company which was exactly contrary to the facts. The announcement as furnished us by that company was to the effect that the Toledo Stove Company, Toledo, Ohio, had just closed a contract for the year 1898 with the Chicago Stove & Range Company, Chicago, Ill., to handle the Toledo Stove Company's Stoves and Ranges in territory west of Chicago. This contract is a *bona-fide* sale of the goods, and guarantees a purchase of a stipulated amount in cash during the year and at very favorable terms.

The sixty-fourth semi-annual meeting of the Detroit Stove Company was held in Detroit, Mich., on the morning of Tuesday, February 8, when William Tefft Barbour was elected president, William G. Henry vice-president, G. Bert Gunderson secretary and treasurer and Lafayette Crowley superintendent. The officers named, together with E. T. Barbour and M. B. Mills, constitute the Board of Directors. The reports of the officers showed that the business of the company last year was the largest in their history.

The Indianapolis Stove Company of Indianapolis, Ind., now have their new plant in full operation. The spring trade is said to be opening up well and the outlook for business is most encouraging.

The foundry of the Marcy Stove Repair Company, located at Perth Amboy, N. J., was burned Thursday morning, entailing a loss said to be about $15,000. The buildings destroyed include the foundry and the carpenter shop, but the pattern building, which is a fire proof one, was saved, so work can be begun as soon as new buildings can be put up. In the meantime the company will make arrangements to place some of their molders in another foundry and continue to fill orders as usual.

Col. James A. Sexton of the firm of Cribben, Sexton & Co., Chicago, Ill., has sold his interest in the business to his partners and retired from the firm. He had been in active business 31 years, and his retirement is due to inflammatory rheumatism, from which he is now suffering. Colonel Sexton has not only been prominent in the Stove trade but in army and political circles as well. He was Postmaster of Chicago for four years, resigning in March, 1892, though he did not leave the office until the following winter, owing to delays in appointing his sucessor.

The alterations in the plant of Excelsior Steel Furnace Company, at 38 West Monroe street, Chicago, are practically completed, and the manufacturing and warehouse floors present a changed appearance. Five new presses have been installed. and over 400 new dies addded to those previously in use. Many special tools, largely the product of the foundry and machine shop of the company, have been placed in position for the manufacture of the new line of double safety Wall Pipe which they are about to place on the market. The bins and compartments for warehousing the new goods are in readiness and are being rapidly filled. The sample room for the display of the numerous productions of the company has been repainted and rearranged, and is ready for visitors when the spring trade opens. The space devoted to the shipping department has been enlarged in anticipation of an increase in business this season.

Application has been made to the Dominion Parliament for the incorporation of the Burrow, Stewart & Milne Company, Hamilton, Ontario, to manufacture stoves and implements. Capital $150,000.

TRADE REPORT.

METAL MARKET.

Pig Tin.—The advance in wholesale prices last week has been followed by a further movement upward during the week under review to the extent of about 15 to 20 points. Purely speculative operations have failed to materialize, despite the advance of the past two weeks and the heavy transactions reported from London, but purchases for regular trade account and for consumption continued fairly large. Spot stocks have been cut into, since only about 200 tons have been received this month. There are 2600 tons afloat for this country, including 850 tons shipped from Europe, but this circumstance has had no perceptible influence upon the market. Jobbers' prices for small lots from store, while firm, are unchanged at 14½c. to 15c. per lb. for Straits Pig.

Copper.—There has been an advance of ⅛c. to ¼c. in the wholesale prices of Ingot, and the market is decidedly firm. The continued heavy export movement, which, along with home trade deliveries, has kept the supplies available for early delivery down to an unusually low point in the face of heavy production, is largely accountable for the advance. The domestic demand is of fairly large volume, both in wholesale and retail lines. Dealers' quotations for small lots are very firm at 12¼c. per lb. for Lake Ingot, while Ansonia Grade Casting Copper has been advanced ¼c. to 11½c. per lb.

John Stanton reports the Copper production in the United States and of the foreign reporting mines and United States exports as follows, in gross tons of 2240 pounds :

	Reporting mines.	Outside sources.	Total U. S. product.	Product foreign mines.	U. S. exports.
First half 1895....	70,612	9,100	79,712	42,484	34,215
Second half 1895..	84,885	6,600	91,485	43,674	30,507
Total 1895...	155,497	15,700	171,197	86,178	64,722
First half 1896....	94,180	7,200	101,380	42,255	58,216
Second half 1896..	95,314	7,200	102,514	43,941	67,287
Total 1896.....	199,494	14,400	203,894	86,196	125,503
First half 1897....	103,651	5,000	108,651	44,263	64,870
Second half 1897..	100,555	6,900	107,455	44,007	64,340
Total 1897.....	204,206	11,900	216,106	88,270	129,210
January, 1898.....	16,544	1,200	17,744	5,556	11,030

Sheet Copper.—The advance in raw material has been accompanied by increased inquiry for manufactured Copper during the week. Although orders for Sheet Copper are still generally confined to the filling of immediate needs, they are being received in more liberal volume, showing that the consumption is expanding. Manufacturers are preparing for a large expansion of the demand in the near future and regard the outlook in this department as very promising. While dealers' quotations still vary, the leading houses are holding Sheet Copper in retail quantities firm at about 15c. per lb., basis.

Lead.—Buying by jobbers and for consumption has been more free and the market, supported by the "bullish" element, is decidedly stronger, wholesale prices showing an advance of about 1-10c. in the pound over a week ago. But little large business was done, however, buying being limited largely to moderate quantities for present use. Small lots of American Pig from store sell at 4⅛c. to 4.20c. per lb.

St. Louis advices report no special change in this metal, sales being limited in volume.

Lead Pipe and Sheet.—These materials are still selling rather slowly, as is natural at this season, but the feeling among dealers is more cheerful as regards the outlook. A great deal of building is in prospect for the present year, which should stimulate the demand for plumbers' materials. Jobbers in this section quote Pipe at 5½c. and Sheet at 6½c. per lb., subject to the usual trade discount of 20 per cent.

Spelter.—There has been a further fractional advance in wholesale prices and the market displays a very firm front, yet the demand does not appear to have increased to any important extent. The basis of the advance is rather due to limited offerings from primary sources. Good Western brands in retail quantities are quoted at about 4½c. per lb.

St. Louis advices are as follows: The market remains practically unchanged. Consumers are not disposed to anticipate their wants, and confine their purchases to small lots for their immediate wants.

Sheet Zinc.—Sales are of a routine character and the demand is merely moderate. Prices have not varied, jobbers quoting 600-lb. cask lots at 5⅝c. to 5¾c. per lb., and smaller quantities at 6⅛c. to 6¼c. per lb.

Antimony.—Business is moderate, but prices are very firm, the cheaper grades having been advanced about ¼c. In small parcels from store Japanese is quoted at about 7½c. per lb., Hallett's at 7¾c. to 8c. and Cookson's at 8½c.

Nickel.—The price for small lots has not varied from 38c. per lb.

Aluminum.—The demand for this metal is referred to as good. Prices are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb.; 100-lb. lots, 30c.

Tin Plate.—No improvement has been developed either in the demand or in prices, which remain at their former low level. American Plates have been selling slowly, neither consumers nor sellers showing much interest. The former find further cause for delaying the placing of their orders in recent news regarding the effort to pool or combine the manufacturers. It is understood that a number of difficulties are being met with by the committee working on the combination scheme, foremost among which is the independent attitude of one of the largest concerns in the business. Nevertheless the committee are still earnestly at work, and those most interested in the proposed consolidation are by no means discouraged as to its ultimate success. The negotiations, which seemingly failed in New York, have been resumed further West. It should be borne in mind that the completion of such a comprehensive and important plan as is contemplated must involve long and patient effort. The committee having it in charge, after formulating their report, will have to submit it to their principals, the manufacturers, for their indorsement, before any definite steps can be taken in the premises. Then will come the matter of arranging terms with the 40 or so firms in the industry, involving further negotiations, all of which will consume an indefinite amount of time. Meanwhile, the consumers will be forced to come into the market in order to secure their absolutey needed supplies, and if there should be a sudden rush of orders there is every likelihood of at least a temporary shortage, for stocks are understood to be by no means excessive. In this event higher prices would result. At present prices are as low as they ever were. The retail business has been fairly good, but hardy as large in the aggregate as it was last month. The recent severe wether has no doubt had its effect on small orders. Jobbers' prices show no quotable change. Small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows, but there is a good deal of cutting under these rates: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates remain dull and prices are largely nominal.

Chicago advices are as follows: Jobbers report a little better movement in Tin Plates. The spring trade seems to be opening up in this branch, and the demand is expected to show growth from this time forward.

Sheet Iron.—There has been quite a good demand from the mills for best Sheets, and the mills are running full with considerable work in hand. Common Sheets have been pressed for sale at low prices, but buyers discriminate closely and appear willing to pay the price for the right kind of stock Orders placed for both Black and Galvanized Sheets have been quite heavy and the outlook for the first half of the year is quite promising. Several mills have recently booked some large contracts for the second quarter. Prices, as a whole, are well maintained. Jobbers in this quarter report a very moderate business. Small lots from stock are quoted at about 2.40c. for No. 27 Common Black Sheets and 75 and 10 and 5 per cent. off for Galvanized.

Chicago advices are as follows: Black Sheets are not so active, but heavy orders are being placed for Galvanized. Galvanized Sheets are firmer, more business being now taken at prices which buyers considered too

high at the beginning of the month. Jobbers quote small lots of Black Sheets from stock at 2.30c. to 2.40c., and Galvanized Sheets at 80 and 2½ to 80 and 5 per cent. off.

Old Metals.—The market is very firm, with a good demand for almost all lines of old metals, both for home consumption and for export. Scrap Brass and Copper are specially active at full prices, and low priced Scrap Iron is moving very freely. Yard dealers in this city and vicinity are paying about the following rates for moderate sized lots, delivered here:

Heavy Copper	per lb. 9⅜c.
Light and Tinned Copper	per lb. 8⅛c.
Heavy Brass	per lb. 6¼c.
Light Brass	per lb. 5¼c.
Lead	per lb. 3⅜c.
Tea Lead	per lb. 3⅛c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$8 25
Heavy Cast Scrap, per gross ton	8.25
Stove Plate Scrap, per gross ton	5.75
Burnt Iron, per gross ton	4.25
Tin Plate Scrap, per ton	3.75

THE IRON MARKET.

Bessemer Pig in the Central West has been quiet and steady. There has been no evidence of further purchases by large consumers, and for the present the views of sellers and buyers are apart.

In Foundry Iron the markets are still irregular. The Southern makers are holding a meeting to day at Birmingham with the aim to graduate from the discredited "gentleman's agreement" to a more effective organization, in which all sales are to be handled by a commissioner. The attitude of some of the interests does not encourage much hope for success.

The Iron Age's monthly blast furnace statistics show a moderate increase in active capacity, and an increase in stocks. in which nearly all sections participate, of about 40,000 tons for the month of January.

The engineers who have been appraising the plants included in the Wire consolidation have practically completed their work, and it is understood place the valuations close to those set by the owners upon their property. This is interpreted as being favorable to the success of the plan. Practically all the preliminary work is now done and the final negotiations are progressing, so that possibly next week may bring the announcement of their consummation. There may be some delay, however, since the leader of the financial syndicate is absent.

Pig Iron.—In the New York market sellers report a fair volume of business, but prices remain in an unsatisfactory condition. The Birmingham producers are in session today, continuing their efforts to get the industry into better shape. The plan now under consideration is to handle all the sales through a commissioner. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $10.75 to $11.25; No. 2 Plain, $10.50 to $10.75. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.75; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

The feeling in the Philadelphia Pig Iron market is very unsettled. The demand has not met expectations, and as requests for postponements of deliveries are becoming unpleasantly frequent holders are disposed to push sales so as to avoid accumulations at furnaces. Buyers are very timid, however, so that not much progress is being made in sales, while prices are gradually drifting toward a lower level. It is hoped that an improvement in the demand will be met with in the near future. It is difficult to give exact quotations, as each seller seems to have a price of his own, regardless of what others may do. A fair average of asking prices for seaboard deliveries would be about as follows, with usual rebate according to freights at points within a radius of 100 miles south or west: No. 1 X Foundry, $11.75 to $12; No. 2 X Foundry, $10.75 to $11; No. 2 Plain, $10.50 to $10.60.

The situation in Pig Iron in Chicago is peculiar. A very good inquiry is being received for all kinds of Iron, and with the heavy orders now on the books of furnace companies prices ought to be well maintained. The volume of business has been large since early in December. The local furnace companies and Southern sales agents have been well favored with orders, but at the present time the market is weak owing entirely to the attitude of some of the Southern producers. The local companies are making some sales, but refuse to meet the prices quoted by the Southern producers, believing they will not have long to wait until the weak sellers are loaded. The local manufacturers report in fact that they have some difficulty in arranging for deliveries, owing to the condition of their order books. Notwithstanding the cutting of Southern prices, the situation in the main is considered fairly satisfactory. We quote for cash as follows:

Lake Superior Charcoal	$11.50 to $13.00
Local Coke Foundry, No 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.35 to 10.60
Southern Coke, No. 3	10.10 to 10.30
Southern, No. 1 Soft	10.85 to 11.00
Southern, No. 2 Soft	10.35 to 10.60

Pittsburgh reports indicate that there is practically nothing doing in Bessemer Pig there, but the market is very firm. As to the future of the market opinion is divided. The consumption of Iron promises to be much heavier this year than ever before, and this, in connection with the advance of 15c. in Ores agreed upon, leads well informed authorities to believe that the present market will be sustained and that higher prices are likely. On the other hand, it is claimed that there is an overproduction of Pig and a shortage in converting capacity, and that prices of Bessemer will be low until production is restricted. Foundry Irons are dull. We quote, f.o.b. Pittsburgh: No. 1 Foundry, $10.40 to $10.50; No. 2 Foundry, $9.90 to $10; Bessemer, $10.15 to $10.40, depending on delivery.

The St. Louis Pig Iron market continues to be quite active, but there is no change to note in prices. The market is hardly in shape to stand any advance, and none is likely to be made. Sales during the past week have been heavy, and the prices quoted below are the basis on which these sales were made. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.25 to $10.75
Southern, No. 2 Foundry	10.00 to 10.25
Southern, No. 3 Foundry	9.75 to 10.00
No. 1 Soft	10.00 to 10.25
No. 2 Soft	9.75 to 10.00

CHICAGO REPORT.

Scrap.—All kinds of Old Material are in strong demand, especially Cast Scrap. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7.50	....
Malleable Cast	6.50	...
Stove Plate (free of burnt)	5.50	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8¾c.
Copper Clips	....	9¼c.
Red Brass	....	8 c.
Yellow Brass	....	6¾c.
Light Brass	....	4½c.
Pipe Lead	....	3.10c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—The movement is again very light and prices are lower. The ruling prices of carload lots of 12 tons minimum are as follows:

	Grate.	Egg, Sto and Ch.
Chicago, Ill	$4.75	$5.00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	6.75	7.00
Council Bluffs, Iowa	6.75	7.00
Lincoln, Neb	6 90	7.15
Sioux City, Iowa	7.25	7.50
Aberdeen, S. Dak	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis	6.25	6.50
St. Paul, Minn	7.25	7.50
Burlington, Iowa	6.25	6.50
Des Moines, Iowa	6.75	7.00
Davenport, Iowa	6.05	6.30
St. Joseph, Mo	6.75	7.00
Leavenworth, Kan.	6.75	7.00
Omaha, Neb	6.75	7.00

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

Trade is gradually improving, but apparently awaits, in the East at least, further progress of the season before assuming full proportions. The kind of weather which has prevailed in different sections has also had a repressing effect on business. It is, however, almost the universal report of both manufacturers and jobbers that last month showed a substantial increase in the volume of its transactions over January of a year ago. Goods generally continue on the same level of prices as heretofore and the tone of the market on most lines is not especially strong. Some goods under special influences are a little firmer and, in some cases, quotably higher, but as a rule manufacturers are not able to advance prices as yet, awaiting the coming of more favorable conditions and a marked increase in the volume of trade, prices of the raw material or cost of manufacture. Notwithstanding the fact that prices are in most lines very close, yielding but a small margin of profit, manufacturers are very desirous of securing orders, and in some instances are making slight concessions to this end. There continues to be an active movement of goods to foreign markets, large quantities of Nails and Barb Wire being exported. There are also indications of increased enterprise on the part of manufacturers to secure this class of business, and the number of lines which can advantageously be sold abroad is constantly enlarging. The manner in which the volume of general business is expanding is a very favorable sign, leaving no doubt that there is throughout the country a better and a still improving condition of things.

Advices from Chicago.—Shelf Hardware jobbers report a satisfactory trade in most sections, but with considerable interruption in others owing to the annual mud blockade. This feature of the West and Northwest may now be expected to figure more or less prominently in trade reports for several weeks. Alternations of freezing weather with thaws will keep the roads in very bad shape. Wherever trade is not affected by these conditions the demand is excellent, and salesmen report very encouraging prospects. Orders for future delivery on spring and summer goods are being steadily placed, and the demand for staple goods is on the increase as usual at this season. New stocks of Hardware are still being bought, several having been filled in this market during the past week. Jobbers of Heavy Hardware also take a very cheerful view of the situation, reporting their February business much in excess of that of February last year.

Advices from St. Louis.—The movement in Shelf Goods continues to increase, and a heavy trade is the general report from all jobbers. Builders' Hardware is in excellent demand, but orders largely call for the cheaper grades. Galvanized Iron is active at 80 and 5 per cent. discount. Tin Plates and Black Sheets are also free sellers just now. The demand for Mining Tools and Supplies for the Alaska trade is heavy, and jobbers are issuing special circulars containing description and prices of goods adapted to this trade. This department gives promise of becoming a very important one as the season advances. Traveling men are sending in good orders, and refer to the bright prospects for a heavy spring trade. Collections are satisfactory.

NOTES ON PRICES.

Wire Nails.—There continues to be a good demand for Wire Nails, trade being stimulated by the higher prices now ruling and the prospect of a further advance. The approach of spring has also something to do with the increased demand. The tone of the market is decidedly firm, and these prices are well maintained. The New York price for small lots from store is $1.70 to $1.75.

Advices from Chicago.—Heavy shipments are being made by manufacturers on old orders and some fresh inquiries are being received, but, on the whole, new business is rather quiet. Jobbers are undoubtedly well covered for the remainder of February, and will wait a little longer before placing contracts for March at the advance of 5 cents which is asked. Meanwhile it is also probable that the consolidation scheme will be definitely settled one way or another. Manufacturers are confident that it will go through as outlined in the announcements hitherto made by interested parties. Jobbers report their trade growing better. An improvement in their shipments has been noted regularly for the past four weeks. They quote small lots from stock gradually firming up to $1.65, which is the difference made by manufacturers on small lots.

Advices from St. Louis.—The market is very firm and mills report a heavy trade. The combination of the Wire interests is now generally accepted as practically accomplished, and dealers are increasing their orders in consequence. Jobbers report an increasing trade and quote $1.65 to $1.70, base, for lots from store.

Cut Nails.—The Cut Nail market is not characterized by as firm a tone as Wire Nails, but prices are, on the whole, quite well maintained. Small lots from store, New York, are quoted at $1.30.

Advices from Chicago.—The trade is only fair, the higher price of Wire Nails apparently having had no effect on the demand for this class of goods. Small lots from stock are unchanged at $1.45.

Advices from St. Louis.—There is no change to note either as regards prices or the demand. Jobbers ask $1.40 to $1.45 for small lots from store.

Barb Wire.—In common with other Wire products Barb Wire has a firm tone and the advanced prices recently agreed upon by the manufacturers are well maintained. The trade are beginning to place orders quite freely.

Advices from Chicago.—The factories are reported to be shipping out their Wire as fast as made, no stocks having been accumulated in warehouses this winter. The spring movement is expected to be very good, promising to keep manufacturers well employed. Jobbers still continue to sell small lots at about $1.60 for Painted and $1.90 for Galvanized.

Advices from St. Louis.—The demand for Barb Wire is very heavy and mills have advanced prices. Jobbers quote small lots of Painted at $1.70, with the usual advance for Galvanized.

Shot—The announcement of the decline in Shot as mentioned in our last issue has been followed by an advance of 5 cents per 25-pound bag, the present prices of the Eastern manufacturers, which went into effect February 14, being as follows, terms net cash 30 days, or 2 per cent. discount for cash in ten days and the usual discount on ton lots :

Drop Shot, sizes smaller than B, per 25-pound bag	$1.22
" " " " " " " 5 " "	.30
" " B and larger sizes, per 25-pound bag	1.47
" " " " " " " 5 " "	.35
Buck Shot, per 25-pound bag	1.47
" " " 5 " "	.35
Chilled Shot, per 25-pound bag	1 50
" " " 5 " "	.35
Dust Shot, per 25-pound bag	2.00
" " " 5 " "	.50

The prices in the West are about 10 cents less.

Glass.—The number of Glass factories in operation is on the increase, the capacity now being represented by 1876 pots, and it is not improbable that this number will be increased within the next week or ten days to nearly 1900. Most of the product of the independent factories is controlled by jobbers or the factories are operated by them. Spring orders are not being placed very liberally by jobbers dependent upon the association factories for their supply of Glass, apparently not being satisfied with the changed conditions resulting from the formation of the American Glass Company. New York jobbers report demand by the retailers as light, and that a discount of 85 and 10 per cent. is still obtainable for Glass in small lots.

Mica.—Eugene Munsell & Co., New York and Chicago, have issued the new standard price-list of Mica for 1898, as agreed upon by the association. These prices are subject to change without notice. The following discounts accompany the list:

North Carolina	40 per cent.
Wyoming	50 per cent.
Assorted Packages	Net. No discount.

All Mica is delivered to any part of the United States free of transportation charges.

White Lead.—The market for White Lead has been enlivened somewhat by larger orders for spring delivery and an upward turn in the market for base material. The list prices of the leading corroders are unchanged, however, as are their terms, and no important fluctuation has taken place in prices of the foreign brands. Business in the latter is mostly of a retail character.

Red Lead.—Both domestic and foreign Red Leads are quoted unchanged in price, with only fair sales, and the demand is not above the average for the season.

Linseed Oil.—Until within a day or two wholesale prices for both city and out of town makes were maintained at the range quoted last week, but latterly competition has become somewhat livelier and the market has weakened in consequence. Retail prices have not been changed, however.

Spirits Turpentine.—Dealings have been very fair, but mostly in moderate quantities, and prices have undergone very little change.

Old Rags, Paper, &c.—The market shows a fair amount of activity, but no quotable change in values, which remain firm at about former quotations. Dealers

are paying about the following rates for New York City delivery:

No. 1 White Rags	per lb.	2⅝ to 2¾c.
No. 2 White Rags	per lb.	1¾ to 1⅞c.
Mixed Rags	per lb.	1 c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1½c.
No. 2 White Book Shavings	per lb.	¾ to 1 c.
Light Book Shavings	per lb.	½ to ¾c.
No. 1 Mixed Shavings	per lb.	¾ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1 c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to 9/16c.
No. 1 Manila Paper	per lb.	⅝ to ¾c.
No. 2 Manila Paper	per lb.	⅜ to ½c.
Bogus Paper	per lb.	⅜c.
Common Paper	per lb.	¼ to 9/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	½ to ¾c.
Hemp Twine	per lb.	1⅜ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	¾ to ⅞c.

Old Rubber.—A fair demand is noted and prices show no quotable change. Local dealers are paying about the following figures:

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb	4 c.
White Syringes, per lb	4 c.

Spelter in 1897.

C. Kirchhoff, agent of the United States Geological Survey, has issued a statement relating to the production of spelter during 1897, the figures being as follows:

Production of Spelter (Short Tons).

States.	1897.	1896.	1895.
Eastern	7,218	8,139	9,484
Southern	3,365	2,427	3,697
Illinois and Indiana	37,876	36,173	35,732
Kansas	33,396	20,759	25,775
Missouri	18,125	14,001	14,998
Totals	99,980	81,499	89,686

Capacity has been considerably increased during the year. The Nevada Spelter Company have built four new furnaces; Robert Lanyon's Sons Company have erected a large plant at Iola, Kan.; W. & J. Lanyon have erected new works in the same State, and a third plant is approaching completion in the district. The Empire Zinc Company have added one block to their Joplin Works. The Swansea Vale Zinc Company are erecting a new plant. Humphrey, Chipman & Co. started the works at Wenona, Ill., in September, and will soon have the plant at Upland, Ind., working. Producers representing a total output, in 1897, of 61,883 tons report a decline in stocks from 3306 to 1538 tons.

A statement of exports of spelter shows that there were exported 14,245 net tons during 1897, of which 598 tons were shipped from New York, 6396 tons from Galveston, Texas, and 6828 net tons from New Orleans. Of the total quantity 13,582 tons were shipped to England.

The National Association of Manufacturers, who have had their headquarters hitherto at 1743 North Fourth street, Philadelphia, are about to remove their general offices to other and more convenient quarters in the Philadelphia Bourse. Large offices on the ground floor of the building, at the Fourth street end, have been secured as well as a suite on the mezzanine floor above. The new offices will be occupied during the present week. The offices in the Bourse will be made a general headquarters for manufacturers, and a large room on the mezzanine floor will be set aside for meetings of the members whenever desired. It will also be used for meetings of the Executive Committee. The rapid expansion of the work and the necessity of increasing the office staff has called for the change of quarters now undertaken.

The Youngstown Freight Committee has decided to reduce the rates between points in the Mahoning and Shenango valleys on pig iron, billets, sheet and tin plate bars and scrap. The reductions are to take effect at once, and are for the purpose of equalizing the cost of assembling material at the mills of the two valleys.

TRADE NOTES.

In their advertisement, elsewhere in this issue, Jno. W. Bell & Co., Mercer, Pa., direct attention of the trade to their Wire Eave Trough Hanger. The fact is referred to that this Hanger is of neat appearance, strong and sold at a low price. It is handled by the jobbing trade.

In our special advertising columns this week notice is given by E. Bissell, Son & Co., 12 Murray street, New York City, of a special sale by order of the St. Louis Stamping Company, St. Louis, Mo., of six carloads of Granite Enameled Ware, to be sold in case lots only. The goods include a full line of Tea and Coffee Pots, Dish, Milk, Fry and Pudding Pans, Pails, Buckets, &c.

The two Sheet mills of the Sharon Iron Works, Sharon, Pa., which have been idle for a long time, were last week put in operation.

The Leos Metal Polish Company of Chicago have been incorporated, with a capital stock of $3000. Incorporators: George D. Eddy, A. M. Eddy, Thomas A. Easter and W. H. Lahman.

A. C. STONE, Administrator,
Claremont, N. H

Special Notices.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address
"STOVES,"
office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

ROCHESTER STAMPING WORKS, - 161-167 JONES ST., - ROCHESTER, N. Y., U. S. A.

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper Into All Forms.

By JOHN FULLER, Sr.

Cloth Bound; Size, 10 x 6½ inches; 327 pages; 474 Engravings Price, $3.00.

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical, and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are nearly 500, and which add much not only to the interest but to the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details, a fact that will be especially appreciated by those who read the book for instruction in this handicraft.

"This is a veritable storehouse of information, the descriptive matter and the many illustrations being easy of comprehension. In fact, the whole subject is handled in so masterly a manner that any one with ordinary effort and application cannot fail to understand and appreciate it."—*The Plumber and Decorator.*

"This admirable book has been written with abundant knowledge and a clear head. Mr. Fuller appears to have succeeded thoroughly. His book is singularly simple and clear, and yet very minute in detail."—*Railroad Gazette.*

"The work is the most complete consideration we have seen on this subject, and Mr. Fuller tells his story with clearness and force."—*Fire and Water.*

"The author has so well executed his task that I doubt very much whether any other man living could have done it better. The treatise seems to fully justify his claim that it is entirely practical, and of the publishers, that it is exhaustive; since few will be able to name any article made of sheet copper the practical construction of which, or of some strictly analogous article involving the same methods, is not fully and clearly described in the book, from the laying out of patterns through all intermediate steps and processes to its final completion. The book is a much needed and welcome addition to modern technical literature, and should at once be placed in every up-to-date trade school and technical library."—*Engineering Magazine.*

"Mr. Fuller has happily succeeded in a most difficult task, that of writing a book that is at once a practical reference book, and is at the same time a most readable and interesting one—even to those not especially interested in the subject treated. An evident love for the subject permeates the entire work. We must say a good word for the numerous illustrations, which are lucid and simple."—*American Artisan.*

Prevents the brass from running over and sticking to the metal. Used and recommended by bicycle makers and repairers and others. Send for sample and price.

JOSEPH DIXON CRUCIBLE CO., - JERSEY CITY, N. J.

—Bashful Lover—I leave here to-morrow. How long shall you remain, Miss Ethel?

Up-to-date Girl—Remain Miss Ethel? I leave that to you.—*Brooklyn Life.*

—THE CHEERFUL IDIOT.—"For five years," said the aged boarder, "I had to use an invalid chair."

"And I," said the Cheerful Idiot, "have been using crippled chairs ever since I became a boarder."—*Indianapolis Journal.*

THE NEW METAL WORKER PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given,
75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

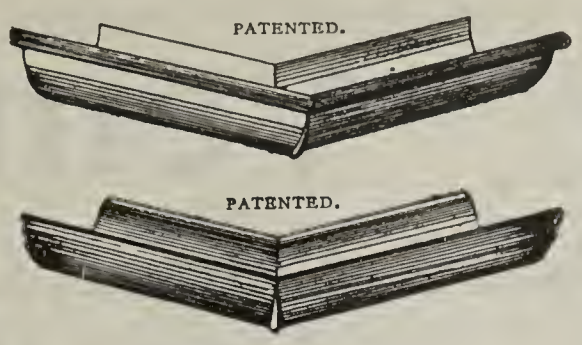
Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex.

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete



Encyclopedia of Pattern Problems

for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

Sent, Express or Postage paid, on receipt of price, FIVE DOLLARS, by

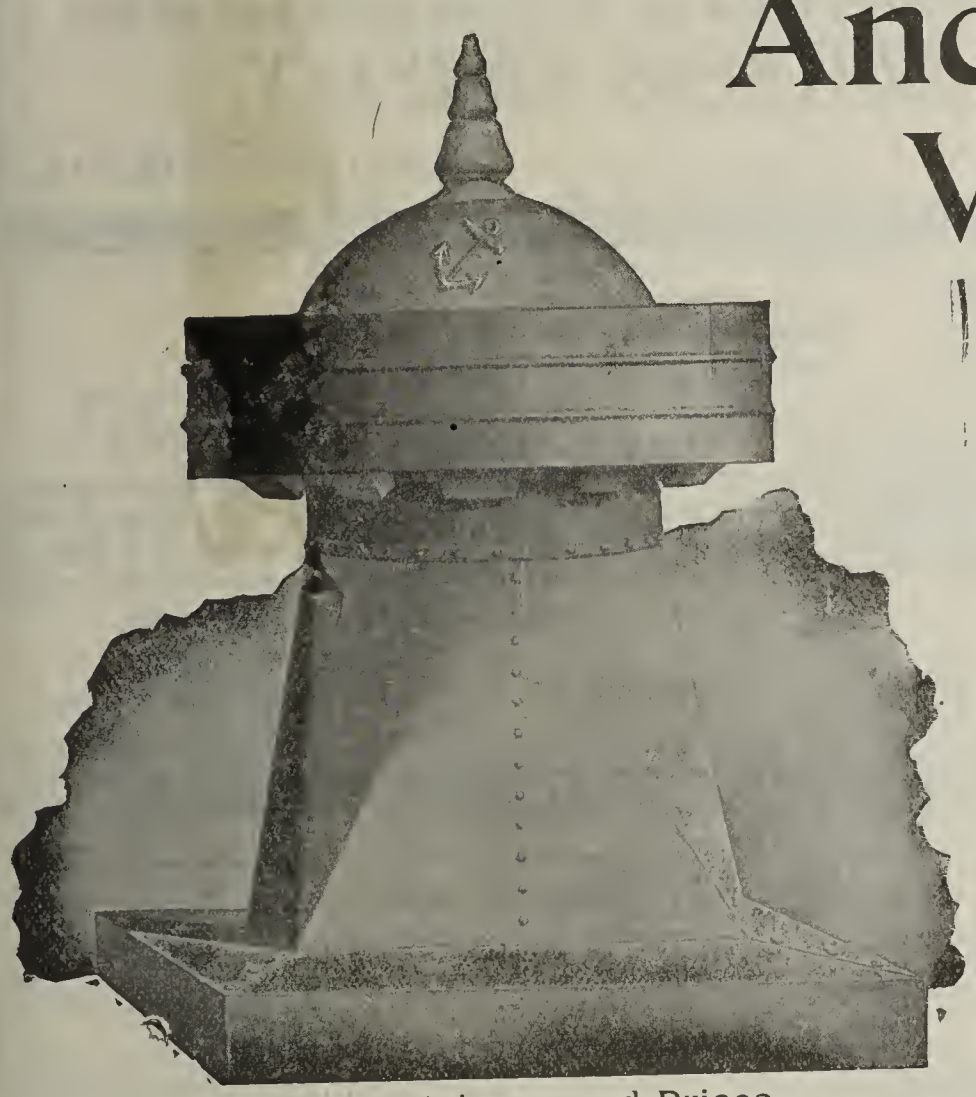
Sheet Metal Work

any design or ornamentation desired can be supplied promptly, cheaply, and of superior workmanship. Write us for prices or send specifications for proposal.

Art Metal Relief Co.,

(J. F. WEITZEL, MANAGER).

Covington, Ky.



It's for you

to determine what amount of tinware business you will do in a year. If you want a business with a good margin of profit sell a good article and let cheap trade go. Tinware would be used as largely to-day as in years long past if you would supply the right sort, the kind that would give good service. Make that right sort, solder a little brass plate bearing the word "*Guaranteed,*" as well as your firm name, on each article, and tell your customers that you will guarantee the article sold to last a year, with reasonable care. That's a safe plan when you use GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES, as you might with equal safety guarantee them for three years or more. Risky business with any other brand of plates, though.

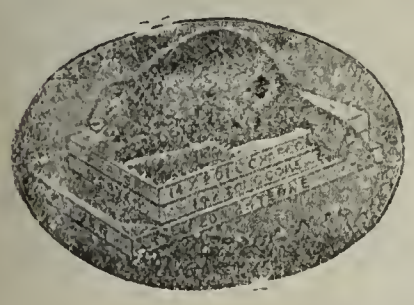
GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Iron Bars, by the good old fashioned hand methods employed 50 to 75 years ago in making charcoal tin plates, insuring absolute freedom from pinholes. No better plate *is* made; no better plate *can* be made. For tinware or roofing they are unequaled. Send for a sample.

GUMMEY, McFARLAND & CO., PHILADELPHIA.

Anchor . . Ventilators

ARE SUPERIOR TO ALL OTHERS.

Are stormproof and durable, and unexcelled for ventilating schools, churches, mills, factories, etc.



They Ventilate and prevent down draft and smoky chimneys.

J. L. PERKINS & CO., - - 243 Lake Street, Chicago.

THE other day, as I was clinging to a strap of a Lexington avenue car, two ladies sat near me, and as one opened her portemonnaie to pay her fare a scrap of paper which was pasted to the leather was disclosed.

"Is that your shopping list?" asked the other; "it doesn't look like a long one."

"No," was the reply; "it is not the list, but it is what keeps the list from being a long one," and she read:

"He who buys what he does not need will soon need what he cannot buy."

"What a capital guardian of your capital! You must let me copy that for my leaky purse. Who wrote it?"

"I don't know, but I wish I did, for he has saved many a dollar from lightly rolling from my hands since I put it there."

I was intensely interested in the conversation, for at that very moment there lay in my note book a scrap which I would have brought forth but for the fact that my own corner was reached.

I publish it, for if the truth which it contains were assimilated, many a pocket-book would remain a pocket-book.

"We are ruined, not by what we really want, but by what we think we do; therefore never go abroad in search of your wants. If they be real wants, they will come home in search of you; for he that buys what he does not want, will soon want what he cannot buy."—*Christian Advocate.*

—"Yardsley donated a caster worth 97 cents to the minister, and put a tag on it marked $16."

"Yes?"

"Well, the parson took the article to Yardsley's store yesterday and traded it for drygoods. Yardsley's smile won't be able to be out again for six weeks."—*Harper's Bazar.*

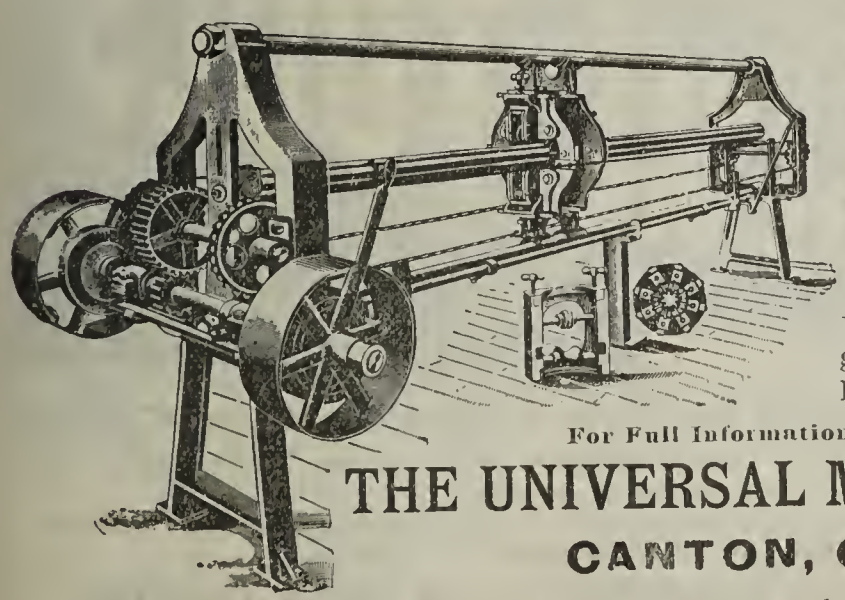
DOUBLE TRUSS CORNICE BRAKE CO.,
BUFFALO, N. Y.



Gentlemen:—Enclosed please find N. Y. Exchange for $—— to pay for Cornice Brake sent us about six weeks ago. We never paid a bill for tools where we thought we came as near getting our money's worth as we do in paying you for this Brake. The machine is all right, and all you claim for it.

The Brake is now in a distant part of this state where our men are putting in a job of large square galv. piping. Should it get in a wreck and be lost to us, we would order another just like it at once.

All the boys in the shop are anxious to know when that Brake is coming back. For our use we would rather have this than an iron one. We are, Very respectfully yours, LUCAS BROTHERS.

All Sizes from 3 ft. to 10 ft. Indispensable to Cornice makers, roofers, tinsmiths, furnace men, etc.
Send for our latest prices.

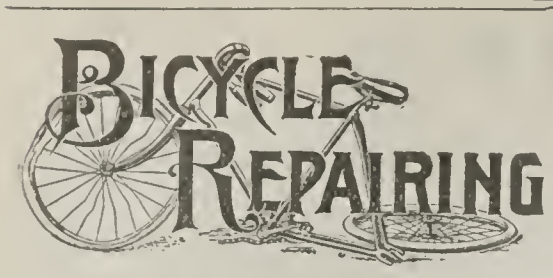
BRIDGEPORT, CONN

—MIS' BROWN'S FUNERAL SERMON.—"If folks could have their funerals when they are alive and well and struggling along, what a help it would be!" sighed Aunt Jerusha. She had just returned from a funeral, and Mrs. J. B. Lummis pictures her in "Zion's Herald" as wondering how "poor Mis' Brown" would have felt if she could have heard what the minister said.

"Mis' Brown got discouraged," continued Aunt Jerusha. "Ye see, Deacon Brown, he'd got a way of blaming everything onto her. I don't suppose the deacon meant it—was just his way—but it's awful wearing.



"And the minister a-telling how the deacon brought his young wife here when 'twan't nothing but a wilderness, and how patiently she bore hardship, and what a good wife she'd been! Now the minister wouldn't have known anything about that if the deacon hadn't told him. Dear! dear! If he'd only told Mis' Brown herself what he thought. I do believe he might have saved the funeral.

"And when the minister said how the children would miss their mother, seemed, as though they couldn't stand it, poor things!

"Well, I guess it is true enough; Mis' Brown was always doing for some of them. When they was singing about sweet rest in heaven, I couldn't help thinking that that was something Mis' Brown would have to get used to, for she never had none of it here.

"She'd have been awful pleased with the flowers. They was pretty, and no mistake. Ye see, the deacon wa'n't never willing for her to have a flower bed. He said 'twas enough prettier sight to see good cabbages a-growing; but Mis' Brown always kind of hankered after sweet-smelling things, like roses and such.

"What did you say, Levi? 'Most time for supper? Well, land's sake! so it is. I must have got to meditating. I've been a-thinking, Levi, you needn't tell the minister anything about me. If the pancakes and the pumpkin pies are good, you just say so as we go along. It ain't best to keep everything laid up for funerals."—*Exchange.*

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price. $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age*.

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

QUICK MEAL

A WORD ON CHEAP STOVES.

We mean so-called Cheap Stoves, which are made Cheap and sell Cheap and prove Dear to the Dealer and Dear to the User.

As well known, these cheap stoves are sold at most any price and the dealer's profit is very small indeed. It knocks out **right then** the sale of a good stove on which he might have made a fair, legitimate profit and which stove would have given his customer good satisfaction. Result: The user soon finds he needs repairs—it being sold cheap, it is made cheap—and having given out so soon he expects his dealer to furnish them free. Being unsafe it does some damage—he does not blame the stove but the dealer. He condemns Gasoline Stoves in general and his dealer in particular; he dissuades his friends from buying a Gasoline Stove of any kind and particularly buying it from his dealer. The dealer has made no profits but has lots of repairing and explaining to do and loses a customer and perhaps more than one.

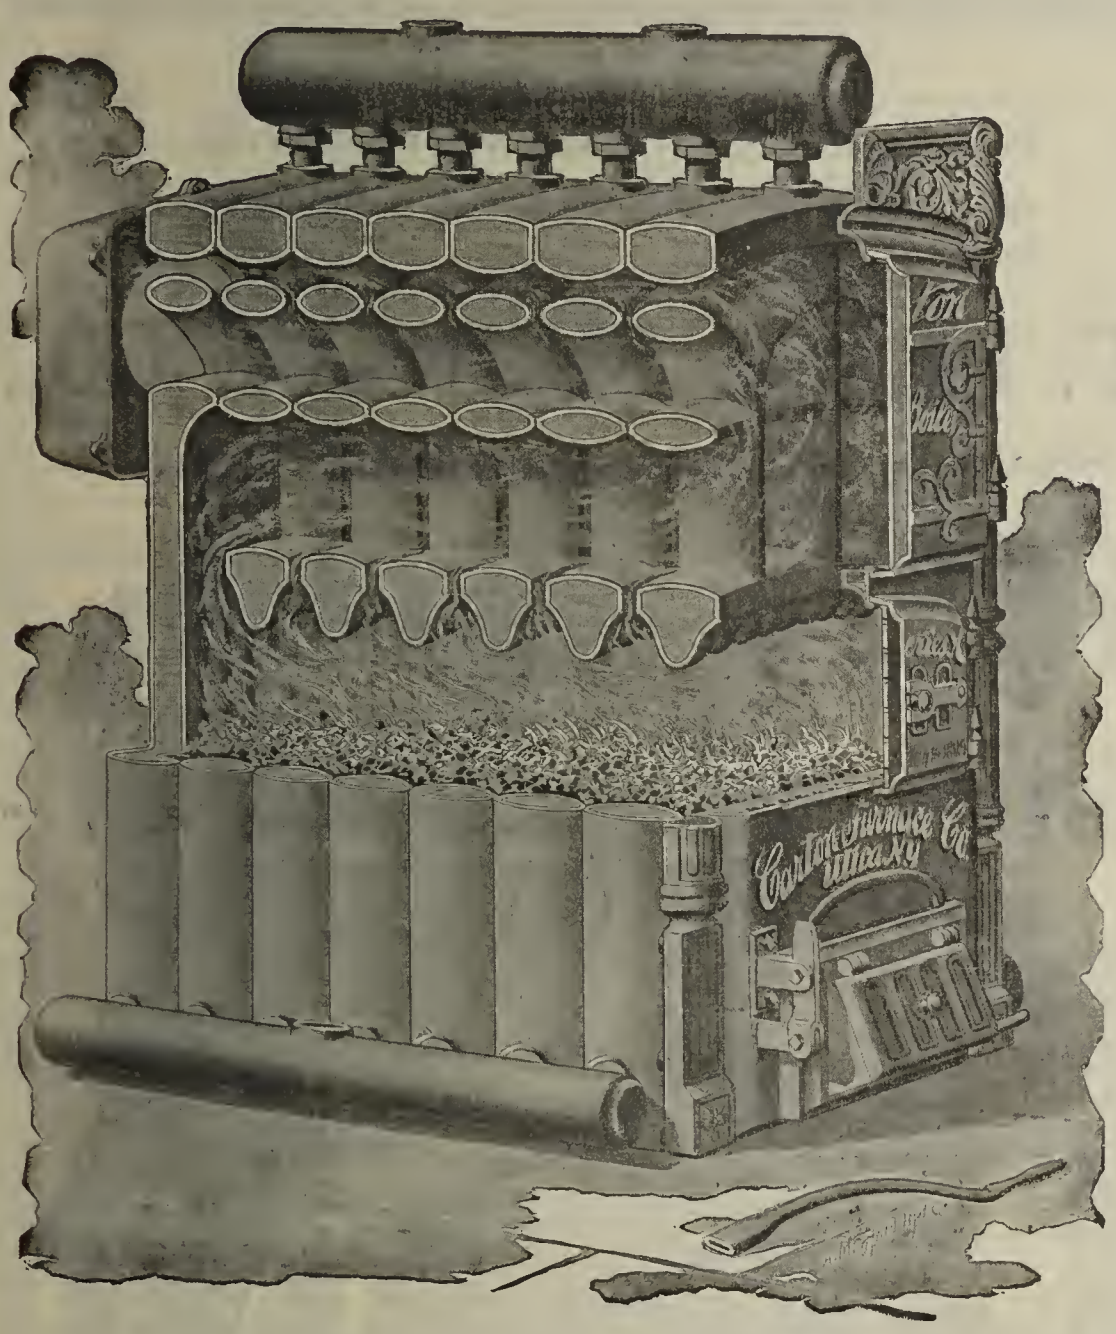
What a contrast with the result of selling a **Good Stove**—a Quick Meal Evaporator, for instance—quick sale, quick profit, quick satisfaction, quick recommendation, quick additional sales, satisfaction without end to all concerned.

Yours truly,

Ringen Stove Co.

ST. LOUIS.

P. S.—The Quick Meal Steel Range is a winner. It looks well, it cooks well, it bakes well, it sells well, it satisfies well. There is none better.



We Claim

Colonel Waring, the well known street commissioner of New York City, estimates that in 1897, ***$200,000 of coal was thrown out with the ashes into the streets of New York.*** If there is this waste in that city, it exists proportionally elsewhere.

This evil can be in a great measure avoided if proper heaters are installed and care exercised in their use.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.

MY DEAR SIR:

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal.

Very truly,
I. N. EVANS.

Profits.

Heating men who handle the American Boiler Company's Steam and Hot Water Heaters frequently tell us that they secure contracts even when their bids are higher than those of their competitors. There's good reason for that. We know of more than one steamfitter who have found their profits increase after the adoption of these heaters: "Florida," "Soleil," "American," "Modern"—for steam; "Spence," "Perfect," "Advance," "Tropic," "Little Giant"—for water.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.
" 10. High and Low Pressure Steam Heating and Power Plant.
" 11. Exhaust Steam Heating.
" 12. Power Fan or Blower System of Heating and Ventilating.
" 13. Design. Estimate. Specification.
" 14. Dwelling House Heating.
" 15. A Successful Heating Job.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.
Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

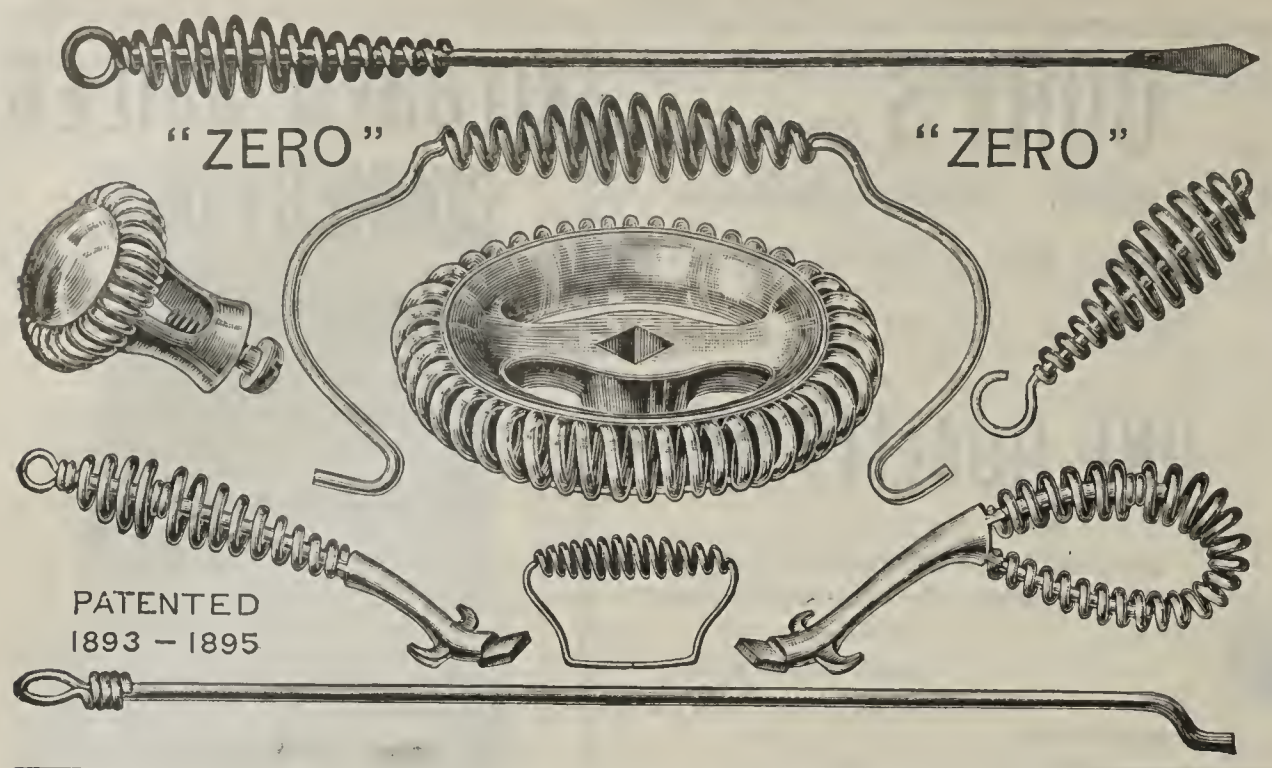
The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

NEWARK CHICAGO NEW YORK

—"A WONDERFUL CLOCK.—A railway station is commonly supposed to offer fewer attractions to the imagination than any other spot on earth; but a certain watchmaker in Warsaw evidently found inspiration in one, for he has used its shifting scenes as a theme in his own branch of art. He has constructed a clock whose mechanism represents, every fifteen minutes, all the activities of a miniature railway station. Two quadrants in a central tower give the time at Pekin and New York. The telegraph operator sends a dispatch, the doors of the station open, the station master and his assistant appear on the steps, the clerks open the windows and distribute the tickets, several travelers rush toward the train that comes in at full speed. In short, until the train has gone, the usual stir of such station is exactly reproduced. As the train leaves the automatons return to their places, and for a quarter of an hour everything is peaceful. The dimensions of this clock are not given, but it is said to have cost six years' labor.—*Exchange.*

PRACTICAL HINTS
— ON —
JOINT WIPING,

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, **25c.**

Watch Your Cues and Figures

The fellow who wants to do business must stir up his customers with a furnace that's built differently from the ones the other fellows sell. He wants a furnace that will stand investigation like ***this*** one, so he can worry his competitors with good working points. There is oftentimes too much similarity with furnaces to make a choice any object except the price. If a dealer makes money in the furnace business he wants goods that look well, which sell easily, and give good satisfaction when used.

PATENTED JULY 13th, 1897.

Start the New Year

with our line of tubular construction. It will bring you business away from the best of them. Try it. A letter of enquiry is solicited. Already the reports come to us, telling how well these furnaces act. If you want letters of commendation, we can furnish them by the score. We believe we can satisfy anybody as to their worth. Why not you?

The Business Situation.

The strength and stability of the existing trade situation have had a severe test during the past week. The grave apprehensions aroused in the public mind by the terrible disaster to the "Maine" and the prevalent suspicion that the explosion which destroyed the battle ship and caused the loss of so many valuable lives may have been due to treachery have had their influence upon the speculative and financial markets. But general trade has not been affected to any appreciable extent. It is true that some large enterprises are being delayed and business men are acting cautiously in the matter of new ventures, while the possibility of a warlike outcome to the present excitement is in the air. Yet the reports from trade centers continue to point to steady improvement in the volume of general business. As indicated last week, the improvement is, however, much more marked in the West than in the East. Nevertheless, even in this quarter the enlargement of business over last year, as illustrated by bank clearings, is very pronounced, showing an average gain of nearly 50 per cent. Only one previous week for years past—that ending January 8 last—had a larger volume of clearings to its credit than last week. The prices of staples have advanced or are notably firm. Wheat has risen from day to day, gaining about two and a half cents a bushel during the week without checking exports, notwithstanding that the advance was due to speculative manipulation. Corn, too, scored a fractional gain, and the recent advance in cotton has been sustained. In the iron and steel trade the volume of business is very large, but so is the production, and competiton is great. Bessemer Pig made a small advance and is very firm on heavy purchases. In metal lines, Copper is very strong and the price has started on an upward direction. A feeling of nervousness and apprehension over the Cuban situation has been growing in Wall street and was used by the "bears" to depress prices. The stock market developed notable weakness, and was only saved from demoralization by remarkably heavy purchases of American securities by London. Bonds, too, fell off in strength and activity. The money markets were firmer, with slight advances in all classes of loans due to heavy calls for funds from the interior and also to the war talk and the weakness of the stock market. The New York City banks have increased their loans $13,000,000 in the past two weeks, and their surplus reserve has meanwhile been decreased by over $9,000,000, largely on account of calls for commercial loans, a striking change from the conditions which existed in this department a few months ago.

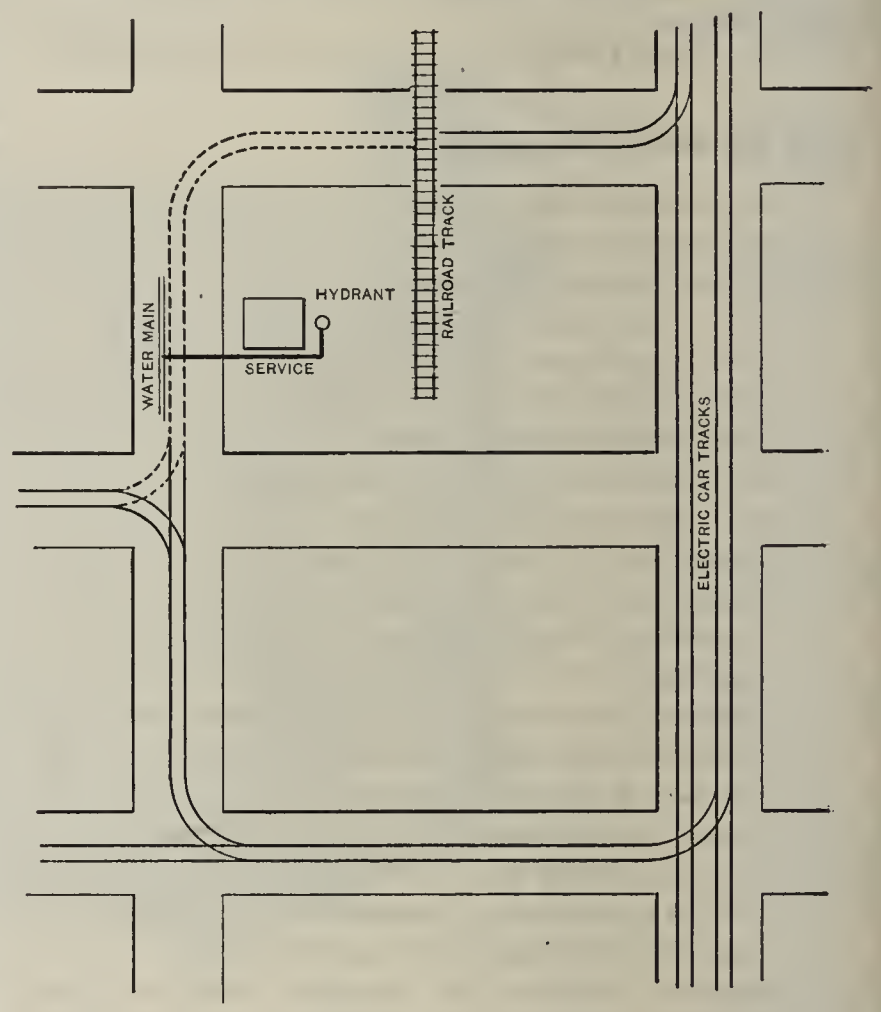
Whatever the issue may be for the thousands of adventurous persons who are preparing to brave the hardships and toil of gold searching in Alaska this year, it is certain that the "Klondike craze" has given an immense impetus to trade in various directions. On the Pacific Coast the business in miners' supplies and outfits and that of the transportation companies is already reported to be enormous. In British Columbia the business activity directly connected with the Klondike movement is said to be unprecedented. Here in the East, and presumably all over the country, evidences of keen interest in the new Eldorado are seen on all sides. "Klondike supplies" is becoming a familiar advertisement, and the newspapers daily contain accounts of parties starting or preparing to start for Alaska in the search for gold. Old miners say that not one out of a hundred of the prospectors is likely to reap any adequate reward, and probably not one out of a thousand will make a fortune. But that is no deterrent to the would be Klondikers. They are going to the gold fields in swarms, and are spending good money on outfits and transportation, which money is going into circulation and helps to swell the volume of trade.

Action of Mercury on Aluminum.

According to *La Révue Technique* of Paris, M. C. Margat, an instructor at the University of Geneva, Switzerland, has made a curious discovery concerning the action of mercury on aluminum. If the surface of a plate of aluminum, which has been well sandpapered, is rubbed lightly with amalgam of mercury, there will be produced on it, within a very short time, an extraordinary efflorescence. The surface of the metal will soon be covered with a growth of alumina, which will shoot up literally within plain vision. No more remarkable sight is to be observed than the formation of this miniature forest, which attains, in the course of half an hour, a hight of nearly ½ inch. If the metal is brushed over it will be found pitted, as if with an acid, at all the parts in which this rapid oxidation has taken place. But a little heat applied to the plate suffices, by reason of the volatilization of the mercury, to arrest the phenomenon entirely. It will, however, be reproduced each time the surface is rubbed anew with a little amalgam of mercury. The experiment succeeds more easily with the amalgam, as it is difficult to sufficiently pulverize a drop of mercury with the finger, the metal not soaking into the aluminum. It is probable that the mercury merely produces catalytic action, and that it then allows the aluminum disintegrated by its presence, or, perhaps, reduced to a porous condition, to be more readily attacked when cold by the oxygen of the air. Nevertheless. the plate is heated to a degree appreciable to the touch, and actual combustion is evidently established.

The success which has attended the Southern cotton mills has induced a movement for the establishment of woolen mills in the Southwest. It is believed that the woolen industry can be conducted with equal success in that section and the matter is receiving enthusiastic support in the South.

THE LETTER BOX.



Hoods for Ranges.

From S. & S., Warren, Pa.—Will you kindly give through the columns of *The Metal Worker* information concerning ventilating hoods over kitchen ranges? We desire to know the proper size and shape of a hood and the sizes for the pipes leading from it. If any of these hoods have been illustrated in *The Metal Worker*, we should be glad to know in what number they appeared.

Answer.—We have published in back numbers of *The Metal Worker* several contributions on this subject, and would particularly refer our correspondents to an article entitled "Pattern for a Range Canopy," printed in the issue of December 7, 1895. On talking with a prominent manufacturer of ranges for hotel and restaurant kitchens and for household use, we find that there is no definite rule for determining the size of hoods, the location of the range and the hight of the ceiling in the kitchen being the conditions which govern. Where the wall space is clear and the ceiling of sufficient hight the hood should extend beyond the range 6 inches at each end and should extend out beyond the front 6 inches. The bottom of the hood should be about 6 feet 2 inches from the floor. For a range of family size, where the hood would be 3 x 4½ feet in dimensions, it should not be over 18 or 20 inches high. If the dimensions of the hood were 4 x 10½ feet, in order to get a graceful curve to the hood and a good appearance the hood should be from 28 to 30 inches in hight. It is very seldom that a hood is made 36 inches high from the bottom line to the top. This is only when the hood is very large and the ceiling is of such a hight as to permit it. The size of the pipe used with the hood is governed entirely by the size of the flue to which it is connected. In many instances the outlet from the hood is put into the same flue which is used in connection with the fire box of the range, and if the opening was too large the operation of the range would be interfered with. It is better to put a register over the opening in such cases so that the ventilating opening can be entirely closed if it interferes with the work of the range, and particularly when the oven is used. In cases where a separate flue is provided for ventilation, immediately beside the flue used for the range, the size of this flue will determine the size of the pipe that should be used. If a pipe is to be carried from the hood through the roof of the building the size can be made as large as circumstances will permit. In such instances where very long hoods are used it is not uncommon to take two pipes, one from near each end of the hood, and connect them by means of a Y into a larger pipe of sufficient capacity and which is carried out of doors. In hotel or restaurant kitchens the main pipe is sometimes as large as 16 or 18 inches in diameter, but 10 or 12 inches is more common, and if a single pipe 6, 7, 8 and 9 inches are common sizes. The shape preferred is a curve from the wall line at the top to outer edges at the bottom, although for ecocomy the straight pitch is often used.

Corroded Lead Pipe.

From N. H., Homestead, Pa.—We send you a piece of lead pipe which is a section of a line that has given us a great deal of trouble from corrosion. We also send you a sample of the clay in which the pipe was laid, and will be very glad if you can tell us what caused the corrosion. As this is sometimes due to electrical action, we inclose a sketch of car lines from which you will see that the service pipe crosses the trolley line, but the dotted portion indicates that the cars do not run continually over the track, as they are not permitted to cross the railroad, though the wire crosses, the result being that the cars run very infrequently over that portion. We were told by the engineer of the electric line that in order to affect the lead pipe it would have to come in contact with a direct current. We have had the clay tested for acid and found that it did not contain any injurious substances. We would like very much to find out if the trouble is caused by electrolysis. When we put in the service line we bored about 10 feet in the street, and the pipe, when dug up, was as badly eaten as that portion which was laid in the trench. It is a very common thing in Pittsburgh to find lead pipe which has been laid in cinders badly eaten. These cinders come from glass factories and contain an

Corroded Lead Pipe.

acid which corrodes lead. In this case, however, the pipe was in the clay.

Answer.—The corrosion of lead pipe by the action of clay and other natural soils is not probable and not known in the experience of engineers of city water works. The electrolysis of water pipes by their crossing or running in nearby parallel lines with electric railways is well known, and has been brought to the notice of trolley line companies in a legal way, to compel repairs of pipes and changes in the electric circuit in a manner to avoid the electrical corrosion of water and gas pipes. An electrolysis clause has also been inserted in charters to electric railways. The dead end of the trolley line as shown in the sketch is charged at all times from the main line of travel, which we apprehend turns in the opposite direction at the street crossing near the pipe affected. The crossing under the railway tracks of the house service pipe has probably made a short circuit by the water main back to the power house. The lead service pipe being nearest to the tracks would naturally become the most direct path for the current through the moist earth. The trouble is very much increased by defective rail bonding. There is much that should be known that is not contained in our correspondent's complaint. That is, if other service

pipes in the neighborhood are giving out, whether the water main from this point is a short circuit to the power house, as also the condition of the rail bonds. This trouble occurred in the city of Albany, N. Y., and was remedied by laying a line of heavy copper wire in the ground directly from the negative buss-bar in the power house to the neighborhood of the trouble, and connecting at several places directly to the water in the mains by bronze plugs screwed into the main and connected to the main wire. In the newer laid Brooklyn tracks a supplementary return of large galvanized iron wire is laid in the ground between the rails and connections made with the rail bonds, terminating in an overhead return to the negative buss-bar.

Injustice to Plumbers from No Examining Board.

From S. R., New York.—Can *The Metal Worker* tell me why the Examining Board of Plumbers for the Borough of Manhattan is not appointed and why their appointment is not in sight? I ask the question as a prospective applicant, and the delay in the appointment of the board causes what perhaps is a good opening to slip away and certainly keeps me from taking paying work. Can you advise any remedy?

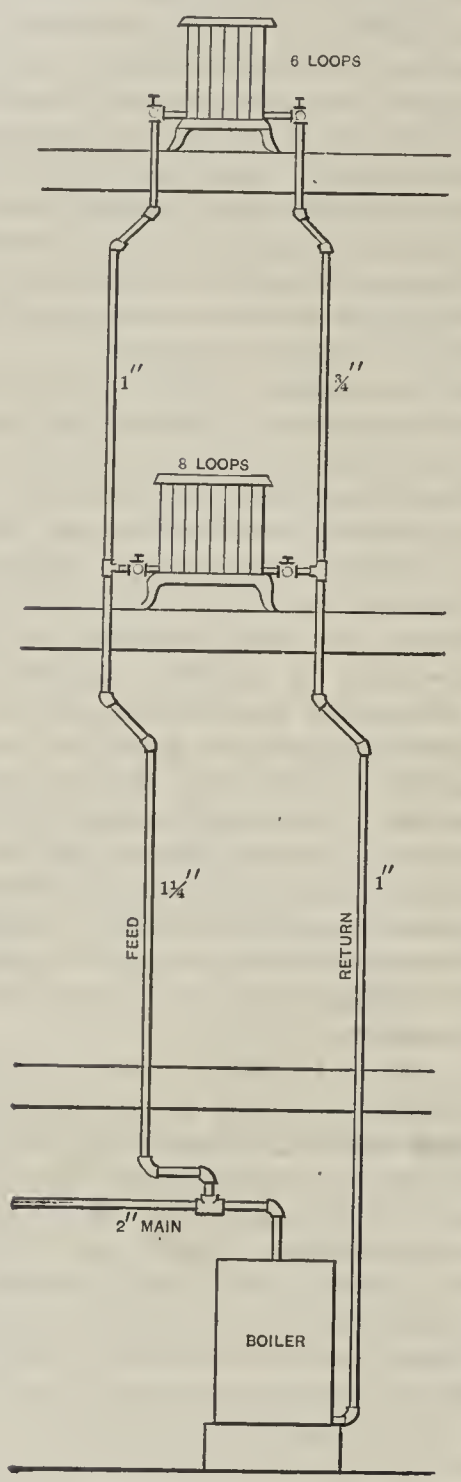
Answer.—There is an evident injustice to the citizens who desire to take the examination in order to secure certificates and take out liceases when the city does not provide a Board of Examiners. To that class of citizens who are identified with the plumbing business there is no more important department in the city government than the Board of Examining Plumbers, and although a new charter has gone into effect that is no reason why the board should not have been appointed ere this, especially when the city officials will not pass the work of those who are not licensed plumbers. Our correspondent might engage in work and when stopped appeal to the courts for protection. This, however, would entail a law suit. A simpler and better way is to follow the custom employed by out of town plumbers who occasionally have a plumbing contract in New York City, and that is to get some other master plumber who has a license to take out the necessary permits for the work and to have the work done in his name. His application for examination will be received and placed on file.

Testing Gas Pipes.

From E. E. H., St. Louis, Mo.—Will *The Metal Worker* please explain how many ways there are for testing gas pipe and the advantages of each?

Answer.—The advantages of different systems depend upon the conditions under which they are to be used, and must be judged by the workman. To answer the first part of the question we have reproduced below, from "Practical Gas Fitting," a work which can be supplied by our Book Department, the following: If the application of the test pump reveals the unpleasant fact that the job is not tight, it will be necessary for the fitter to hustle to find the leaks Should the rapidity with which the gauge falls after being pumped up demonstrate that the leak is a large one, but little time or trouble is likely to be required in finding and remedying the defect. First go over all the caps and see that none of them is loose, and that no nipple or drop has been left out. All the time the job is being gone over keep the ears open and have the pump steadily worked, as the sound given off by the escaping air will frequently locate the trouble. For this reason it is well to test during the dinner hour, or before or after working hours, when comparative quiet will reign in the building. If all caps and nipples are found properly secured, then look for splits in the pipes, the usual place for such defects being where the tongs have gripped the pipe in screwing up. If the gauge falls very slowly, demonstrating the leak to be a small one, there will be much more trouble in finding it.

One method of locating the leak is to mix a quantity of strong soap suds, and with a clean brush generously apply the mixture over the surface of the different pipes, at the same time watching carefully for the bubble that will be blown from even a very small leak by the escaping air. It will, of course, be understood that during all these operations the pump must be kept steadily working. Another method is to pour into a cup on the pump provided for the purpose a quantity of ether, in this case the nose being the organ used in the hunt, the fitter carefully going over the pipes, smelling for the ether that will escape from the leak. This method of finding a leak in an open building is somewhat uncertain and tedious, but is frequently used with success.



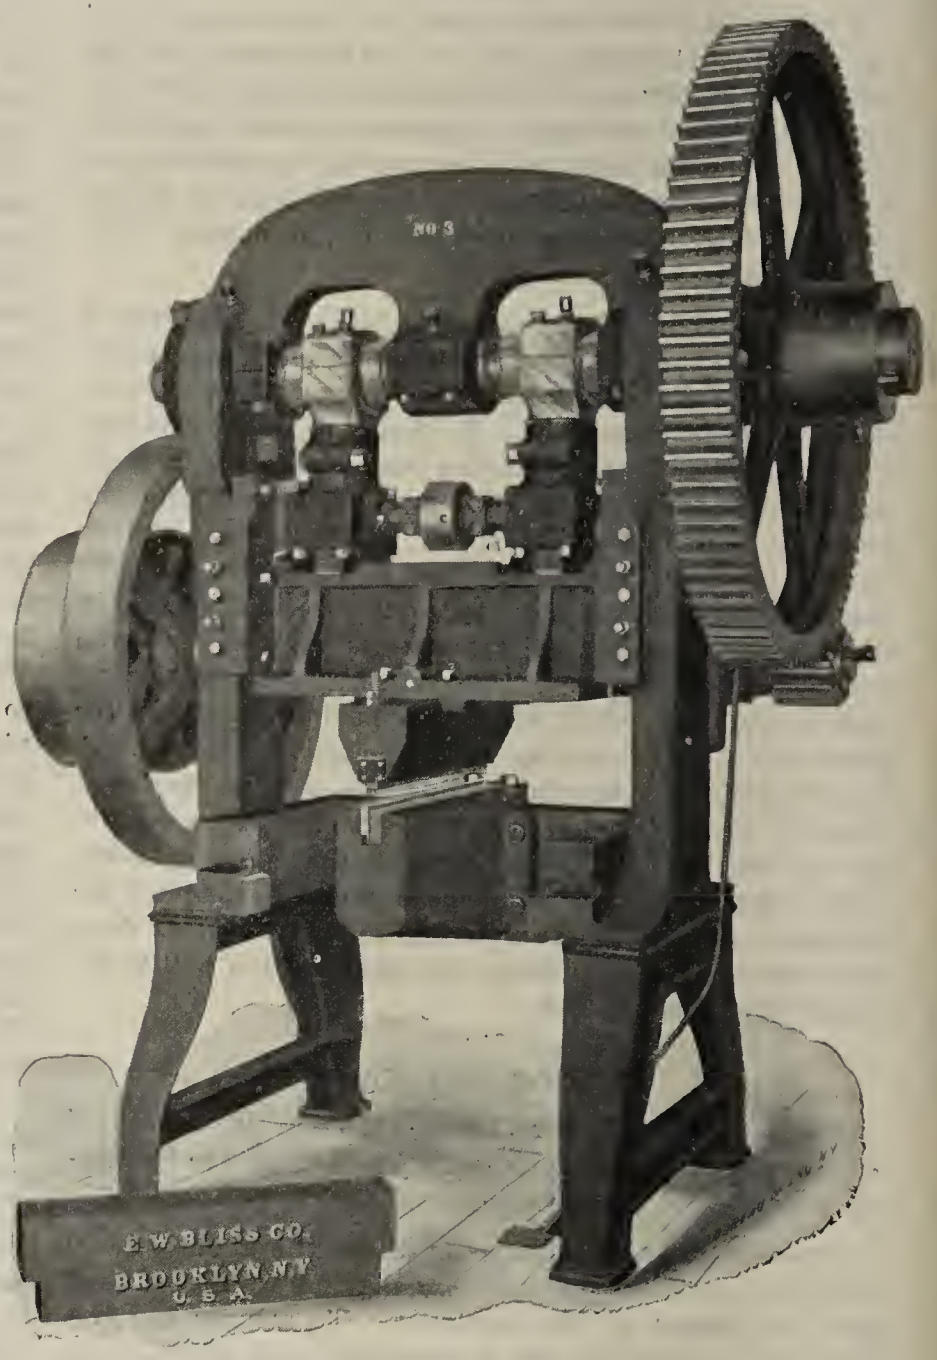
If the gas service is in and permission from the gas company be had, the service and house main can be connected and the nose may be assisted by a lighted taper in the search. If the lighted taper is employed great care must be exercised to guard against setting the building on fire, as the very small flame likely to result from a leak may not be perceptible to the eye, especially in the daylight. Or the flame may be at the back of a fitting in some inaccessible place, beyond the reach of eye sight. It is a good rule to test with a light in no place that cannot be easily reached to blow out any flame that may result, and further, when there is a strong odor of gas, a light must never be put in confined places, such as between floors or behind partitions—this especially applies to searches for leaks in finished buildings—for by so doing the fitter may have an explosion added to his troubles.

Sometimes it is possible to fill the pipes with water and locate the leak in that way. This is a risky business, however, as it is very difficult to empty out the water, especially from the smaller pipes, and may cause trouble for months. The writer, nevertheless, has known fitters who did not hesitate a moment in adopting this plan, it being a certain and rapid plan of finding leaks. When following this plan, however, the proper way to empty the pipes is to take off the caps on the nipples and drops that are highest. Then remove the caps on the lowest nipples and drops and on the main, blowing violently several times into each nipple on the upper or top flat. Then take the caps off the next lower flat and blow into all the pipes on that floor, and so on down, keeping at it until there is no uncertainty as to the pipes being entirely emptied of water. They can then be left for a few days and the blowing out process repeated. This method of finding leaks is, of course, out of the question in cold weather.

In fitting up large buildings it is a safe plan to test the work in sections, say a flat or two at a time, leaving suitable connections for joining all the parts tested before making the final test of the whole job. Having found the leak, there comes up for consideration the question of making effectual repairs. A split pipe or fitting must be removed and replaced with sound material, but a small hole in a fitting may be closed with gas fitters' cement, the fitting being first well heated by means of the blow pipe and lamp and the cement applied to the attachment while hot. An escape at the screw head may also be firmly closed with cement or with red lead well rubbed in.

In another part of the book this is the advice given for testing the piping: The last and most interesting part of a gas fitting job is testing the pipe. The test should be just as rigid whether an inspector's certificate is required or not. There are two kinds of test pumps—spring gauge and mercury gauge. The reader can see a cut of them by turning to any catalogue of gas fitters' tools. The mercury gauge is the more suitable, because it is more sensitive than the other. The glass may be placed nearly at the bottom of the cup, in order to use as little mercury as will give the required pressure; then should an accident occur there will not be much lost. A column of mercury 2 inches high is equal to 1 pound pressure. Eight inches is ample hight for the mercury column when testing illuminating gas pipe, as there is at most only a few ounces pressure on the mains at any time. The pump for testing may be placed at any convenient opening, and after allowing a moment for the

mercury to settle it should stand 15 minutes without even getting flat on the top of the column. Very small houses may be passed with a ten minutes' test, as the leaks will show sooner. If the mercury falls gradually the leaks are either considerable or very near the pump. If it stands for several minutes and then drops suddenly the leak is very small and usually very remote from the pump. If the pump proves that the pipes leak the pressure may be let off and a little sulphuric ether poured into the opening for the purpose, or into the barrel of the pump. Then pump up the pressure again. A large leak may be smelled and heard too, as soon as you get near it, but the nose will have to be placed close to a small leak to detect the smell of ether. A little soapy water can be used to advantage in hunting gas leaks. If the suspected place is painted with it the air will make a bubble, showing exactly where the leak is. Split pipe and fittings should in all cases be removed. If the fitter has any time to spare when the job is finished, he can employ himself by loosening the caps while the pressure is on to see that no pipe is clogged.



What Makes the Radiator Noisy?

What Makes the Radiator Noisy?

From J. R. M., Philadelphia.—I submit herewith a sketch of a steam heating job that I have done and which, being my first, I would like a little information on in regard to the radiator on the second story, which is connected with the pipes by means of a close nipple and a globe valve. The main is then reduced and run up to the third story and connected with an angle valve. If the third-story valves are kept closed the job works all right, but as soon as we open the third-story valves there is a continual rumbling noise as though of boiling water. These two radiators are on the south side of the building and are the first connections from the boiler. The second conections from the boiler are taken from a main which crosses the cellar and rises in the same way, and connects with two radiators in the same way. When the two valves are opened in the latter case there is no noise as in the first radiator. I should be glad to learn the cause of the trouble and how to remedy it through the Letter Box.

Note.—No doubt some of our readers will give assistance in this case, as the appeal seems to be to them. In the meantime we would say that there seems to be nothing that is wrong with the pipes as connected, and that many jobs are connected in the same way and give no trouble. It is quite possible that the hammering is due to water which fails to return to the boiler owing to the air valves not working as they should. If he will examine his air valves to see if they are in a condition to permit the air to pass off when steam is turned on, or to admit air when it is shut off, he may find that something is wrong which can be easily remedied.

The Bliss Double Crank Geared Press.

The Bliss Double Crank Press.

The special double crank press built by the E. W. Bliss Company, 16 Adams street, Brooklyn, is so designed that it may be used for nearly all the operations required in the manufacture of sheet iron and steel goods, such as vapor stoves and ovens, coal hods, drip pans, elevator buckets, &c., also for operating gangs of punches for rivet holes in tanks, &c. The cross head is guided in long adjustable bearings so that cutting and perforating dies, as well as others requiring great accuracy of movement, may be safely operated. It is built either geared or with a fly wheel, as will be seen from the illustrations. It is also built in an inclined position if so desired.

The geared press has its bed with a removable front piece which is taken out when the machine is to be used for wiring dies. The front piece is left in place when cutting, piercing, stamping or combination dies are to be used. In this manner the machine may be em-

ployed for nearly all the die operations in the manufacture of heavy pieced iron ware.

The fly wheel press, with open front and sunken bolster, is specially adapted for the manufacture of tin ovens, such as are made in connection with gas and vapor stoves ; it is also adapted for bread boxes and similar work. The special horns and forms shown are intended for setting down the inside corner seams of oven bodies. The principal dimensions of this press are as follows : Opening in bed, 16 x 28 inches ; width between uprights, 36 inches ; standard stroke of slide, 2 inches ; maximum stroke of slide, 4 inches ; area of die bed, 24 x 35 inches ; weight, geared press, 9000 pounds ; fly wheel press, 8000 pounds.

Recent experiments at the McGill University, Montreal, Canada, are reported to have demonstrated that a substance so hard and brittle as marble may, under certain conditions, be molded like clay. According to the published descriptions of the experiments a miniature column of pure Carrara marble was placed in a sheath of iron and submitted to gradual and long continued pressure, with the result that the marble shortened and thickened, bulging so as to swell the iron sheath. The iron then being cut away the marble column was found to be greatly altered in shape, although still remaining solid and brittle as before. No increase of temperature or other agency than the pressure was applied in producing this result.

George G. McMurtry, president of the Apollo Iron & Steel Company of Pittsburgh, has returned from a trip to Europe. He reports having had a very pleasant time and is much improved in health.

The almost forgotten project for a Grant memorial in the shape of an ornamental bridge over the Potomac has been recently revived at Washington. The preliminary survey for the bridge has just been completed and the matter is attracting some attention. A proposition has been put forth to make the structure strictly a memorial by having a Grant tower at one end and a Lincoln tower at the other. Such a bridge is estimated to cost about $1,500,000.

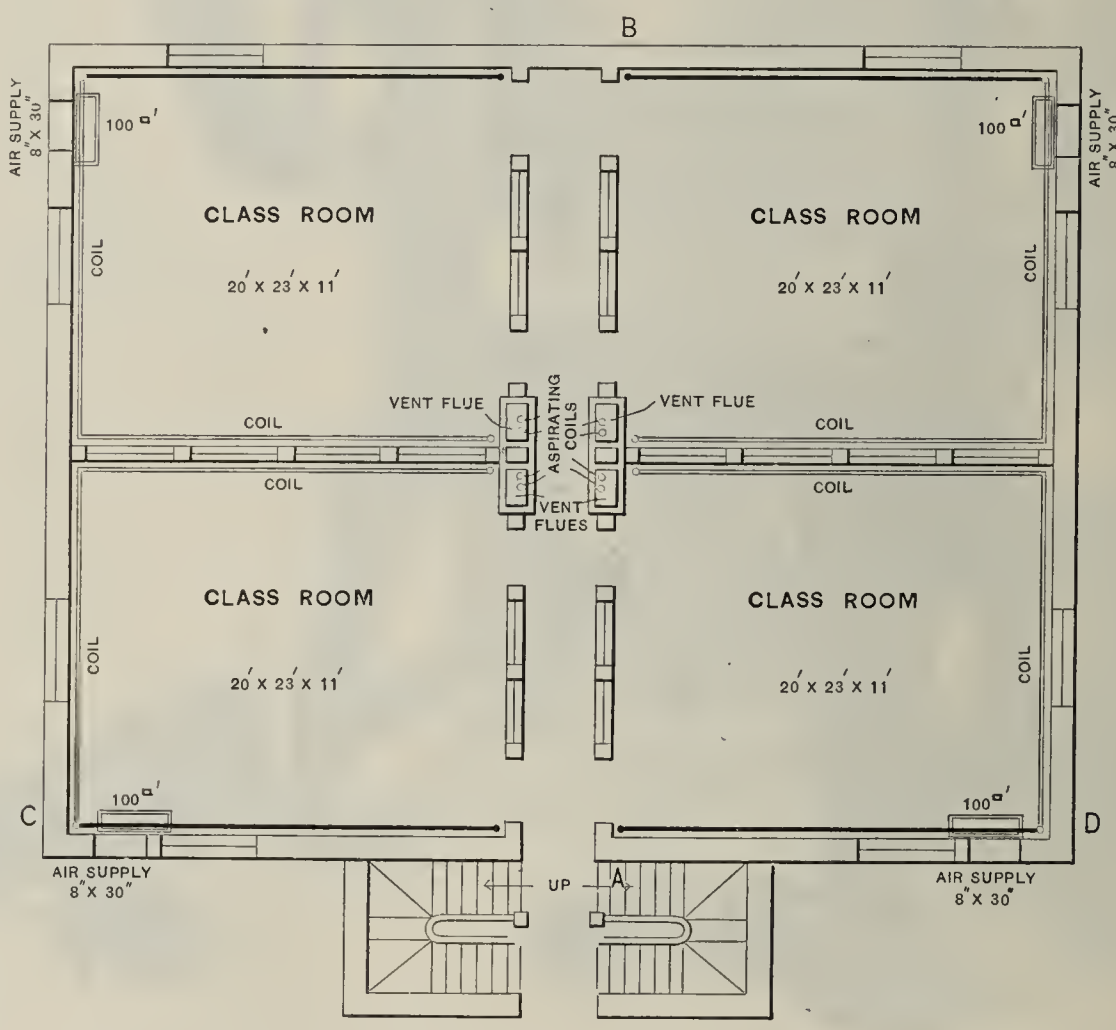
The Bliss Double Crank Fly Wheel Press.

Coating Metals with Tin.

The following receipts for coating metals is taken from *Zeitung für Blechindustrie :*

A mixture of 20 parts powdered cream of tartar, 10 parts of stannic chloride (perchloride of tin) and 50 parts of water is heated at about 60 degrees C. (140 degrees F.) until dissolved. Any zinc articles dipped in this liquid will quickly be covered with a gray deposit, and should then be removed and rubbed or brushed, without rinsing, until, in a few minutes, the surface becomes perfectly white and lustrous. The same effect may be produced if, instead of dipping the zinc, the solution is mixed to a thin gruel, with clean sand, and rubbed over the surface. For copper, brass, iron and lead the same solution is suitable, but as zinc contact is essential a little zinc powder is added to the mixture. Brass, bronze and copper may also be tinned by dipping the articles in a bath of 16 parts ammonium alum, 1 part of tin salt (stannous chloride) and 300 parts water at boiling temperature. When the bath is exhasted it may be renewed by adding more tin salt, but not in excess of the foregoing proportion—viz., one part. To tin iron the cleaned metal is dipped in a bath of 2¼ gallons of water to 1 ounce of powdered cream of tartar and ⅔ ounce of tin salt, but must be in contact with zinc or the tin will not be deposited.

John A. Meade & Co. of New York have been awarded the contract for equipping the proposed New York garbage plant which will be erected at 131st street and East River with conveying machinery. The contracts amount to about $7500. It is expected that bids will be called for for the equipment of another similar plant by the New York authorities within the next week.



HEATING AND PLUMBING.

HEATING THE CARMEN STREET SCHOOL.

The necessity of providing a better method of heating and also furnishing some means of ventilating the Carmen Street School at New Brunswick, N. J., was brought prominently before the Board of Education of that city on investigating the system in use. A plan of the first floor and second floor is presented in Fig. 1, showing the system as remodeled. At the time attention was given to the heating and ventilation problem the different rooms were provided with wall coils four pipes high, made of ¾-inch pipe, extending along two sides of the room. These coils presented about 50 feet of surface, while the rooms were 23 x 20 x 11 feet in size, with a capacity of 5060 cubic feet, so that the ratio of heating surface to the cubic contents was 1 square foot of surface to 101 cubic feet of space, and even with the best efficiency of a steam heating plant this is hardly adequate to the requirements of the school building.

The School Board consulted with T. B. Cryer of the firm of T. B. Cryer & Co., 28 30 Lawrence street, Newark, N. J., and a member of the American Society of Heating and Ventilating Engineers. Mr. Cryer found that the School Board had at their disposal a horizontal tubular boiler of about 12 horse-power. As economy in expenditure was important the system was improved after the method described herewith, and the success that has attended the effort is shown in the satisfactory results obtained last winter. The boiler is located in a space excavated for it, or rather blasted for it, in the rock under the school building, as shown in Fig. 2, which also shows the location of the main and return to the different wall coils and radiators, and also to the aspirating coils placed in the ventilating shafts. The pipes which are underneath the building were run in a space of 18 inches between the rock and the bottom of the floor joists, making the work of securing a correct alignment and pitch more than ordinarily difficult. Risers to supply the wall coils are taken from the ends of the heating main in the cellar, and come up in the corners of the school rooms on the outside wall near the hall in each case.

An elevation showing the arrangement of the piping is presented in Fig. 3, being on the line C D in Fig. 1. It will be noticed that the main and returns from the wall coils and the radiators run along the outside walls of the building, affording additional heating surface, and that the highest point of the heating main is at the hall side of the building, a relief pipe being carried from the point where the main rises to supply the wall coils and radiators to the main return to the boiler. Separate returns are connected with the radiators and the heating coils.

Heating the Carmen Street School —Fig. 1.—Plan of First and Second Floors.

In order to prevent short circuiting, or steam backing up the return pipe in some of the coils or radiators, a false water line is established by forming a trap in the return pipe, as shown in Fig. 4, which is an elevation on the line A B of Fig. 1. It will be noticed that the steam main in the basement is relieved at the point where it rises to connect with the radiators and coils. By the establishment of the false water line the returns from all the radiators are attached to the return main at a point below this water line, which effectually prevents steam from one return passing up another and interfering with the circulation in the coil or radiator.

Having devised a piping system the addition of the necessary radiation to provide a comfortable temperature was made in such a manner as to effect also a change of air in the school rooms. In order to prevent interference with the wall coils already in place, radiators presenting 100 square feet of surface were supported at a point above the heads of the scholars and openings prepared in the

walls for an influx of fresh air, the openings being 8 inches in hight and 30 inches in length, controlled by dampers. To secure a positive outflow of air from the room a series of flues were built, as shown in Fig. 1, making available for each tier of rooms one 12 x 20 inch ventilating flue. From this it may be readily seen that the fresh air inlet and the ventilating outlet were of equal dimensions. To secure a positive outward flow of the air in the room through these vent flues a connection was made with the steam main, and an aspirating coil was placed in each flue, extending to the ceiling of the second floor room, and presenting about 25 square feet of surface. These aspirating coils were connected with the steam main on the one-pipe system, there being no return except through the flow connection, the pipe throughout being 2 inches in size.

Without considering the surface presented by the main and return on the outer wall of the building, it will be noticed that the available radiation in each room is equivalent to 130 feet of direct radiation. The common custom is to calculate that to secure the same efficiency in direct indirect radiation 25 per cent. must be added to the amount of surface that will be required for direct radiation. Then as the direct-indirect radiators present 100 feet of surface it may be considered that only 80 feet is available as direct radiation, and this added to the 50 feet of surface present in the coils makes the 130 feet of direct radiation, and a proportion of 1 square foot of heating surface to about 40 cubic feet of space. Each room is suposed to accommodate 40 pupils, and since the system has been in operation experiments to test the efficiency by Dr. Helm of the Board of Education with an anemometer have demonstrated that about 8 cubic feet of air per pupil per minute is secured by the system now in use, and that the air in the room is changed three or more times an hour. This air supply is about one-third of what is required by law in some States, but that it is far superior to the atmosphere previous to the change is said to be clearly shown by the comfort of the pupils and their increased interest and improved standing in their studies.

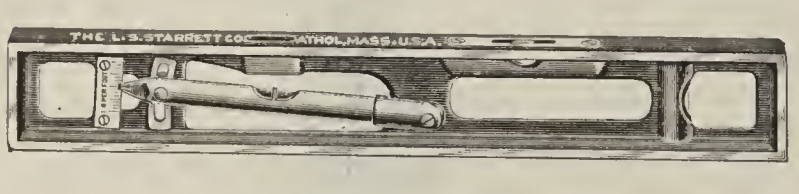
RADIATOR MAKERS FAIL TO ORGANIZE.

The sharp competition, the weak market and the low prices prevailing for radiators were the occasion for a meeting of the radiator manufacturers of the United States in New York City last week. Nearly all of the larger plants were represented and the gathering included 20 prominent representatives of the trade. Three days were taken up with the deliberations of the representatives and the advantages of some combination for the improvement of the trade were discussed fully. On last Saturday, when the last meeting was held, the conclusion reached was that no arrangement which would be satisfactory to all concerned could be arrived at, and the meeting closed with no immediate probability of a similar meeting being held in the near future. The expression of some who were present at the meeting gives evidence that while the separation was marked by no acrimony it is quite possible that the competition will be no less sharp during the coming season.

Richmond Borough Master Plumbers.



Richmond Borough, Greater New York, plumbers have been notified that they must be licensed in accordance with the rules of the Health Department, and a movement was begun recently for the organization of the men. This meeting culminated in a meeting held at the St. George Hotel February 15, when organization was effected under the title the Master Plumbers' Association of Richmond Borough.

Twenty-eight employing plumbers were present and they were addressed by W. Lockwood of New York; Thomas Kelly, president of the Brooklyn Master Plumbers' Association, and William Walsh of Manhattan Borough.

These officers were chosen: Charles W. Alexander, president; William J. Barry, secretary, and John J. Santry, treasurer.

Plumbers' and Pipe Fitters' Level.

The L. S. Starrett Company, Athol, Mass., are introducing the level herewith shown. The instrument, which is known as No. 133, includes an adjustable incline

Plumbers' and Pipe Fitters' Level.

level, a fixed level and a plumb. The hinged tube inside the working face of the frame, carrying a level glass, is adjustable to the graduated scale, and shows any incline by thirty-secondths of an inch, or less, to 2 inches to the foot without interfering in the least with the plumb or level. While it can be used as a level there is also a longitudinal groove in the seat of the frame, not shown in the engraving, that adapts it to rest on a cylindrical shaft or pipe as well as on a flat surface. From this it will be readily seen that the level is extremely useful for running steam pipes and horizontal drain pipes. The pitch being determined the hinged tube is set and then the level is used on the pipe runs and an accurate and even pitch is maintained. With the increasing use of steam heating this instrument will be a great convenience to fitters in getting their pipe properly adjusted and enable them to erect a system free from traps and giving perfect circulation, while the plumber, it is pointed out, will find it useful in running his horizontal drain pipes. The instrument is provided with either ground or plain glasses.

The Kenney Flushometer System.

We have received from the Kenney Company, 72 Trinity place, New York City, a handsome little pamphlet devoted to the Kenney Flushometer System. The first cover is adorned with a half-tone engraving of a group of prominent buildings on lower Broadway, New York, which are equipped with their system, including the Bowling Green, Standard Oil and Produce Exchange buildings. The pamphlet contains a description and an enumeration of its advantages, with engravings showing water closets, which are arranged to be flushed without the use of a tank in connection with each closet, one engraving showing a tank in an attic for flushing three closets in different parts of the building. A half-tone engraving shows a battery of closets as arranged in the Bowling Green Building, and another cut gives an elevation showing the closets on different floors being flushed from a tank in the attic. Several pages of the book are taken up with testimonials from the managers of prominent buildings, hotels and one from the Quarantine Commissioners. The last page gives a list of buildings in which this system has been used, and also of two lines of steamboats on which it is in use. A feature of the system is a valve so arranged as to flush a water closet without the use of a flushing tank, the water supply being taken direct from the service mains. The company will be glad to give full particulars to those who are interested in it.

Accidents to Boilers.

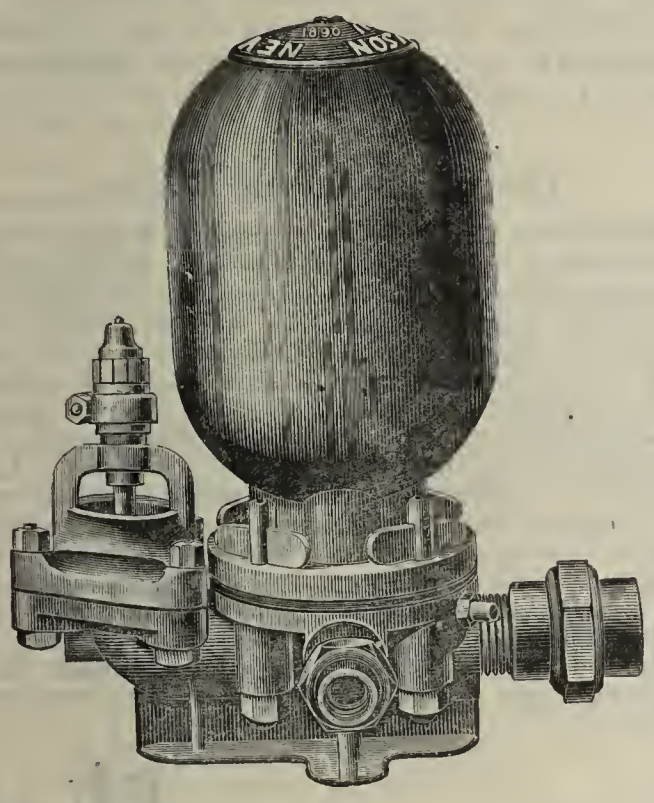
BY LISTENER.

While in the office of a manufacturer of house heating boilers recently, a customer asked the price of several sections of a vertical sectional steam boiler. The natural question was, how did the sections in the boiler become damaged so that they needed to be replaced? The explanation showed that the children in the building were playing in the basement and while the janitor was away for a short time one of them opened the draw off cock on the steam boiler and ran practically all of the water out of the boiler. The boiler was under a good fire at the time and the janitor damped the fire down by heaving on a large quantity of coal. This, however, was not done before three of the sections cracked from overheating.

This brought to light another instance where a building was heated with a hot water system, and as it was in a store building which had no tenant during the latter part of the winter the water was drawn off. The store being rented in the spring the new tenant was not familiar with the fact that the water had been drawn off from the heating system and when cold weather came in the fall a good fire was started in the boiler. A complaint was made at once to the steam fitter whose name was on the boiler that although they had a good fire they were not able to get any heat. On going to the boiler and opening the door it was seen that some of the sections were at a cherry red heat. The steam fitter knew at once that this could not be if the system was filled with water and drew the fire and allowed the boiler to cool down gradually. After the boiler was sufficiently cooled the system was filled, the fire rebuilt and no trouble was experienced in heating the building.

New York State Steam Fitters.

The following call, which specially dwells on the desirability of a full attendance at the annual convention, has been issued by President Wm. N. Tobin and Secretary Wm. F. Quinn of the Master Steam and Hot Water Fitters' Association of the State of New York:



The third annual convention of the Master Steam and Hot Water Fitters' Association of the State of New York will be held in the city of Binghamton, on Monday, March 7, 1898, at 3 o'clock p.m. The master plumbers of the State convene in Binghamton on Tuesday, March 8, 1898, with headquarters at the Hotel Bennett, on Washington street, and as many of the members of the Master Steam and Hot Water Fitters' Association are also members of the Master Plumbers' Association the Hotel Bennett has also been designated as our headquarters for this meeting.

As the year promises a large increase in business, we should associate ourselves more closely to secure the desired protection against the increasing infringements on our rights as dealers. At this convention we should devise ways and means to compel this protection, and if the master steam and hot water fitters in this State that are conducting a legitimate business will arrange matters to and will attend this convention, lending their assistance and knowledge to accomplish the desired results, it will be the largest and most successful convention ever held, and we will place ourselves in a position where we can

compel the consideration due the legitimate trade. We most seriously request every master steam and hot water fitter in this State that is desirous of improving the present deplorable condition of this business to attend this convention. And if we are in earnest and determined, we will feel at adjournment that we are amply repaid for our time.

Hanson's New Patent Hydraulic Ram.

The trade will be interested in the accompanying illustration of the new patent hydraulic ram made by F. P. Hanson, 174 Centre street, New York City. The special improvement is in the delivery valve, which is located between the air chamber and the base and consists of a leather washer or disk, which is fastened on by a check nut to a central seat, the seat being surrounded by an annular opening, and a pivoted seat, through which, and between the edge of the leather disk, which conforms itself to the seat, the water is discharged with less resistance to the rising column than where other forms of valves are used. By this arrangement it is pointed out a very sensitive and quick acting valve is produced, the result being a very high percentage of water forced through to a high elevation. The delivery valve seat is made of composition brass and with an occasional new leather valve, it is claimed, will last an indefinite period. The base and air chamber are faced off true, making a perfect joint, and are fastened together with four slat bolts and keys which can be readily removed, making the delivery valve very accessible for repairs. The bolts are fitted

Hanson's New Patent Hydraulic Ram

into reamed holes and in case of breakage can be removed without trouble. They can also be lengthened or shortened to suit various thicknesses of valve packing. The plunger or waste valve is made of composition brass, very heavy and durable, and is arranged so that the stroke may be shortened or lengthened to suit a variable supply of water. Especial mention is made of an air sniff of an improved pattern which is screwed into the nipple that is between the rim and the drive pipe union for supplying the air chamber with air. The manufacturer directs particular attention to the extreme hight to which it will force water with a low head. It is further pointed out that on account of the high efficiency claimed for the Hanson ram a smaller size can be used than is ordinarily employed. The rams are made in six sizes, weighing from 31 to 212 pounds.

We have received from the Meriden Malleable Iron Company, Meriden, Conn., Supplement No. 10 to their catalogue, devoted to Plumbers' Supplies. The first ten pages relate exclusively to Brackets of various designs for lavatories and also for flush tanks. These are followed by ten pages showing a great variety of straight and offset Lavatory Legs, some plain, and some highly ornamented and adapted for the use of an apron. An extensive assortment of Soap Cups, some made for fastening to the wall with a swinging cup and others for hanging on the rim of a bathtub, are shown, those on pages 26, 27 and 28 being new. A great variety of Sponge Holders of different sizes and shapes for fastening to the wall or for suspending from the bathtubs, and some with special cups attached, are also shown, among which are several that are new on pages 36, 37 and 38. Some new things in Tooth Brush Holders, Tumbler Holders, Comb and Brush Racks are illustrated on pages 40, 41 and 42. Towel Rods, Hat and Coat Hooks, Cigar Rests and a number of specialties in bathroom supplies fill up a catalogue of 50 pages with material of interest to all who do high grade plumbing.

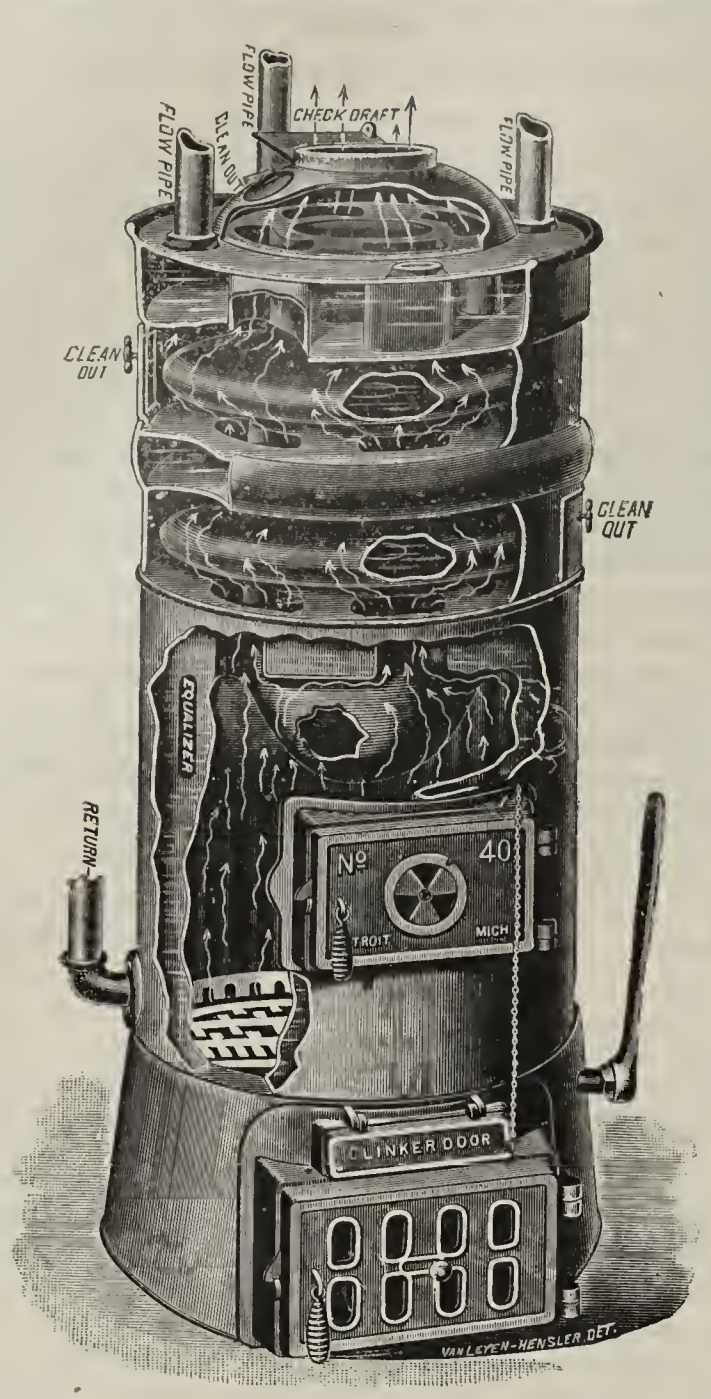
The Difference in Rating Tank Heaters.

BY MYSTIFIED PLUMBER.

The growing custom of supplying hot water to tenants in apartment houses is developing quite a trade for what are known as tank heaters. The size of the apartment house and the number of tenants govern the size of the reservoir and the tank heater that must be used. When the plumber has determined the size of the hot water reservoir that will be required, he must necessarily have some means of judging as to the capacity of tank heaters. There is very little information that can be used as a guide for proportioning the hot water heater to the reservoir as gathered from past experience with water backs in stoves and ranges, and the plumber naturally calls on the manufacturer to give him some idea of the capacity of the heater which he must purchase to do the work with any given job. In looking over the various catalogues of such goods, which have been furnished him on application, he finds a seeming inconsistency in rating, and I send herewith the ratings taken from several different catalogues for heaters having about the same size of grate.

The Difference in Rating Tank Heaters.

Maker.	Fire pot diameter. Inches.	Capacity in gallons.	Capacity in radiation.
A	12	50	100
B	12	75	100
C	12	75	130
D	12	75	150
E	14	75 to 100	125
F	12	100	75
G	12	120	80
H	13	175	150
I	13	250	225



It is not strange that all the heaters are not rated of exactly the same capacity, and some difference in rating might be accounted for by the difference in construction which would provide more heating surface in one heater than another. It will be noticed, however, by a study of the two columns giving the capacity that the water heating and radiation capacity of the heaters are not in at all the same proportion in different cases, one boiler heating 50 gallons of water or 100 feet of radiation, while another of the same size of fire pot will heat 120 gallons of water or 80 feet of radiation, and it is this inconsistency that is confusing to the plumber.

There has been a general impression among those who have had experience that hot water heaters will heat from one half to two-thirds as many gallons of water as they will carry feet of direct radiation. This seems reasonable, inasmuch as in a hot water heating system the water circulates and ordinarily leaves the heater at a temperature of 180 degrees, more or less, and after making a circulation through the system is returned at a temperature of about 150 degrees or less, losing 30 or more degrees in temperature in the radiators and piping system. It is also generally known that radiators hold on an average considerably less than a quart of water per square foot of surface, and some are said to hold but one pint of water. Taking this into consideration and also that the water returns to the heater to be reheated at a temperature of 150 degrees, it seems reasonable that a given heater could not heat as many gallons of water as it will carry square feet of radiation. The ratings given in the above table, however, in the majority of instances state that the tank heaters will raise from 40 or 50 degrees, the temperature of the water from the street main, to a temperature of 212 degrees as many gallons of water per hour as given in the table. From a study of the table it is natural to conclude that some of the heaters must be overrated in their water heating capacity or underrated in their capacity to carry radiation.

Among recently authorized corporations in Illinois are the Acetylene Generator Mfg. Company; capital stock, $50,000; incorporators, H. W. Carter, A. H. Graves and Charles W. Beck.

The Peerless Heating Boiler.

We show in the accompanying illustration a broken view of a Peerless boiler made by the Detroit Furnace & Heating Company, Detroit, Mich., who are seeking to en-

The Peerless Heating Boiler.

large their boiler business for 1898 by placing on the market a new line of steam and hot water heaters. They have also completed their line by adding additional sizes up to and including 30-inch grates. The latter they state is as large as they expect to make their round boilers, depending for boilers of additional capacity on a vertical sectional square boiler, which they expect to have ready for the market by April. Although comparatively new in the boiler field the manufacturers report a very satisfactory demand for their product, particularly among jobbers and other manufacturers who wish to add that type of boilers to their line. As will be seen by an examination of the cut, the travel of the products of combustion in this boiler is back and forth, around and through the sections, the flue spaces being so arranged that the hot gases impinge directly upon the water surface above, giving, it is claimed, the greatest efficiency. The manufacturers will be glad to furnish particulars of these boilers to any who are interested.

Michigan State Plumbers.

The annual convention of the Michigan State Association of Master Plumbers was held at Lansing February 16, with a large attendance. After disposing of the regular business the following officers were elected:

President, James Meathe, Detroit.

Vice-President, F. C. Bennett, Lansing.

Treasurer, John F. Wheeler, Kalamazoo.

Secretary, S. K. Morgan, Detroit.

Executive Committee: James W. Partlan, J. H. Crumley of Detroit and W. W. Armstrong of Lansing.

Delegates to the National Convention: C. G. Jewett of Howell and W. H. Sullivan of Bay City.

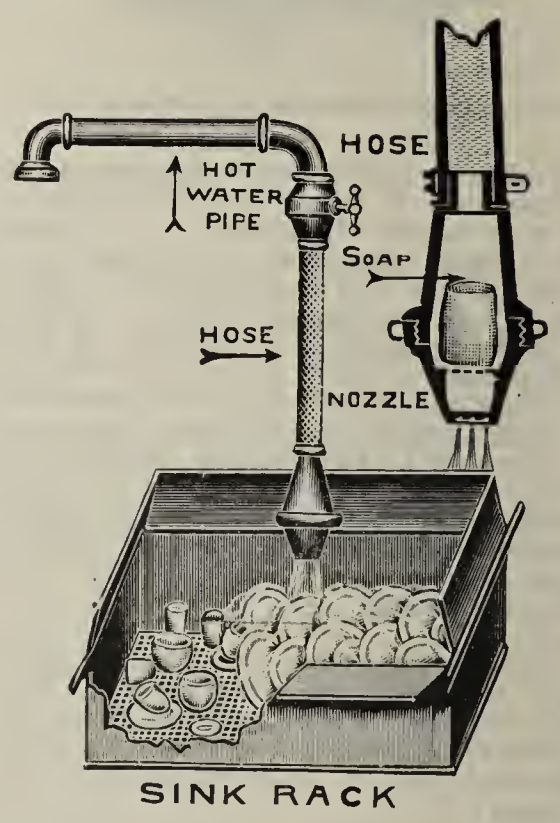
Alternates: Titus W. Hutzill of Ann Arbor and M. N. Eddy of Alpena.

Delegates to the Central League: W. T. McGarrin of Grand Rapids and J. H. Crumley of Detroit.

Ohio State Plumbers.

The convention of the Ohio State Association of Master Plumbers was held in the Knights of Pythias Hall, on East Third street, Dayton, Ohio, February 18. The convention was opened by Secretary Louis Poplowsky of Cleveland, Ohio, on account of the illness of both President Walker of Toledo and of Vice-President C. H. Ware. Among those present were J. S. Farrell, president of the Indianapolis Association, and W. T. McGarren, president of the Michigan State Association. Among others present were B. Robinson, Plumbing Inspector of Cleveland; Tobias Ruhwedel, Plumbing Inspector of Columbus; J. A. Smith, Akron; George Stoker, William Boely, Charles Howman, James McGrath, Arthur McFee, C. Schlemmer, James Dowd, Tom Canary, William Wagner of Cincinnati, Thomas Kewley of Toledo, O. J. Wheeler, P. A. Fitzpatrick, Sam. Esswine of Columbus, Secretary Edward Gruber, Robert Raitz, Charles Meissner, William E. Gerkins, Allen McClellan, John Schultz and Thomas Manion of Toledo. After disposing of the regular business the following officers were elected:

President, Charles H. Ware of Dayton.



Vice-President, Louis Poplowsky of Cleveland.

Secretary and Treasurer, Frank Clemens of Dayton.

Delegates to the National Convention: Robert Raitz of Toledo and J. Feller of Cleveland.

The Buckeye Dish Washer.

The Buckeye Dish Washer Company, Toledo, Ohio, are manufacturing a device for washing dishes, views of which are shown in the accompanying illustration, the article itself being presented as well as a sectional view through the nozzle and soap receptacle. It will be seen that the washer consists of a sink rack, on which the dishes and table ware are placed, while over it is a hose with a special form of nozzle, the hose connecting at the upper end with the hot water pipe of the sink. This nozzle, which is readily removed, is arranged to contain a small piece of soap about as big as the thumb. Any plumber, it is pointed out, can make the attachment in a few minutes, and as to its efficiency, it is stated that with it 159 pieces have been washed in 40 seconds without wetting the hands of the operator. Furthermore, as the water can be used at the highest temperature, hotter than the hands can bear, the cleaning is more effective and the

The Buckeye Dish Washer.

dishes are quickly dried. During the first part of the operation the soap in the nozzle is dissolved, and after that clear water flows, finally cleansing the plates. In the bottom of the nozzle are ten small holes giving needle jets of boiling hot water, which are thrown upon the dishes with great force where the house pressure is sufficient.

Minnesota State Plumbers.

The annual convention of the Minnesota State Association of Master Plumbers was held at St. Paul last week. The convention was called to order by President Huber Kelly of Minneapolis, and Governor Clough made an address of welcome to the delegates. Among those present were W. E. Goodwin of Milwaukee, treasurer of the National Association of Master Plumbers, who made a short address, in which he stated that papers that were brief, practical and interesting should be read, so that the members might not only be interested in the session, but that they might be benefited and have something worth thinking about after they had returned home. He advised the members to support their local associations, otherwise the work of the State and National associations would be largely hampered. After the reading of a number of interesting papers on sanitary plumbing, considerable discussion was given to the subject of sub-contracting, and it was advised that the members of the association use their efforts to have the contract for the plumbing reserved from the general contract for the building. The report of the secretary showed an increase in membership of 62 during the year, and the report of the treasurer showed a balance on hand of $1008. After disposing of the regular business of the convention the following officers were elected :

President, Hubert Kelly of Minneapolis.
Vice-President, John J. Dwyer of St. Paul.
Treasurer, George A. Kees of St. Paul.
Secretary, Charles Wilkins of Minneapolis.
Delegates to the National Convention, James Doyle of Red Wing and Hubert Kelly of St. Paul.

The following is a complete list of the delegates :

Duluth—A. J. Harker, M. Griffin, William Hoops.
Faribault—E. Eardley, A. L. Carufel.
Mankato—E. I. P. Staed, Edwin Schumacher.
Minneapolis—M. Cody, George W. Hineline, W. C. Hobart, J. S. Kearney, O. J. Ringer, F. H. Schuler, E. E. Sahler, J. C. Stewart, Frank Stepke, W. S. Bayley, W. W. Sykes; A. W. Scott, delegate at large.
New Ulm—Charles Tober.
Northfield—John Sitze.
Red Wing—James H. Doyle, Peter Nelson.
St. Cloud—E. H. Jarrard.
St. Paul—John H. Shea, M. J. O'Neill, John J. Dwyer, J. J. Dunnigan, S. A. Hill, John R. McKee, John J. Bailey, James H. Prendergast, H. S. Krause, John McQuillan; W. P. Hudner, delegate at large.
St. Peter—A. J. Potts, J. M. Peterson.
Stillwater—M. M. Peasley.
Waseca—William Wabschall.
Winona—J. V. Cunningham.
Brainerd—F. J. Murphy.
Owatona—C. J. Clifton.
Lake City—A. C. Meacham.
Le Sueur—J. R. S. Cosgrove.

St. Cloud was selected as the place for holding the next convention. After the convention the delegates were banqueted at the Metropolitan Hotel, John J. Dwyer acting as toastmaster.

NOTES.

Sharper competition has been noted by the larger buyers of Radiator Valves, and compared with last year lower prices have ruled in some of the larger sales that have been made. This is said to be due to a new factor in the selling field making strenuous efforts to gain an entrance to the market.

A meeting of the manufacturers of Cast Iron Soil Pipe was held in New York on Thursday and Friday of this week. At the time of writing the meeting was still in progress and no news of the result was obtainable. It is expected that a higher range of prices on Soil Pipe will be adopted by the manufacturers in view of the recent advance in raw material. Considerable irregularity has prevailed in this department of late, and prices have been cut to such an extent in some quarters that an agreement to maintain a uniform level of prices will be received with satisfaction in the trade.

John W. Roberts has been appointed plumber to the Federal Building at Cincinnati, Ohio.

The Board of Health of Syracuse, N. Y., has appointed Patrick F. McDonald as Plumbing Inspector, the appointment taking effect on March 4, when Inspector Smith's term expires. Mr. McDonald has previously served as assistant to the Inspector.

The master plumbers of Nashville, Tenn., have prepared an ordinance which they have submitted to the Mayor and the Aldermen for enactment, requiring that all plumbers pass an examination and take out a license.

The Iowa Master Plumbers' Association has prepared a bill which has been submitted to the Legislature for enactment.

Some new circulars relative to the O S Distributing Fittings for hot water fitters' use and the Temple Back Vent Fittings for plumbers' use are accompanied by a letter from Oliver Schlemmer, Cincinnati, Ohio, stating that these goods have been used in work by the United States Government with such success that they are now being included in their specifications.

The Master Plumbers' Association of Auburn, N. Y., gave a complimentary dinner at the Avery House on February 11 to William G. Reid, president of the New York State Association of Master Plumbers. The Auburn plumbers are desirous of having the next State convention held in their city and will make an effort to that end at the next annual convention at Binghamton.

William Hochrein succeeds the plumbing firm of Hochrein & Kraus, at 319 South Main Street, Ann Arbor, Mich.

Charles McQuillan and J. G. Mehl have formed a partnership in the plumbing and gas fitting business at 855 Main street, Topeka, Kan.

Daniel Sexton has resigned his position as head plumber of the Carlinville Water Works to engage in the plumbing business at Carlinville, Ill.

T. J. Horn is the proprietor of a new factory for the manufacture of Mineral Wool at Alexandria, Ind.

The partnership in the plumbing and heating business formerly existing between George A. Wiley and David A. Calhoun has been dissolved and the business will be continued by Mr. Calhoun at 60 Union street, Portland, Maine.

John Kelly of the plumbing firm of Weldon & Kelly, Pittsburgh, Pa., sustained a serious injury last week by slipping in the act of going down stairs, falling head foremost.

The Bruce Generator Company have been incorporated at St. Paul, Minn., with a capital of $50,000, to manufacture Gas Generators and Fixtures. The incorporators are V. P. Roberts, Minneapolis; H. B. Cramer, St. Paul Park; L. S. Breher and Charles Karst, St. Paul.

The Supervising Architect at Washington, D. C., will receive bids until March 8 for a low pressure exhaust steam heating and mechanical ventilating plant with cold and hot water supply system and fire pump for the United States Post Office, Court House and Custom House at Milwaukee, Wis.

Clifford H. Smith, whose establishment at Highlands, Mass., was burned out, has purchased the plumbing, stove and tinning business of Frost & Whitcomb, at Athol, Mass. Joseph E. Wood, who has been 16 years with the old firm, will remain with Mr. Smith.

The Burbanks Hardware Company of Cohoes, N. Y., have been incorporated to carry on the business of plumbing, roofing, steam fitting, gas fitting and dealing in Hardware, Stoves, House Furnishing Goods and Bicycles. The capital is $8000 and the directors are Paul H. Andrae, Clara E. Pierce and Adolphus G. Burbanks of Cohoes.

John L. Finnegan has been elected Inspector of Plumbing at Nashville, Tenn.

Morris Barry, Uncasville, Conn., has moved his plumbing and tinning establishment to a new building erected for the purpose.

The usual objection is being made by interested property owners against the ordinance which provides for a Board of Examining Plumbers and Plumbing Inspector at Savannah, Ga.

A. J. Wright and R. L. Dunlap have formed a partnership in the plumbing business at Champaign, Ill.

In *The Metal Worker* of February 5 we stated that H. M. Page had opened a plumbing shop on Larimer street, Cheyenne, Wyo. This, however, was a mistake, Mr. Page starting in business at 1715 Larimer street, Denver, Col.

The committee appointed by the Business Men's Club of San Antonio, Texas, to solicit subscriptions to defray the expenses of the National, Southern League and State associations of master plumbers' convention, which

meets in San Antonio April 11 to 16, inclusive, consists of Ed. Steves, Prof. Carl Beck, Ed. Braden, Jr., and William C. Schuwirth.

Judge Sutherland of the Superior Court, sitting at Milwaukee, Wis., has rendered a decision in the suit to test the validitv of the State plumbing law, in which he cites the discriminations it makes which destroys its validity. The case will be carried to the Supreme Court. The following statement is from the decision: I cannot too strongly emphasize the fact that appropriate laws with reference to the examination and licensing of plumbers are both beneficial and necessary. But a law which attempts to provide for such examination and licensing, which contains in itself discriminating provisions, cannot be upheld. The law ought to provide that every person who seeks to do business as a master plumber shall, by an appropriate examination, show himself qualified to be a master plumber, and that every person, no matter whether he is a member of a firm or a corporation, who lays his hand to the practical work of plumbing should also pass an examination, showing himself qualified to do that particular work—not the work that somebody else is to do; and that no one, no matter in what capacity he seeks to do work or how he may be associated in business with others, should be permitted to escape the provisions of the law.

The small town of Totis, in Hungary, claims to be the first town which has adopted municipal lighting by acetylene gas. Not only streets and squares are being lighted in this manner, but also several houses, and on the occasion of the recent visit of the German Emperor, the park of the royal shooting box, the effect being excellent. Among other places Vienna is contemplating making experiments with acetylene gas lighting on one or two of the large squares.

George H. Keeler, Hammondsport, N. Y., has disposed of a half interest in his business to Daniel Albright, and the style has been changed to Keeler & Albright. A full line of Hardware is carried, plumbing and steam fitting being also done.

W. F. Porter & Co., 210 Third street, South, Minneapolis, Minn., have been making a specialty of combination Hot Air and Hot Water Heating Plants, and have been doing a large business during the past winter.

The St. Louis Radiator Mfg. Company have appointed A. C. Stiles their agent in Chicago. His office is located in room 453, The Rookery. This appointment is regarded as evidence that the company's interests in Chicago are to be vigorously pushed.

The Detroit Furnace & Heater Company, Detroit, Mich., will have several new constructions ready for the market soon. Among them will be a line of Vertical Sectional Boilers and a Wood Furnace. They report an unusual demand for their goods in what is considered a very dull time of the year.

The annual banquet of the Master Plumbers' Association of Boston and vicinity, held at the American House on Monday night, was attended by 120 members and guests, and was made the occasion for presenting William Lumb, the oldest master plumber in the city, with a gold headed cane. David Smith, chairman of the Committee of Arrangements, made the speech of presentation. Speeches were also made by David Craig, president of the association, and Vice-President Edwin Mills. Mr. Lumb is 79 years of age and has worked at the trade for 65 years, having entered his apprenticeship when he was 14 years old.

The Master Plumbers' Association of Newark, N. J., held a very enjoyable smoker and supper at Achtelstetter's Hall, in Newark, on February 16. It was largely attended by the members of the association, although a very cold night. After the supper the guests were entertained with music and variety artists. President Ira H. Budd presided at the supper, and was assisted by A. Selden Walker, F. J. Sturn, Louis Stevens, Robert Berla, C. Sullivan, F. J. Koether, W. Champlain and F. Lang. Winslow Zelliff, national State vice-president for New Jersey, was the guest of honor on the occasion.

N. M. Fell has purchased the plumbing business of M. F. Hinman, at Malone, Pa.

Wiliam E. Alford and R. Frank Lawder are a new firm in the Gas Fixture and plumbing business in the new building at 105 West Fayette street, Baltimore, Md., where they are making a handsome display.

W. R. Armstead has moved his plumbing establishment to 104 South Fourth street, Leavenworth, Kan., and now enjoys a more central location in the city.

A. W. McDougal, 44 Centre street, the New York manager of the William F. Haines Company, Philadelphia, Pa., has recently hung out an imitation of the Heinze Steam Saving Trap as a sign that heating contractors may readily locate him. Mr. McDougal reports that trade for the Trap is increasing wherever it has been used so that its operation may be learned. He invites an investigation by the trade who may visit New York.

Senator John Fertig, president of the Titusville Iron Company, Titusville, Pa., was the guest of W. C. Joy, their New York manager, at 152 Centre street, this week.

Fred. D. Johnson of Fred. D. Johnson & Co., 80 Centre street, New York City, has recenty returned from an extended trip among the users of steam goods and reports a good trade on the Frontier and Weber Valves for steam and hot water work, for which he is the general sales agent.

Joseph Shaller has opened a plumbing establishment at South Natick, Mass.

Major John Aldrich has sold his interest in the plumbing and gas fitting supply house of W. B. Stevens & Co., at Lakeport, N. H., to Irving O. Sanborn.

Geo. B. Cobb, 44 Centre street, New York, was elected vice-president of the Roberts Machine Company at a meeting of the directors held at Collegeville, Pa., this week. Mr. Cobb will look after the interests of the Roberts steam and hot water heating apparatus.

C. F. Hauss, manager of the New York office of the Richmond Stove Company, recently visited the Iron City Heating Company, Pittsburgh, Pa., and saw a number of Richmond Boilers in use where natural gas was used as fuel and rendering good service.

Frank C. McLain of the J. H. McLain Company, Canton, Ohio, is now settled in his quarters at 82 Centre street, New York City, and is showing samples of their full line of steam and hot water heating apparatus, in cluding the Cornell, Cambridge, Amherst, Princeton, Humber, Yale and Sandow Heaters, and is ready to extend a cordial welcome to the heating contractor who visits New York City.

Gaylord & Eitapence of Binghamton, N. Y., were awarded the contract for the heating, at $4873, and the plumbing, at $1550, of the new building for the State Hospital at Binghamton.

Pipe Hanger.

Beaton & Corbin Mfg. Company, Southington, Conn., are putting on the market the pipe hanger shown in the

Pipe Hanger.

accompanying illustration. The hanger is made of sheet steel, and its simplicity, lightness and strength are emphasized by the manufacturers.

President Diaz of Mexico is making arrangements for a visit to the United States, in the course of which he proposes to visit all the important cities of the Union.

A movement for the formation of a Southern Confederacy of Labor is meeting with decided opposition among the labor organizations of the South. Among others, the Atlanta Federation of Trades have passed a resolution declaring emphatically against the proposal.

A boom in Southern timber lands is in progress. Many large sales have been made recently, Northern and English capital being mainly represented in the deals.

SHEET METAL WORK.

SLATE AND COPPER ROOFING ON FIRE PROOF BUILDINGS. VI.

BY WILLIAM NEUBECKER.

SECURING HIGH CAP FLASHINGS ON SLATE ROOFS.

The method of fastening high cap flashings on a slate roof is illustrated in Fig. 32. After the roof beams are laid the wall is topped out, and in some cases the entire wall is covered with a cap flashing, as shown. After this has been done the coping is laid by the mason and the roof planked by the framer, or covered with fire proofing, after which it is ready for the slater. The illustration indicates the manner of securing the cap flashing at the bottom and obtaining a water tight joint between the gable wall and roof by means of slate step or shingle and cap flashing. Referring to Fig. 32, let A B C represent the gable wall and D E F the copper cap which is placed on the wall as shown. Over it the coping is laid in cement. H J is the roof planking or fire proof terra cotta blocks, K L M N the slating, R V X X the step or shingle flashing and O P S the brass clasps. A water tight joint is obtained between the roof and wall as follows: Let M N be the slate, showing the nailings, which are covered by the upper course Y. The shingle flashing which has been slated in with the courses K and L is shown by X X. The shingle flashing which has been slated in the slate N is indicated at V, while R shows how the shingle flashing overlaps the previous flashing V and is nailed at the top. Over the flashing R is placed the brass clasp S,

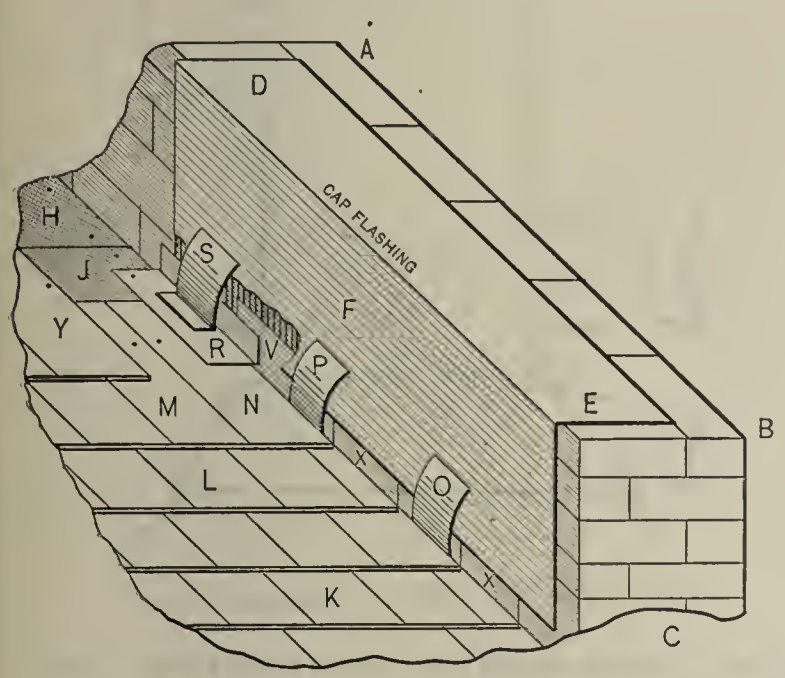


Fig. 32.—Method of Applying Brass Clasp to Secure Cap Flashing.

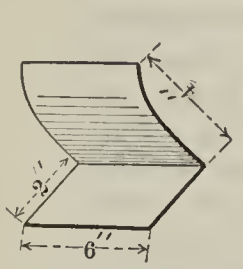

Fig. 33.—View of Brass Clasp.

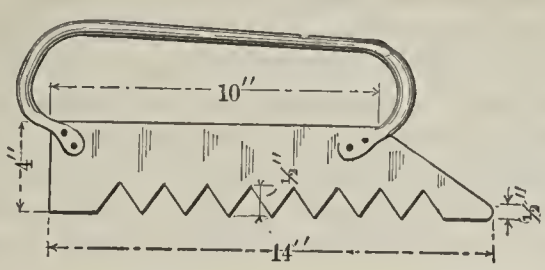

Fig. 34.—Sheet Steel Mortar Saw.

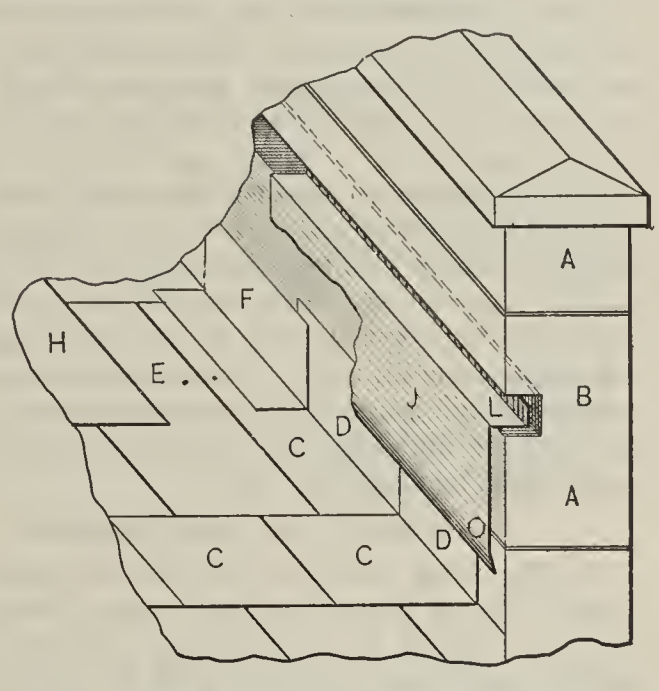

Fig. 35.—Method of Fastening Cap Flashing in Stone Wall or Slate Roofing.

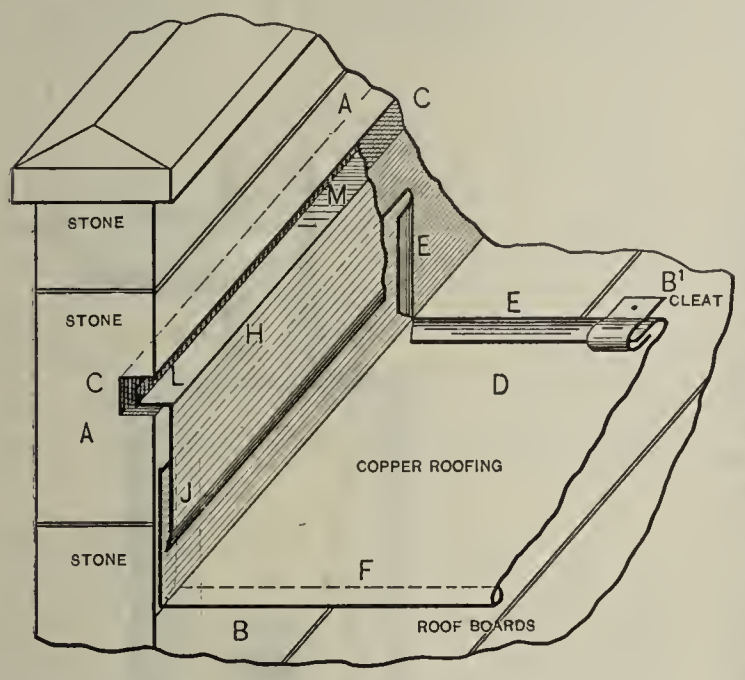

Fig. 36.—Method of Fastening Cap Flashing Into Groove Cut in Stone Wall, on Copper Roofing.

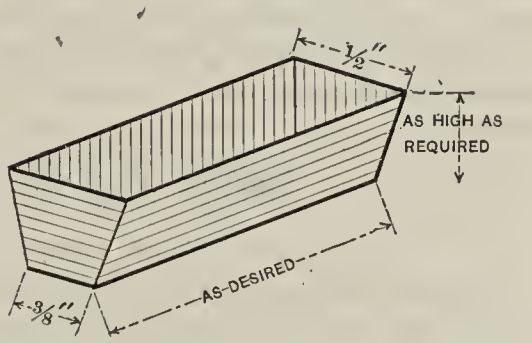

Fig. 37.—Black Sheet Iron Die, for Casting Lead.

made of 1-16 inch hard brass of the shape shown and slated in at every other course, or as many as required to keep the cap flashing close over the step or shingle flashing. The slate is now laid and nailed over the flashing R and clasp S, as in the case of the clasps O and P. Care should be taken to have the step or shingle flashing go up under the cap flashing at least 3 inches to prevent the snow blowing under. In Fig. 33 is shown a brass clasp used in connection with work indicated in Fig. 35. Some times the gable walls are so high above the roof that it would not be advisable to put on a full cap flashing, owing in the first place to the expense, and in the second

place to the action which the sun and cold would have, causing a succession of buckles. Thus in the above case a cap flashing is put into the wall after the wall is finished, allowing it to lap sufficiently over the step flashing and about 1½ inches into the joint of the brick work, using wall hooks and roofers' cement to make a tight joint. The joint between the bricks is often cut out with a hammer and chisel, but a better and quicker way is the use of what is known as a sheet steel mortar saw, shown in Fig. 34, and giving full size measurements. It is made of a piece of sheet steel with the teeth cut as shown, having a handle made of round iron, flattened at the ends to allow it to be riveted to the saw. It is operated the same as a saw, working right and left into the joints.

FASTENING CAP FLASHING INTO STONE WALL.

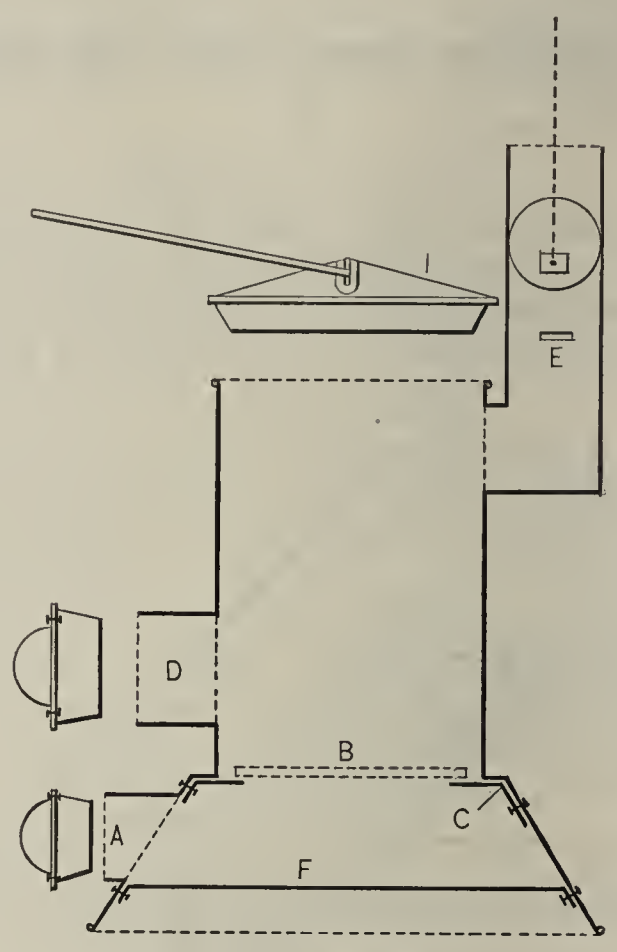
In Fig. 35 is shown the method of fastening a cap flashing to a stone wall over a slate roof. A A shows the stone wall and B the groove, which is cut into same about ½ inch wide and 1 inch deep. C C C E H shows the slating in the various progress of the work and D D F the step or shingle flashings. J represents the cap flashing, with a slight bend at O, so that it will lay tight against the step, and bent at the top as shown at L. The edge L is then placed into the groove B and wedged in tight with cast lead wedges, made tight with the calking chisel and hammer.

FLASHING FOR COPPER ROOFING.

In the same manner in Fig. 36 is shown the method of securing copper roofing and flashing between a stone wall and roof. A A represents the stone wall, B the roof boards and C the groove, which is cut into the stone work as before explained. D shows part of the copper flashing or roofing, flashed up against the stone work as shown, having a lock bent upward at E E on which to lock the next sheet, and a lock bent downward at F, which locks into the lower sheet. H shows the cap flashing having a small edge bent at the bottom at J, as shown, and a top edge bent as at L and M, and is let into the stone groove. It is made tight by means of lead wedges fastened by means of the hammer and calking chisel, the copper roofing being fastened by cleats B^1.

CASTING THE LEAD WEDGES.

In Fig. 37 is shown a die used for casting the lead wedges. These dies or pans are made of heavy black iron as long as desired, the usual length being 24 inches, ½ inch wide at the top and ⅜ inch wide at the bottom. By making the wedges tapering the cast lead falls out easily when turned after cooling, and can be easily put into the stone groove. Any old lead pipe can be melted for this purpose. Care should be taken to place a number of these pans between strips of wood, to keep them from twisting when casting.



TINNERS' FIRE POT.

BY OLIVER TWIST.

A tinners' fire pot that has some advantages peculiar to itself is shown in the accompanying illustrations, which I hope will prove of value to "E. E. H.," St. Louis, Mo., who made inquiry in *The Metal Worker*, January 22. It is simple in construction, and can be made by the average tinner without any trouble. The difficulty with most fire pots for burning charcoal, &c., is that they are more or less wasteful, because they are not sufficiently air tight. Very often the tinner is called away from a good fire and hot soldering coppers to attend to some other work for a time, and on his return finds the fire out, and what is worse, his fuel gone.

Fig. 1 gives a sectional view from the side. The body can be made from 24 gauge black iron, and is 8 inches in diameter, 12 inches high and wired with quarter rod. The base is a frustum of a cone, 15 x 10 x 5 inches deep when finished, heavily wired and provided with a false bottom, F, riveted in, leaving a rim 1½ inches high, which is perforated with ¾ inch holes, as seen in Fig. 2. This forms an ash pit, from which the ashes may be removed at A, which is 3 inches in diameter and has an air tight plug. B is the fire grate, for which we can always find something suitable in the scrap pile, and which is supported by band iron lugs, as at C, or two straps may be placed across at right angles to each other.

Make a cylinder 4 inches in diameter and cut it so as to fit the pot, giving it a projection of 4 inches, secure it in

Tinners' Fire Pot.—Fig. 1.—Sectional View.

place and fit it with an air tight cover with a good handle riveted to it, as shown at D. This gives lots of room for even large coppers. The smoke pipe is 3 inches in diameter, leaving the pot about 1 inch from the top, having a close fitting damper, E. I have found in practice

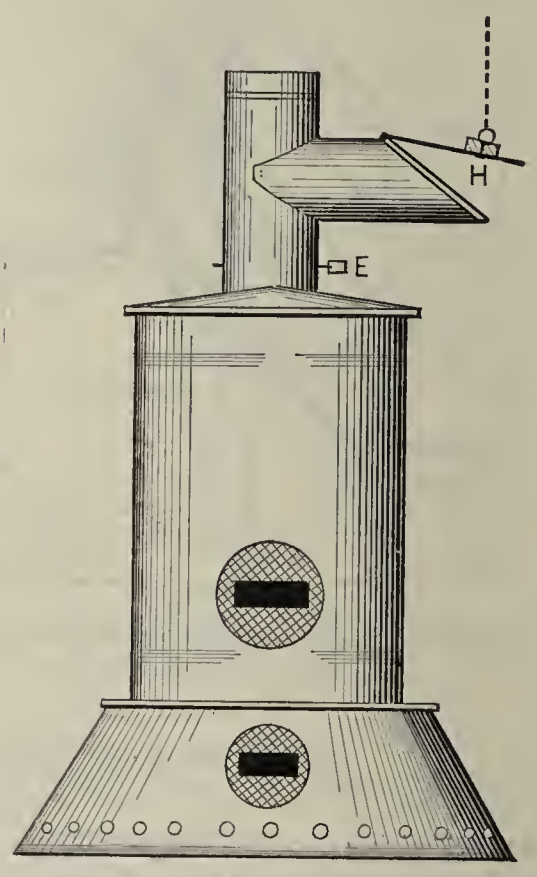


Fig. 2.—General View.

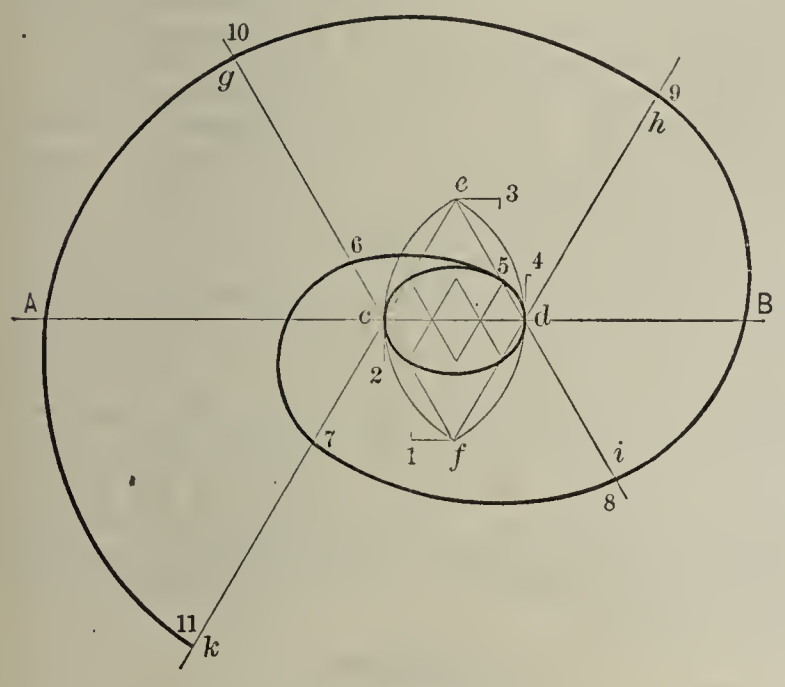


that a check damper was beneficial, so a 3 inch tee should be made, cut on the bevel and fitted with a hinged cover with a weight and hook fixed, all as shown at H, so that by means of a small chain it can be hooked up when needed. Make a good fitting cover, I, with the rim a little flaring, so that it may be removed easily, and fit it with a long wire handle, which will save somebody's fingers from being burned. Fig. 2 shows the general appearance from a front view. It was made for shop use and stands in a

shallow square pan 16 x 20 x 1½ inches deep, which keeps the bench clean and safe. When called upon to leave the fire, remove the coppers from D, put in the plug, shut damper E and leave H open, which will so check combustion that the fire will be held a considerable time. By fitting it with a bail and leaving off the check damper it makes a first-class pot for outside work and is very light.

Drawing an Oval Scroll.

We are indebted to George Kummal, 772 Columbia avenue, Baltimore, Md., for an interesting letter in which he describes a method of drawing an oval scroll that will be interesting to many of our readers. We present below Mr. Kummal's letter and have reproduced the drawing which he sent with it:

I have been looking through some German books and I found how to draw an oval scroll, and send herewith a sketch of the same, from which it is possible a rule can be

Drawing an Oval Scroll.

worked out. On the line A B take two points *c* and *d*. Describe arc *e f* and draw the line *f c g*, *f d h*, *e d i* and *e c k*; also draw the lines *d*4, *e*3, *c*2 and *f* 1 any equal distance. With one leg of the compass at the point 1 describe the arc 5 6 ; set compass at the point 2 and describe the arc 6 7 ; set on point 3 and describe the arc 7 8 and continue in this way. Always transfer the compass to the next point of the four points previously determined. This method I found in the book of Dr. Burgheim, architect in the Drawing Academy of Minden, Germany, 1861. The author's name is Vignola, an Italian, born 1507, died in Rome 1573. I found this an interesting method, and perhaps some of the readers of *The Metal Worker* will care to see it.

Tinsmithing Fifty Years Ago.

In the article in *The Metal Worker* of February 12, from John Brett, Millington, Mich., there were certain errors in the table as published, which are corrected in the following letter which we have received from Mr. Brett : 14-quart pails or dish kettles should be 16 for a day's work, and boilers 50 cents a dozen should read 50 cents each, and the price for tea kettles was 37½ cents each. The price of piece work should read 62½ cents, not 67½ cents, a day's work, up to 88 cents. The use of pit bottoms was only intended to refer to tea kettles and boilers.

FLASHINGS.

The Newark Cornice & Skylight Works have been incorporated by Henry W. Egner, Henry Teuscher, George Schwing and Gottlieb Runker of Newark, N. J. The capital stock is fixed at $12,000, of which $4000 will be immediately available for the business.

Henry C. Messenger, a leading business man of Conshohocken, Pa., died in that town on February 22, aged 74 years. He was born in Germany and came to this country at an early age. In 1855 he started the Tinware and Sheet Metal business at Conshohocken, which he carried on up to a few years ago. Mr. Messenger served as Town Councilor and Burgess of Conshohocken, and was interested in many local enterprises.

Mooney Bros., 313 Main street, East Orange, N. J., are erecting a new store and would like to have estimates of the cost of metal ceiling and siding.

Cowgill & Badgley are a new firm entering into the Tin, Sheet Metal and Coppersmithing business at Terre Haute, Ind. They will make a specialty of Roofing Materials and Sheet Metal Ornaments, Elevator Buckets, Conductor Pipes and Eave Troughs. They will also do a Hot Air Furnace and Stove business.

Gustav Schwinn has withdrawn from the partnership existing under the firm name of George W. Schwinn's Sons. Alfred Schwinn will continue the Sheet Metal and Cornice business under the name of George W. Schwinn's Son.

The Denison Tin & Cornice Works, Denison, Texas, have contracted to put the Slate, Copper and Iron Cornice work on St. Patrick's Church, Denison ; also the Iron, Tin and Ornamental work of the Owen McCarthy Block on Main street.

The Apollo Iron & Steel Company of Pittsburgh, with mills at Vandergrift, Pa., are making large additions to their capacity for the manufacture of Apollo Galvanized Sheets.

The Weir Reeder Sheet Iron Company have been incorporated at Louisville, Ky., to buy, sell and manufacture Sheet Iron The capital stock is $10,000, and the officers are William Weir, president ; Joseph F. Reeder, secretary and treasurer, and James A. Starr, general manager.

L. W. Bosley of Gainesville, Texas, has patented a Stove Pipe Groover with mandrel attachments, which he hopes to put on the market before very long.

Missouri Sheet Metal Ornament Company of St. Louis, Mo., have been incorporated, with a capital stock of $12,000. The incorporators are Frederick Buel, A. C. Fuellee and John Kuengler.

The Challenge Machine Company have been incorporated at Camden, N. J., for the purpose of manufacturing and selling machines for working metals. The capital stock is $50,000, the incorporators being F. N. King, J. W. King, B. F. Baird, E. C. Regn of Philadelphia and William F. Fithian of Camden, N. J.

The sheet mills in general are reported to be very busy. Some say they have not had as much work on their books for years as they have to day, and much of it is for quick delivery. Galvanized Sheets are in particularly active demand all over the country, and some heavy orders are being placed for Black Sheets.

The Light of the Firefly.

Prof. H. Muraoka, a Japanese scientist, who occupies the chair of physics at the University of Kioto, has recently made some interesting experiments regarding the properties of the light emitted by the firefly, or lightning bug. The method pursued by the professor was to place from 300 to 1000 fireflies in a small flat box under a hemp net. The box also contained a photographic dry plate, between which and the fireflies Professor Muraoka placed various substances consisting of metal, paper and wood. After wrapping the box carefully with several thicknesses of black paper he left it for two nights in a photographic dark room, from which all sunlight and artificial light was carefully excluded. In the result it was found that the light of fireflies possesses all the properties of ordinary light. The professor also found that rays are given out which resemble the Röntgen rays in their special penetrating powers. Recent investigations have shown that a very marked resemblance exists in these rays to the light of fluorescent bodies.

The following recipe for cleaning and polishing brass work is given by an exchange : Take 1 ounce of oil of vitriol, ½ gallon of sweet oil, 1 gill of powdered rotten stone, 1½ pints of rain water. Mix and shake well before using. Add to the mixture ½ ounce of nitro-myrbane to make it fragrant. Put on with cotton waste and polish with woolen or chamois.

The Meriden Machine Tool Company of Meriden, Conn., issue a finely illustrated catalogue and price-list of the extensive line of forming lathes and tools which they manufacture. These lathes are all illustrated by half-tone and line engravings and full descriptions accompany the illustrations.

A trolley line, 35 miles long, is to be built from Penn Yan, in Yates County, N. Y., by way of Geneva, to Lyons, N. Y., by Baltimore capitalists.

TIN PLATES.

Decrease in the Value of Mills.

In the event of the scheme for a combination of the tin plate manufacturing interests being carried to a successful issue, it would involve either the buying up or the exclusion of those mills which, by reason of unfavorable location or from the antiquity or inefficiency of their equipment, could not be profitably run as a part of the combination. The owners of the majority of such mills would probably look with satisfaction upon a proposal to sell out, provided the recompense was large enough to meet their ideas. But this question of compensation would be likely to prove a stumbling block of large proportions. The valuation of old fashioned mills to-day would fall materially below the valuation placed on them by their owners four or five years ago, and would be, in most cases, much under the actual initial cost of the plants. Practical mill men assert that a completely equipped modern tin plate plant can be erected at a cost not exceeding $25,000 a mill. A few years ago the cost was nearer $40,000 a mill, and the mills then put up were not the equal of those of improved type erected to-day at a cheaper cost. Naturally, therefore, differences would arise when it came to a valuation of the plants. To avoid trouble on this score, it is reported that the unfavorably circumstanced tin plate plants will be left out of the combination altogether. It is argued that if they remain independent they could not compete to any extent worth consideration with a combination of strong mills, while if absorbed they would be an extensive burden on the central company. Should the weak and antiquated plants be left out of the combination they must either compete at an immense disadvantage or collapse. They would seem to be "between the devil and the deep sea" in any case. But the combination is still a long way from being an assured fact, and the makers referred to are not borrowing trouble over the matter just yet. Some way may be found whereby they may come out on the right side, even if the combination does materialize and they are left out in the cold.

New Black Plate Mill.

The black plate mill of Hamilton & Co. at West Newton, Pa., which has been in course of construction for some months, has been completed and was put in operation last week. The plant is a very complete one, having modern equipment throughout. The main building is 130 x 100 feet, and is of iron and steel. It contains two hot mills 24 x 32 inch and three cold mills 22 x 32 inch. It is fitted up with a Shaw electric crane, while the rolls are driven by a 36 x 60 inch Corliss engine, built by the E P. Allis Company, Milwaukee, Wis. Another engine, built by the Buckeye Engine Company, Salem, Ohio, drives the dynamos, shears, &c. The pickling house is 40 x 40 feet and the boiler house is of the same size. The plant is so constructed that a switch leading from the Baltimore & Ohio Railroad is built to one end of the main building, on which sheet bars are received, and they go right through the different processes, being finished into black plate at the other end of the building. There is thus no rehandling of material. The facilities for getting coal are of the very best, a track through one side of the building dumping the coal right in front of the furnaces direct. The entire plant has been built with a view of securing the very lowest possible cost in the production of black plate for tinning. The output will be about 15 tons per day. It will be used by John Hamilton and C. W. Cadwallader, makers of tin and terne plates, whose plants are located at Hazelwood, Pittsburgh.

New Method of Rolling Tin Plate Bars.

The Carnegie Steel Company, Limited, of Pittsburgh for some time have been rolling tin plate bars in rolls of a peculiar contour, by which, it is claimd, they are rolled more truly to weight than is done by the common rolls. A large quantity of these tin plate bars have been exported to Wales, and bars as wide as 10 inches have been rolled. The method employed is that of lateral rolling. the billet being spread to the desired width by the peculiar contour of the different passes, five of which are customarily employed. In the first pass, which receives the square billet, the rolls have non-registering projections, which form similar non-registering grooves in the billet, one above and one below, which give it a cross section of essentially **Z** shape if viewed sidewise. The next pass flattens the ends of the **Z** out so that the contour is essentially **S** shape. The two following passes still further spread the metal, at the same time opening up the angles or curves so that at the final pass little work is required to reduce the section to a flat. It is believed that this method besides being advantageous from the fact that a square billet can be employed, forces the metal into the corners better, and thus produces a more uniform section. Many years ago an effort was made in this country to get rolling mill men to take up an English idea which embraced lateral rolling, the shape of the pass being essentially of a **W** form. Both edges of the bar thus abutted against the same roll. The idea was not taken up extensively, however. The present method employing the **N** shape is different, in that the edges of the bar abut against opposite rolls. The idea has been patented, December 28, 1897, No. 596,403, by Joseph Guest, roll turner at the Homestead Steel Works of the Carnegie Steel Company, Limited.

SCRAP.

Tin Plates are still the Cinderella of the metal trade. A tame demand and an unsettled and weak market is the report this week, so far as the East is concerned. A better condition appears to exist in the West, however, although the prices at which orders have been taken are far from satisfactory.

There has been quite a slump in the market for Tin Plate Scrap in the past week or two, and, as noted in our trade report, the price has dropped about $1 a ton. Practically all the Scrap Tin turned out from the big Tinware and can factories has been sent to Antwerp and Germany for treatment in the reducing works. It appears that this business has received a temporary check, and the export firm who handle most of the Scrap sent abroad are not now buying any quantity of the material. The reason given is that there is for the time no market for the Scrap steel which remains when the Tin is extracted, and this material has piled up on the other side to the extent of some 3000 tons, making it unprofitable to carry on the work of reduction. Hitherto the Steel Scrap has been readily sold, and it is thought that it will again find a market later. Meanwhile the market for Tin Scrap is completely flattened out. On the other hand, an active demand exists for Tin dross, both for home and foreign consumption.

As noted in our trade columns, there has been recently a sharp advance in prices of the higher grades of palm oil, such as are now generally used in the manufacture of Tin Plates. According to one of the largest dealers in this line in the country, the Tin Plate makers, in the course of experience, have found it most economical to use only the very best quality of palm oil in their tinning pots, and have generally discontinued the use of the cheaper kinds. The active condition of the Tin Plate industry has brought about such a large demand for the higher grades of the African product of late that there is a shortage in the market, and prices have risen accordingly.

The impression which has gone abroad that the effort to form a combination of the Tin Plate mills is in abeyance seems to be erroneous. We learn from a reliable source that the Committee of Four who have the matter in hand are still briskly at work, and moreover that they entertain very lively hopes of the ultimate success of their labors. Two of the members of the committee were laid aside for a few days by sickness, but both are again

devoting their active attention to the work in hand. It is understood that the plan of combination is supported by the large majority of the effective mills, and the promoters of the scheme count on securing the co-operation of at least 75 or 80 per cent. of the total capacity now in operation.

The Tin Plate mills, as a whole, are reported to be running full. Many of them are said to be supplied with orders enough to keep them going for the next three months, and buyers have no difficulty in placing contracts for deliveries well into the second half of the year. This does not look as though an early consummation of the consolidation scheme was anticipated.

The import and export returns of the United States for the calendar year 1897 show an importation of Tin Plates amounting to 83,851 tons, valued at $4,366,828, as compared with 119,171 tons, valued at $6,140,161, brought into this country in 1896. A small quantity, 2,951,473 tons, is shown to have been re exported in 1897, being probably in transit to Canadian points. The report of the Bureau of Statistics unfortunately does not contain the statistics for exports of Tin Plate under the drawback clauses, which are estimated in the trade to be about 40,000 to 50,000 tons per annum.

A San Francisco correspondent, under date of February 14, 1898, writes as follows regarding the Tin Plate trade of the Pacific Coast: "Our imports of Tin Plate of late have been large by rail and by sea, too. For the past two weeks we have been in receipt of 14 whole cars, or 6657 boxes, mostly to one big company that manufacture a great deal of cans used in putting up the fruit, meat and salmon, as well as the vegetable pack of the coast."

The wage dispute at the sheet mill plant of the Reeves Iron Company, Canal Dover, Ohio, has been settled by the company agreeing to pay the regular scale for rolling Black Plate.

The Pittsburgh offices of John Hamilton, manufacturer of Tin and Terne Plate, will be removed on April 1 from 122 Third avenue to Hazelwood, Pa., where the Tin Plate plant of Mr. Hamilton is located.

W. F. Janeway, Columbus, Ohio, sends us a handsome half-tone engraving of the new Biological Building of the Ohio State University, at Columbus, Ohio. This building is covered with Conesera Tiling, requiring the best Tin available for the valleys and gutters. Janeway's Franklin brand of Terne Plate was specified for this purpose.

It is proposed to have a celebration in New Castle, Pa., when the new 30-mill tin plate plant of the Shenango Valley Steel Company is completed, which is expected to be in June or July. The celebration will take the form of a centennial, from the fact that it is just 100 years ago since the first settlement was made on the site on which New Castle now stands.

The Welsh Tin Plate works, according to last accounts, were suffering from a scarcity of Tin Plate Bars. Some mills had been shut down temporarily for want of material.

A bill has been introduced in the Maryland Legislature prohibiting the use of acid and other injurious substances in the manufacture of Tin Cans used for the packing of food and food products, or in the capping or sealing of such cans. Violation of the law is made punishable by a fine of from $100 to $500, or imprisonment for from one to six months. To carry the law into effect the office of Inspector of Sheet Metal Cans is to be created, the Inspector to be appointed biennially by the Governor of the State. His duty will be to visit the Can factories and packing houses and cause the arrest of all offenders against the law. The bill has the indorsement of the Baltimore Federation of Labor.

It is intended by the National Association of Manufacturers to open a sample warehouse for the permanent display of American manufactured goods at some large European business center. Hamburg, Germany, will doubtless be selected, although there are members who prefer London and other centers. J. H. Cummings, the association's special representative, has just returned from Hamburg, and reports the opportunities offered there as most favorable.

The report of the Department of Buildings of the former City of New York for 1897, just published, shows that during last year plans were approved for the construction of 3502 buildings. The estimated cost of the buildings was $84,398,164. Plans for alterations numbered 1790, at an estimated cost of $7,462,083.

A bill passed in October last by the Swiss National Council providing for the State purchase of the railways of Switzerland, at a cost of about $200,000,000, has received the popular approval by referendum. There are about 2300 miles of railway open for traffic in the country. The Government is projecting a loan for the purchase.

Mica and Its Uses.

Invention remarks that the recent formation in London of the Mica Mfg. Company, to acquire the mineral rights of mica properties in Canada, directs attention to the general uses of this interesting and useful mineral, or, rather, group of minerals. The name mica signifies to shine or glitter, and the word micas is applied to a large class or group of finely foliated minerals, of a pearly luster, and transparent and translucent, tough and elastic. The distinguishing features are their brilliant luster or glitter and the readiness with which they can be split or cut, to any desired thickness, into transparent plates. These laminæ can also be cut or divided with the aid of an ivory or steel knife, and so thinly that the sheets may be only one-two hundred and fifty thousandth part of an inch in thickness. Another remarkable property of the micas besides their distinct cleavage in one direction is their great elasticity and toughness. Mica in the combination of elasticity and toughness is probably excelled by nothing natural or artificial.

The group of micas can be classified in two divisions: Muscovite or biaxal, and magnesia or uniaxal mica. Muscovite or biaxal mica is in color amber, black, brown, white, silvery white, red, violet, gray and green (green and black being the usual tints), with pearly, metallic luster. It can only be fused on thin edges before the blow pipe, and has very tough and flexible leaves. It consists of silica, 46.3 per cent.; alumina, 36.8 per cent.; potash, 9.2 per cent.; peroxide of iron, 4.5 per cent; fluoric acid, 0.7 per cent., and water, 1.8 per cent. Muscovite mica varies in hardness and in density. Magnesia or uniaxal mica (also called biotite) is in color brown, reddish, yellowish brown, olive green, gray, with pearly luster. It whitens in the blow pipe flame, and melts on thin edges. Its hardness and density are identical with muscovite mica, and it is also so tough and elastic that it can be split or cut into sheets of tenuity. In magnesia mica a certain proportion of magnesia replaces alumina, which is present to the extent of about 15 per cent. Magnesia mica is generally found in limestone. Other varieties of mica are the fuchite, a green mica, containing chrome; plumose mica, in which the scales are arranged in a feathery form; and rubelland, which is a name given to red mica. Granite is composed of crystals or crystalline masses of mica, quartz and feldspar. Mica is often confused with talc. But it differs from talc inasmuch as it affords thinner folia, and is elastic, and has not the same greasy feel. Then, again, talc will yield to pressure or indentation, while mica is nearly as hard as calcspar.

Mica is sometimes found in plates 2 or 3 feet in diameter and perfectly transparent, in which state it is well adapted for use as a substitute for window glass. Its common use in this way in Siberia has procured for it the name of muscovy glass. It was formerly much used in the Russian navy, on account of its elasticity, rendering accidental explosion by percussion or concussion well nigh impossible. Mica ground in a mill increases vastly in bulk and forms a loose mass of scales, not unlike bran. In this form it is largely used in a mica powder as an absorbent of nitroglycerine, its peculiar elasticity rendering explosion impossible, while it does not interfere with the power or energy of the nitroglycerine when exploded by a fulminate or other similar device. Mica, coarsely pulverized, is found to be an excellent roofing material, to which use it is also applied in the same manner as slate. It is also used in pulverized form for calico printing and for decorating porcelain and glassware. When finally ground and reduced to powdered form, mica has a slippery and greasy character, and makes a good lubricant for railroad axles, bicycles, &c., and for all machinery requiring high speed. It keeps the bearings free from heat, even at the greatest speed, and in the form of axle grease for railway cars, &c., it meets all requirements. Scrap or refuse mica, which has hitherto been regarded as valueless, is now used as a most efficient covering for steam boilers and pipes, on account of its non-conducting quality. Mica is also very largely used for electrical machinery, its insulating power being superior to that of any other substance. It will stand the highest test of heat, and is infusible, tough and non combustible. In this use the Canadian mica, more generally known as amber mica (being of amber color), is the most in demand in Canada and the United States.

The Canadian Government has refused an offer of agents of the Rothschilds to build a railway into the Yukon gold district. The Rothschilds offered to construct a road to Pyramid Harbor, by way of the Dalton trail, a distance of 100 miles, in return for a grant of 5000 acres of mineral lands.

THE RETAIL STORE.

New Fire King Broiling Range.

The engraving herewith shows the new gas range which A. Weiskittel & Son, Baltimore, Md., are bringing out. It is made in two sizes, with ovens 12 inches and 16 inches wide respectively, to be known as Nos. 75 and 85 in their line of Fire King gas ranges and stoves. In construction the range differs somewhat from the usual style of gas range, the broiling oven being located near the top instead of at the bottom, as ordinarily, a very convenient feature. The ovens in both sizes are 16½ inches deep, which makes the range especially convenient for use in apartment houses or other places where space is limited. The regular burners are of the loose top Fire King pattern, but the broiling burners are of a new pattern, constructed so as to throw down a very intense broiling heat.

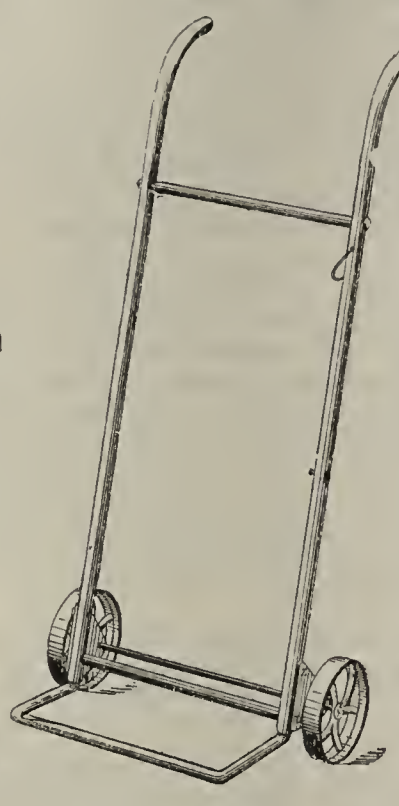
New Fire King Broiling Range.

The broiler door is nickel plated all over and has a rubber finished wood handle which remains cool for handling at all times. The top has a nickeled edge and is supplied with two shelves. The range is of handsome design and is substantially constructed throughout.

Combination Hose Reel and Store Truck.

The accompanying engravings show the all iron combined hose reel and store truck which the Crescent Reel Company, Lancaster, Pa., are putting on the market. The article has been designed with a view to meeting the demand of householders, storekeepers and others for a hose reel which should possess the attributes of durability and low cost and be adapted for use as a truck for the conveyance of ash cans, barrels, bales and other loads. Fig. 1 shows the construction of the article. It is of iron throughout ; the handles and sides are made from gas pipe ; the foot is of round iron, the ends entering the piping forming the sides, a frame bolt passes through the foot and sides and secures on the outside a V-shaped axle. The spider or reel revolves on its axle rod, and is provided with four supports for the hose nozzle. The ring seen on one side of the frame is intended to drop over the bracket, thus holding the spider firmly in place. The reel, with hose attached, is easily lifted out of its centers, when the frame proper may be used for purposes of a truck. The makers claim that the device, being made entirely of iron, is durable, and state that the article can be sold at a price low enough to bring it within everybody's reach. The truck is made in two styles and four sizes, weighing 20

Fig. 1.—Truck and Reel Combined.



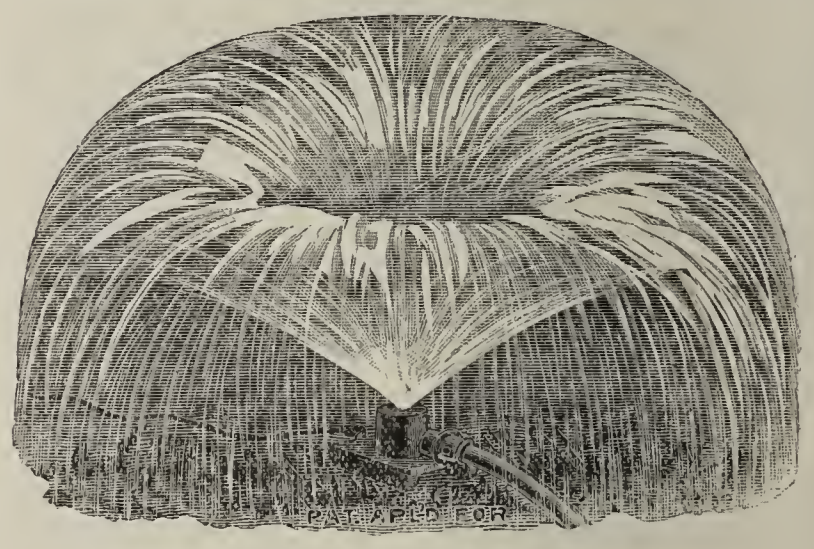


Fig. 2.—Truck without Reel.

pounds and 30 pounds each, and it can be shipped to any point without any risk of breakage in transportation.

Sensible Lawn Sprinkler.

The accompanying engraving shows the Sensible lawn sprinkler, which is just being placed on the market by John C. Kupferle, St. Louis. This sprinkler is made of iron in one piece fitted for ¾-inch hose, and is referred to by the manufacturers as having large openings, with no revolving parts for gritty substances to find a lodging place, and that it is constructed so as to throw a beautiful

Sensible Lawn Sprinkler

spray covering a space of ground from 30 to 40 feet. It is made with low runners, which enable the operator to draw it around the lawn as desired, the runners being low to prevent any possibility of the sprinkler being turned over when being drawn from place to place.

A fire, which supposedly was started in the plumbing department of J. M Ives & Co., dealers in Hardware and House Furnishing Goods, Danbury, Conn., on February 18, did about $10,000 damage to the company's stock and $5000 to the building. The loss is reported as having been covered by insurance.

Fred. Fulmer, dealer in Stoves and Tinware, Newport, Ky., has gone out of business.

NORTH DAKOTA RETAIL HARDWARE ASSOCIATION.

The second annual meeting of the North Dakota Retail Hardware Association was held in Fargo on the 16th inst. Nearly 70 firms were represented. The local committee made admirable arrangements for the accommodation of the guests. President Clark W. Kelly of Devil's Lake, after calling the convention to order introduced Mayor Johnson, who gave the delegates a hearty welcome to the city of Fargo. President Kelly then delivered his address, which was as follows :

President Kelly's Address.

At annual meetings it is customary and it is expected that the president make a report of what has been accomplished and the progress made since the last meeting.

Most of our time has been devoted to the increase of membership, and while the expectations have not been realized, a report is to be given showing nearly 100 members, including most of the strongest dealers in the State. I feel confident that if outside dealers could know of the derived benefits in other States, and what we are determined to accomplish in this, they would join at once.

A meeting of the Executive Board was held on February 2 and took action on an invitation from the Minnesota Association requesting the presence of three delegates at their annual meeting, the delegates to confer with a similar number from Wisconsin and Minnesota regarding the formation of a Northwestern Association. The committee selected as such a delegation C. N. Barnes, H. Harrington and your president. The delegation received a hearty welcome from the Minnesota Association.

Soon after our organization last October our secretary wrote to the jobbers and manufacturers who solicit trade in this State, inclosing a copy of the by-laws and resolutions, requesting a favorable or unfavorable reply to our association. He also stated that if no reply was received it would be understood as being unfavorable. With but few exceptions the replies were favorable. I think there were but three who ignored us. After comparing our success with the delegates from Wisconsin and Minnesota, it was found that a number of the firms favorable to us were unfavorable to them and some of those unfavorable to us were favorable to them. So, realizing how much was to be accomplished by the three States working in unison, we decided to organize a Northwestern Retail Hardware Association, subject to the approval of the three State organizations.

At the Minneapolis convention the delegates from Minnesota were empowered to act.

This association will consist of the presidents of the respective State associations, who are to act as a board to settle all questions referred to them by the different Executive Committees. The Minnesota secretary will send out lists and the cost of the same will be divided pro rata.

To our secretary much credit is due for the excellent work he has done. The work to increase our membership should be pushed by every member until every dealer in the State is with us. We must have strength to accomplish our object, and numbers means strength. With more individual work we will gain our point. Let us all pull together.

Report of Secretary Barnes.

The report of C. N. Barnes of Grand Forks, the secretary, followed, reference being made to many of the matters mentioned in the report of the president. In addition Mr. Barnes said :

During the four months of our organization we have added to our membership over 60 members, but it has mostly been done by correspondence and the good words spoken of our association by some of the traveling men who are with us. I am proud to be able to say that at the present time the North Dakota Retail Hardware Association has the largest number of members in its organization in proportion to the number of available dealers in the State of any similar State Hardware Association. This membership covers every part of the State, and we have members from every county where there is a Hardware dealer, except in three instances.

For further information I will say that according to the best and most reliable list I am able to secure, there are about 190 legitimate Hardware dealers in the State, 44 in towns of 1000 and over, 54 in towns of 700 and over, 65 in towns of 500 and over, leaving 125 in towns of less than 500 population.

The report of the treasurer showed that there was money on hand, and owing to the fact that the hardest part of the organization work had been done, it was pointed out that the expenses would grow smaller, rather than larger, and a resolution was adopted making the dues on the following schedule : $3000 or less, $4 a year ; $3000 to $5000, $5 per year ; $5000 and over, $6 per year.

The first matter taken up after the noon recess was the election of officers. Clark W. Kelly was nominated for re-election as president and received a unanimous vote.

C. F. Jacobs of Hillsboro was nominated for re election as vice president, and received a unanimous vote, and the following Executive Committee were also elected : W. R. McIntosh, Bottineau ; H. Harrington, Fargo ; J. F. Newgaard, Grafton ; H. B. Allen, Jamestown ; O. A. Gallup, Edgeley ; A. J. Smith, Fesenden; W. H. Pinkerton, Lakota, and the president and vice-president.

In executive session the matter of a Northwestern Association was discussed at considerable length, and the result was the passage of a resolution providing for the organization of a Northwestern Retail Hardware Association composed of the States of Wisconsin, Minnesota and North Dakota: that the association shall be represented in executive session by the president or any member of the local association that the president may appoint, and that the rulings emanating from this Executive Board will become effective in the States forming the association.

It also provides that the members of this association confine the purchase of Hardware, Stoves and Tinware to manufacturers and wholesale dealers who sell goods only to firms that are regularly engaged in the retail Hardware business. Retail Hardware dealers are described in the resolution to mean any person having an established place of business and carrying a line of Hardware, Stoves and Tinware and such other goods as are usually kept in a first-class Hardware store, and in all cities of less than 5000 population all persons carrying a complete line of Hardware in connection with any other kind of merchandise.

The resolution also provides for the keeping of a record of all jobbers or others who sell goods to other dealers than those described in the resolution as retail Hardware merchants. It also provides for taking such action as may be deemed necessary to enforce the provisions of the resolutions, ending with the claim that the measures are just and necessary for their welfare and a rigid enforcement is demanded.

Several interesting papers were read. Among those prepared was one by A. H. Duntley of Grandin, favoring the formation of the Northwestern Association, and another by L. P. Strong of Neche on the subject of The Importance of Small Things. H. F. Strehlow of Casselton also prepared a paper on What Are the Benefits of this Association to Us.

The Executive Committee held a meeting after the papers had been disposed of, and C. N. Barnes was re-elected secretary. H. N. Joy was chosen as treasurer. About 20 of the members from the western part of the State were unable to reach Fargo before 6 o'clock in the afternoon, owing to delayed trains, and they indulged in an informal meeting the evening after the convention had been adjourned. Matters of interest to all were discussed openly, and the evening session proved a profitable one.

SPRING TRADE.

BY BASKET GRATE.

It was in a good old country town with a right smart sprinkling of Quakers among the horny handed old farmers that I got my first experience in the stove business. After stock taking in January, which we soon completed, I worked in the shop or clerked in the store if the boss went around neighboring a little. We made ware and did all sorts of tin and sheet iron work, set furnaces, sold stoves, hardware and all kinds of house furnishing goods. I had been through one fall season when the spring of 1875 was looked forward to and this experience enabled me to escape doing more than my share in the preparations that were made for it. In our section moving day came on March 25, and in February we blacked up our stock and filled up the sample row mostly with big flat top cook stoves, just such as the farmers wanted. We cleaned up the tinware and brought in new stock from the storeroom and got ready for the " movers " and " begin-

ners." There wasn't so much fun selling the "movers" who had concluded that their old stove wasn't worth moving from one farm to another; they dealt too close. But the "beginners" had to stand a lot of chaff. Our store had been established somewhere about 1825, and the course of treatment for "beginners" had been improved as it had been handed down from time to time, and I received my preparation from a fellow who had got a better job than lifting stoves, though in his day he had been "the best in town."

When "him" and "her" made their appearance with the old folks and announced that he had taken the "Spung farm" on "shears," and that they, the "beginners," had just been "spliced" and were "pricin'" an "outfit," we received them with a cordiality that was warm enough to bake with one joint of pipe. Of course, the cook stove came first, and they looked at a No. 7, but we suggested that crops weren't the only thing to look forward to and a No. 8 would be handy in a few seasons. The old man would laugh, and his wife would busy herself feeling to see if there was good iron in the oven plate, while he scowled and she looked as becomes a modest woman. After dickering as to how many pots and pans went with the stove and settling that, we would throw in a Sunday tea pot for the bride. Then the dish pan and other kitchen tinware which we assured them was absolutely necessary was all brought out and as much crowded on as possible.

Then came the knives and forks and spoons, &c., and then the clothes wringer, washtubs and wooden ware, with many suggestions that were received with varying expressions. While this line was being selected the old man might grow weary and draw up to our stove, and if an old, seldom seen acquaintance dropped in the old man would be asked if it was "off" or "on"—"off" meaning that the "gal" had done well and would be no more expense, while "on" meant that he reckoned on having two to keep, this conversation being in tones that might be "heard at the barn." The old folks if they were "setting the gal up" wouldn't want to appear mean, and if they were good pay we would see to it that she had a good outfit. Then he wouldn't want to appear mean when we went at him for pitchforks and other barn tools, and she would say good tools made work easy, and as she had everything to make work light she didn't want him to be killed by having to work hard with cheap things. When we got through we promised to mend all the tinware the first year free and made ourselves solid with her, even if she did make the "jour" mad by taking a stamped dish pan instead of one of our own make.

Then to wind up, we said the old folks ought to make them a present of a parlor stove, and if we could work it they got one that heated upstairs by a register in the floor, for it was suggested that a warm bedroom was handy when any of the family was sick in the winter. If it all went through as nice as I have told it, we would clinch their future trade by throwing in a wood grate, so they wouldn't have to burn coal in the summer to heat up the house, for this always tickled "her" and had a good effect on "him." Well, I hain't sold an outfit for many a year, but I'm told by them that do that it can't be done in the spring to any extent nowadays, and the sort of spring trade I've been talking about has been knocked out by gasoline and blue flame oil stoves.

MEMORANDA.

The McKee & Campbell Company, Chattanooga, Tenn., will in a short time move to a larger building, where they intend to put in a wholesale and retail Crockery, Glassware and House Furnishing department.

Scott & Forsee, dealers in Hardware and Stoves, Eminence, Ky., have been succeeded by E. F. Forsee.

L. R. Brickenstein has succeeded to the retail Stove business hitherto conducted by Senseman & Brickenstein, at Salem, N. C.

The fame of the Rochester Silver Nickeled Ware, made by the Rochester Stamping Works, Rochester, N. Y., is not confined alone to the United States, where it is so extensively used, but has spread to many foreign countries, and there is hardly a place in the civilized world where it has not found its way. For High Grade Nickel Plated and Copper Ware this product of the Rochester Stamping Works has secured an enviable reputation. Those who care to know more particularly what goods are made in this ware and what they look like can satisfy their curiosity by writing to the Rochester Stamping Works for one of their catalogues and price lists.

The C. H. Gagen Roofing Company, who are now located at 189 West Tenth street, New York City, will be glad to receive catalogues and price-lists from manufacturers of Hardware, Tinware and House Furnishing Goods. They will also appreciate the receipt of samples and prices of roofing materials.

H. B. Rusler, Johnstown, Ohio, will be glad to send to any one applying for it a catalogue relating to the Comet Sprayer, which in addition to a Fruit Tree Sprayer is a Lawn and Garden Force Pump. The catalogue likewise gives hints on spraying.

The Excelsior Steel Furnace Company of 38 West Monroe street, Chicago, have just issued a new price list of their Furnace Fittings, showing some changes in sizes and also in the construction of this line of goods for '98. The shape and size of the inside pipes of their Double Safety Wall Pipe have been altered so as to make the air spaces between the inner and outer pipes uniform, and also to admit of the use of a new and improved separator. The new separator is claimed to possess great strength, and stress is also laid on the fact that the ventilation in the Excelsior double piping is into the partitions and not into the living rooms. The price list on both double and single Wall Pipe and on double and single Boots or Foot Pieces has been reduced. Copies of the new list will be mailed to the trade about March 15.

C. Sidney Shepard & Co., 23 and 25 Randolph street, Chicago, have made an improvement in their Steaming Pans used in connection with Buffalo Egg Poachers, which will be greatly appreciated by those who use them. The size of the Pans has been increased by making the steaming ring narrower. The same effect is obtained, but the capacity of the Pan is considerably increased, enabling a larger quantity of cereals or other food to be cooked at one time. They have brought out a new Chafing Dish, which they expect to prove a desirable size.

Hibbard, Spencer, Bartlett & Co., Chicago, have added materially to the capacity of their great establishment on the corner of Wabash avenue and Lake street, by securing the last store building in the block on Lake street. The lease of the present tenant expires May 1, but they hope to be in possession before that date, when they will enjoy the ownership of a solid block, running from Nos. 16 to 32, bounded by Lake street on the south, Wabash avenue on the west and wide alleys on the north and east. They have long had this enlargement in view, but circumstances have not been entirely favorable for its consummation until now.

The store of H. B. Webber & Co., Ionia, Mich., was completely destroyed by fire a short time ago. The firm will resume business as soon as a new building can be erected on the old location. The house carried on both a wholesale and retail business in Hardware, Stoves, Tinware, Sporting Goods, &c.

Joseph Simmons has withdrawn from the E. L. Wilson Hardware Company, Beaumont, Texas, and opened up on his own account under the style of Simmons Hardware & Mill Supply Company, handling Hardware, Stoves and Tinware, Agricultural Implements, Sporting and Athletic Goods, Paints, Oils, Bicycle Sundries, &c.

Henry E. Kemp Hardware Company, Phœnix, Ariz., have been incorporated, They are doing a wholesale and retail business in Hardware, Stoves, Tinware, Implements, &c. They have lately taken possession of new quarters on Washington street.

At the regular annual meeting of the stockholders of the Barlow Hardware Company, Corry, Pa., on the 7th inst., the following officers were elected for the ensuing year: Will E. Steele, president; G. H. Barlow, secretary; James L. West, treasurer, and R. J. Follett, vice-president. The company are jobbers and retailers of Hardware, Mill, Plumbing and Lumbermen's Supplies, Bicycles, &c.

The Cuprigraph Company, 108 North Green street, Chicago, are sole manufacturers of a water distilling apparatus which they style the Sanitary still. It has been designed to meet the growing demand for a method of securing absolutely pure water in every household. This is secured by distillation. The apparatus commonly employed, however, is cumbrous and not well adapted for household use. The Sanitary still can be used on gas or gasoline, oil, coal or wood stoves, and not only distills water but aerates it at the same time, thus producing a much more palatable beverage than if not aerated. Various sizes are made to suit different requirements.

STOVE TRADE NOTES.

SHORTS.—I.

BY THOS. F. KENNEDY.

In stove foundries the term shorts is applied to pieces that are wanting to complete a stove or batch of stoves. They may be only a few pieces, or they may be the greater part of a stove, the latter being often the case when a stove is being evened up just previous to going out at the end of a season. To the conscientious foreman or superintendent of a stove foundry shorts are the bane of life. To the piece workers, molders and mounters they are a great annoyance and cause of loss of time, which to them means money. They also often cause delay at critical moments. But it is the man or men who foot the bills on whom the greatest loss falls.

The actual loss from this cause is never known exactly, and in the majority of foundries it is not known even approximately. From 1 to 3 per cent. is added to the piece price as an allowance for breakage. But I have known cases where 10 per cent. of the molding price would not cover the cost of molding shorts, not to mention the loss and annoyance they cause in other directions. From the first day a stove goes in the sand there are two forces at work making shorts, for every casting must run the gauntlet of loss by the molder and breakage after leaving the molding room. As no two pieces go any length of time with the same amount of loss from these causes we soon have shorts. To these may be added the demand for certain pieces for repairs after the stove has been on the market awhile, and when there are several pieces of different kinds on one follow board, if one is a little more difficult to cope than the others, and the molder gets an imperfect lift on it, as the lesser of two evils he lets it go by the board and finishes the mold without it. He loses, of course, but he reasons that he would lose more by stopping to make another cope.

In the mounting department a short is a short, but the man whose duty it is to go on the molding floors and have them made knows that there are shorts and shorts. He knows, if he has ever given the matter a thought, that while shorts may be the same always and everywhere, he has to deal with them under several widely varying conditions. First : Pieces made one on a board or two of the same kind on a board. The treatment of these is simple and obvious. If they are short and must be evened up, it means more flasks. When only straight bar flasks are required the only loss that occurs is the molding price of pieces that have been broken after leaving the molder's hands. Shorts in this class from the other causes mentioned entail no loss, except the infinitesimal amount lost in remelting pieces that have been lost by the molder. A piece that is short from being left out may cause delay and inconvenience, but no direct loss. If a piece in this class requiring a cut flask is short and must be evened up, the making of a flask is a matter of some expense unless, as often happens, the stove is only running four or six a day and there are eight or ten sets of flasks, or when only one or two pieces extra are needed, and where the heat is long enough it is a common practice to cast one of the molds early in the heat and use the flask to make another mold, which can be cast later in the heat. This is called "molding over," and can hardly be done in small foundries where the heat is short.

Next come the small pieces boarded with larger ones in waste spaces on the board, commonly called deadheads. When one of these is short and must be made extra it may be given to the day hand, if one is employed, who makes it without a board in a small flask. If the piece worker whose job it is makes it in a small flask without a board, he expects and gets from 10 to 200 per cent. more than the piece price for it, the custom differing in different shops and often in the same shop varying with the mood or conscience of the man who sets the price or the conscience and nerve of the man who asks the price. Often even when the molder gets the outside figure he does not make as much as he would in the regular course. The snap flask is very convenient for such of this work as can be made in it. An expert snap molder will make a temporary board out of new sand in about ten minutes, which will last several days and can be used to make as much as 100 molds. He will expect and is entitled to something for making the "match," and from 10 to 25 per cent. more than the board price for each piece, the amount varying with the nature of the work. All of this class of shorts cost more than the board price to get them made up, no matter how lost, whether broken, left out or lost by the molder. Managers of foundries who were so disposed could during the last few years dictate the terms of settlement for evening up work, and it is to their credit that no harsh measures have been adopted.

Then comes the work made in snap flasks. The man with the short list, approaching the first bench molder, may be heard to say something like this: "No. 1, make four extra of your name plates to day." Passing on to the next : "No. 2, those doors you are making are away behind; make 25 extra at the rate of five a day," and so on down the line of snap molders, or he can use his chalk and never say a word. I have noticed that "sure to-day," marked in chalk on a follow board, never fails, as it cannot well be forgotten. Whatever way he goes about it, it will not take as long as the telling, and he needs no corps of flask carriers to aid him. Shorts of work made in snap flasks cause but little delay or inconvenience to any one, and the only direct loss is on broken ones.

The last and most difficult of all shorts to deal with are those where two or more patterns of different kinds are made on one board. When a piece on one of these boards is short the first thing that must be done is to examine the board to see whether it can be used to make the piece in a small flask; if it can the flask carrier comes around and takes the measure and hands up a flask that will make it. If the piece worker makes the piece and only gets the piece price for it, he is certain to lose on it. It often happens that a short piece cannot be molded except in a flask made for a board on which there may be several pieces, and up to the time the depression set in it was the custom to pay a piece worker for the whole board when he made even one piece in the flask that belonged to the board. Long after the last stove has been made from a set of patterns the demand for certain pieces for repairs continues, and I have known cases where it was more convenient to make a piece without any board than to use the one on which it had been made.

Shorts are inevitable under the prevailing piece price system, but it is possible to remove the cause of some, and at the same time modify the conditions that make it difficult and expensive to deal with them. The means employed to do this would be mutually advantageous to molder and manager, as I shall try to make plain in the next chapter.

Rathbone, Sard & Co., Albany, N. Y., received a letter from the West lately asking them if they had some printed directions for operating the Good Samaritan Cook Stove made in 1859, as there was no one there who seemed to understand operating it properly. It would seem from this that the manufacturers of Acorn Stoves made them so well in the '50's that even now they are in use. They

also received a letter from the South asking for some castings for the Good Samaritan, the writer stating that she was delighted with the Stove as a baker and therefore hated to part with it, unless she could not get a top to fit the Stove.

The Stove Trade in Maine.

In an interview with the representative of a Portland, Maine, paper the manager of the Portland Stove Company is reported to have expressed himself as follows regarding the stove situation in that State:

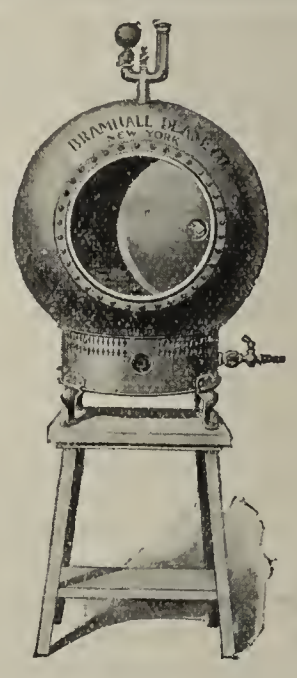
"I consider the outlook better than it has been in the last five years. Sales are more numerous and collections better than they have been of late."

"In your opinion is Maine going to be able to hold its own in the stove making industry in competition with other States?"

"I don't know why not. Maine can hold her own in most anything. Her people, as a rule, are loyal, and the cost of manufacturing in this State is as low as anywhere in New England. Here in Portland we have, perhaps, a little advantage over inland cities in the matter of freights, our iron and coal coming to us by water and being landed at our very doors. So far as I know, the two stove foundries at Bangor and the one at Waterville have been doing well, and it seems to me the plant in Auburn ought to be made to pay. The stove business is not what it used to be, for Western competition has increased to the extent of cutting down the profits. We aim to conduct our business as economically as possible and to sell nothing at less than the cost of manufacturing. There are innumerable details that need careful supervision. Too much attention cannot be given to the little things pertaining to the business. The time was when it was thought that Maine could not compete with some other States in stove making, but that time has long since gone by. Maine is an excellent field for the sale of its own products. We try to cover it thoroughly, and we have met with a considerable degree of success. We send agents into New Hampshire, Massachusetts, Vermont, Connecticut, and have just begun to work the Rhode Island field a little."

"Have you been forced to curtail of late in the number of your employees?" was asked.

"No; we have been running our regular crew of about 75, and so far as we can now foresee there will be no occasion for curtailment this year."



Monarch Stoves and Ovens.

A copy of a handsome illustrated catalogue of Monarch stoves and ovens for gasoline, gas and oil reaches us this week from the Monarch Stove & Mfg. Company of Mansfield, Ohio. The volume consists of 88 pages, is printed in colors upon a good quality of paper, and is bound in lithographed covers, on the last page of which is illustrated the progress which has been made in cooking since the sixteenth century. The first picture represents a scene in a forest, where by means of an open fire an Indian is cooking his evening meal. The next shows the open fire place and the manner in which it was used for cooking purposes. The next shows the early cook stove when wood was the universal fuel, following which comes the coal range, and finally the Monarch Process stove of the present day. In the make up of the catalogue the illustrations appear for the most part upon the right hand pages, with brief descriptive text on the facing pages. In the upper left hand corner of each descriptive page is a corner piece consisting of a picture of the Monarch Process stove. In referring to the Monarch line the manufacturers state that "it enters its eighteenth year of public service with a positive assurance that it has reached the high water mark of progressive development." The company state that they have made it their constant aim to incorporate into every pattern they make "some original feature that will afford the pushing and live merchant an opportunity to build up a reputation for high class goods and to reap a profitable trade from their sale." The leading place in the volume is given to the Monarch New Method, which is shown in several varieties, after which we find the Regal Monarch double oven cabinet range, accompanied by illustrations of the smokeless lighting device and subheating flame for single generator, these in turn being followed by the Monarch with stationary oven and broiler. The Monarch No. 24, with new Giant smokeless generator, is next in order, after which are shown a number of styles of the Monarch with elevated tank. The Monarch blue flame oil stoves occupy a section of the catalogue, after which come the Monarch blue flame heaters, the Monarch sheet flue ovens, the Royal Monarch gas range, Monarch hot plates, gas heaters with asbestos back wall for natural or artificial gas, Monarch gas instantaneous circulating water heater, Monarch gas burners, &c.

At a meeting of the Reading Stove Works, Reading, Pa., on February 18, a dividend of 10 per cent. was declared.

Deane's Eclipse Sterilizer.

In the accompanying illustration we show Deane's Eclipse sterilizer, made by the Bramhall-Deane Company, 264 Water street, New York City, which has been primarily designed for the use of physicians, dentists and such professional men as desire to sterilize their instruments, bandages and other articles used by them. It consists, as may be seen, of a wrought iron table supporting a copper globe. A large circular opening is provided in the front, through which water may be supplied for the generation of steam by means of a gas burner beneath. Racks are provided for supporting the articles to be sterilized. At the top of the globe is a fitting to receive a specially constructed thermometer, which shows both the temperature and the pressure of the steam, and a safety valve, which is so constructed as to overcome all liability of sticking in its seat and failing to open under undue pressure. The attractive feature of the sterilizer is the workmanship and the method of sealing the front opening. The face of the circular door shown in the engraving is ground to fit the inner surface of the door frame. As soon as the door is closed the steam is generated, the slightest pressure effectually sealing the door against leakage and prevents its being opened until the steam

Deane's Eclipse Sterilizer.

pressure has ceased. The large surface presented by the door effects a pressure against the seat so great that even under 1 pound pressure it is almost impossible to open the door. The company also manufacture a varied line of cooking apparatus, and heating and drying apparatus adapted not only for hospital use but also for hotels and restaurants.

Water of Combustion from Gas Stoves.

The well-known English manufacturer of gas stoves, Thomas Fletcher of Warrington, sends the following entertaining and also instructive letter to the *Gas World*:

The faults which have been claimed for this (the flueless gas stove) are numerous. The last new fault has been discovered by an "expert" and architect, who has been called in to certify that the dampness of a house is caused by the water of combustion evolved by a flueless gas stove. If an expert cannot prove, beyond question, anything he is paid to prove, he is certainly not an expert. The amount of gas used for warming a room is about the same as would be required to light it if the burners were placed in a proper position; and, if the expert's opinion is correct, the use of gas for lighting should also be discontinued, although flueless gas stoves have been in use for years to keep large organs dry in public buildings. One curious thing in connection with this is that the amount of moisture formed by a gas burner consuming 4 cubic feet per hour is precisely the same as that given off by the lungs and skin of an average healthy person—*i.e.*, 60 ounces, or 3 pints, in 24 hours. If this expert is correct as regards the cause of dampness in a house, how much greater the trouble must be with the large amount of moisture exhaled by the residents in the house. Figures can be made to prove anything. An average healthy person, if in bed for eight hours, will lose 1 pint, or 20 ounces, of water through the skin and lungs. One pint of water in bed every night ought to be a serious matter, and yet we survive, and our lives are longer than those of our ancestors, spite of microbes, flueless gas stoves and beds which ought to be damp. The expert will, perhaps, try to prove next that sleeping in bed is the reason why so many people die there. Perhaps we shall have this question raised in the newspapers during the next Parliamentary recess.

ODD PLATES.

At the South Presbyterian Church, at Galena, Ill., there was recently given by the Ladies' Aid Society a magazine entertainment, which proved to be a very novel and unique divertisement. The programmes took the form of the cover of a miniature magazine and were furnished gratuitously to the ladies by A. W. Glessner, president of the Excelsior Steel Furnace Company of Galena and Chicago, and were printed on a new press especially intended for fine color work.

Cribben, Sexton & Co., manufacturers of Universal Stoves and Ranges, Chicago, will shortly convert their firm into a corporation, under the name of Cribben & Sexton Company, with a capital stock of $300,000. Although Col. James A. Sexton has retired from the firm, as stated last week, the old name will be practically retained, as it has been so long known in the Stove trade that it undoubtedly has a commercial value.

John Demarest, well known in the New England heating trade, has arranged to represent the Craig-Reynolds Foundry Company of Dayton, Ohio, in the New England States, and will establish his headquarters at 165 and 167 Fort Hill square, Boston, where a complete line of Triumph Warm Air Furnaces, Steam and Combination Heaters, Hot Water Boilers and the Triumph Acetylene Gas Machines will be carried in stock. Mr. Demarest will look after the interests of the Craig-Reynolds Foundry Company in all parts of New England, and will carry stock in Boston for distribution to the trade at short notice.

The Excelsior Stove & Repair Mfg. Company of Quincy, Ill., have found it necessary, owing to the expansion of their business, to again increase their facilities. They have purchased the entire plant and machinery of the Bonnet-Nance Stove Company, which was partially destroyed by fire in November last. The work of rebuilding has already commenced and it is expected will be completed within 90 days, the structures now under way being much larger than those destroyed. The company are getting out patterns for many new lines of goods which they expect to show the trade in the near future.

Isaac A. Sheppard & Co. of Philadelphia, Pa., continue favoring their friends in the trade with cards of various sizes and shapes calling attention to some of the good things which they are prepared to furnish in the way of heating apparatus. The cards are cleverly illustrated, while the text calls attention to the merit of Paragon Furnaces and Excelsior Ranges. In this connection they direct attention to their little book, entitled "Hints About Heating," which was written to show how the Paragon Furnace operates "in the correct, logical, satisfactory way for heating a house." While it was written for that purpose alone, it contains tables, diagrams, &c., which they say ought to interest every architect and builder. A new edition, revised and enlarged, has been issued and a copy will be forwarded free to any architect.

We have received with the compliments of W. H. Colebrook & Co., Syracuse, N. Y., a steel plate portrait of George Washington, accompanied by a neatly printed leaflet, the top border of which carries a design made up of clusters of cherries and a hatchet which has evidently seen hard service. In referring to the "Father of his country," the company state that although glowing tributes have been paid to his many virtues by great and good men the world over, none is better known than "he could not tell a lie." The company also make the point that while in some of his best qualities Washington was superior to them, they claim in one respect to be his equal, in that they cannot tell a lie when they say their goods are the best and their prices are the lowest on their Asbestos Furnace Cement and Indestructible Stove Putty.

Advance sheets have reached *The Metal Worker* of an unpretentious little work on heating which the Excelsior Steel Furnace Company of Chicago are printing at their Galena publishing house. It is designed to be placed in the hands of intending house owners by the agents of the Excelsior Steel Furnaces, and tell the "Facts Not Fancies" about heating, presenting the subject in an attractive manner which can hardly fail to interest the reader. The treatise is printed on white paper in two colors of ink, and when the 72 pages are completed the work will be handsomely bound in crimson raw silk and will be fine enough for "my lady's" dressing table.

We are indebted to the Stamford Foundry Company of Stamford, Conn., for a photograph of a new six-hole Range which has just been placed upon the market and for which the manufacturers are beginning to fill orders. The Range is known as the Stamford and presents a very attractive and substantial appearance. It is embellished for the most part with cast ornamentation, this being relieved by an odd shaped nickeled name plate on the oven door. In this panel is an oven thermometer, so that the temperature of the oven may be noted at a glance. The photograph shows the Range with end shelf, pedal oven door opener and ornamental skirt. The general design of the Range is of a character well calculated to attract the attention of dealers, and we have no doubt this latest production of the company will meet with a wide popularity.

Announcement is made by John Sweeney that he has sold his entire Stove Board business to Cooper & McKee, Brooklyn, N. Y., the well-known manufacturers of Refrigerators. Mr. Sweeney bespeaks the confidence and patronage of the trade for the new concern who have taken over his Stove Board business.

According to Southern advices the interests of C. W. and A. L. Adams in the corporation of Bridgeford & Co., Louisville, Ky., were purchased on February 15 by P. Galt Miller, formerly vice-president of the concern, and George Ogle, who has been connected with the business for 38 years and for some time past has been superintendent of the tin department. The corporation will be continued under the old name of Bridgeford & Co., Mrs. W. L. Bridgeford retaining her interest. We understand it is the intention of the new owners to keep the plant in Louisville, but new quarters for the foundry will be purchased, as the old building and ground have been secured by the Illinois Central Railway Company. The new owners will make arrangements to run the various departments full capacity. A. B. W. Allen, who has been connected with the company for 35 years, will have charge of the office. Mr. Miller, who until ten months ago was vice-president of the corporation, began his connection with it when 16 years old and remained 44 years. We understand that the purchasers of the Adams' interests have ample capital back of them to push the business, and that their purchase included all merchandise, tools, patterns, good will, &c.

The Western Hardware & Mfg. Company of Milwaukee, Wis., are about erecting an extensive plant in that city on the south side of the tracks of the Chicago, Milwaukee & St. Paul Railway Company, and will move from their present quarters on Third street about May 1. The new site consists of 7 acres and the factory is to cost, we understand, $75,000. There will be a foundry 50 x 150 feet in size, a manufacturing building 150 x 300 feet and four stories high; enameling and japanning department. 75 x 150 feet, two stories in hight; a store house, 100 x 200 feet and three stories high; engine and boiler house, offices, stables, &c. The company now employ from 125 to 150 hands, but in the new quarters they expect to employ from 300 to 400 in the manufacture of Oil, Gas and Gasoline Stoves and Hardware Specialties.

Leonard Fingal, 692 North Irving avenue, Chicago, Ill., has been granted a patent on a press to be run by power for packing the sand in a flask in making molds for foundry purposes, instead of the present method of ramming sand by hand. The apparatus is said to be particularly adapted for the higher class of iron casting, especially stove plate and similar work. The object of the inventor was to furnish a machine that would give the same results as ramming by hand, the best feature claimed for it being that the pressure is from above in a flask with the sand below, thus allowing the pattern to be withdrawn from the sand in the ordinary manner. The patentee points out that in stove plate work the pattern can be returned by printing back in the mold to good advantage.

The McClary Mfg. Company's Benefit Society of London, Ontario, held their annual concert in the local opera house on the evening of Friday, February 18, which brought out a large attendance. The programme was varied in its character, including vocal and instrumental music, readings, dumb bell drill, &c. We understand that the receipts of the benefit society during 1897 were $2144 and that over $1200 were paid out in sick benefits.

The Excelsior Stove & Repair Mfg. Company, Quincy, Ill., have certified to an increase in capital stock from $21,000 to $60,000.

The Kernan Furnace Company report that their Furnaces have been used successfully for heating the school at Philadelphia, N. Y., and the First M. E. Church at Bovina Centre, N. Y.

The Victor Stove Company of Salem, Ohio, announce that Mr. Myers of Philadelphia, Pa., is representing them this year as salesman in the State of Indiana and is now calling on the trade. They suggest to dealers that orders be reserved until he calls, as they are out with a new line of Oak Stoves which are up to date in all respects, having jointless base, being well mounted, attractively nickeled and offered at a low price.

A plan of making the smoke of a Stove pass between two concentric tubes, so that it heats the air in the inner tube before it itself goes away up the chimney, is, says a foreign exchange, coming considerably into use in Russia The inner tube is open at both ends, so that the air heated within it passes in a rapid current into the room.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Notwithstanding large arrivals and an almost total absence of speculation, the market has held up remarkably well. There has been a very good business with consumers and the interior jobbing trade, and the fact that the firmness of the market is due wholly to the large consumption is taken as an encouraging sign. Jobbers' prices for small lots of Straits Pig from store are firmly held at 14½c. to 15c. per lb., according to size of order.

Copper.—Between quite heavy exports and liberal deliveries to home consumers there is a movement that absorbs about all of the current production and keeps the market in strong position. No new business of unusual character is taking place, but a considerable amount of the metal is involved in present negotiations, and the situation is such that holders are quite generally asking higher prices. Dealers' quotations for small lots from stock are firmer, at 12½c. per lb. for Lake Ingot and 11½c. for Ansonia Grade Casting Copper.

Sheet Copper.—In sympathy with the advance in raw Copper, greater firmness is noted in all lines of manufactured Copper, including Sheet, which is now generally quoted in retail lots at 15c. per lb., basis. Increased inquiry and an outlook which promises a heavy consumption have encouraged the manufacturers and the radical cutting of prices which has prevailed for some time past is less in evidence, although prices are not yet uniform. There is some talk of a renewal of the agreement among the makers of Sheet Copper, but nothing definite in this line appears to have been initiated so far.

Pig Lead.—Dealings have been moderate here and the demand has developed no new activity. For that matter, speculation has been remarkable only in point of inactivity, while large consumers and jobbers have purchased very sparingly. Some improvement is noted in the retail demand, however, and prices are quite steady. Small lots of American Pig from store sell at 4⅛c. to 4¼c. per lb.

St. Louis advices are as follows: There is no change to note in this metal. The demand is improving and the market is being fairly maintained.

Spelter.—There has been merely an ordinary business and no especially lively demand in this quarter. Offerings by smelters are somewhat reserved, however, and the output appears to be well taken care of. Prices are held very steady. Good Western brands in retail quantities are quoted by dealers at about 4½c. per lb.

St. Louis advices are as follows: A better demand is noted for Spelter and consumers are disposed to increase their orders to some extent and not confine their pruchases to their immediate wants as heretofore.

Antimony.—The market has been rather quiet, but prices remain firm, especially for the cheaper kinds, of which stocks are somewhat scanty. In small parcels from store, Japanese is quoted at 7½c. to 7¾c. per lb., Hallett's at 7¾c. to 8c., and Cookson's at 8½c.

Nickel.—Sellers are still quoting 37c. to 38c. for small lots.

Tin Plate.—American Plates remain unsettled in price and rather weak, but show no quotable change. Orders in this vicinity are coming in very slowly and the total volume of business done during the week was of comparatively small proportions. The large consumers still remain indifferent, and the smaller are buying generally in hand to mouth fashion. Uncertainty as to the proposed consolidation of Tin Plate mills has its influence in holding off those large buyers who have not placed their contracts some time back. Many are understood to have done so, but, on the other hand, there are others who are known to be awaiting the outcome of the combination negotiations before placing their orders, and these, it is believed, will require a very large amount of Plates. The canners generally are looking for one of the largest packs this season ever made, and their requirements are likely to make a big hole in the available output of the mills. The Tinware manufacturers also anticipate a heavy business, and it is expected that the demand for Roofing Plates will reach considerably better proportions than last year. Consequently the outlook for a good business in Tin Plates is decidedly favorable. It is the question of prices that is worrying the trade. They are down now as low as they can be to yield a profit, and it seems as though they are so heavily weighted that nothing but an absolute shortage will be forcible enough to hoist them up to a more profitable level. Small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows, but there is still a good deal of cutting under these rates: American Coke Tins, IC, 108 lbs., 14 x 20. Bessemer Steel. $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3 30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4 25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are selling very slowly elsewhere than among canners of export goods, and their prices are largely nominal.

Chicago advices are as follows: Manufacturers have recently had a heavy trade. Large contracts for Coke Plates have been entered for canners covering deliveries to July 1 and in some cases through the year. Leading manufacturers are looking for a scarcity in Coke Plates and much higher prices, but others are not so confident, owing to the increased producing capacity which will shortly be available.

Sheet Iron.—Manufacturers' agents report the demand for both Black and Galvanized Sheets is active, buyers placing orders quite liberally, especially for forward delivery. All the mills are busy and many are well booked up for the next three or four months. Prices, while showing no quotable change, are more firm. Jobbers in this quarter report a rather better business. Small lots from stock are quoted at about 2.40c. for No. 27 Common Black Sheets and 80 per cent. off for Galvanized.

Chicago advices are as folows: Continued heavy business is reported in Galvanized Sheets, but not much doing in Black Sheets as far as can be learned. Black Sheets seem to be rather weaker. Jobbers quote small lost from stock at 2.30c. to 2.40c. for Black Sheets and 80 and 2½ to 80 and 5 per cent. off for Galvanized.

Old Metals.—The demand for old metals, both for home consumption and for export, is quite active, and values of Scrap Copper, Brass and Zinc are all somewhat higher for the week. There is a better movement also in Scrap Iron, but while holders are getting more money than was possible two or three weeks ago, prices of this material generally do not vary from former quotations. There has been a slump in the Tin Plate Scrap, the export demand being shut off *pro tem.*, owing to surplus stocks on the other side. Otherwise the market for old metals, as a whole, is decidedy stronger. Yard dealers in this city and vicinity are paying about the following rates for moderate sized lots, delivered here:

Heavy Copper	per lb.	9⅝c.
Light and Tinned Copper	per lb.	9 c.
Heavy Brass	per lb.	6⅜c.
Light Brass	per lb.	5⅜c.
Lead	per lb.	3⅜c.
Tea Lead	per lb.	3⅛c.
Zinc	per lb.	3 c.
No. 1 Pewter	per lb.	8 c.
No. 2 Pewter	per lb.	4½c.
Wrought Scrap Iron, per gross ton		$8 25
Heavy Cast Scrap, per gross ton		8.25
Stove Plate Scrap, per gross ton		5.75
Burnt Iron, per gross ton		4.25
Tin Plate Scrap, per ton		2.75

THE IRON MARKET.

The business community generally suspends judgment relative to the "Maine" disaster, but at the same time the more prudent are moving cautiously so far as any new ventures are concerned. It is stated, for instance, that the bankers who are to underwrite the Wire consolidation are now of the opinion that the near future may not be a particularly auspicious time for launching the new company. Until recently everything connected with the scheme progressed very favorably, but quite recently a hitch has come up which may prove troublesome. A meeting is called in New York for the 28th inst.

The Alabama furnace interests are still conferring. It is understood that a pooling arrangement had been practically perfected when the decision in the Cast Iron Pipe Trust case was announced. That put an end to efforts in that line, and since then other methods for getting on a remunerative basis have been under consideration. In the meantime prices continue low, with indications that

at least one company are determined to get additional business.

There has been quite a fair movement of Bessemer Pig in Pittsburgh, our correspondent reporting sales aggregating 30,000 tons at $9.60 to $9.75, Valley furnace.

Steel Billets are very quiet, but a large tonnage has been placed in Sheet Bars, including one very large deal. The quotation is $17 at maker's mill.

Pig Iron.—In the New York market the only recent sale of magnitude is one of 2000 tons to a Boston consumer, the order being taken by a Birmingham furnace at a close price. There is a fair sized export order in the market. The Alabama producers have continued their efforts to get together. One company, however, maintain their usual attitude of independence. We quote as follows: Northern brands, No. 1, $11.50 to $12; No. 2, $10.75 to $11.25; No. 2 Plain, $10 50 to $10.75. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.50; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

Chicago advices indicate that the inquiry is fair for Southern Coke, but at present trade is not very large, buyers waiting to see the outcome of the conference among the Southern furnacemen. The largest sale reported for the week was 500 tons, although a deal involving 2000 to 3000 tons is surmised to have been made. The local producers report a good week's business and are firmer than ever, notwithstanding the low prices made on a few Southern brands. It is believed that our quotations now represent absolute bottom on local Coke. Consumers have lately been pressing for increased deliveries, and the furnace companies are more than ever troubled with endeavoring to make arrangements to supply their needs. We quote for cash as follows :

Lake Superior Charcoal	$11.50 to $13.00
Local Coke Foundry, No 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.35 to 10.60
Southern Coke, No. 3	10.10 to 10.30
Southern, No. 1 Soft	10.85 to 11.00
Southern, No. 2 Soft	10.35 to 10.60

Somewhat larger sales of Pig Iron have been made during the past few days in the Philadelphia market, but the best that can be said of prices is that they were not lower than during the week previous. It is impossible to say what the next turn will be, although on general principles it ought to be toward better prices, as a vast amount of Iron will be melted during the next three or four months. A fair average of prices for seaboard deliveries would be about as follows, with usual rebate according to freights at points within a radius of 100 miles south or west : No. 1 X Foundry, $11 75 to $12 ; No. 2 X Foundry, $10.75 to $11 ; No. 2 Plain, $10.50 to $10.60.

The Bessemer Pig Iron market in Pittsburgh is referred to as very firm. Sales of Bessemer aggregating probably 30,000 tons have been made at prices ranging from $9.60 up to $9.75, Valley. Spot Iron is very firm at $9.60, and it is doubtful if any considerable amount could be had at that price. We quote, f.o.b. Pittsburgh: No. 1 Foundry, $10.40 to $10.50; No. 2 Foundry, $9.90 to $10; Bessemer, $10.25 to $10.40, depending on delivery.

CHICAGO REPORT.

Scrap.—Iron Scrap is in light supply, with a continued good demand. Cast is still very scarce. Old Copper has advanced in sympathy with higher prices for Ingot. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7 50	....
Malleable Cast	6 50	...
Stove Plate (free of burnt)	5.50	....
Burnt Iron and Grate Bars	3 75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9¾ to 10c.
Copper Bottoms	....	9 c.
Copper Clips	....	9¾c.
Red Brass	....	8 to 8¼c.
Yellow Brass	....	7 c.
Light Brass	....	4½c.
Pipe Lead	....	3 c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	..	1 c.

Anthracite.—Trade continues rather quiet. The ruling prices of carload lots of 12 tons minimum are as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$4.75	$5.00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	6.75	7.00
Council Bluffs, Iowa	6.75	7.00
Lincoln, Neb	6.90	7.15
Sioux City, Iowa	7.25	7.50
Aberdeen, S. Dak	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis	6.25	6.50
St. Paul, Minn	7.25	7.50
Burlington, Iowa	6.25	6.50
Des Moines, Iowa	6.75	7.00
Davenport, Iowa	6.05	6.30
St. Joseph, Mo	6.75	7.00
Leavenworth, Kan.	6.75	7.00
Omaha, Neb	6.75	7.00

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

Reports from the West indicate an increasing volume of business, and in some of the leading markets should certainly from its volume be satisfactory to the merchants. It is evident that the retail merchants are buying more freely, and that there is an increased activity in manufacturing concerns, calling for a larger consumption of raw material, tools, &c., and giving more employment to the laboring classes. As a result of this condition of things Western jobbers are doing a fair business, which is reflected by their orders to the manufacturers of the goods which they distribute. In the East the small trade are not buying so freely and apparently the improvement of business, which is most marked in the wheat growing States, has not yet visited the States nearer the seaboard. New England business is only fairly good and the demand has not yet come up to the expectation of the merchants. Prices continue without important modification. In a few lines the tone of the market is decidedly firm, in others only fairly so, while the mass of goods continue without material change. Export trade is good and promises to assume larger proportions, thus affording an important outlet for manufactured products. Collections give little ground for complaint.

Advices from Chicago.—Jobbers report their trade much better than had been expected, considering the condition of the country roads and the widespread snow storms recently prevailing throughout the Northwest. Outdoor operations have been considerably curtailed. Nevertheless, the jobbers' packing floors are well covered with a great variety of orders, comprising general assortments. The movement of staple goods continues excellent, but without any tendency to speculation. Retailers are evidently of the impression that prices of Wire goods will not be materially higher, even if the consolidation is perfected, and therefore they are buying merely what they need. Manufacturers of Poultry Netting and Wire Cloth and other finished Wire products are talking of advancing prices, owing to the higher cost of their raw material. The Tin Plate trade is looking better. Manufacturers are well filled with orders, particularly for Coke Plates, and the movement from jobbers' stocks is about as good as usual at this season, although not what it once was when every tinner made pieced Tinware during the winter months. Heavy Hardware jobbers report a larger movement from stock, not only of Iron and Steel, but all kinds of Wagon Material and Blacksmith's Supplies.

Advices from St. Louis.—The Hardware trade continues to be extremely satisfactory. Dealers are complaining somewhat, but the condition of the roads throughout the West is the explanation of the dealers' complaint. The best evidence, however, of their faith in the immediate future of business is the increased orders they are sending in to the jobbers. The jobbing trade are making preparations for a heavy spring trade, and are in position to take care of it, no matter how good it may be. Orders for new stocks continue to be a noticeable feature. In Builders' Hardware a heavy trade is reported, which continues to be largely confined to the cheaper grades. A heavy trade is reported in staples such as Plain and Barb Wire, Cut and Wire Nails, and an advancing tendency is plainly noticeable in these several lines. Collections are very satisfactory.

NOTES ON PRICES.

Wire Nails.—The trade in Wire Nails has been active, the mills being well occupied in making shipments, many of them having orders which will keep them busy into March. Prices remain unchanged and the general tone of the market is firm. The New York price for small lots of Wire Nails from store is $1.70 to $1.75.

Advices from Chicago.—The situation remains practically as reported last week. Manufacturers are making heavy shipments, but very little buying is noted for March. The higher price named for March is having the effect of making buyers wait until they see that they really need the Nails. Jobbers report a very good trade, somewhat larger in volume than that of last week, with small lots selling at $1.65 from stock.

Advices from St. Louis.—The market is extremely active, and prices are strong and well maintained. Mills are running full, and have sufficient orders on their books to keep them satisfied for some little time to come. Jobbers report an active demand, and quote $1.65 to $1.70, base, for small lots from store.

Cut Nails.—There have been no special developments in the Cut Nail market during the past week. The volume of business is fair but not specially heavy. Manufacturers are desirous of having some understanding or concerted action by which they may obtain higher prices in sympathy with the better condition of things in Wire Nails. New York prices are about $1.30 for small lots from store.

Advices from Chicago.—The manufacturers are stated to be endeavoring to get together with a view of securing better prices. Jobbers report only a light movement from stock, with small lots quoted at $1.45 as before.

Advices from St. Louis—The market is fairly active, and jobbers ask $1.40 to $1.45 for small lots from store.

Barb Wire.—There is a fair activity in Barb Wire, and the trade are placing orders for early shipments.

Advices from Chicago.—The shipments of Barb Wire continue as heavy as previously reported, with no accumulation of stock. The demand for future delivery is light, but manufacturers are not concerned on this account, believing that with the approach of spring the demand will be fully as heavy as, if not heavier than, in previous seasons. Jobbers quote small lots from stock at $1.65 for Painted and $1.95 for Galvanized.

Advices from St. Louis.—The movement in Barb Wire shows continued improvement. Jobbers quote small lots of Painted at $1.70 with the usual advance for Galvanized.

Smooth Wire.—The price of Smooth Wire remains steady. The tone of the market is decidedly firm.

Advices from Chicago.—Manufacturers report a considerably increased inquiry for Plain Wire, which seems to be in greater demand among manufacturers of all sorts of Wire products.

Rivets.—The Rivet market has for some time been irregular, low prices prevailing. At a meeting of the Rivet manufacturers, however, on the 17th inst., the price on bulk Rivets and Carriage and Hame Rivets was advanced to discount 75 and 10 per cent., and on Thousand or Tinners' Rivets to discount 75 and 10 and 5 per cent. The usual freight allowances are continued.

Glass.—Some at least of those who have made present Glass conditions a study are of the opinion that lower prices than those now ruling are a considerable distance off, as the normal consumption of Glass will largely absorb stocks before factories start up again in the fall. Imported Glass has almost ceased to make any unfavorable impression on the market, as it is reported not to exceed 40,000 boxes per month. Local conditions are unchanged, orders coming in slowly and only to cover immediate requirements. Under the influence of competition to secure orders prices continue weak, and 85 and 10 per cent. discount is obtainable for Glass in small lots.

Palm Oil.—A shortage of the higher grades of Palm Oil has caused an advance in price of about ⅛ cent a pound. The market is reported very firm at 5¼ cents per pound for Fancy Lagos and 5 cents for Clarified in 1500-pound casks.

White Lead.—There has been very good distribution in a jobbing way, and some orders for good sized lots are being placed at intervals besides. Prices are unchanged and terms as well remain as quoted for some time past.

Red Lead.—Red Lead is selling in ordinary way only, but to a very fair extent, and prices for both domestic and foreign products remain very steady.

Linseed Oil.—There has been no change in wholesale prices since the decline reported in this column last week, but the market is still rather weak and affected more or less by sharp competition that offsets, momentarily at least, the comparatively high cost of raw material.

Spirits Turpentine. — The market has been quiet throughout the week and prices have remained quite steady.

TRADE NOTES.

The Leos Metal Polish Company have been incorporated at Chicago, Ill., with a capital stock of $3000, by George V. Eddy, A. M. Eddy, Thomas A. Easter and William H. Lahman.

The feature of the week in the Metal trade is the strong position of Copper. Continued heavy exports and an active domestic demand easily keep pace with the production, and prices rule higher than for some time past. Moreover the metal seems destined to enjoy for a long time to come its exceptionally favorable conditions. The strength of the raw material extends to manufactured Copper in its various forms.

Fesier & Davidson have succeeded Fesier & Crawford in the business of selling Stoves, Hardware, Implements, Buggies, &c., Riverside, Iowa.

H. A. Spielman, dealer in Hardware, Stoves, House Furnishing Goods, &c., Fairfield, Iowa, has been succeeded by Chas. H. Gage, who will continue at the old stand.

The ninth annual banquet of the Hardware, Metal and associated trades was given at the Waldorf-Astoria, New York, Monday evening, February 21.

W. H. DUNNING,
Hewes and So. 2d Sts., Brooklyn, N. Y.

To Hustling Plumbers.

A Plumbing and Stove Establishment for sale. Established a quarter of century. Well appointed. Best reasons given for selling. Address or apply on the premises,

THOMAS CUMBERSON,
Red Bank, New Jersey.

FOR SALE.

I will sell cheap an old established Furnace Range, Roofing and Jobbing shop. On leading business street. I am now manufacturing tinware and cannot attend to both businesses. A good chance for one or two men who understand the business. No charge for good will. Work coming in every day.

JOHN W. WALLACE,
329 Myrtle Ave., Brooklyn, N. Y.

FOR SALE.

Second-hand Cornice Brake. In good condition. Cheap.

FRANK J. TYLER,
259 W. 21st St., New York.

BUSINESS FOR SALE.

A small Tinning, Plumbing and Heating business in a city of 30,000 population on the Hudson River. Small stock on hand with good established jobbing trade. Owner wishes to retire. Address "RETIRE," office of *The Metal Worker*, 232-238 William St., N. Y.

AGENCY WANTED. By an old established Furnace house, who are favorably known and have a fine salesroom in New York City, the agency for a first-class line of Steam and Hot Water Boilers for New York City and vicinity. Parties manufacturing such a line and who are not represented in New York City will find this a good opportunity to increase the sale of their line of goods. Address "HEATING," office of *The Metal Worker*, 232-238 William St., New York.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"
office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

Register For Sale.

The patentee of a new Improved Dustless Register wants to either sell same or interest manufacturers who can make same. This register can be manufactured 8 to 10% less than any other register on the market and has strong selling points over any other.

A. L. CANFIELD,
284 Pearl Street, New York.

OWING to the death of the proprietor, a Stove, Heating, Plumbing and House Furnishing business is offered for sale, in Claremont, N. H. A growing manufacturing town of over six thousand inhabitants. This is a first-class opportunity for any one wishing to engage in this business.

A. C. STONE, Administrator,
Claremont, N. H.

New Metal Worker Pattern Book.

DAVID WILLIAMS COMPANY,
PUBLISHERS,
232-238 William Street, New York.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

By JOHN FULLER, Sr.

Size, 10 x 6½ inches; 327 pages; 474 engravings. **Price, $3.00.**

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author has acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are 474, and which add much not only to the interest but the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details.

Fig. 107.—Planishing Tea-Kettle Side.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Saucepans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set for Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills

—CHANGE OF HEART.—Sweet Girl—I hope you will call again, Mr. Coolhead.

Mr. Coolhead (new admirer)—Thank you, I should be delighted to call very soon again, if I were sure of finding you at home.

"Oh, I'm nearly always at home; but—let me see—it won't do for you to call Tuesday evening, for that is the night of the Home Mission meeting; and Wednesday night the Emperor's Daughters meet; and Thursday the Blue Ribbons have a most important session; and Friday is the monthly meeting of the Dorcas Club; and Saturday the Browning Club—really, I hardly know what day to set; but"——

"Um—do you expect to belong to those societies always?"

"Oh, yes, indeed; I'm a life member of them all."

"Er—I should like to call again soon, but this is our busy season, and I shall be confined very closely to the office for several months. Good-evening."—*New York Weekly.*

Paxton Hardware Manufacturing Co.,

PAXTON, ILLINOIS.

Confirming our Claims.

One of our representatives writes from a point in Indiana in regard to a customer's experience with GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES, "he was among the first to buy these plates, and made up a lot of coffee pots from them five or six years ago. Just a short time ago two of the pots came in for repairs, bottoms worn out, but otherwise in good condition. One of the purchasers of the pots remarked that his pot was bought five years ago." It's tinware of this character which will bring you back the trade which cheap enameled ware has taken away. Try these plates just once and see for yourself their great value.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Iron Bars, by the good old fashioned hand methods employed 50 to 75 years ago in making charcoal tin plates, insuring absolute freedom from pinholes. No better plate *is* made; no better plate *can* be made. For tinware or roofing they are unequaled. Send for a sample.

GUMMEY, McFARLAND & CO., PHILADELPHIA.

Anchor . . Ventilators

ARE SUPERIOR TO ALL OTHERS.

Are stormproof and durable, and unexcelled for ventilating schools, churches, mills, factories, etc.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

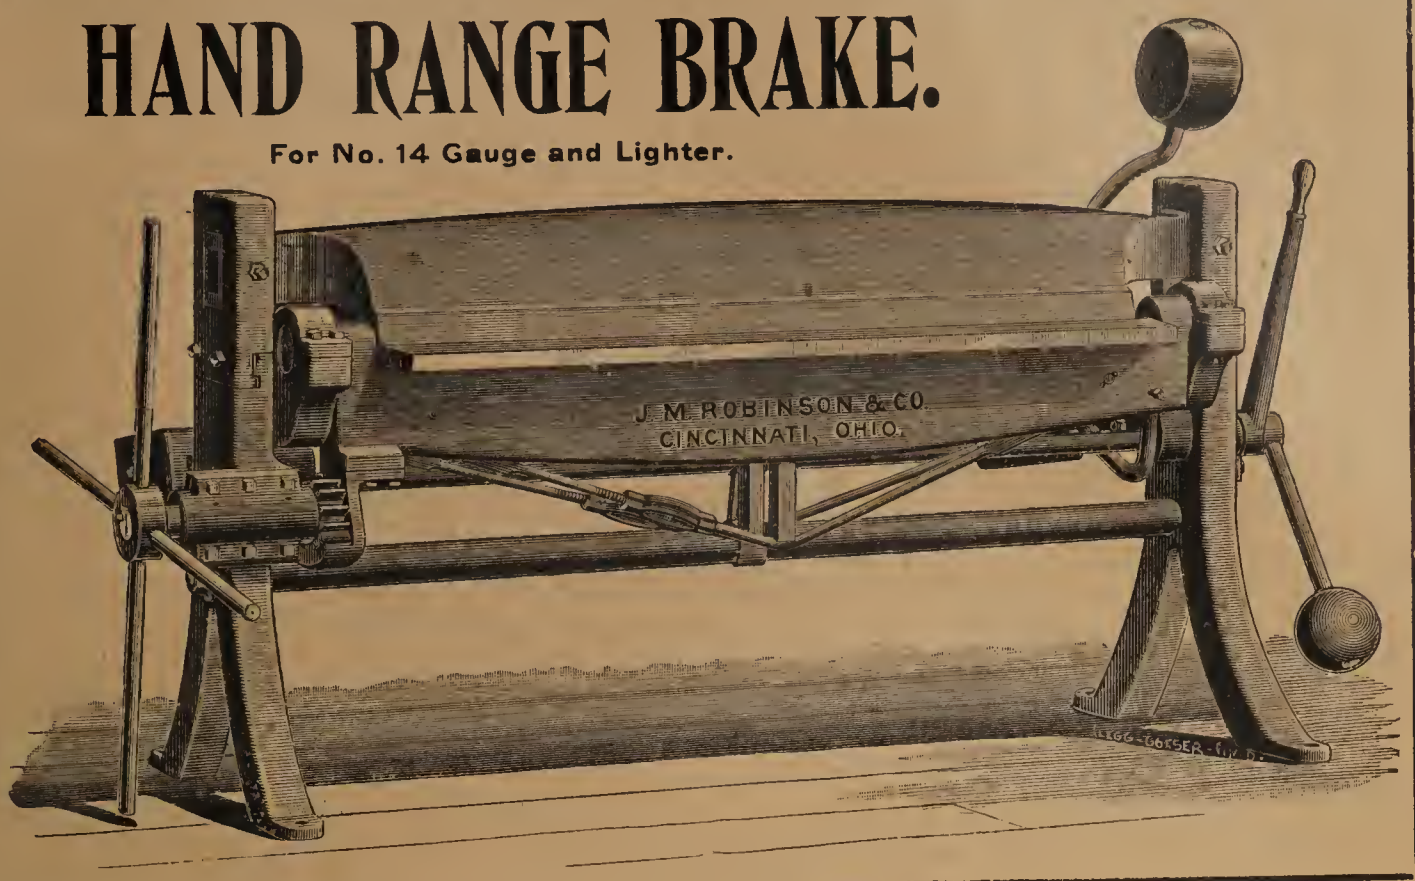
Sheet Metal Working Mch'y

OF EVERY DESCRIPTION

Manufactured by

BERTSCH & CO.,



CAMBRIDGE CITY, IND.

—The centenarian has once more caused us to marvel. This time, at the age of 101, he has grasped the hand of President McKinley among the northern hills and announced his dim recollection of General Washington when the father of his country visited Albany—although at the time he could not have been more than two years of age. The most interesting confession made by the veteran, however, was that he attributes his long life to bear meat and johnnycake. This is a welcome departure from the tobacco or whisky habit, total abstinence or early rising; and it is to be hoped that all intending centenarians will make a note of it.—*Mail and Express.*

RANGE MANUFACTURERS' 6-FOOT GEARED HAND RANGE BRAKE.

For No. 14 Gauge and Lighter.

Possesses all the features of the power brake made from the same patterns. Bending bar is operated with a pilot wheel, and imparts great power to the bending bar through the medium of spur gearing meshing into segment attached to the bending bar. Send for complete catalogue and discounts.

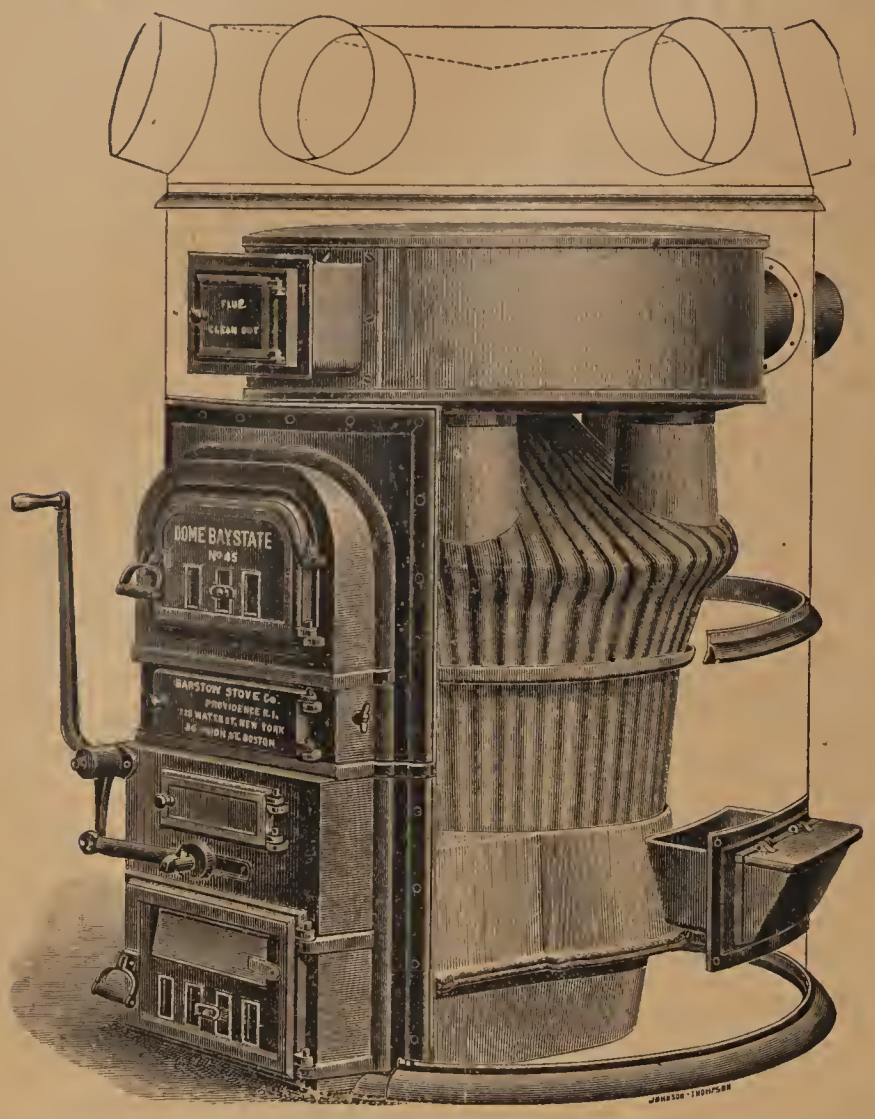
Critic—You must be glad that it is out.—*Exchange.*

—OBEDIENCE.—"How far can you swim, Willie?" inquired the visitor.

"Oh, I don't know," replied Willie.



"Across the ocean?" persisted the visitor facetiously.

"I shouldn't wonder," answered Willie promptly.

"Why, Willie, do you know how far it is across the ocean?" demanded Willie's mother.

"Don't care how far it is," retorted Willie. "Pop told me once never to admit that I couldn't do a thing until I'd tried and failed, and I never tried this."

QUICK MEAL

Some few Dealers are under the impression that hard times are going to last forever, and that as a consequence during the coming season Inferior Stoves, which have held the day during our financial depression, are going to sell to almost the exclusion of Good Stoves. That is not the case. Inferior Stoves have the only advantage of being Cheap—they are absolutely devoid of any other advantage to either dealer or user—and Good Goods are as sure to come to the surface after the storm is over as the sun is sure to reappear after the clouds have passed.

Quick Meal Evaporators are better than ever; they could not be made better at any price; they give absolute satisfaction and a purchaser will never cease thanking the dealer for having sold him the Best; he is likely to be a good customer for a good many years to come. Quick Meal Evaporators make Happy Dealers, Happy Users and Happy Homes.

Ringen Stove Co.

ST. LOUIS.

P. S.—The sale of Quick Meal Steel Ranges has **DOUBLED** during the season. They are not the **CHEAPEST,** but they are the **BEST.**

HATBORO, PA., Dec. 26th, 1896.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.

MY DEAR SIR :

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal. Very truly, I. N. EVANS.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.

THE METAL WORKER

Stove Storage Receipts.

FOR the accommodation of Stove Dealers who desire to undertake the summer storage of stoves for their customers, we have printed books of Receipts arranged on a new and ingenious plan. The Receipt to be given to the customer is on one side of the page, and on the other side is a Memorandum of the conditions, needed repairs and storage charges agreed to. *Opposite the Receipt* is its Duplicate, and *opposite the Memorandum page* is its Duplicate. When the leaf which has the Receipt on one side and the Memorandum on the other is torn out for the customer, it leaves Duplicate of Receipt and Memorandum on pages facing each other.

This arrangement has the advantage of bringing the two Receipt pages and the two Memorandum pages opposite each other, before the customer's Receipt is removed, facilitating copying and comparison, so that the Receipt and Memorandum given to the customer may *exactly correspona* with that retained by the person who receives the stove for storage.

Substantially Bound in Canvas.

100 Receipts and 100 Duplicate Records, $1.00.

Profits.

Heating men who handle the American Boiler Company's Steam and Hot Water Heaters frequently tell us that they secure contracts even when their bids are higher than those of their competitors. There's good reason for that. We know of more than one steamfitter who have found their profits increase after the adoption of these heaters: "Florida," "Soleil," "American," "Modern"—for steam; "Spence," "Perfect," "Advance," "Tropic," "Little Giant"—for water.

KELSEY FURNACE CO., Syracuse, N. Y.

GENTLEMEN:--It is with pleasure that the School Board of Crown Point, Ind., can speak a good word for your Generators. We have used one of your Heaters for two years, and put in two more new ones last fall. We find they do better work than the old ones of a different make did, with fully one third less fuel. As we shall be in need of further Heating Apparatus you may depend upon our orders.

Yours respectfully,

JOHN J. WHEELER, Secretary.

The Air Tight Round Oak Range!

A POT OF BEANS!

Read this from a user!

"We placed a crock of beans in the oven upon retiring at night—put in ONE stick of wood—and in the morning found the beans perfectly baked—and live coals enough to quickly start the fire."

BAKED POTATOES—*this from a dealer.*

"There never was a stove sold that I have known anything about—that was half as good in any of the following points: it will keep fire perfectly with one stick of wood all night:—bakes perfectly with two small sticks:—oven can be heated and bake potatoes for breakfast in 30 minutes—and in every way it is far superior to all others. I shall push them another season."

It is all in the painstaking fitting.

Do you like to sell the best?

The Climax Ratchet Stock.

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors n corners, over head, etc With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers.

Also Mfrs. of La Belle and Imperial Refrigerators Capacity 150 Refrigerators per day.

—"MINSKY was telling me one of those Grand street stories about the man who wanted to take some limburger cheese to the old folks at home on his annual Christmas visit. He couldn't carry it in the car with him, of course. There was too much of it, and besides the cheese wouldn't have been a popular traveling companion. Freight was too slow and the express rates were too high. So he packed it in one of those big coffin cases and put it in the baggage car. When he got to the end of his journey the station agent was sympathetic. He put on a long face and he says to this feller as he helps load the box on a truck:

"'Was the deceased your brother?'

"'No,' says the feller.

"'A near relative?'

"'No, only a very dear friend,' says the feller.

"'Too bad,' says the station agent, 'too bad. In the midst of life we are in death. But, my friend, you have one bit of consolation. The deceased is in no trance. He'll not be buried alive, you can be sure of that.'"—*New York Press.*

THIS volume has been compiled from the extended series of articles in *The Iron Age*, on the arrangement of Hardware Stores, and contains a large and varied mass of information in regard to store arrangement.

A chapter is devoted to each subject and all are fully illustrated.

The summary of contents will convey an idea of the wide scope of the work, which treats of almost every subject connected with the arrangement of Hardware Stores.

Every hardware merchant should have a copy.

"Small Talk About Business."

By A. E. RICE.

A Banker's Business Hints for Men and Women.

A bright man, with his wits about him, is often described as "All Business." Being "all business" is knowing how to do the right thing the right way.

Do you want to be "all business?" The book tells. The wrong way wastes money and wastes time. Where is the good of that? The book tells nearly everything that an enterprising business man ought to know. Everything in it is worth knowing.

The book is called "Small Talk About Business." It is full of money-saving talk for old and young, for men and women, for business-like and unbusiness-like people. YOU ought to have it.

Price, 50 cents. 120 Pages. Elegant Cloth Binding.

Sent, post-paid, on receipt of price, by

DAVID WILLIAMS CO., Publishers and Booksellers, - 232-238 William Street, New York.

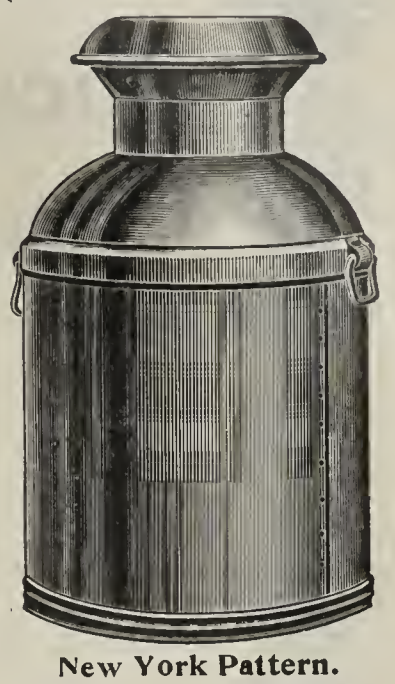
BEWARE of him who stoops to Denounce and then to Imitate.

MILWAUKEE R. R. MILK CANS.

A PERFECT CAN AT A MARVELOUS PRICE.

Iowa Pattern.

THIS CAN



is made of heavy wrought steel. The neck and bowl, which is drawn in one piece, is double seamed to the breast, and the breast is double seamed to the body in such a manner as to form a very strong and rigid edge, and is protected by a heavy beveled edge iron band. The body and bottom rest on the O. G. heavy iron bottom band. The can is put together in the black and then double tinned very heavily, making it the strongest, most perfect and durable can on the market.

Watch Your Cues and Figures

The fellow who wants to do business must stir up his customers with a furnace that's built differently from the ones the other fellows sell. He wants a furnace that will stand investigation like ***this*** one, so he can worry his competitors with good working points. There is oftentimes too much similarity with furnaces to make a choice any object except the price. If a dealer makes money in the furnace business he wants goods that look well, which sell easily, and give good satisfaction when used.

The Business Situation.

In reviewing the condition of business for the past week, and estimating the future, the tone of the review will depend upon whether it is based upon the actual state of trade in the country or whether it is the expression of the condition in Wall street, which, being the money center, is the most sensitive index of the industrial situation. More properly speaking, however, it is the barometer that foretells disturbances, the timidity of capital being proverbial, and any cloud upon the business horizon will make its influence felt. So far as the actual volume of trade is concerned, the record of the week is very satisfactory. Reports from different sections of the country summing up the business for February very generally show an increased activity and amount, the total trade for the month being considerably in excess of 1897. The changes in prices in the lines in which *The Metal Worker* is interested have not been many or important. In wire an advance, determined upon some time ago, was put into effect after March 1. The tone of the metal markets has also been strong, particularly in the case of tin and copper, lead and spelter having been quiet and easy during the week, while tin plates continue to be unsatisfactory. The stock market has shown quick changes during the week, and the tendency has been downward, with a decidedly uncertain feeling on some days. The situation in Wall street reflects the uncertain relations existing between this country and Spain, for while it is pretty generally believed that the Spanish Government was in no wise implicated in the loss of the "Maine," there is no doubt that in Washington a certain tense feeling exists, and the Government is showing worldly wisdom in making preparations for whatever may happen. The daily press by unexampled misrepresentation and invention have, in a measure, wrought upon public feeling, though the people are being educated to disbelieve these imaginative journals, and can more calmly read their hysterical fairy tales.

The Foundry Iron Situation.

Manufacturers of foundry iron are not unanimous in their support of the opinion advanced by General Manager Swank of the American Iron and Steel Association that an advance in prices is needed. They agree with him that the situation is unsatisfactory and hope for an improvement. But the improvement which is most desired is an increase in consumption. The production for the past month or two has evidently outrun the consumption in foundry iron, as shown by the weakness in prices. Too many sellers are soliciting the favor of buyers. When we emerged from the slough of despond some months since, and the situation began to brighten, it was feared by conservative manufacturers that too many furnaces would be blown in. For a brief period their fears seemed groundless, but it must now be conceded that the trend of recent events has been in the direction of their predictions. An advance in prices would not correct prevailing conditions by any means. Impatient owners of other idle blast furnaces would seize the opportunity to re-enter the market if the price advanced above their cost line, and the situation would be made worse.

Producers of foundry iron are watching developments in the export trade with special interest in view of the pressure on the domestic markets of the present tremendous output. They hope that relief may come in that direction if not from the expansion of domestic consumption. The growing exports from the South excite strong hopes that in the very near future the surplus product in that section may find more attractive markets abroad than the well supplied consuming centers of the North. Southern producers are not always the chief disturbing element in the foundry iron trade, but they have gained that unsought distinction recently. They have upset calculations and rudely shaken dreams of a reasonably prolonged season of maintained prices if not of large profits. There are grounds for hope of an improvement in consumption with the approach of spring, which may give the hungry enough business to keep them satisfied. But volume of business, whether of foreign or domestic origin, is more needed than an advance in prices.—*The Iron Age.*

The Navy of the United States.

In time of peace prepare for war is undoubtedly the axiom that has been governing the recent preparations to place our sea coasts and our fleet in such an efficient condition that come what may we will be found on guard. It can be confidently asserted that, to a greater extent than is generally believed, we are already quite well off in the way of fortifications and ships. Obviously we are not yet in such a condition as will enable us to cope successfully with Great Britain. It is equally true, on the other hand, that we are ready to meet on more than even terms such a nation as Spain. Even supposing the fleet of Spain to be the equal in numbers and efficiency to our own—which is by no means the case—still would it be at the great disadvantage of having to steam 3000 miles to reach our coast, where having arrived it would be in the embarrassing situation of having no coal depot, no fitting out port and no equipping yard.

Our navy to-day is composed of the following ships, all of which can be made ready within a week, most of them within 24 hours:

First-rate vessels, 5000 tons displacement and over, 11, of which 8 are armored.

Second-rate vessels, 3000 to 5000 tons displacement and over, 13, of which 5 are armored.

Third-rate vessels, 1000 to 3000 tons displacement and over, 27.

Fourth rate vessels, 7.

Of this total of 58 ships, 40 are now in commission doing active service in the different waters of the globe as follows: In the Atlantic, 23 vessels ; in Europe, 2 ; in the Pacific, 7 ; in Asia, 7, and 1 on the great lakes.

The work cut out for this fleet is now before it : In Europe the small squadron of two vessels would be sufficient to create uneasiness in Spain and necessitate the retention in home waters of a fleet of equal power. In the Pacific the Palawan, Caroline and other Spanish possessions could be captured by the Pacific squadron. In Asia the Philippines would be blockaded by our fleet now there, and in the Atlantic, Cuba and Porto Rico would be invested. It is here off Cuba and Porto Rico where the decisive action would be fought; and superiority in numbers alone should insure us the victory.

There is no attempt made in stating these palpable facts to belittle the Spanish navy ; so far as it goes it is an excellent one ; indeed, some of its vessels of the most modern types are models of advanced naval architecture, but it is not so large a navy in any respect as the American. This can be better realized perhaps by giving some figures pertaining to the approximate available marine forces of the two countries.

The armored displacement tonnage of Spain amounts to 68,000 tons; that of the United States to 86,000 tons, excluding the 13 old style monitors, one and a third greater.

If all the guns mounted on board the Spanish armored ships were to be fired at once the weight of the amount of metal thrown would be equal to about 10 tons ; the amount of metal thrown by the United States fleet would be about 16 tons—more than one and a half times heavier.

In our navy we have an excellent type of battle ship in the "Indiana" class, of about 10,000 tons displacement. Notably heavy are the batteries mounted on the three ships of this class; each ship carries the tremendous armament of four 13-inch, eight 8-inch and four 6-inch guns. In the way of protection the thickest side armor is to be found in the partial belt protecting the vitals ; this armor is 18 inches thick, of nickel steel. The four largest guns, more than a foot in diameter of bore, are mounted inside turrets of 17-inch steel, and the other guns are protected by 5 inches of the same metal. The speed of the ship is 15.5 knots, and though the coal supply of 400 tons is not large, yet is it sufficient to enable the ship to perform well any service within 500 miles of our coast. The "Iowa" is another battle ship, a little larger than the above, and not unlike them in other respects. Still another battle ship is the "Texas." She is considerably smaller, only 7000 tons, with two 12-inch guns and six 6-inch, but she is a very efficient ship indeed. These five battle ships constitute a bulwark of safety incomparably superior to any force Spain can bring to demolish it.

Of the type of vessel known as the armored cruiser our navy has two—the "Brooklyn" and the "New York," of 9300 and 8300 tons, respectively. The former is the better ship in every way, mounting eight 8-inch and 12 5 inch guns to the latter's six 8-inch and 12 4-inch. The armor of the "Brooklyn" is 3 inches thick on the belt and 8 inches on the turrets, that of the "New York" 4 inches and 10 inches for corresponding positions ; but the former's armor is of the latest development of face hardened Harveyed nickel steel, and is stronger than the "New York's." Both ships are capable of fighting long and hard and well.

Other armored ships in our service are the armored ram "Katahdin" of 2200 tons, unarmed, except for small rapid fire guns, and designed exclusively for attacking with her ram. And we have besides five double turreted monitors, the most powerful being the "Puritan," of 6000 tons displacement, armored on sides and turrets with 14 inches of metal and mounting four 12-inch guns and six 4-inch rapid fire guns. The other four monitors are of 4000 tons each, with 11 inches of armor and four 10-inch guns. These monitors are essentially coast defenders ; in smooth water they have been proved to be an admirable type. Spain has no analogous type to them.

Our unarmored fleet is not so large as might at this juncture be desired. Our naval authorities have virtually stopped constructing the unarmored type of cruiser, considering that our more pressing needs lie in the direction of obtaining more battle ships and torpedo boats. We have 16 unarmored cruisers, varying greatly in nearly every particular—in size from 2000 tons displacement in the "Marblehead" to about 8000 tons in the "Minneapolis ;" in speed from 15 to 23 knots, in armaments from 4-inch guns to 8-inch guns, &c.

However, in addition to these cruisers we have what are technically called gunboats ; in reality they are cruisers of a less displacement than 2000 tons. There are nearly 25 of these gunboats. They are armed with 4, 5 and 6 inch guns, have good coal carrying capacity, good speed and are capable of doing good service, on the blockade, as scouts, as dispatch boats, as aids to the larger ships and to fight other unarmored vessels.

A type of small vessel that can be of much value to a fleet, especially when the theatre of operations is near a home base, is the torpedo boat. These small craft can dart about hither and thither carrying orders, firing their torpedoes, slipping past blockades, and in many ways assisting a fleet of heavier ships. Our navy is still weak in this important element of defense, and though great efforts are making now to better it, it is doubtful if we could get ready for immediate hostilities more than 15 of these craft. These torpedo boats are some of them of 100 tons displacement, others of 150 to 18, with speeds varying from 20 to 30 knots.

In closing this brief description of our fleet as it exists to-day ready to be mobilized—that is, passed from a condition of peace to a condition of war—mention must be made of auxiliary cruisers or casual cruisers, as the Ordnance Department calls them. These are merchant steamers that have been inspected by navy officers with a view to mounting guns on board them in time of war so as to utilize them as cruisers. About 35 steamships have been listed for this cruiser service, plans for mounting guns on board them have been drawn up and the duty to which they are to be assigned is understood. Undoubtedly they would all be pressed into service should a war arise.

Of personnel the American navy has 566 line officers and 181 engineer officers, besides doctors, paymasters and others sufficient to meet the present demand. Of men there are 11,000 sailors and 750 boys.

We present these authentic data, not because we believe that a conflict is impending, but because they put at rest some of the very wild statements which have been flaunted in the public press. It is certainly not a proud position for a great country to be forced to figure its capacity for resistance against a third-rate power. The incident should bring home to our people the necessity for a speedy development of our navy and of our coast defenses.—*The Iron Age.*

Lead Coated Mirrors.

Lead is not generally regarded as a material that would adapt itself to purposes of reflection. But Monsieur Berthelot, the eminent French chemist, has discovered that the metal was used as a reflecting medium by the ancients. His recent researches have been devoted to some glass mirrors lately unearthed near Rheims, France, which date from the third and fourth centuries. In these mirrors he found the glass was coated with a metallic substance and also with a layer of whitish material. The metal proved to be lead, with no trace of gold, silver, copper, tin, antimony or mercury, nor was there any organic substance present, showing that no extraneous material was used to cement the lead to the glass. The mirrors appeared to have been cut from hollow blown glass globes, and it is posible that, before being cut, the molten lead had been poured into the interior, adhering to the previously warmed glass. The whitish layer consisted of lead carbonate and lead oxide formed by the oxidation of the lead coating and calcium carbonate which had been deposited from the water of the district in which the mirrors were found.

The United States Acetylene Liquidation Company, whose plant in Jersey City, N. J., was destroyed by fire last December, have decided to establish at Lebanon, Pa. The plant is the only one of its kind in the United States, and supplies all the liquefied acetylene for the Government buoys and harbor lighting, as well as the general trade.

THE LETTER BOX.

Apparatus for Cooling Water.

From J. B. C., Brooklyn, N. Y.— I have had a call from a manufacturer to devise some means of supplying a quantity of iced water at about 45 degrees Fahrenheit, with as little possible loss from friction due to coils, &c. The quantity of water is about 15 gallons per operation through a ½-inch nozzle, the maximum operations being about six per hour and about 30 per day of nine hours. The water when used is about 55 degrees Fahrenheit, using the main water supply to increase the temperature, the supply from the main in the summer being about 65 degrees. My idea is to have two cylinders made about 4 feet long to contain about 25 gallons of water each, with large inlets and outlets to reduce the friction. I would place these cylinders horizontally in a tank of water (well insulated), 6 feet long and 3 feet wide, placing the ice on top of the cylinder so as to be immersed in about 3 inches of water and so immediately chill the water that enters the cylinders. In my experiments I found that placing ice on a small cylinder and allowing the drippings to run off as in a refrigerator is not at all effective. I believe that to chill the water as I intend to will take about 400 pounds of ice, and this I think is too much to obtain the object desired. As this water is to be used every day would it be practicable to use a small ice machine or apparatus, not to make the ice, but to chill the water in the tank? If this is practicable I would be glad to have some particulars, as I am quite ignorant on the subject. Are there any publications that relate to work of this kind from which I could get some data to proceed on? Would better results be obtained by putting, say, about 400 pounds of ice into a 250-gallon boiler or tank, such as is used to heat water for large buildings and flats, making use of the two manholes on top for putting in the ice? The objection to this plan would be the trouble of shutting off the water each time the ice was needed. If, however, better results can be obtained by this plan the objection to shutting off the water would not be a serious one. I would consider it a great favor if the readers of *The Metal Worker* would give me some suggestions and opinions on the subject through the Letter Box.

Answer.—Supposing that our correspondent requires the water to be used at a constant temperature of 45 degrees, we do not find that the two cylinders that are suggested, nor any small coil arrangement, will meet the requirement of the intermittent use of the water as stated. By any such arrangement the tanks or a small coil filled with water, after standing during the intervals between the times of using the water, would with the water they contained become too cold and the water entering during the drawing of the water would not sufficiently change in temperature, so that there would be no equality of temperature in the water drawn. With the view of a day's supply of even temperature water we suggest a large round wooden tank, say 6 feet diameter, 4 feet high, thoroughly insulated bottom and sides. Place in the tank a bent coil of 2 inch pipe, say 100 feet in length, which will hold 20 gallons of water and expose 60 square feet of cooling surface. Place an overflow to the tank and fill it with water, say 500 gallons, at an average temperature of 60 degrees F., say 3750 pounds. To cool the water and coil filled with water to 45 degrees will require 450 pounds of ice for the first charge, which should be made at night. This will cool the whole body of water, coil and contained water, to a little below 45 degrees, when the day's operation can commence. For each time that 25 gallons of water are drawn from 13 to 18 pounds of ice should be added to the tank, according to the variation in the supply temperature, which will keep the water in the tank at a nearly constant temperature of about 42 degrees, the large body of water in the tank so equalizing the temperature of the water drawn that it will not vary more than 2 or 3 degrees. The daily use of ice will then be about 450 pounds, which will be much cheaper than to run a small refrigerating machine. For a study of the principles and different methods of refrigeration we can furnish Siebel's "Compend of Mechanical Refrigeration" for $2 50.

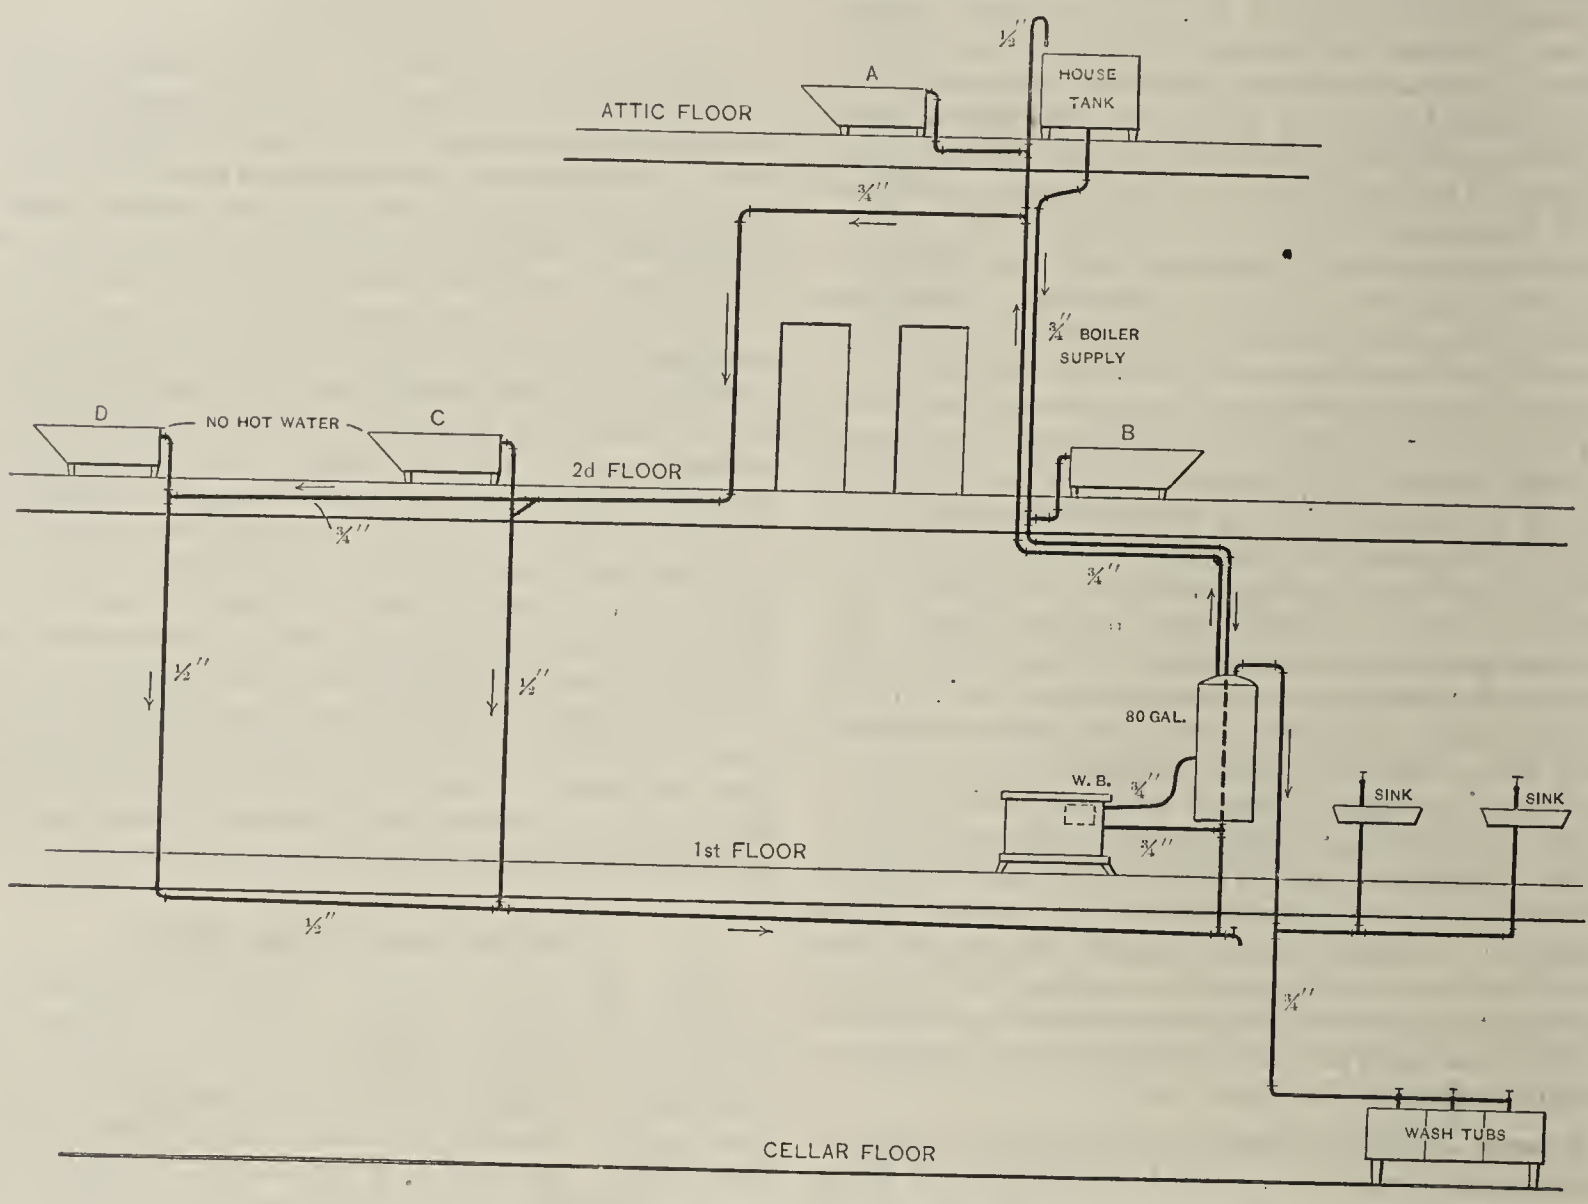
Laundry Drier.

From C. B. H., Tariffville, Conn.—Can you or any of your readers give me data in regard to a laundry drier? I want instructions upon how to build and heat a small room, say 4 feet wide, 6 feet high and 6 feet long. As all know, outdoor drying of clothing when passed through a wringer when washing is at the best uncertain, whereas if each batch could be dried in 20 or 30 minutes after washing family laundry operations could be carried on continuously, one lot drying while the next could be washed. There are several such appliances in the market, but they cost $140 or so, which is too high for the ordinary purse. It would seem to be within the mechanical ability of any carpenter or tinsmith to build such an inclosure as I speak of, with an oil or coal heater at the base and ducts for the admission and exit of warm air, so as to thoroughly dry one batch of clothes in the time spoken of. The frames, with galvanized iron lines, could be drawn out and loaded and then pushed in again, a wire netting being stretched across the base over the stove, which should be at the base or just outside the base, for safety. I have found so much useful information in your columns that I thought I might get some serviceable suggestions from some of your readers.

Trouble from Rusty Water.

From W. L. D., Keene, N. H.—The plumber who states in *The Metal Worker* of February 19 that he has had trouble from rusty water from a copper range boiler may find his trouble due to the same cause as that of a similar experience of our own, through which we have just passed. We put in a new stove and a copper pressure range boiler and used all brass pipe. The hot water was about the color of strong tea. We supposed, of course, that it must be discolored from the use of a cast iron water front. We replaced the water front with a brass water heating coil, which made no difference in the water, which was just as rusty as before. We then changed the copper range boiler, using one of another make, which cured the trouble. We found upon examination that the boiler which gave the trouble had a steel coil inside to prevent collapsing. It is quite possible that the plumber who is seeking assistance has one of the same make of boiler.

Can Steam Be Generated by a Range Boiler?



From W. H. F., Stroudsburg, Pa.—Is it possible to generate steam in a circulating range boiler under 40 pounds pressure with an ordinary range water back?

Answer.—The fact that the system is under 40 pounds pressure would render it more difficult to generate steam. However, if no hot water had been drawn from the boiler for a considerable time and a hot fire had been running in the range for several hours, it is possible that the steam generated in the water back might heat the water in the boiler to such a temperature that steam might accumulate in the top of the boiler. It is not an

uncommon thing for steam to accumulate in the boiler where the boiler is fed from a tank instead of a street pressure and in consequence the pressure on the boiler is very light. From the fact that steam may be generated in the boiler under such conditions it can readily be seen that it is only a question of hard firing without drawing off water to allow steam to accumulate in the boiler sufficient to force some of the water out of it. The steam will occupy an increasing amount of space until a limit is reached, when condensation will take place and water will run into the boiler to take the place formerly occupied by the steam and considerable noise, hammering and rumbling will result.

Cold Water from Circulating Pipe.

From S. C. L., New Bedford, Mass.—I should like to have information about a hot water circulation job which is shown in the sketch presented herewith. Is it proper to take the expansion pipe off from the highest point on the circulating pipe? Why don't the bathrooms C and D get hot water when A and B get it? Will the fixtures in the bathrooms C and D draw cold water through what is intended for the return ½-inch pipe to the bottom of the boiler sooner than draw the water through the ¾-inch pipe, and if so, why? Will a swing check valve placed in the lower circulating or return pipe in the cellar rectify the trouble? Does it make any difference about the size of the range and range boiler, and if so would a smaller boiler give better results? Is an overhead system with a return in the cellar good practice as a rule in a long building?

Cold Water from Circulating Pipe.

Answer.—In reference to the first question, would say that if the expansion pipe was not taken off at the highest point, as shown, the circulating pipe would become air bound, and possibly to such an extent as to entirely stop circulation. In answer to the second and third questions, it is not uncommon for the water in a system to take a reverse direction from that intended when the conditions are such as to permit it, and the failure to secure hot water at C and D may be readily accounted for in that way. In this case the more direct route to these fixtures is from the bottom of the boiler up the circulating pipe. By going up the circulating pipe there are only two turns to interfere with circulation before the fixture is reached, while in the regular hot service piping there are five turns which must be made, which must retard the flow, so that when the fixtures at C and D are opened the water naturally follows the line of least resistance from the point where the greatest pressure impels it. It is quite common practice to use a check valve on a circulating pipe to prevent just such troubles as presented in this case, and in many instances it would be difficult to overcome them without it. If the water back has the power to heat all the water in the boiler down to the bottom as the fire in the range is ordinarily run the size of the boiler and range will have no effect on the service rendered, but with so many bathrooms to supply it is probable that the water in the bottom of the boiler will be cold most of the time. Then if the water flows up the circulating pipe to C and D no hot water could be expected. There is no objection to the overhead system or to the return, but where it is possible it is preferable to make the return in a less exposed position than in the cellar. Owing to the water continually circulating it loses heat and requires a stronger fire than would otherwise be needed. The covering of the return under such conditions would be a material gain. It is quite possible that some better results would be accomplished if the return of the pipe from the tub C was omitted. With a check valve in the return a reverse circulation would be impossible, but with the pipe from C remaining it would be possible for a short circuit to be made and still leave the tub D improperly supplied under some conditions.

Cotton Seed Oil.

From H. V., Milroy, Pa.—Please give us through *The Metal Worker* information relative to cotton seed oil. What is its color, is it similar to linseed? Does its odor resemble linseed? Will it do as a substitute for linseed oil in painting if used alone? If it cannot be used alone

in painting, in what proportion could it be used? What would be the result if used alone for painting with white lead, iron oxide or venetian red for surfaced boards or siding, and also rough boards? Where can we buy cotton seed oil to good advantage? What is its specific gravity and weight per gallon?

Answer.—Cotton seed oil is of a brown color, pale orange or dull yellow color, depending upon the degree of purification or bleaching that has been applied in its production. The refined oil appears so much like olive oil in color and consistency as to require an expert eye to distinguish any difference. It weighs about 7½ pounds per gallon, and has a specific gravity of from 0.92 to 0.93 (water 1). It is largely used for adulterating olive oil, for making or adulterating lard oil, for making lard, margarine and butterine. The price has fallen quite fast of late years and is now about 21 cents per gallon for crude, and 24 cents for refined. It has no drying quality and has not yet been substituted for linseed oil to our knowledge. Cotton seed oil can be purchased through the oil trade or the American Cotton Oil Company, 46 Cedar street, New York City.

New York Board of Examining Plumbers.

From O. B., New York.—Kindly inform me through the columns of *The Metal Worker*, as far as possible, of the best method of getting a plumber's license in this city. I would like to know where the board meets, and if it is required to have a place of business before making application, and whether there is a practical examination and what the cost is.

Answer.—The Bureau of Plumbing is under the direction of the Building Department at Eighteenth street and Fourth avenue, New York City, where application for a license should be made. It is necessary for the application to have the signature of two master plumbers who know that the applicant has had experience in the trade of plumbing. On filing the application a notice will be given to the applicant when and where he must appear before the board to be examined. The examination is both practical and theoretical. Those who apply for a certificate are expected to give the address of the place where they expect to engage in business. The cost of the license can be learned at the time the application is made, as we do not know what fee will be required by the new Examining Board just appointed. Under the old board the fee was $5 at the time the application was made.

Water Back Too Large.

From C. N. L., Woodbury.—I would like to receive through *The Metal Worker* some information that will enable me to overcome a trouble which I am having with a range boiler and water back. I recently connected a large range with boiler, and it seems that the range or water back is too large and therefore heats the water too much, causing steam to be generated, which makes the boiler dance. The boiler holds 24 gallons, and is of the vertical circulating type resting on a boiler stand. A No. 9 range is used and the water pressure is 53 pounds. The owner does not want to take the boiler out and put in a larger one, so I am called upon to remedy the difficulty. Would the trouble be overcome by putting a steam boiler safety valve with weights on the boiler and running the waste pipe over to the kitchen sink? Is there any other way that can be suggested for carrying off the steam without permitting all the hot water to run out of the boiler? Where and how should a safety valve be placed? Is there any kind of an arrangement by which I would not have to carry a waste pipe away from the boiler?

Answer.—The cause of the trouble in this instance seems to be clearly understood, that the water back is too large for the work, and the simplest and easiest way to overcome the difficulty is to take out the water back and to use a smaller one. If a smaller water back cannot be secured it is a simple matter to make a water heating coil of iron pipe with a close return bend. This will be far more satisfactory to all concerned than any attempt to use a safety valve or some other system. If the fire chamber of the range is of such a character as to permit the use of a fire brick between the fire and the water back now in use, so as to prevent the water back from excessively heating the water, this would be less trouble than to replace the water back with one of less heating capacity.

Wants a Local Vent.

From E. C. V., Stockbridge, Mass.—I would like to be informed whether in a job of plumbing it is necessary, according to sanitary requirements, to supply local or seat vents to the closets? I put up a job of plumbing for a customer, and did not put in the seat vent because no live chimney was near. Now my customer says the job is not complete. The contract did not call for a local vent, and I say that the job is complete. Which is right? There is nothing else in the job with which fault can be found.

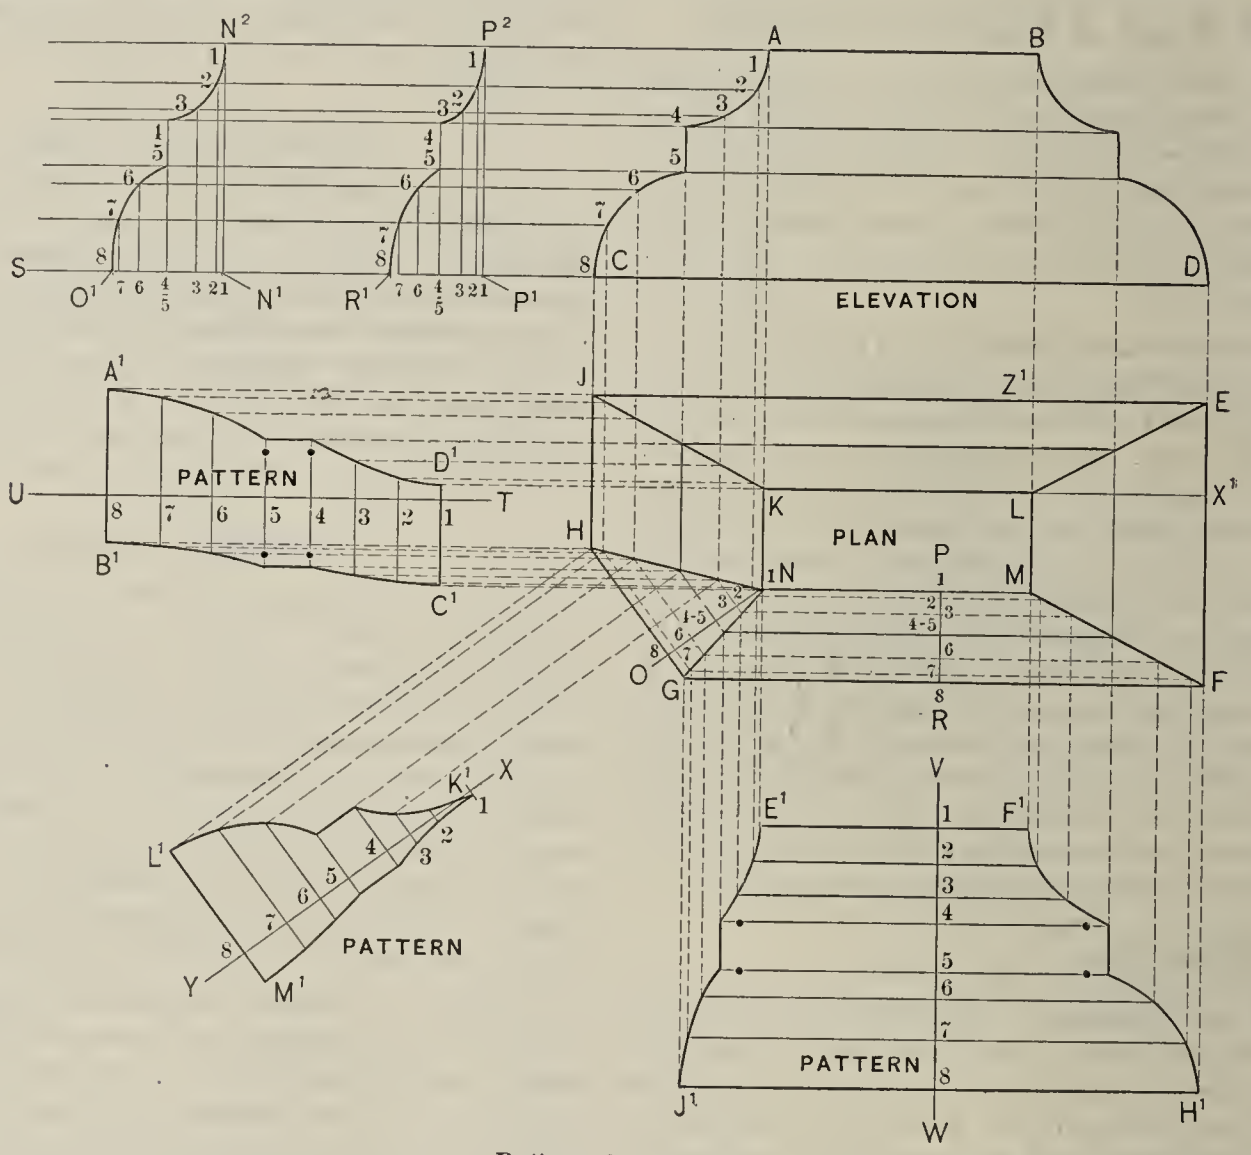
Answer.—The local vent is not essential to make the job sanitary, and is a provision that is confined to localities rather than in general use throughout the country where thoroughly sanitary work is done. When connected with a live chimney a local vent is of advantage, but unless the local vent pipe is heated or an outgoing current produced in some other way it would not serve any useful purpose.

Laying Copper Valleys.

From C., Mansfield, Ohio.—Through the columns of *The Metal Worker* I desire to thank those who so kindly answered my question on laying copper valleys, which appeared in *The Metal Worker* of February 5, and as soon as the weather permits I shall do this work as they suggest, all the answers being nearly alike. I have got many good hints from the Letter Box, and should an emergency arise where I can be of any assistance to those seeking information I shall only be too glad to offer my help.

Chimney Questions.

From A. W., Chicago.—Will you kindly inform me through *The Metal Worker* how a chimney 60 feet high should be constructed so as to produce the greatest amount of draft? Where a chimney is 14 x 9 inches inside measurement, running to the roof of building 50 feet high, and then enlarges to 14 x 14 inches inside for a distance of 12 feet above the roof, would this increase have any effect on the draft? If so, why? Would it be better to have it go all the distance 14 x 9 inches? In a properly built chimney 60 feet high what would be the effect upon the draft of each foot of increased hight?



Answer.—A chimney to have the greatest efficiency should be so constructed as to have not only a smooth and regular interior wall surface, but should also have the least amount of wall surface for a given area. With this principle in view, it is found that a cylindrical chimney is the best, a square chimney next best, and rectangular chimneys of different dimensions decrease in efficiency with the greater difference in their dimensions. For example, a 12 x 12 inch chimney will have a stronger draft than a 6 x 24 inch, both having the same area. With the case our correspondent describes the chimney 14 x 9 has an area of 126 square inches, and the enlargement an area of 196 square inches. So great an enlargement gives a sudden check to the velocity of the gases up the chimney and adds nothing to the strength of the draft. If the upper section can be smoothly tapered to 14 x 12 at the top without detriment by the changed form, it will have a small increase in the strength of the draft by the additional hight. In larger chimneys an increase of about seven one-thousandths of the draft pressure has been realized per foot added.

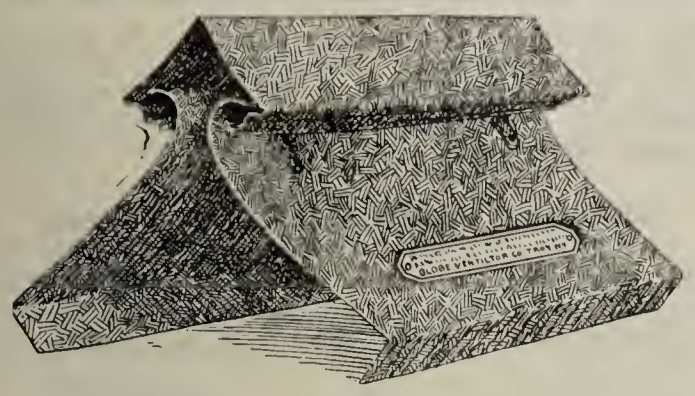
A test was made last week at Fort Washington of the new Rayburn 10-inch fortification gun mounted at that point. Three shots were fired, each one reaching almost to Alexandria, seven miles distant, and the test, which was witnessed by the navy officials and a Congressional delegation, was regarded as highly successful. The gun, it is stated, can throw a shell 11 miles.

SHEET METAL WORK.

PATTERN FOR A MITER.

A correspondent in Lafayette, Ind., asks us to explain through *The Metal Worker* the method of developing the pattern of the adjacent miters to the triangle H N G in the plan inclosed, which we have reproduced in the accompanying illustration. A B C D is the elevation of the article, E F G H J the plan of the base, and K L M N the plan of the top, the miter line in elevation, corresponding with the line N G in plan, being omitted, as unnecessary in the development of the patterns. As every side has a different projection in plan, it will be necessary to obtain profiles for the various sides from which to obtain the stretchout for the development of the patterns. Divide

Pattern for a Miter.



the profile A C in elevation, which represents the section on the line Z K in plan, into a number of equal spaces, as shown by the small figurers 1 to 8. From these small figures and at right angles to C D draw lines passing through the miter line J K in plan and intersecting the miter line H N. From the points of intersections on the miter line H N and parallel to H G draw lines intersecting the miter line G N ; then from these intersections and parallel to G F draw lines intersecting the miter line M F, as shown. Now at right angles to F G and G H draw the lines P R and N O respectively, intersecting the lines drawn from the profile A C. On the line D C in elevation, extended as D S, place a duplicate of the lines P R and N O, including the several points in each, as shown by P^1 R^1 and N^1 O^1 respectively. At right angles to C S and from the various intersections on the lines P^1 R^1 and N^1 O^1 draw lines intersecting those of similar numbers drawn from the profile A C parallel to C D. Trace a line through points of intersections thus obtained, as shown by P^2 R^1 and O^1 N^2 respectively. Then will R^1 P^2 be the out of the profile O^1 N^2, as shown by the small figures. At right angles to X Y and through the small figures draw lines, which intersect with those of similar numbers drawn from the intersections on the miter lines H N and N G of the plan at right angles to H G. Lines traced through the points thus obtained, as shown by K^1 L^1 and K^1 M^1, will be the required pattern.

For the pattern for that part shown by N M F G draw V W at right angles to G F, upon which place the stretchout of the profile R^1 P^2, as shown by the small figures. At right angles to V W and through the small figures draw lines, which intersect with those of similar numbers drawn from the miter lines G N and M F at right angles to G F. Lines traced through points thus obtained, as shown by E^1 J^1 and F^1 H^1, will be the required pattern.

For the pattern for that part shown by M L E F proceed in similar manner, obtaining the stretchout of the profile B D, which is the same as A C, and for the pattern for the part L K J E obtain the stretchout from R^1 P^2, because the projection L Z^1 is equal to P R.

The Globe Ventilated Ridging.

We have no doubt the members of the sheet metal trade will be interested in what is known as the Globe ventilated ridging, recently patented and now being introduced to the trade by the Globe Ventilator Company of Troy, N. Y. This ridging is designed to exhaust the heat

Globe Ventilated Ridging.—Fig 1.—*Style Known as No* 1.

from attics and ventilate residences, halls, churches, barns, &c., "without breaking the sky line or disturbing the artistic appearance of the building" in connection with which it may be employed. The manufacturers refer to the fact that the ridging can be readily applied to both old and new roofs without regard to the pitch. In the case of old buildings it is only necessary to cut back the boarding

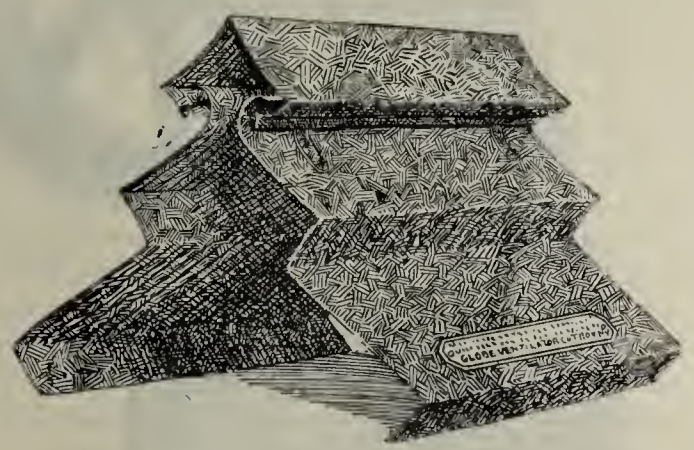


Fig. 2.—*Style No.* 2.

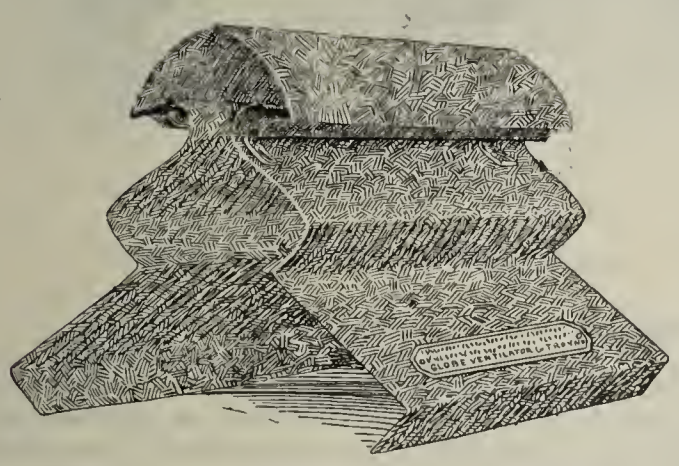
sufficient to allow for an opening of ½ inch on each side of the ridge pole, while in new work this space can without trouble be left ready to receive the ridging. Before being presented to the public the ridging was thoroughly tested by the manufacturers for over a year on several important buildings and found to be storm proof. It was in use during the severest weather of this and last winter, while at the same time it proved itself during the heated period of last summer to be an efficient ventilator under all conditions and circumstances, exhausting the heat from attics,



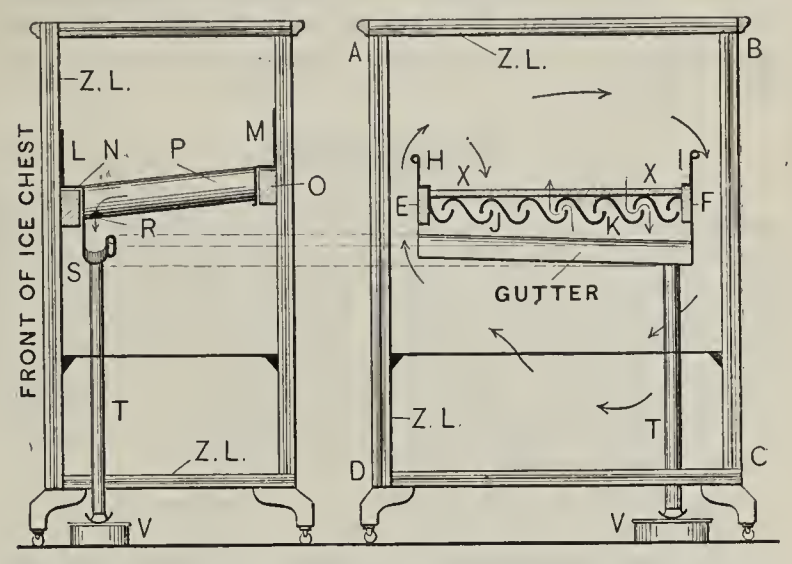


Fig 3.—*Style No.* 3.

rendering the upper floors comfortable and habitable, and preventing the roofs from sweating. The ridging is made in copper or galvanized iron, can be ornamented and provided with finials, and is offered in several different styles, some of which are shown in the accompanying illustrations. Fig. 1 represents a ridging 6 inches in hight, girt 14 inches and apron 3½ inches, while in Fig. 2 is shown a larger style, measuring 8 inches in hight, with a girt of 19 inches and an apron of 4 inches. In Fig. 3 of the engravings a ridging is shown 8 inches high, with a girt and apron the same as that indicated in the previous engraving. These styles are known as Nos. 1, 2 and 3, and the company request architects to so designate them when ordering.

COMBINATION VENT AND ICE PAN FOR REFRIGERATORS.

BY W. N.

The flat bottom ice pans usually employed in refrigerators are sometimes a source of inconvenience, owing to the dripping of the condensation forming under the pan. The ice being on the upper side, the warm air entering every time the door of the refrigerator is opened strikes against the bottom of pan, causing condensation and dripping below. In the cut are shown the front and side view of a louvered ice pan, which allows the warm air to circulate freely, thus keeping the top and bottom of the refrigerator at an even temperature. In the illustrations Z L indicate zinc linings. Let A B C D be the section through the refrigerator, E and F hard wood strips over which the frame of the pan H and I rests, and J K the louvered formed sections, fitting as shown, over which a wooden frame X X is set, on to which the ice is laid. The ice when melting drips into the gutterlike form at the bottom, follows the pitch of the louvers shown by

Combination Vent and Ice Pan for Refrigerators —Longitudinal and Vertical Cross Sections.

P, dripping out of the hole R, which is punched in every louver, into the gutter S, then following the pitch of the gutter into the tube T and out in the dripping pan V at the bottom. At N and O wooden strips are also screwed, on which the frame L and M rests.

Modern Improvement.

BY FOSSIL.

This article does not propose to spread itself, however thinly, over the topic of its title, nor refer to those advances of invention and construction which are comparatively of recent date. The writer has in mind an improvement rarely mentioned in print, and only noticed in the light of memory and experience. It is of parisitic nature, living on and ornamenting the tree of competition, and remarkable because of its apparently abnormal nature. There has been a marked change from the carefully guarded trade secrets of the time which some of us remember to the present days of reciprocal information, making a modern improvement which may be called craft courtesy. Looking backward to a tin shop apprenticeship, memory recalls an incident that may illustrate the difference between then and now. The boy wanted to get on in what was called in his indentures "the art and mystery of the trade," which meant simply instruction in manual operations. The art of constructing from patterns was taught him in course, but making without a pattern was a mystery and trade secret, held as personal property by those in possession and sold by them conditionally. Among the boy's desired attainments was how to lay out an elbow varying from a right angle, and he was not inclined to pay a journeyman for it. Taking a vessel of water, he set in a joint of pipe at the desired angle with the surface, and cutting the pipe on the water line he soon had the nucleus of a theory afterward developed by practice. Workmen of the present day having a similar "want to know" may take choice of various means for learning, and application to technical papers will furnish them with information "to burn." It is remarkable and equally satisfactory, as contrasted with old times, to note how a question appearing in the Letter Box of this paper seems to turn on lights of theory and experience from willing illuminators. This feature in connection with special books, which he who reads may run—his business by, may well be considered a modern improvement.

TINSMITHING SIXTY-THREE YEARS AGO.

We are in receipt of a letter from E. N. Hughson of Clyde, N. Y., and we will be glad to hear from any of his contemporaries telling of their experience in the old times when tinware was a hand product. Mr. Hughson's letter is as follows:

I notice in *The Metal Worker* of February 19 an article from John S. Brooks, who commenced his trade 53 years ago in Rochester, N. Y., at tinsmithing. Then all tinware was made by hand—so many articles for a day's work and 6 shillings for a day's work in our shop. Most always, however, we made 12 days' work per week, except on punched tin lanterns, which in our shop were considered a sack job (unless a compromise was made with the boss). The largest sheets of tin that we got at the time I started in my trade 63 years ago were 10 x 14 inches. We had to make pail ears, pits, every article, in fact, right from the stock. I can see a great change in the past 63 years in the manufacture of tin, iron and copper, which I have worked ever since I commenced my trade. I am still in my shop enjoying the fruits of a long apprenticeship, and hope to remain there many years more. Next.

FLASHINGS.

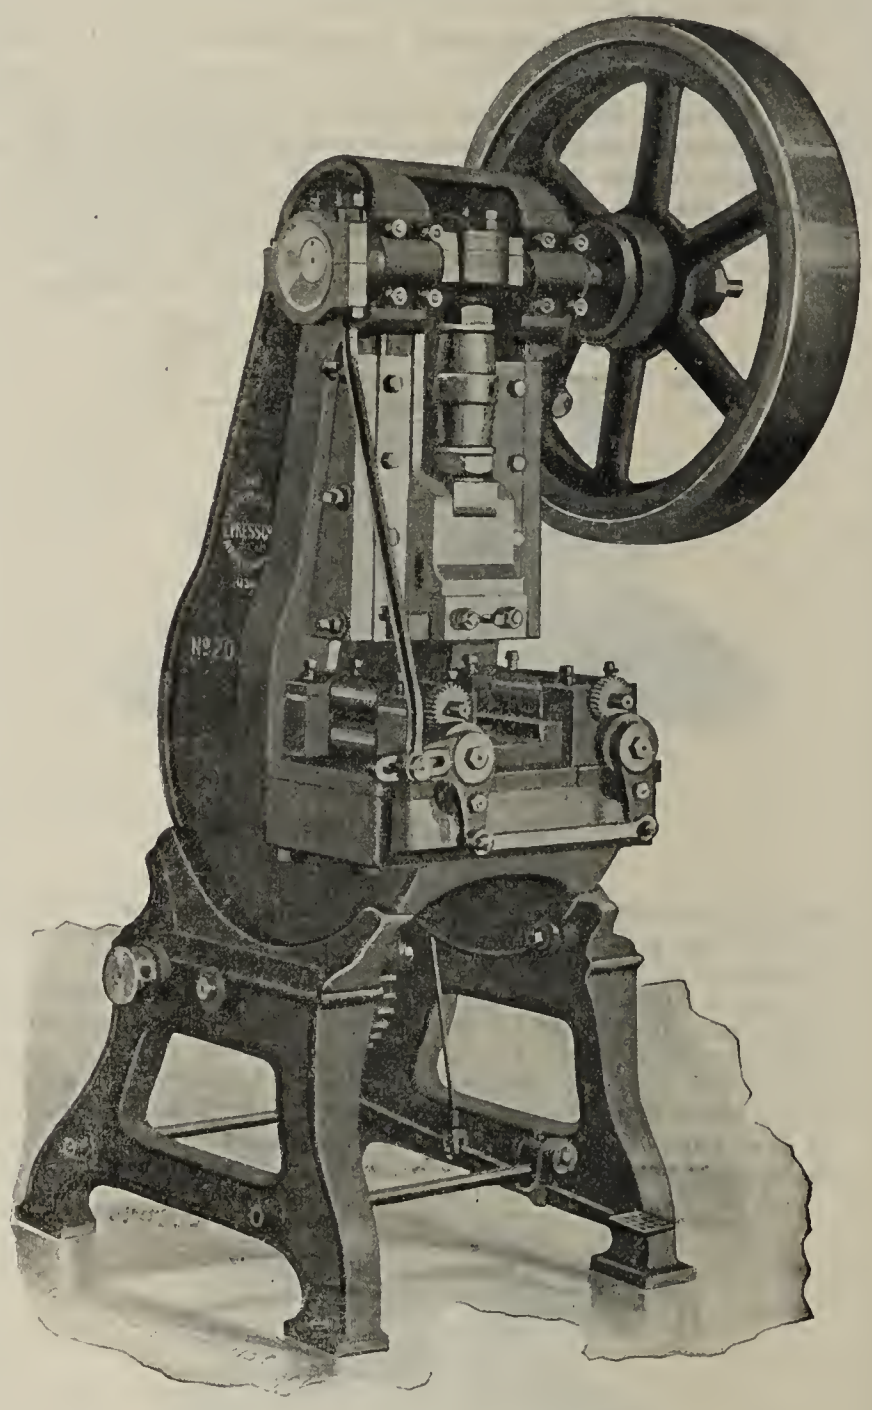
Under date of March 1 the announcement is made that the Niagara Stamping & Tool Company, Buffalo, N. Y., have changed the firm title to the Niagara Machine & Tool Company. This change is due to the increasing demand for their tools, which has made it necessary to devote their entire plant to the manufacture of tools and machines and discontinue the stamping line which they formerly followed. They will continue the manufacture of Tinsmiths' Tools, including Squaring and Rotary Shears, Presses, Dies and special machinery.

Powers Brothers, Streator, Ill., are now manufacturing two styles of Powers Brothers' Automatic Chimney Top Castings, the second style being much lower in price and brought out to meet the demand for a cheaper article.

Trouble is apprehended in the metal roofing and galvanized cornice trade in Chicago owing to disagreements between employers and workmen relative to the limitation of apprentices, wages for overtime and holidays and other questions. It is to be hoped that everything can be settled amicably.

John Scott, who had been the proprietor of an Ornamental Cornice works in Allegheny, Pa., for many years, died in that city on February 21, aged 71 years. He was born in Belfast, Ireland, and came to Philadelphia at an early age, moving to Allegheny over 50 years ago. Mr. Scott is survived by his widow and four children.

Catalogue D for 1898, issued by the St. Paul Roofing, Cornice & Ornament Company, St. Paul, Minn., is an interesting pamphlet of 50 odd pages, illustrating the class of work done by this well-known concern, whose business is the manufacture of Metal Fronts, Siding, Roofing, Patented Fire Proofing and Sheet Metal Building Materials. Those who are interested in Steel Ceilings should send for their catalogue C, 1897, while Pressed Zinc Ornaments are the subject of their special catalogue of 1895. The first 30 pages of the volume at hand show the wide adaptability of their Metallic Fronts for renovating old buildings and for covering new ones. A remarkable instance is shown by two half-tone engravings on page 3, where an old fashioned brick city house has been altered into a very modern looking structure. Other half-tone engravings show all sorts of stores and public buildings finished with the metal coverings made by this concern and illustrate the great variety of artistic effects produced. The latter pages of the pamphlet illustrate and give prices of Cornices, Window Caps, Ornaments, Skylights, Ridge Rolls, Iron and Steel Roofing, Metal Shingles, Eave Troughs, Conductor Pipe, Crestings, &c.



The Double Truss Cornice Brake Company, Buffalo, N. Y., are having a demand for their goods from the uttermost parts of the earth. In addition to their local trade they have recently made shipments of their well-known Double Truss Brakes to British Columbia, Texas and Mashonaland, Africa. The latter shipment had to be carried 400 miles inland, which, the manufacturers state, shows that their improved Brake gives excellent satisfaction and that advertising pays.

The property of the Los Angeles Iron & Steel Company, Los Angeles, Cal., has been sold under foreclosure proceedings to R. H. Herron & Co., local oil machinery and supply merchants. The nominal sum of $150 was paid, the property being still subject to a bonded indebtedness of $30,000 and $2000 due for taxes. The plant consists of sheet rolling mills, with corrugating and galvanizing departments, and cost about $120,000. The working capital was too small, and the hard times caused a collapse. Los Angeles has an abundant supply of native oil for fuel, the local demand for Sheets is excellent, and the purchasers of the plant are hopeful of inducing practical iron men to take hold of it and resume manufacturing.

The American Corrugating Company, St. Louis, have just shipped a carload of Corrugated Iron to Omaha, to be used on the power house of the Trans-Mississippi and International Exposition, which will shortly be opened in Omaha, Neb.

The Stiles Adjustable Incline Press.

The new press built by the E. S. Stiles Press Company of Watertown, N. Y., is fitted with double roll feed for automatically feeding the sheet metal, paper, &c.;

The Stiles Adjustable Incline Press.

for forming, cutting, stamping, &c. The stock is fed from left to right, first from the right hand rolls beneath the dies and then to the left hand rolls which carry away the scrap. The driving mechanism for the rolls is new in design and very simple in construction. An eccentric on the end of the main shaft carries the connecting rod, which is fastened to the feed arm of the left hand set of rolls. By employing this eccentric and connecting rod the necessity of an intermediate rocking arm is obviated, thereby reducing the number of working parts of the feed and producing more accurate work. The feed arm is slotted, thereby permitting adjustment of the connecting rod, which, in connection with the eccentric, which is also adjustable, allows very accurate setting of the length of feed. The rolls are driven by triple pawls, thus insuring at least one or more teeth at all times in mesh with the ratchet wheels. The dies and punches can be easily adjusted or removed without disturbing the feed mechanism. The principal dimensions of the machine are: Diameter of rolls, 3 inches; width of rolls, 6 inches; distance between rolls, 13 inches; range of feed, 0 to 3 inches; hight over all, 84 inches; floor space occupied, 37 x 38 inches, and weight complete, 2800 pounds.

HEATING AND PLUMBING.

How to Do Good Plumbing.

BY A. P. C.

There are still many in the plumbing trade who are of the opinion that there is little necessary to learn after they have either mastered the art of wiping a joint or have hired a man who has. Men who are no better equipped than this should never undertake to connect a fixture with a house drain, for they are liable to arrange their work so that it is a menace to health and just the opposite of what it should be. We assume that no man would willfully execute work so that it is dangerous, and when it is done so it is done in ignorance. To prevent such dangers is the object of the united efforts of the plumbers all over the country in securing State and local legislation to regulate the way plumbing work is done, to inspect the work and to examine those who do it and give certificates of competency.

Those who wish to become informed on this subject will do well to get the plumbing ordinances of several prominent cities and study the requirements of each section until the reasons for the provisions are well understood. This will occupy many evenings if conscientiously and thoroughly done. It will require much questioning and many conversations with plumbers, inspectors and those in the trade as well as a careful reading of papers and books devoted to the subject. There is no book that takes up the plumbing trade and treats it like a story that begins at the beginning and runs smoothly in story fashion to the end so that the reader will know the whole plan and practice from start to finish. With a good set of plumbing regulations for a base plan and a disposition to study, the man who desires to learn all about plumbing will read and will then find something in all he reads that he can appropriate to his own use. He will place a higher value on drawings, sketches and plans and may cultivate the art of making them. If he studies with interest and questions freely he will soon get a good idea of the principles governing the arrangement of soil, waste and vent pipes. When he thoroughly understands the theory of plumbing and is able to apply it in practice with careful workmanship, he need fear no examining board in existence, but he should never cease studying. In the last 15 years plumbing work has been greatly advanced, and an era of further progress is now at hand. Plumbing work is done better to day than ever before in some sections, and the effort to have it equally well done everywhere may be seen in the laws submitted for enactment by those who have the best interest of the plumbers and the public at heart.

Illinois State Plumbers.

The annual convention of the Illinois State Association of Master Plumbers closed its work on February 24 at Ottawa, Ill. The reports of the officers showed that the association has a membership of 864 and a balance of $1000 in the treasury. The next convention will be held in Galesburg. Officers elected for the coming year are:

President, W. W. Murphy, Peoria.
First Vice-President, Ed. C. Hall, Springfield.
Second Vice President, P. J. Crane, Alton.
Secretary, Arthur J. Ancliff, Peoria.
Treasurer, John G. Roland, Chicago.
Delegates to National Convention: J. M. Dougherty, Ottawa; Charles Law, Earlville.
Member of Interstate League, L. B. Davis, Rockford.

M. W. Edgar has purchased the business of Herbke & Co., plumbers, at 128 Shelby street, Detroit, Mich.

New York Board of Examining Plumbers.

The end of last week Mayor Van Wyck of New York appointed the following as a new Board of Examining Plumbers: George B. Brown, 231 Lexington avenue; John Rennehan, 1291 Madison avenue, master plumbers, and James E. McGovern, 1844 Park avenue, journeyman plumber. This board will prepare the questions and examine applicants for certificates to take out licenses to carry on the plumbing business in New York City. The members of the board receive a compensation of $10 a day when they are in session.

How to Figure Heating Surface of a Greenhouse.

In the new catalogue of steam and hot water boilers made by Abendroth Bros., New York, is the following information for determining the amount of surface required in greenhouse heating:

In figuring a greenhouse, we have to deal entirely with exposed surface, cubic contents rarely, if ever, being taken into account; therefore, the entire amount of glass exposure and its equivalent should be determined, and in doing this the ends and side walls should be figured just as surely as the overhead and end glass. The sides and end walls, if of wood, sheathed and papered good and tight, should be figured in the following proportions, viz.: Five square feet of wall to 1 square foot of glass.

After obtaining the number of square feet of glass and equivalent, the next point is the proper amount of heating surface necessary, and this is dependent upon the temperature required in the greenhouse. The following proportions of glass to heating surface will be found fairly accurate.

	St.	H. W
To a temperature of 40 degrees, divide number of square feet of glass by	9	6
To a temperature of 45 degrees, divide number of square feet of glass by	8	5
To a temperature of 50 degrees, divide number of square feet of glass by	7	4
To a temperature of 55 degrees, divide number of square feet of glass by	6½	3¾
To a temperature of 60 degrees, divide number of square feet of glass by	6	3½
To a temperature of 65 degrees, divide number of square feet of glass by	5½	3¼
To a temperature of 70 degrees, divide number of square feet of glass by	5	3

The above is based on an outside temperature of zero.

Albany Master Plumbers.

The Master Plumbers' Association held a meeting February 22 and elected the following delegates to attend the annual convention of the State Association of Master Plumbers, which will be held at Binghamton, N. Y., March 8 and 9: J. H. Russell, T. E. Kerwin, J. E. James. State Vice-President H. F. Westcott and Local President J. E. Dugan will attend the convention by virtue of their office as *ex-officio* delegates.

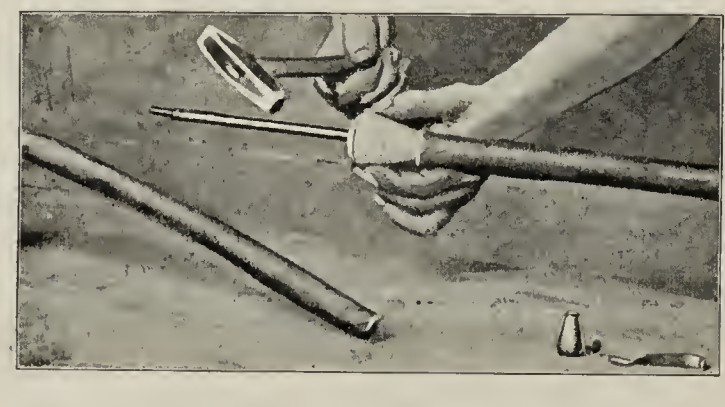
The alternates chosen are J. H. Moran, J. J. Britt and F. F. Schimpf.

J. H. Moran, A. Gilmour, Jr., and T. E. Kerwin were elected delegates to the national convention of master plumbers, to be held at San Antonio, Texas, on April 13, 14 and 15.

Plumbing Supplanting Slumming.

Not slumming, but "plumbing" is the latest and most fashionable diversion in New York, says the *Sun*. The plumbing does not consist in laying or repairing the pipes and mains, but in inspecting and criticising them. There is, of course, a guide or leader who first picks out some houses where things are peculiarly defective, and who then pilots the party about, pointing out how dreadfully unhygienic it all is. Most of the inspecting crowd probably know no more about it when they are through than when they began, but the diversion has the air of being philanthropic, not to say scientific, and it is certainly novel. There was a "plumbing party" on hand yesterday. It was made up of the rank and file of the New

York Household Economic Association (none of the important members being present), and it left the Palace of Industry at 3 o'clock About 20 women were in the crowd, and it was in charge of Charles F. Wingate. As the one man and the whole crowd of women made their way along the streets it was interesting to observe the stares and the comments of the passers by who were not yet familiar with the "plumbing party." Not until the new diversion becomes more common may we expect the general public to be callous to it. The party tackled a house on East Sixty-third street and proceeded to examine its drains. Mr. Wingate was very particular to point out the importance of the right sort of traps, and the women were soon converted to his opinion. The questions the women asked were remarkable and varied. They ranged all the way from queries as to the proper size for butlers' pantries to interrogations concerning the high price of putty in New Orleans. Mr. Wingate was both patient and painstaking, however, and tried his best to make everything clear. There is no doubt, too, that the new diversion contains much of practical value to those who enter into it in the proper spirit. The slumming party was nothing more than a gratification of curiosity; the plumbing party provides a capital object lesson in that most important field—domestic science.



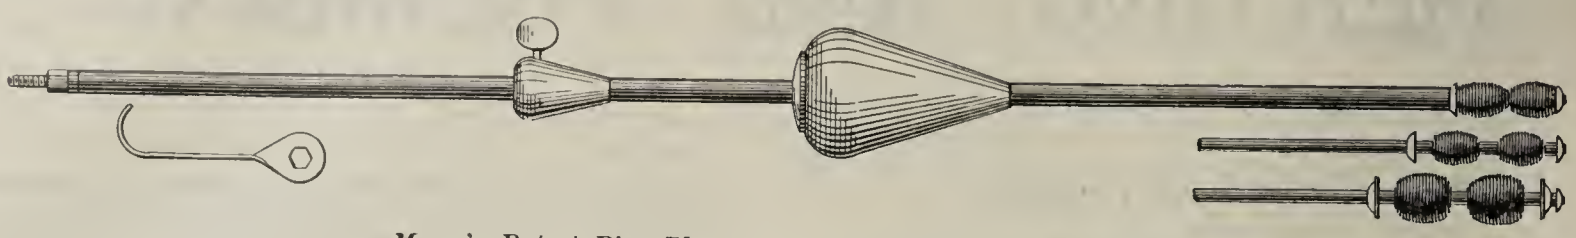


Fig. 3.—Expanding Pipe with Hollow Tampion.

James McCrea & Co., Chicago, Ill., have opened an office at 54 John street, New York, under the management of L. Stary, for the sale of the Climax Steam Clamp Joint. This device is intended for stopping leaks due to faulty threads in pipe or fittings without the labor and expense of taking them out and replacing them.

Moore's Patent Pipe Plug.

In the accompanying illustrations we show Moore's patent pipe plug, made by John F. Moore & Brother, Terre Haute, Ind., with which, it is claimed, a joint in a lead pipe can be made while the pressure is on. In

Moore's Patent Pipe Plug.—Fig. 1.—The Plug for Lead Pipe.

Fig. 1 we present a view of the pipe plug, which consists of a hollow shaft through which a rod passes for expanding the rubber bulb which is placed on the end of the shaft, different sizes of rubber bulbs being supplied for different sizes of pipe. Where a leak occurs in a pipe from any cause and it is necessary to repair the leak without shutting off the water supply, or where there is no provision for shutting off the water supply, it is claimed that by the skillful use of the Moore pipe plug the pipe can be repaired without the workman getting wet. It is suggested that the pipe be cut off with a saw, a cloth being laid over the top of the saw, preventing the water splashing on the workman. As soon as the pipe is severed the plug is inserted in the end, as shown in Fig. 2, and the little wrench shown at the left of Fig. 1 is used for expanding the rubber bulb. After the expansion of the bulb stops the flow of water the hollow tampion can be slipped over the hollow

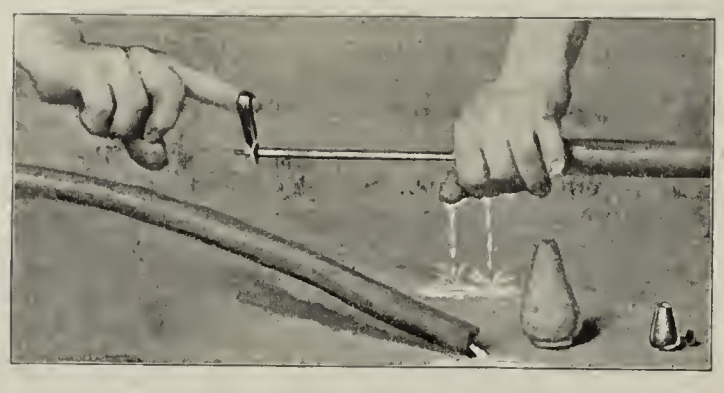

Fig. 2.—Expanding the Bulb After Insertion.

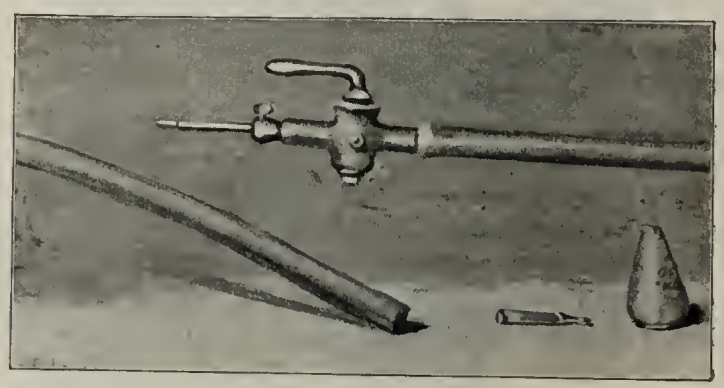

Fig. 4.—Holding the Stop Cock for Wiping.

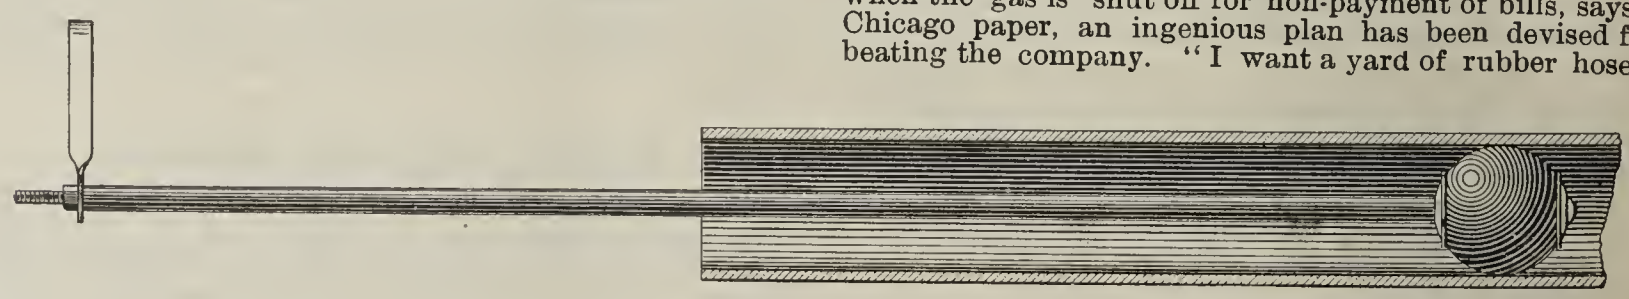
shaft and used for enlarging the end of the pipe to receive the stop cock, as shown in Fig. 3, after which the end of the pipe is prepared for wiping in the usual way. The stop cock is slipped over the shaft and by the use of the thumb screw is held securely in place, as shown in Fig. 4, while the joint is being wiped. Then, on withdrawing the shaft and the rubber bulb through the stop cock, the stop cock can be closed, shutting off the water until the joint is wiped on the other end connecting the pipe and the stop cock, so that a continuous line is made. These plugs have been used in various parts of the United States with great satisfaction to the operators. In Fig. 5 we show the device as used for gas piping. It is pointed out that a workman can sever a pipe, insert the plug, then thread it and make all the necessary connections without the loss of any considerable amount of gas or the danger of asphyxiation. It is of special utility where pipes have been broken through accident in new buildings or in the streets by paving, sewer construction or other municipal improvements. A catalogue giving full instructions for use and pictures of the process of application will be sent to those who write for it.

Now that the gas companies lock the meters in houses when the gas is shut off for non-payment of bills, says a Chicago paper, an ingenious plan has been devised for beating the company. "I want a yard of rubber hose," said a customer in a rubber store the other day. "For gas or water?" was the query. The customer was indignant, but the clerk said afterward that rubber hose was extensively used in making "merry-go-rounds" to obtain



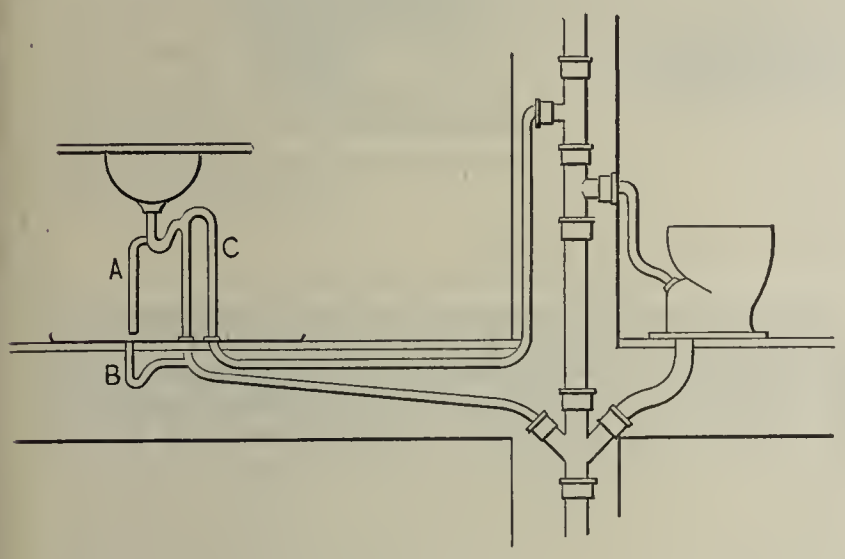


Fig. 5.—The Plug for Gas Pipe.

gas free. As every one knows, gas goes into the meter through one pipe and comes out through another. One end of the rubber hose is attached to the lower pipe and the other end fitted to the upper pipe. Thus the meter is entirely avoided. The gas company estimate that they lost $100,000 in the last year in this manner.

Destroying the Efficiency of a Vent Pipe.

BY J. D.

The plumbing which is done so as to reflect the most credit so far as workmanship is concerned is often so arranged as to entirely frustrate its object, and in some instances the work becomes positively dangerous. I submit herewith a sketch of some plumbing work which I recently found in a building. Owing to the location of the lavatory it was difficult to carry the vent from the trap up and over to the soil stack. In consequence it was taken from the top of the trap and carried down to the floor and run across under the floor to the soil stack, where it rose to a point above the highest fixture and was connected with the soil stack. If this pipe could have been kept clear it might have performed some of the functions of a vent pipe, although the number of turns in it would have added greatly to the friction of air passing and might have prevented an influx of air with sufficient rapidity to prevent the trap of the lavatory being siphoned when the water closet connected with the same stack

Destroying the Efficiency of a Vent Pipe.

was flushed. The workmanship throughout was, however, above criticism.

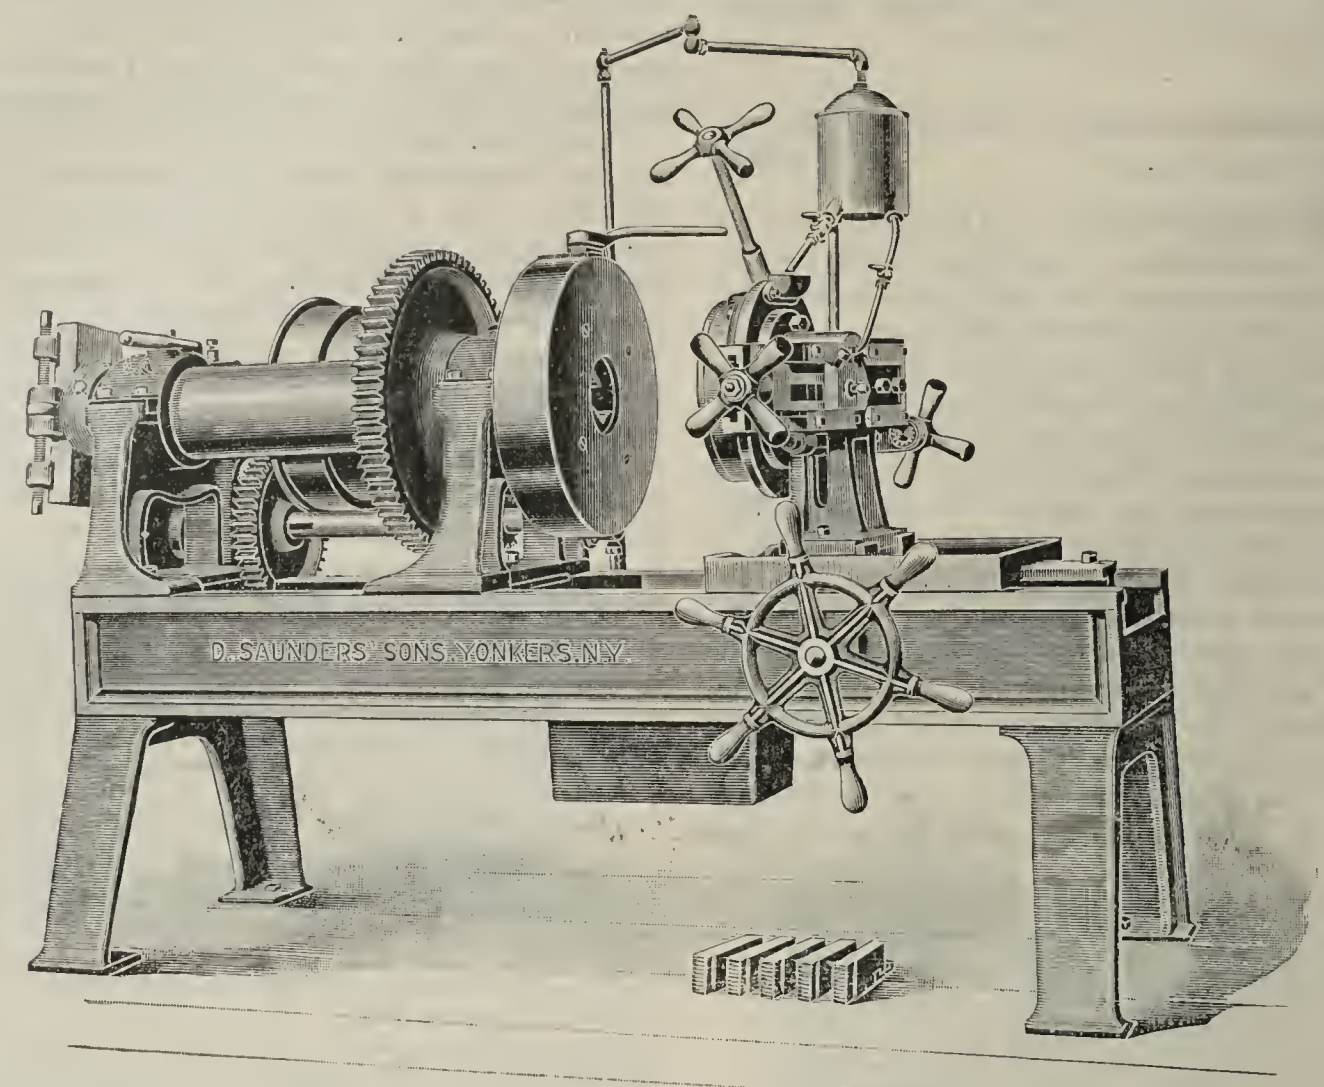
The plumber had also provided a safe waste under the lavatory so that in case it should overflow from any cause instead of flooding the building the water would be caught in the safe waste and pass off. The outlet from the safe waste, however, was a comparatively small pipe arranged with a trap in it and connected with the waste pipe from the lavatory. The plumber had realized that it was possible that the water in the trap at B would be very likely to evaporate and would need replenishing. To provide water in the trap a pipe was connected with the waste in the lavatory as shown at A, so that when the lavatory was discharged some of the water would pass down A into the safe waste and from it to the trap B. He did not realize that by discharging water from the lavatory the trap B would invariably be siphoned and that no water would remain in it, which was the condition that brought this piece of plumbing work to my notice. The odor found in the room was unbearable and my services were sought to remove the cause. On examination I found it to be as shown in the drawing. I disconnected the pipe A entirely and carried a pipe from the safe waste to the kitchen, where I arranged for it to discharge in case of an accident or overflow into the kitchen sink. To prevent odors from the kitchen passing up this pipe I turned the end horizontally at the bottom and placed on it a flap valve which would in no way interfere with the discharge yet would close the end of the pipe and prevent air currents and odors passing through it. The pipe C I found to contain filthy water up to a point 3 inches above the top of the horizontal part, so that it was utterly impossible for air to pass through it to prevent siphonage. I disconnected the pipe entirely and owing to the construction of the building carried this vent pipe up through the building and above the roof independent of any other stack of pipe. I closed the opening in the soil stack to which it had been formerly connected.

The system has now been in operation for some time and the disagreeable odors have disappeared, and when the water closet is discharged it is found that the seal of the trap of the lavatory is no longer affected by the discharge. From the fact that the workmanship in this case was good it shows that it must have been done either by a young man who had yet a great deal to learn about plumbing or by an older workman who had done the work as he was told regardless as to whether it would be sanitary or not. It also points out the advisability, if not necessity, of filing with proper officials a plan of all work that is to be done and an inspection of the work after it is completed. It is safe to say that the plan for such a piece of work would never have been passed by any health official or plumbing inspector, and had the work been examined by an inspector it would have been condemned and the changes which I have made would have been ordered.

The Electro Gas Company.

The Electro Gas Company of New York are having built a plant for the manufacture of all kinds of lamps for the exclusive use of acetylene gas and the cartridges with which they will be charged. This plant is being built on the property of the Niagara Falls Power Company, at Niagara Falls. The building is to be of frame, two stories high and 50 x 100 feet at the foundation. It is understood that the Electro Gas Company are building it for a company that will put the theories and experiments of that company into practical use and introduce them to the public. The cartridges will be made of various sizes to fit lamps for household use, lamps for bicycles, carriages, lanterns, &c. The calcic carbide for loading the cartridges will be obtained from the factory of the Acetylene Light, Heat & Power Company, which stands close by the new plant, and thus all expense of freight will be done away with in carrying the carbide to the new factory. For several months the Electro Gas Company have been experimenting with the carbide cartridges, and all these experiments have been so successful as to cause the company to hasten to get their new product on the market, where it is expected to meet with a satisfactory reception by the people. If the lamps prove as successful as they are predicted to be, they will supplant oil lamps in many homes. The acetylene lamp will be cleaner than one burning oil, and it is said they will be cheaper while giving a much better light with no danger of an explosion. Furthermore, portable lamps burning acetylene will do away with the necessity of piping a house in order to use gas, which of itself will be an item of expense many would be glad to save.

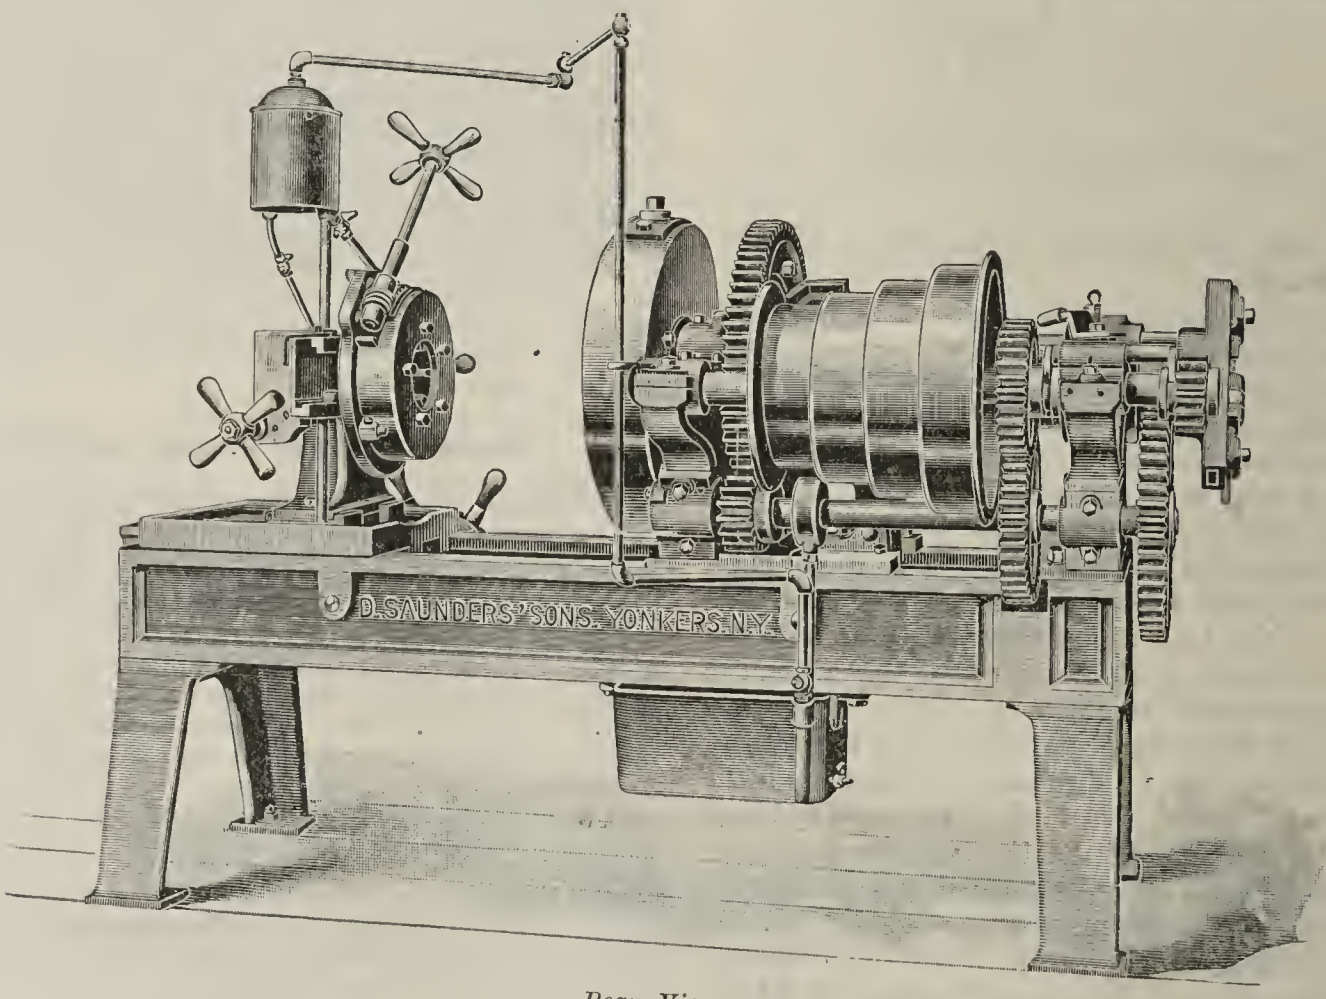
Abendroth Bros.' Boiler Catalogue.



Catalogue No. 20 is just received from Abendroth Bros., 109-111 Beekman street, New York City, bound in maroon covers, with the address of the house on the front cover in gilt and their trade-mark in gilt on the back cover. The catalogue is devoted to the Abendroth sectional hot water and steam boilers. The first page shows a view of their foundries at Portchester, N. Y. The title page is followed by a half-tone engraving illustrating a group of their boilers Half-tone engravings showing broken views of their boilers are interspersed among the desciptive matter. The views give a correct idea of the arrangement of the return flues and the fire travel. The descriptive matter is followed by tables giving full dimensions and data and ratings of the various boilers. Some useful information is included in the catalogue in reference to the sizes of the mains, method of figuring radiation for heating buildings and also for heating greenhouses. The last two pages of the book are devoted to the Little Gem hot water heater, adapted for supplying hot water for hotels, apartment houses, laundries, &c. The catalogue is accompanied by a circular devoted to the O S distributing fitting for hot water work, made by Oliver Schlemmer of Cincinnati, Ohio.

The Judson A. Goodrich Company, 228 Water street, New York, are displaying in their show window some of their high grade steam specialties. A Pump Governor and a Reducing Valve of large size attract considerable attention.

The Saunders Pipe Threading and Cutting Machine.



The belting and gearing of the improved pipe threading and cutting machine built by D. Saunders' Sons, Yonkers, N. Y., have been arranged with the view of obtaining suitable power and speed for the various sizes of pipe.

The die head, shown in place on the machine, is of the adjustable expanding style, operated by cam movement, to open and close the chasers. The die head and head to which it is attached are so constructed that pipe may be alternately threaded and cut off without removing the die head from the machine. The die head, being on front of the cutting head, can be brought close to the gripping chuck, and short pieces of pipe may be threaded. This advantage often saves the use of a nipple socket. When the pipe is to be moved to adjust it for cutting off the die head is pushed to one side on ways, allowing the pipe ample room to pass through the cutting head without passing through the die head, to the injury of the chasers by sliding the pipe over them, which is the case when the die head is held stationary in the center of the ways of the machine.

The Saunders Pipe Threading and Cutting Machine.—Front View.

The No. 3 machine has two die heads, one threading ¼ to 2 inches, the other 2½ to 3 inches. The No. 4 also has two die heads, one threading 1 to 2 inches, the other 2½ to 4 inches. By having two there is less changing of the chasers, loss of time in changing and less cost for extra chasers for the small sizes. When the small die head is used the large one is pushed to one side, allowing ample room for the small die head to be brought to the center. The large die head remains on the machine. The cutting off tool is conveniently placed. Two hardened steel V jaws, self centering, are used for steadying the pipe while cutting it off. They are operated by a hand wheel and right and left hand screw, centering the pipe.

Rear View.

The universal gripping chuck for holding the pipe is strong and well fitted. On the rear of the spindle there is a self centering two-jawed chuck for steadying the pipe. An automatic oil pump is attached to keep a constant flow of oil on the chasers and cutting off tool.

Peck Bros. & Co.

Peck Bros. & Co., New Haven, Conn., are again in possession of their large plumbing goods manufacturing plant. At the receiver's sale on March 2 a representative of the stockholders bid $265,500 and secured the plant and assumed the unpaid claims that had not been disposed of by the receiver. The friends of the house will be glad to learn that the management of their affairs is again in their own hands and will join us in wishing them a prosperous future.

Massachusetts Plumbing Inspectors.

Thirty members of the Massachusetts Association of Plumbing Inspectors were present at the quarterly meeting held at the Quincy House, Boston, Mass., on Tuesday. Dinner was served at 2 o'clock, previous to which a business meeting was held, at which the president, D. F. Callahan of Marlboro, was in the chair. Interesting papers on "Sanitary Plumbing" were contributed by John F. Bresnahan of Fitchburg and Henry H. Wilcox of Taunton, and these were followed by a general discussion on plumbing laws.

Another matter that came up for consideration was the advisability of forming a New England Association of Inspectors of Plumbing. Most of the New England States have State associations, and there has been more or less talk about the formation of an association which will be composed of all the different State organizations. This matter will probably be brought to a head at a meeting to be held at Worcester some time in June.

A Chicago Consolidation.

Peck Brothers Company, 65 Market street, Chicago, jobbers of plumbing supplies, have purchased the business of the Lehner, Johnson, Hoyer Mfg. Company, 68 to 74 West Monroe street, Chicago, manufacturers of brass goods and also jobbers of plumbing supplies. The consolidated business of these two houses will be conducted under the name of Peck Brothers Company. It will be arranged so that the jobbing trade will be handled at 65 Market street, and the West Monroe street house will be used only for manufacturing. The Lehner, Johnson, Hoyer Mfg. Company have been running a branch store at 4736 South State street, Chicago, and it will be continued at least until May 1. Peck Brothers Company have an exceedingly attractive store at 65 Market street, with not only ample space, but fine opportunities for displaying goods. They will take a much more prominent position in the trade hereafter, through their control of a manufacturing department. The officers of the company are as follows: President, O. D. Peck; vice-president and factory superintendent, J. H. Johnson; general manager, A. D. Sanders; secretary and treasurer, W. A. Radcliffe.

Catalogue of Roberts Machine Co.

We have received through the courtesy of Vice-President George B. Cobb of the Roberts Machine Company of Collegeville, Pa., a copy of their latest catalogue in reference to the Roberts safety steam and hot water heaters. The first 15 pages contain an interesting treatise on what a house heating boiler should be. This is followed by detailed descriptions and cuts of their round self feed and also surface burning boiler and their vertical sectional boiler. Sectional views are used showing the construction. A special view shows the method of making a joint between two castings of the Roberts boilers. Tables are presented giving the grate surface, fire surface and flue space contained in their boilers, together with dimensions which are necessary to the heating contractor. The last pages are devoted to thermometers, expansion tanks, automatic water feeders, dampers, regulators, gauges and fittings for use with the upright boilers for connecting a number of heating mains. Accompanying the catalogue is a sheet giving a number of testimonial letters from those who have used Roberts boilers with gratifying success.

H. Gilbert Hart of the Hart & Crouse Company, Utica, N. Y., was in New York this week and visited W. M. Mackay, manager of their steam and hot water department, at 235 Water street.

Pennsylvania Association of Master Plumbers.

On Tuesday, March 15, 1898, at 9 o'clock a.m., in the hall of the Monongahela House, corner Smithfield and Water streets, Pittsburgh, Pa., will convene the fourth annual convention of the Pennsylvania Association of Master Plumbers. Former conventions of this association have proven deeply interesting, not alone to plumbers of Pennsylvania, but to all plumbers throughout the land, and this convention promises to be no less interesting than any that have preceded it.

NOTES.

Fred. C. Worthington, Westfield, Mass., has purchased the plumbing and gas fitting business of George H. Farrell.

A bicycle man of Oakland, Cal., who is expert in repairing punctures in tires, has, it is reported, been arrested for violating the plumbing regulations in repairing the punctures in the various pipes of a plumbing system in a residence.

S. Stille, Escanaba, Mich., is exhibiting in his plumbing establishment the Ransom Gas Machine, which is adapted for lighting residences and other buildings with a gas generated from gasoline.

The city of Chicago has been non-suited in an attempt to collect a fee for inspecting a low pressure house heating boiler. The city will sue again, and the owner, it is said, will carry the case to the Supreme Court.

L. P. Smith, Camden, N. Y., has added a tinning and plumbing department to his hardware business and has secured the services of C. M. Nesbit of Hammond, N. Y., who has already begun work.

W. H. Coopman, for some years past advertising manager for the Ahrens & Ott Mfg. Company, Louisville, Ky., resigned his position March 1, and is succeeded by W. B. Gray, formerly associate editor of *The Sanitary Plumber* and well known for his contributions on plumbing topics to the trade press.

At the regular weekly meeting of the Master Plumbers' Mutual Protective Association of Baltimore, Md., a constitution and by-laws were adopted. It was stated that arrangements were completed whereby the members of the association can buy their materials at wholesale prices on the co-operative plan, the members agreeing not to patronize the Baltimore dealers.

On recommendation of the Examining Board of Plumbers, the Board of Administration of Cincinnati, Ohio, has granted master plumbers' licenses to John Ring, E. H. Mueller and James McIntyre.

A. J. Marks has opened a plumbing shop at 315 Cambridge street, East Cambridge, Mass. Mr. Marks will also carry a full line of Hardware.

A fire doing a damage of $3000, covered by insurance, visited the plumbing establishment of H. H. & S. H Avery, at Jackson, Mich., last week.

F. W. Sleep of Thomas G. Oakes & Co., 54 John street, New York, has recently returned from a visit to the factory at Greensburg, Pa., where their line of Acorn Valves are made.

C. M. Lyman, one of the salesmen of Russel Wheeler & Co., Utica, N. Y., visited the heating trade in New York this week in the interest of the Palace King and Palace Queen line of Hot Air Furnaces and Steam and Hot Water Heaters.

The R. T. Connell Plumbing Company were sufferers from fire in the Badger Block, at St. Joseph, Mo.

Jacob Taylor has opened a plumbing shop in Sweney Building, Chester, Pa.

The Boston house of the Henry McShane Mfg. Company, Baltimore, Md., had a fire doing $200 damage on Tuesday morning.

Chas. M. Cantieny and Elmer Tuttle have purchased the shop of W. B. Chaney & Son, Lima, Ohio. The new firm will be known as Cantieny & Tuttle.

Edward R. Monihan, representing Robt. K. Story, 44 Centre street, New York, is finding an increasing demand for the Detroit Valves and the Marsh Air Valves and Illuminated Gauges with the opening of the spring trade among the fitters.

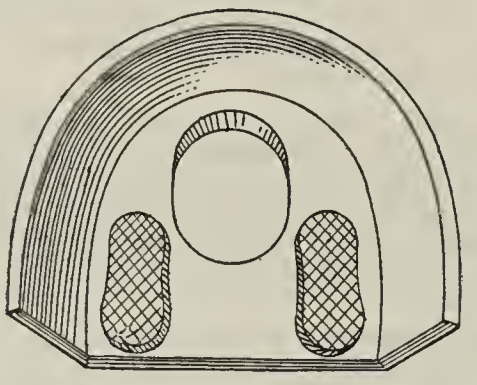
March 16 has been set as the date for the holding of the convention of the steam fitters of the State of Connecticut, of which previous notice has been made in *The Metal Worker*.

F. W. Wagner, 313 South Clinton street, Syracuse, N. Y., celebrated Washington's Birthday by having a small conflagration in his plumbing shop.

John E. Harbison, who has been the Plumbing Inspector of Schenectady, N. Y., ever since the office was created, has turned over his office to his successor, Lewis Friday. Mr. Harbison has associated himself with John Hill of the Albany Business School, and will soon open a plumbing store at 16 Central Arcade.

The plumbing shop of McCaffery & Sturrock has moved to 110 Stevens street, Spokane, Wash.

The Master Plumbers' Association of Pittsburgh, Pa., is arranging for a general meeting and banquet on March 15. The committee rooms and banquet hall of the Monongahela House have already been engaged.



Robert T. Rock, Plumbing Inspector of Bridgeport, Conn., has resigned his position.

The Samuel I. Pope Company, contractors for steam and hot water heating, Fifth avenue and Jackson boulevard, Chicago, made an assignment February 25 to Albert M. Eddy. The assets and liabilities are given at $15,000. The company were one of the oldest in the city. Samuel I. Pope is president, and William A. Pope secretary and treasurer. Most of the company's work has been in large buildings. It is said the company will probably be reorganized.

Sanitary Fixtures in the Levant.

The primitive character of the sanitary appliances in the domain of the Sultan is related as follows by a correspondent of the London *Ironmonger:*

The sanitation of the Near East is at present in a very elementary condition, but a steady progress is made toward better things, and with it has come a growing demand for English water closets and iron flushing cisterns—articles in which British makers are easily ahead of all others. In the European quarters of the cities of the Levant English water closets are now generally used,

Sanitary Fixtures in the Levant.

but a certain drawback to their application is the frequent absence of any sewage or drainage system. Cairo, for example, has a population of 600,000, comprising a large proportion of Greeks, Italians and other Europeans. It has magnificent hotels, splendid palaces, electric tramways, modern gas plant and water works. Yet Cairo is as devoid of drainage as the neighboring desert. Many schemes have been propounded, and a few years ago an eminent British expert (Baldwin Latham) was invited by the Egyptian Government to investigate the Cairian drainage question on the spot. So far, however, nothing has been done beyond "studying the problem," though it is clear that it must ere long be taken in hand seriously. When that time comes there will be some good contracts for drain pipes, manhole covers and so on. But the day is not yet.

The closets most in use in Moslem countries—Egypt, Algeria, Tunis, Morocco, Turkey, and even in Greece—are of the kind known to some English makers as the *siège Turque*, and shown in the accompanying illustration. In a Moslem house the seat of the closet (if I may use that term, for it is not really used for sitting down upon) is raised only a few inches above the floor. The pan is placed in the center and let in so that its rim is about flush with the seat.

The pans in question are made of cast iron, enameled inside. They are of the usual hopper shape, but are fitted at the bottom with a self closing valve intended to prevent the foul air from escaping. An iron weight balances the valve back into its normal position after it has been forced down by the weight of the soil, thus always keeping the bottom of the pan closed when it is not in use. It is customary for the user to flush these pans with a pail of water at hand for the purpose.

All the pans of this kind used in the Mediterranean countries are made in France or Alsace-Lorraine. I believe that this is an article in which British iron founders could compete. As the law of the Koran is very explicit in its details concerning personal cleanliness, it is improbable that the *siège Turque* and its accompanying pan will ever be superseded by earthenware closets with wooden seats.

The town houses are built entirely on the flat system. They have no yards or gardens, so that all the closets are indoors. And, as a rule, by some strange perversity on the part of the builder the closet is placed as near to the kitchen as it can be put.

In Cairo and other undrained towns there is beneath every block of buildings a large cesspool into which the night soil finds its way through an iron pipe about 6¼ inches in diameter. Even where a sewage system does exist pipes of the same kind are used for connecting the closets with the sewer. The demand for them is therefore very large. They are made in Belgium, and are much lighter than Scotch pipes of the same description, weighing only 21 kg. per meter for a diameter of 16 cm., which equals a weight of 42 pounds 5½ ounces per yard of 6 5-16 inches in diameter. The makers' price is 126 francs per 1000 kg. (equal to 99 shillings per ton), delivered f.o.b. Mediterranean port. The business is worth having so far as the quantity turned out is concerned, and if the Scotch makers once secured it I fancy they would keep it, too, because in the heavier rain water pipes the Belgians cannot touch them.

Plumbers' brass foundry calls for little comment. So long as British water companies remain so exacting in their requirements as they are now the standard of such work turned out in Britain will be higher than is required in foreign parts, and all that needs be done to secure Egyptian business is for cock founders to turn out a specially light and cheap article for exportation only. The baths used in Mediterranean countries are generally made locally, but the few that are imported all come from Great Britain.

SCRAP.

In an article on the development of metal stamping prepared by Oberlin Smith for the *Engineering Magazine* there is a sentence containing incidental advice to Tin Plate makers. The writer refers to cuts illustrating well-known forms of can tops and bottoms "which certainly," he says, "are not unique," and any one of which a modern press run by a girl will produce from the sheet at the rate of from 10,000 to 20,000 a day. Were the Tin Plate of which they are composed made as it ought to be, and as inventive ingenuity will soon enable it to be, in long reeled up strips instead of small square sheets, these presses could be automatically fed and the articles produced at a much more rapid rate.

A Dutch journal gives a forecast of how long Tin mining will last in the islands of Banka and Billiton. During the last 16 years Banka yielded a yearly average of about 2500 tons of this metal. Borings show that this output may last over 30 years without any marked falling off. Billiton's Tin resources, with a yield of about 2000 tons yearly, will only last four years.

It is rumored that the New Castle Steel & Tin Plate Company, New Castle, Pa., will soon place contracts for ten more tin mills. This would give the concern the distinction of having the largest single Tin Plate plant in the world.

The two-mill plant of the Johnstown Tin Plate Company, at Johnstown, Pa., is making good progress toward completion. The buildings are about finished and the machinery is being rapidly put in place. It is expected that the works will be in operation early next month.

B. M. Decker has been appointed manager of the Irondale Steel & Iron Company's Tin Plate plant, at Middletown, Ind., in the place of Ambrose Beard, Jr., who recently accepted the position of superintendent of the Star Tin Plate Company's mills, at Pittsburgh.

The United States Iron & Tin Plate Mfg. Company, Demmler, Pa., makers of tin and terne plate, will make some important improvements and large additions to their plant. They will install five new hot mills, squaring shears and other additional equipment.

The employees of the National Tin Plate Company, Monessen, Pa., and of the Baltimore Iron, Steel & Tin Plate Company, Locust Point, Baltimore, have been organized into lodges of the Amalgamated Association.

G. W. Graves, Rochester, N. Y., stopped in New York this week returning from Boston, where he attended a meeting of the gas engineers. Mr. Graves says the prevailing opinion was in favor of lower prices for gas. This he expects will increase the use of gas for fuel and will have a beneficial effect on the sale of National Gas Stoves, made by the National Vapor Stove & Mfg. Company, for whom he is the Eastern representative.

THE RETAIL STORE.

INDIANA RETAIL HARDWARE DEALERS' ASSOCIATION.

The Indiana Retail Hardware Dealers' Association held their annual meeting last week at South Bend. The weather was unfavorable and probably for that reason the attendance was not up to the expectations of the officers. Nevertheless a good representation of the membership was on hand to learn what progress had been made during the year and to encourage the leaders in the work of organization.

The meetings were held in the gymnasium of the Commercial Athletic Association, which had been kindly placed at the disposal of the Hardwaremen and proved to be well suited for the purpose.

President George E. Nichol of Nichol, Makepeace & Co., Anderson, called the opening session to order at 2.30 p.m. on Wednesday afternoon. After some remarks on the objects and aims of the association and the evident benefits to be secured by the Indiana retail Hardware merchants through an organization of this character, he called for the report of the secretary, M. L. Lewis, of the Marion Hardware Company, Marion.

Mr. Lewis made a statement of the work done during the year, mainly in the direction of securing new members, and read a number of letters from Hardware dealers expressing their cordial sympathy with the movement.

Charles F. Bock of Battle Creek, Mich, president of the Michigan Hardware Association, being present, was called upon to address the convention and gave much interesting information relative to the work which had been accomplished by the organization in his State.

Among other things he alluded to the passage of an amended lien law, which had long been needed, but had not been secured until the Hardware merchants took up the question and pressed it to a successful conclusion.

After some discussion of methods of securing a larger membership the following committee was appointed to consider the various plans suggested and to formulate a practical scheme to be submitted to the convention at a later session : E. C. Minas of Hammond, M. L. Corey of Argus, J. C. Shanklin of Frankfort and Irving A. Sibley of South Bend.

At the evening session Mr. Sibley presented the special committee's report, recommending the appointment of a good canvasser to visit the retail Hardware dealers of the State for the purpose of inducing them to join the association, also setting forth a plan by which the canvasser would be remunerated for his services. The report of the committee was agreed to after some discussion.

The election of officers for the ensuing year was then held, which resulted in the following choice :

President, Geo. E. Nichol of Nichol, Makepeace & Co., Anderson.

Vice-president, Geo. W. North of Columbia City.

Secretary and treasurer, M. L. Lewis of the Marion Hardware Company, Marion.

Executive Committee: Irving A. Sibley of South Bend and Sharon E. Jones of the Jones Hardware Company, Richmond.

Two members of the Executive Committee hold over for another year—namely: J. C. Shanklin of Shanklin & Coulter Frankfort, and H. H. Taylor of Taylor Bros., Elwood.

The president, vice-president and secretary are also members of the Executive Committee. They were unanimously re elected.

The convention elected the following Investigating Committee to adjust complaints and grievances : O. E. Lang of O. E. Lang & Co., Mishawaka ; M. L. Corey of Corey & Stevens, Argus, and Charles B. Frame of D. Frame & Son, North Manchester.

After the election of officers, speeches were made by some of those who had been favored, and much enthusiasm was displayed in support of the objects of the association.

This was increased in a discussion introduced by Mr. North on the line of action to be taken relative to department stores and manufacturers selling to consumers. Messrs. Sibley, Corey, Lewis and others took strong ground against manufacturers selling to consumers precisely the same classes of goods on which they are soliciting trade from the retail Hardware merchant.

No radical action was taken relative to department stores, notwithstanding the annoying competition to which a number of the members stated they were being subjected.

Experiences of an interesting character were narrated relative to methods employed in meeting the irregular competition from various sources.

Mr. North told how he had turned to his own advantage a raid of Steel Range peddlers in his vicinity. Finding that they were traveling among the farmers, trying to sell Ranges at $65 or $70, he immediately sent out circulars and advertised in the local papers that he could sell equally good if not better Ranges for $36 to $40. The result was that, while the peddlers sold but one or two, he sold quite a good number of them to people who had their interest in Steel Ranges awakened by the discussion of the subject.

The next place of meeting will be Indianapolis, and probably some time in July, the exact date to be fixed by the Executive Committee.

Retail Stove Merchants' Protective Association.

Through the courtesy of Secretary M. Koch we present the following account of the last meeting of the Retail Stove Merchants' Protective Association of St. Louis, Mo., held February 23:

The present membership, which includes only legitimate one-line merchants, is 75, and there was a full attendance at the meeting. After disposing of the regular business it was decided to have an entertainment for the members at the next regular meeting, to be held March 9. All dealers in good standing who are not members are invited to attend. Music and literary entertainment will be provided, and good speakers will address the members on the benefits of association and the rights of dealers. Refreshments will also be served. The call and invitation are signed by the president, G. A. Pauly, and secretary, M. Koch.

North Dakota Retail Hardware Association.

Besides the proceedings reported in our last issue the North Dakota Retail Hardware Association at their meeting in Fargo on the 16th ult., passed a resolution to the effect that the secretary shall keep a record of any inquiries that may come to his notice of tinners, clerks, bookkeepers and the like who are looking for situations in Hardware stores, and that this information shall be given to any association members looking for such help. The following is the full list of officers elected for the ensuing year : President, Clark W. Kelley, Devil's Lake ; vice-president, C. F. Jacob, Hillsboro ; treasurer, H. N. Joy, Hamilton ; secretary, C. N. Barnes, Grand Forks. Executive Committee : W. R. McIntosh, Bottineau ; H. Harrington, Fargo ; H. B. Allen, Jamestown ; I. L. Newgard, Grafton ; H. L. Eastman, Wahpeton ; A. J. Smith, Fessenden ; W. H. Pinkerton, Lakota.

Combination Churn and Ice Cream Freezer.

The accompanying cuts relate to the duplex butter churn and worker and Klondike ice cream freezer, put on the market by the Duplex Mfg. Company, 221-223 East Second street, Cincinnati, Ohio. The machine is referred

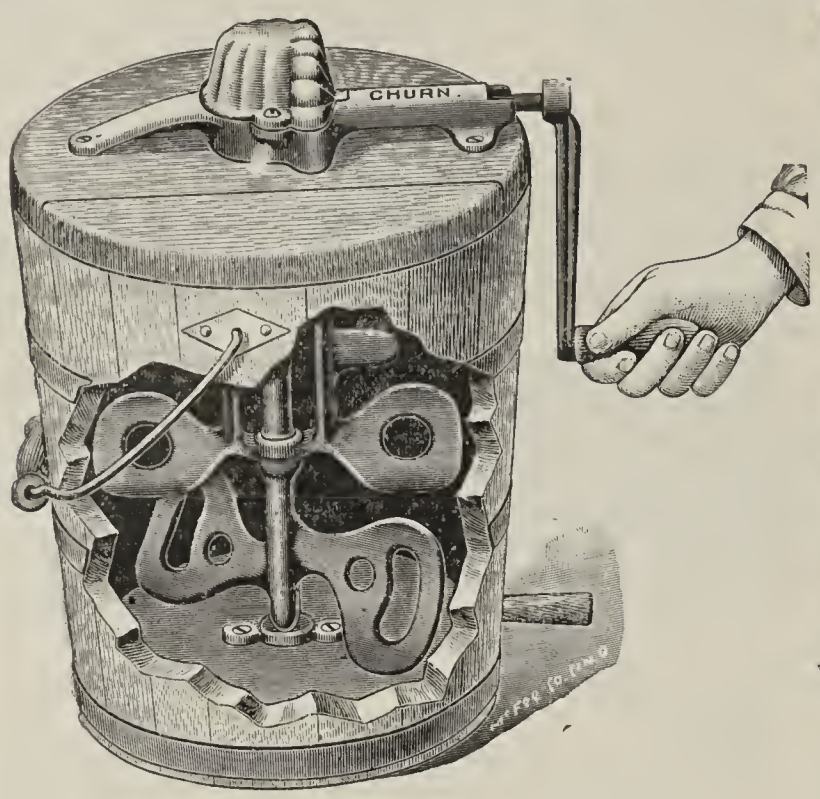


Fig. 1.—The Duplex Churn.

to as rapid, easy and perfect in operation and readily cleanable. The combination is furnished with an extra metal cylinder, which being substituted in a moment for the dasher of the churn transforms it into an ice cream freezer, thus combining a freezer with a churn in one machine. All material in their construction, it is remarked, is of the best. The dasher is made of malleable iron, the

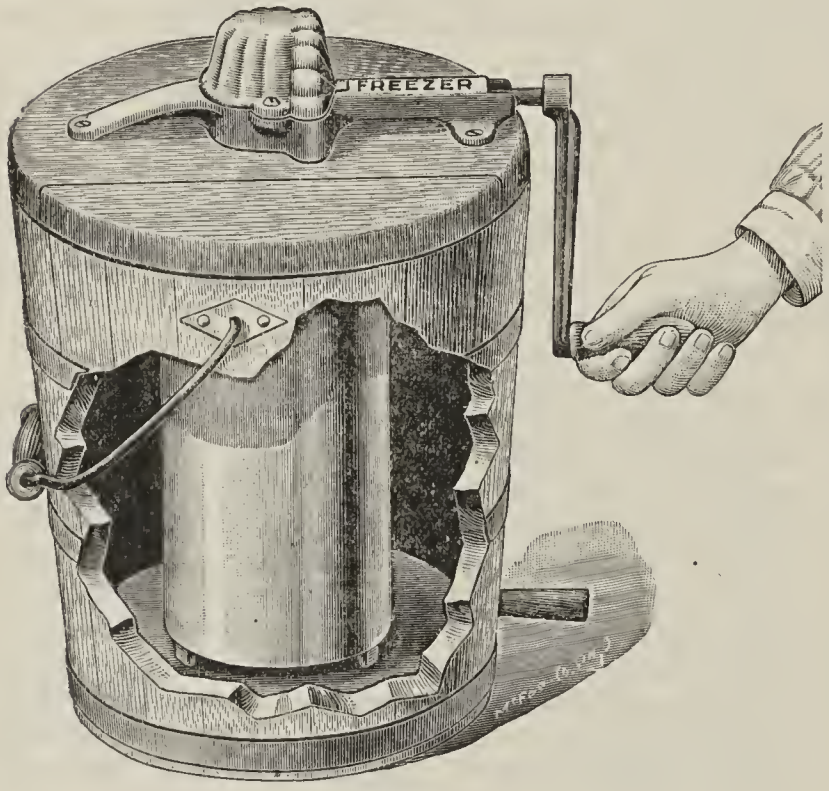

Fig. 2.—The Klondike Freezer

gearing and covers of cast iron, all thoroughly and heavily tinned and galvanized to entirely prevent rust or acids affecting the working parts of the machine. Among the advantages claimed for the apparatus is that it will produce more and sweeter butter from a given amount of cream than any similar device, because of the special design and construction of the dasher, which has a double motion. The manufacturers state that the machines will be made in the usual sizes.

The Leonard Water Cooler.

A new idea of the Grand Rapids Refrigerator Company, Grand Rapids, Mich., is the Leonard cabinet water cooler, which is herewith illustrated. It is constructed of solid ash, and is 49 inches high, 23 inches long and 17 inches deep. It is built like the Leonard refrigerator, being filled with mineral wool. The special features of this water cooler are well shown in the sectional cut. The water tank A holds 5 gallons and is porcelain lined, so that the water will be kept pure and clean for drinking. The pipe B is made of pure tin. It is coiled across the bottom of the ice chamber and submerged in the meltings of the ice C, so that water drawn through the pipe at the faucet above the tumbler is thoroughly cooled without contamination from the ice water. A pipe leads from the tumbler drainer into this compartment

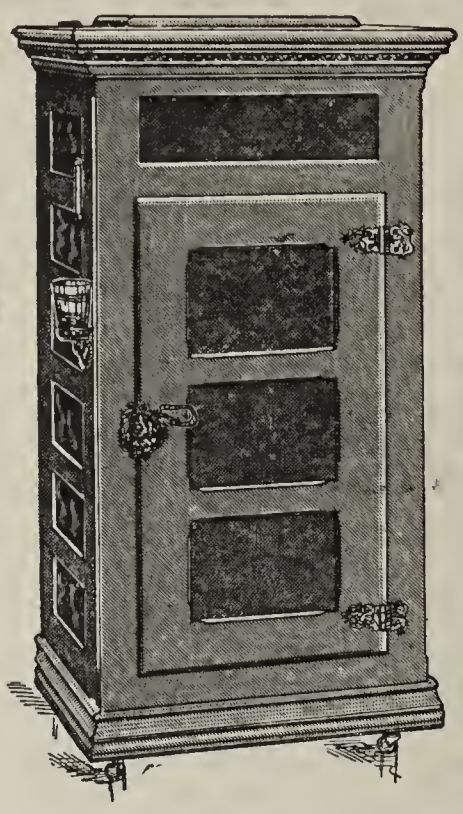

Fig. 1.—The Leonard Cabinet Water Cooler.

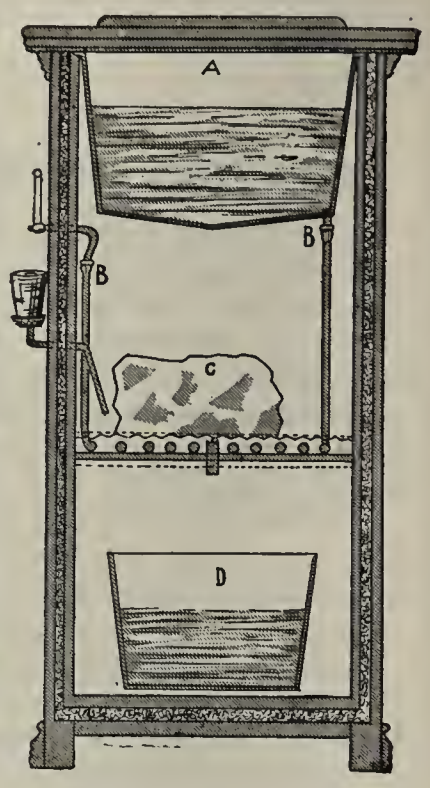

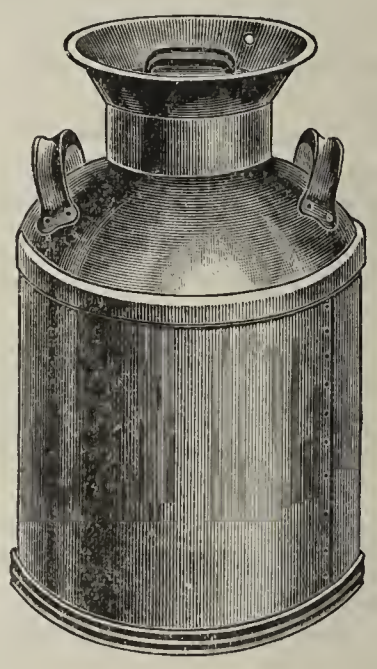

Fig. 2.—Sectional View of Cooler.

enabling the tumbler to be emptied without having an unsightly slop pail exposed. The ice compartment is a very convenient place in which to cool beverages in bottles. All the slops and melted ice water overflow into the pail D. No matter how dirty the ice may be, the drinking water will be pure and cold. The cooler has a lock and key.

The Milwaukee Railroad Milk Cans.

Kieckhefer Brothers Company, Milwaukee, Wis., are manufacturing a new line of milk cans named the Milwaukee railroad cans, of which the Iowa pattern is herewith illustrated as a sample to show the construction. The breast is double seamed to the body, the company claiming to have been the first manufacturers to adopt this method of manufacture. The neck and the bowl are stamped from one piece of metal, and the neck is then double seamed to the breast, which is also a new idea. These cans are retinned after they are completely made up, and the claim is also made that the company named are the only manufacturers of milk cans who do this.

The Iowa Pattern Railroad Milk Can.

Being retinned after manufacture, the cans are perfectly smooth on the inside, with no grooves or cracks for the dirt to accumulate. Three patterns are made—namely, Iowa, St. Louis and New York, with noiseless drop handles. The company make a heavier line of cans known as the Wisconsin railroad cans, equal to the heaviest on the market.

W. S. Crouch, dealer in Hardware, Stoves, Tinware, &c., Merrill, Iowa, has sold out his business to J. C. Button of Akron, Iowa.

THE OHIO HARDWARE ASSOCIATION.

Fourth Annual Meeting.

The fourth annual meeting of the Ohio Hardware Association was held at Columbus on Wednesday and Thursday of last week. At 2 o'clock on Wednesday afternoon J. P. Duffey of Greenville, president of the association, called the gathering to order. The president in his opening remarks stated that the association was to be congratulated that during the year 1897 they had lost no members by death, but that since the dawn of the new year they had to record the passing away of Messrs. Stone of Urbana and Gillum of Chillicothe. Appropriate resolutions had been offered and engrossed at the time by the Executive Committee.

The president noted the increase of membership for the year, referring to the fact that the association now contained the names of many of the best firms of the State.

Report of Secretary-Treasurer John F. Baker, was read, covering the minutes of the last year, the work accomplished and the results obtained in correction of grievances—a satisfatory adjustment or promise of adjustment being made in each case.

There being no salaried officials, the financial report showed no large depletion of the funds.

At the meeting of last year membership was increased from 43 to 65, with indications of a much larger roster before the close of this meeting.

For the good of the membership during the year the secretary wrote some 300 letters, giving some idea of the importance of the work at issue.

Members Present.

E. E. Barch, Elyria, Ohio.
Lion Hardware Company, Springfield, Ohio.
Huyett & Hill, Columbus, Ohio.
W. H. Angle, Piqua, Ohio.
C. B. Horner, Bellefontaine, Ohio.
H. Ronus, Dayton, Ohio.
C. E. Smith & Co., Malta, Ohio.
J. M. Martin, McComb, Ohio.
W. F. White, Shelby, Ohio.
Geo. Ash, Carey, Ohio.
E. G. Laughlin, Carey, Ohio.
Weibling & Patrick, Westerville, Ohio.
Wheaton & Cockrell, Sunbury, Ohio.
H. G. Woodward, Sidney, Ohio.
F. R. Ruhl, Bucyrus, Ohio.
E. Speasmaker, London, Ohio.
F. W. Ingalls, Bryan, Ohio.
M. V. Marquis, Bellefontaine, Ohio.
T. J. Morris, Lima, Ohio.
W. P. Scott, McConnellsville, Ohio.
L. F. Stahler, Waverly, Ohio.
H. A. Harger, Canal Dover, Ohio.
J. J. Ewing, Lima, Ohio.
G. V. Guyton, Ada, Ohio.
Jas. A. Bell, Roscoe, Ohio.
G. M. Gray, Coshocton, Ohio.
Adam Strome, Warsaw, Ohio.
F. H. Campbell, Bloomdale, Ohio.
J. M. Guiss, North Washington, Ohio.
Howard Killen, Plain City, Ohio.
Geo. Connette, Athens, Ohio.
John F.Baker, Dayton, Ohio.
J. P. Duffey, Greenville, Ohio.
O. M. Scott, Marysville, Ohio.
J. W. Brown, Washington, Ohio.
Frank Harrison, Toledo, Ohio.
J. M. Pierson, Greenville, Ohio.
B. M. Clark, Gettysburg, Ohio.
W. C. Bale, Westerville, Ohio.
A. L. Ennis.
C. C. Foutz, Middletown, Ohio.
E. L. Weuland, McComb, Ohio.
H. C. W. Seaman, Springfield, Ohio.
Frank Winter, Lancaster, Ohio.
E. W. Kalb, Bellefontaine, Ohio.
W. P. Bogardus, Mount Vernon, Ohio.
Doyle & Lee, Caledonia, Ohio.
A. Augsberger & Co., Kenton, Ohio.
Fred. Haberman, Marion, Ohio.
A. D. Hogendobler, Osborn, Ohio.
W. J. Conrad, Marysville, Ohio.
W. B. Tallmadge, Mount Gilead, Ohio.
W. A. Remy, Mansfield, Ohio.
H. A. Cosley, Troy, Ohio.
G. B. Hatfield, Troy, Ohio.
A. J. Ross, Bowling Green, Ohio.
M. A. Griffith, Madisonville, Ohio.
H. C. Mylander, Oak Harbor, Ohio.

After the president's address and the secretary-treasurer's report routine business was taken up. The manner of disposal of grievances, the letters in connection, the causes leading up to them, &c., were given in full to the members, followed by the reading of the resolutions of '94, covering the pledges made at that time and since, concerning the relations of manufacturer, jobber and consumer with the retailer.

Notice was given of the opening of a Question Box for the session of Thursday and a committee appointed for selection of questions and classification for discussion in the order of their value to the association.

Payment of dues for the coming year, by those now members and those expecting to become such, created great enthusiasm because of the numerous additions to the membership, some 20 new names being added at this session, others being expected before the close of the convention.

The subjects for the members appointed to read papers at this meeting were of their own selection and not those of the committee, as in other years. H. C. Wiseman of Springfield read the first paper, his subject being "The Progressive Hardware Merchant." Mr. Wiseman presented a comparison of the past and present of Hardware, with a hopeful and prophetic outlook for its future, suggesting methods and means of advancement, and soliciting interest among all for the betterment of the standard of men in the business, of employees, and the elevation of the plane of the business itself.

"Silent Salesmen," the subject of the next paper, which was read by Fred. Haberman of Marion, was an extremely unique and happy one. He brought out much in his subject that should be of great value to merchants, numbering among his silent help the cleanly and attractive showcase, the ever changing show window, the proper sampling of goods, the well swept and properly arranged store, the showy front, the well printed or engraved stationery—all these and more as salesmen—silent yet valuable—their service never ending.

Next a paper was read by W. A. Remy of W. A. Remy & Co., Mansfield, Ohio, on Does Advertising Pay the Retail Hardware Dealer?

Discussion followed on subjects suggested by various members, and subsequently committee reports, after which adjournment was had until time for the banquet, which was served in the ordinary of the Chittenden, to a large attendance of not only the members, but the Hardware friends of Columbus and a goodly number of traveling salesmen invited for the occasion.

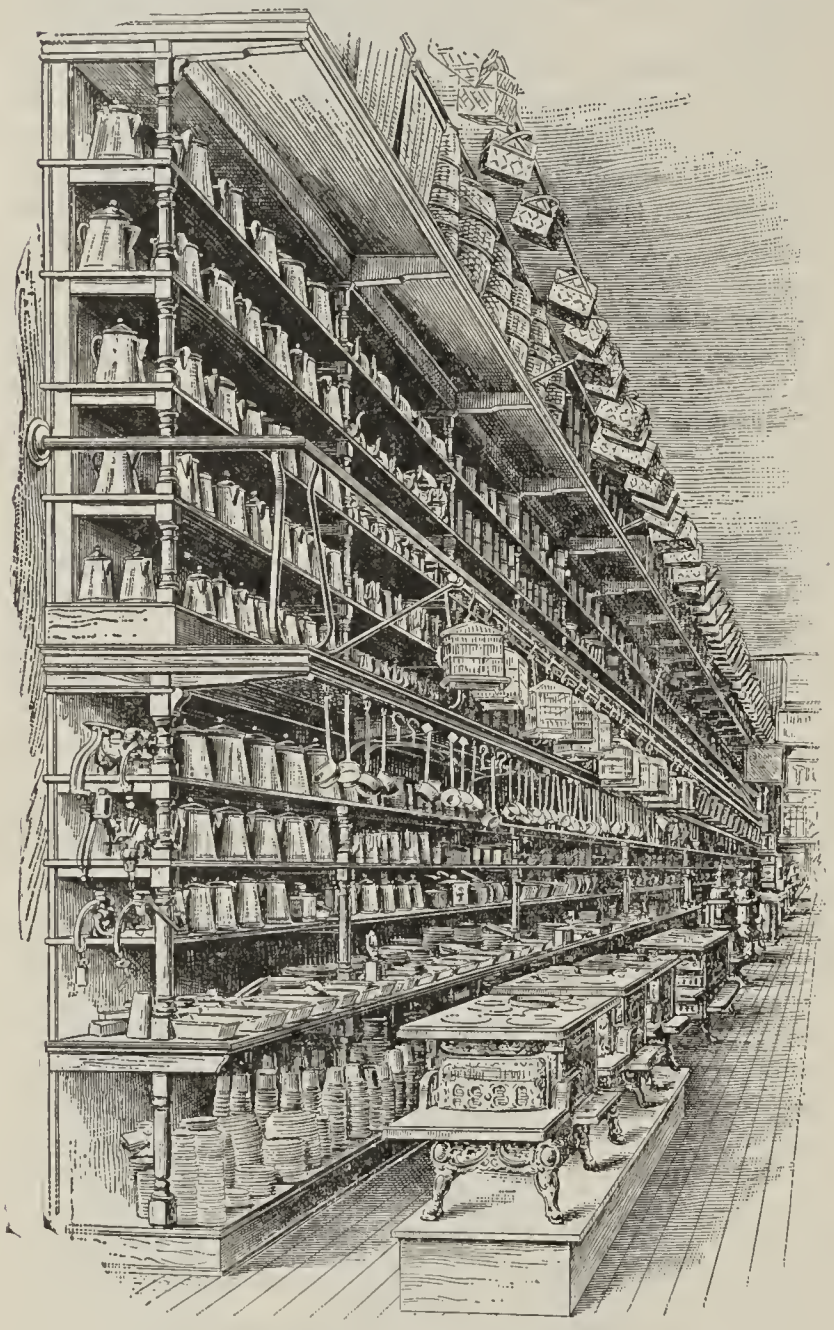
The second day's meeting opened with an attendance of nearly 100, at 9.30 a.m The morning was largely taken up with what to all of the members was quite an innovation, being the Question Box, which on opening was found to be nearly filled with many inquiries of interest to the trade. These were placed before the members by the committee selected, in the order of their supposed value to those assembled. The discussions were very able and could well have occupied an entire day in convention.

In answer to one of the questions President Duffy had prepared a paper, entitled, Is the Department Store a Benefit or Injury to a City?

Toledo was the city selected for the next meeting.

The Committee on Officers for the ensuing year reported as follows:

President.
H. C. Wiseman, Springfield.
Vice-President.
J. F. Harris, Columbus.
Secretary-Treasurer.
J. F. Baker, Dayton.
Executive Committee.
O. M. Scott, Marysville.
W. A. Remy, Mansfield.
L. F. Stahler, Waverly.
F. Harrison, Toledo.
W. P. Scott, McConnellsville.
G. M. Gray, Coshocton.
C. C. Fontz, Middletown.



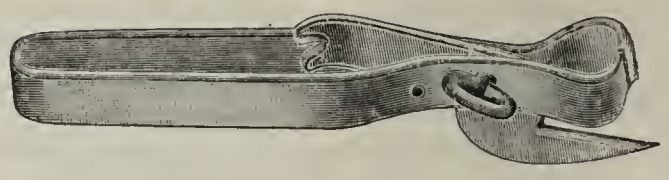
On motion the report of committee was adopted, making the official roster as above.

After short addresses by the retiring and incoming officials the convention adjourned.

In the evening a Bohemian smoker was tendered the association by the local wholesale and retail Hardware Association, and the entertainment proved to be a most enjoyable one.

Shelving and Balconies.

The accompanying cut represents the shelving and balconies in the Hardware store of A. C. Raymer of Omaha, Neb. The fixtures are alike on both sides of the room, the distinctive features of their arrangement being two balconies, one above the other, a wide base to shelving and no counters. The room is 25 x 110 feet in size, with a 22-foot ceiling. An additional feature of the balconies is the arms and rail extending at



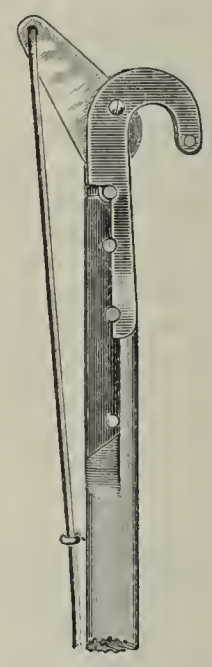
Shelving and Balconies.

an angle over their edges, upon which goods are displayed, such as Cages, Baskets, Lanterns, Coal Hods, &c. In the rear of the room is a steam elevator, which connects with each balcony, thus making the distribution of goods an easy matter. The shelving on the opposite side of the room is used for Shelf Hardware, while in front is a platform for Heating Stoves. Through the center of the room is a third platform, upon which are Steel Ranges and Heating Stoves. These platforms are used for displaying different lines of goods at various seasons of the year. Back of this room is the tin shop, 20 x 25 feet in size, above which is a sample room for Builders' Hardware.

The Keyser Mfg. Company, Chattanooga, Tenn., have published an attractive catalogue and price-list of the Odorless Refrigerators of their manufacture. The general constructive features of this refrigerator are briefly but clearly explained in the earlier pages of the pamphlet, broken views and sectional illustrations making the explanatory notes very clear. The latter portion of the publication is given up to half-tone engravings showing the various styles and finishes of the Odorless Rrefrigerators, which vary from small simple constructions to elaborate Refrigerators for restaurants, grocers, butchers, &c. The catalogue also contains an illustration of a solid red cedar Moth Proof Closet which this concern make. A small pocket edition of the catalogue, giving the same general information, is likewise issued by the Keyser Mfg. Company.

The Klondike Combination Can Opener.

The combined can opener and tack puller here shown is put on the market by the F. J. Hall Company, Wallingford, Conn. The blade is of crucible steel, tempered and sharpened. The handle is Bessemer steel, plated and nicely finished. By loosening the set screw the blade can be revolved, bringing either tool into position. The shape of the end of the tool nearest the set screw is re-



The Klondike Combination Can Opener.

ferred to as being such as to make a large fulcrum for the tack puller, so that the tack is raised out straight before the hand strikes the floor. The point is made that two tools are thus retailed at the price of one. The goods are designed to sell for 10 cents, and are put up in a novel and attractive manner, one dozen in a case.

The New Standard Tree Pruner.

Seymour Smith & Son, Oakville, Conn., are offering an improvement in their tree pruners, as shown herewith. The illustration shows the pole and iron cut away to expose to view the metallic brace plate. This consists of a

The New Standard Tree Pruner.

strip of steel 6 inches long, inserted in a slot in the center of the pole, a recess being cut in the steel to fit the washer in the head. The steel and head are securely fastened by rivets passing through all to strengthen the pole at the point of the greatest strain, reinforcing the wood in such a manner as to prevent its breaking or splitting.

Effective Window Displays.

Landers, Frary & Clark, 82 Chambers street, New York, had an effective front window display, the results of which serve to emphasize the value of concentrating attention on a single leading article. One of their glass Cutlery display cases was taken and neatly trimmed and the interior arranged stair fashion. Along the upper tier was clamped a row of nine of their new Universal Food Choppers, all alike. Directly in front of each Chopper on a lower step was a white enameled 8-inch plate with a number of food articles of different degrees of fineness, varying with the purpose for which they were to be used, showing the universal character of the Meat Chopper and some of the possibilities of its three different cutters. On one plate with a neatly stenciled card was "Cheese for Welsh rarebit, macaroni, &c.," the next "Raw meat for Hamburg steak, beef loaf &c.," followed by "Boiled potatoes for hash, salad, &c.," "Cooked meat for hash, mince meat, &c.," "Cocoanut for cake, pudding, pies, &c.," "Vegetables for soup," "Chocolate for pudding and cake," "Powdered cracker

for pudding, cake, &c.," "Citron for cake and pie," and an extra plate containing horseradish. Hanging on the window just above was a neat sign with the caption "Universal Food Chopper. Chops food of all kinds, either raw or cooked, quickly, perfectly and without waste. Come in and see it work." It is needless to say the idea took and attracted passers by from morning to night.

New Columbus Settee.

The Columbus Wire & Iron Works, Columbus, Ohio, ave added the settee here shown to their line of this kind of metal goods. In common with other styles of settees made by the firm, the new pattern has wrought iron frame and steel wire seat and back. It is remarked that there is an entire absence of cast iron parts which might break, also of wood which is liable to absorb dampness. The wire seats and backs have, it is stated, sufficient flexibility to insure comfort, while there are no large surfaces to absorb heat or cold. The settees can be shipped in a knock down condition in a crate 4 inches in thickness, thus securing to buyers a low freight rate. The construction, it is explained, is so simple that any one can set up the settees without special directions. The particular advantage,

New Columbus Settee.

aside from the knock down feature, is said to be the low price at which the settees are offered. They are designed for lawn and cemetery use.

MEMORANDA.

The Hill-Whitney & Wood Company, 90 Canal street, Boston, Mass., were recently incorporated under the laws of Massachusetts, with a capital stock of $55,000. They succeed the Hill-Whitney Aluminum Company, well known as manufacturers of a large variety of Kitchen Utensils made of special hard aluminum. They advise us that new machinery is being put in and many other improvements being made at their factory.

Benjamin W. Felton, for many years identified with the Stove and Furnace trade of Eastern Massachusetts, died at his home in Roxbury, Mass., on Friday, February 25, at the age of 64 years. He was a native of Fairfax, Vt., and went to Boston when a young man, settling in the Roxbury district. Starting in a small way on Washington street, he succeeded in building up a large business, being the head of the Felton & Turner Furnace Company of 2 Warren street, and was widely known among dealers, architects and real estate men.

The National Patent Company, Johnstone, Scotland, who are large makers of patent mouse traps in Britain, are turning their attention to America, and we understand they are on the lookout for an agent for this country. They are the makers of the Detective, the Snap Shot and the New Snap Shot mouse traps. As indicating the extent of this industry, it is stated that their output last year was at least 150 tons. About 50 hands are employed in this department.

D. H. Evans has lately embarked in business at New Whatcom, Wash. Mr. Evans is retailing Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Sporting Goods, &c.

A. E. Marsh has succeeded to the Hardware business of S. R. Gray, in Lime Springs, Iowa. Mr. Marsh is handilng a general line of Shelf and Heavy Hardware, Stoves, Tinware, Implements, Sporting Goods, &c.

Rodney & Monk, formerly of Woodburn, Iowa, have lately removed to Humeston, where they will continue the retail business in Hardware, Stoves, Sporting Goods, &c. They are located in a brick building, 24 x 100 feet in dimensions. The store has been equipped with new shelving, wall cases, &c.

Jennings & Harris have succeeded to the Hardware business of the Harris Furniture, Hardware & Grocery Company, Water Valley, Miss. The new firm advise us that they are handling only Shelf Hardware and Tinware at present, but expect to take up Stoves in the fall. They refer to trade as good.

The Lion Hardware Company, Springfield, Ohio, have recently been making important changes in their establishment. Their Mantel stock has been removed from the first floor and is now to be found on the floor above. The space formerly occupied by Mantels will be utilized for the accommodation of Harness and Carriage and Wagon Hardware, lines which have not heretofore been carried. The company state that business is rapidly improving and the prospect for the future is very gratifying.

C. W. Young, Juneau, Alaska, wholesale and retail dealer in Heavy and Shelf Hardware, Tinware, Sporting Goods, Lumber, &c., Klondike outfits being, of course, a specialty, has enlarged his store until its present dimensions are 30 x 110 feet. A second story is also being built, which will be devoted to a stock of Furniture. Mr. Young has installed new shelving, counters, fixtures, office, &c., thus adding to the attractiveness of the interior. The exterior is being embellished by a plate glass front.

Sandless Pig Iron.*

BY E. A. UEHLING.

There now exists a successful casting machine which does all that can be desired, and its advantages to the producer of pig iron are such that no blast furnace can afford to be without it.

In proof of this it will suffice to say that the casting machine at the Lucy furnaces, which has been in operation since April 3, 1897, had up to January 1 handled 163,497 tons of iron, 18,000 of which was spiegel. During all that time it did not miss a single ton of the output of the two furnaces. It was and is always ready to take the iron when it is brought to it. The machine at the Duquesne furnaces had demonstrated its capacity to take care of 1200 tons of iron in 24 hours with ease. The cost of handling the iron at the Lucy furnaces, including all repairs to the machine, ladles and refractory material, was 10.6 cents less per ton than that of handling it the old way, thus effecting a saving in labor cost of $17,330.68 in nine months, or $21,663.55 in a year.

The scrap made is less than 25 per cent. of that made by the old way. Contingencies like those faintly pictured above cannot occur. The ladles are returned to the furnace as soon as emptied, and the furnace can be tapped whenever desired. There are no boils, no jump cores, no sheeted beds, there is neither scruff nor cinder on the iron. The pigs are uniform, smooth and clean. The labor required about the machine is so easy that it looks like child's play compared with the other work about the blast furnace. Not a pig of iron is touched by hand from the time it leaves the furnace until it reaches its destination or is piled on the stock yard. These are, in brief, a few of the advantages that will accrue to the producers of sandless (machine made) pig iron in which the consumer does not share. The advantages of sandless iron over sand pig in which producer and consumer share alike may be summed up as follows:

1. The abomination called the sand ton will be done away with. A ton of pig iron will be 2240 pounds, and if it weighs that at the furnace it will weigh the same at the foundry. With it nine-tenths of the wrangling over short weights will disappear.

2. Grading by fracture will no longer be the basis of quality and price, and this will remove the most prolific bone of contention between producer and consumer of pig iron. The fracture of pig iron is a delusion and a snare. There is not one man in ten, whether consumer or producer, who can tell by the fracture a pig of iron suited for car wheels from one fit for stove plates.

At the furnace all foundry iron is graded by fracture. The pigs are broken in the middle and piled according to grade. As a rule, this is done as carefully as possible; but where is the line of demarcation between succeeding grades? What is the difference between an open No. 3 and a close No. 2, for example? No matter how carefully the grading is done, there must be, by the very nature of things, in every grade, some pigs closer than others. There is therefore always room for contention, even when both sides are trying to be fair, which is not always the case.

*Part of paper read before the Pittsburgh Foundrymen's Association

The following episode has come within the writer's experience: A lot of No. 2 iron was shipped to a consumer. Before the cargo arrived at destination the price had declined 50 cents per ton. When the date of settlement came, instead of the proper remittance, there came a long letter of complaint, stating that the iron was not up to grade, that fully 50 per cent. of it would not go better than No. 3, and that a reduction in price must be made on the iron equal to the difference in the market value between the grade sold and that actually shipped—viz., 50 cents a ton. The case was worth investigating. When the furnace representative arrived, he found a lot of samples of the iron in the office awaiting his inspection. The iron was from the lot, there was no doubt of that, and the grade was not better than an open No. 3. He knew that straight No. 2 had been shipped, so closer investigation was necessary. He went to the pig iron yard. The attendant furnished by the customer broke a lot more of the half pigs, with the same result—an open No. 3 at best. But the furnace representative happened to be equal to the occasion. He helped himself to some of the iron and broke it, and to the pretended great surprise of the purchaser nearly every pig showed a fracture much nearer No. 1 than No. 2, and the iron was accepted as sold. The fact is that nearly every pig of iron varies in grade from one end to the other. Not infrequently you can show up three distinct grades in one and the same pig. The sow, if at all heavy, is invariably from half to a whole grade higher than its pigs. Is the iron in the sow therefore of a better quality? This is hardly reasonable, yet you pay from 50 to 75 cents more for it.

The value of an iron does not depend upon its fracture, nor is the fracture any guide as to the special purpose for which a certain iron may be best suited. It is an indication of the condition of the furnace that produced it, and not an altogether reliable indication of that even. The principal factor that determines the grain in the fracture of cast iron is the time given it to pass from the liquid to the solid state. No one is better aware of this fact than the foundryman. Of two castings poured from the same ladle, the lighter casting is invariably the closest grained. The degree of hardness resulting in a casting is not determined by the fracture of the pig; but entirely by its chemical composition and the rate of cooling. No. 1 iron may be fitted for car wheels, or it may be suited for stove plate, or it may be useless for either. How many can tell what it is suited for by the fracture? No. 1 iron may contain anywhere from 0.5 to 3.5 per cent. of silicon, and the other elements with the exception of carbon may vary in the same proportion.

Experience has taught the practical foundryman that certain brands of iron are best suited for a certain class of work. He ascertains this by trying first one and then the other, and then several brands in combination in varying proportions, until he gets the right thing. When he has it, he sticks to it. Everything goes smoothly for a while; but suddenly something gets wrong. The castings come out hard or lack strength, too much shrinkage, full of blowholes, cold shots and what not. What is the trouble? The same brands, the same grades, the same mixture. No change at all, yet there must be something the matter with the pig iron, and it must be in that last shipment, of course. There was no trouble until it was put on.

It is thoroughly investigated, and sure enough the lot contains pigs with close edges, others with dense spots, and more with irregular grain. The iron is not up to grade anyhow, and the whole shipment is condemned. If the price of iron tends downward the producer is in for all or at least part of the damage. With a stationary market it is a toss up, and on a rising market the consumer pockets his loss. In reality the chances are at least even that the trouble was not from the iron at all. There are as many chances as there are brands of iron in the mixture that the wrong brand was condemned. Nine times out of ten it will be used up later on and give the best results. Making up mixtures for special purposes, depending solely upon the fracture to guide you, operates on the same principle on which the Irishman got the weight of his hog. He selected a log with great care, balanced a plank very nicely across the log, laid the hog on one end of the plank and piled stones on the other end until it was accurately counterbalanced, and then he guessed at the weight of the stones.

The condition of the sand in the pig beds, the rapidity with which the iron fills the beds, the size of the pigs, are all factors that greatly influence the fracture. If two pigs lying side by side in the same bed happen to be of unequal size, the larger will invariably be of a higher grade than the smaller. If the large pig is No. 1 the small one may not show better than No. 3. Has the quality suffered because the mold was not run full? Yet this pig, with many others whose fracture suffered from similar causes, goes to the No. 3 pile, and brings 75 cents less per ton.

The reverse also holds good. By proper coaxing a No. 3 can be elevated to a No. 1, and in order to please the consumer who buys on fracture the producer does all the coaxing he can, by making the pigs large, covering them up with sand, providing a third casting bed, &c., to give all the time possible for the iron to cool. Except in very wide limits the fracture of pig iron is simply something to guess the quality by. It is the pile of stones that counterbalances the Irishman's hog—it is something to quarrel about, and the sooner grading by fracture is abandoned the better for all concerned.

Chemical composition is the only true guide by which iron can be intelligently judged as to its quality and fitness for the purpose in hand. Chemistry in the foundry is still in its infancy, and much is yet to be learned. But with foundrymen's associations established all over the country, composed of intelligent and energetic workers in behalf of the practical application of scientific principles, the advantages of chemical analysis as well as synthesis are beginning to be more generally understood and appreciated, and it is only a matter of time when its benefits will be fully realized. The greatest drawback to the practical application of chemistry in the foundry is due to the fact that with iron cast in the sand in the ordinary way it is almost impossible to get shipments of uniform composition. This is due to the fact that the iron as it flows from the furnace is very irregular, and it not infrequently happens that there is a difference of 1.5 per cent. in the silicon from the first to the last bed in a cast of iron of practically the same grade.

The last, but not least, mutual benefit that will be derived from the use of the machine for casting sandless foundry iron will be due to the fact that it will not only be possible but very easy to furnish iron of uniform composition. The iron of each ladle containing 15 to 20 tons will of necessity be uniform, and can be easily analyzed and piled or shipped according to analysis.

We now come to the advantages that sandless pig iron will have for the consumer alone: 1. I am authorized to say that in the basic open hearth furnaces at Homestead where all the iron produced by the Lucy furnaces has been consumed, sandless pig iron has been demonstrated to be worth at least 50 cents a ton more than sand iron of the same composition. This enhanced value is due first to the fact that it melts more readily than iron with a crust of sand about it, and is in a more advanced state of reduction when melted Hence it is more quickly converted. 2. The sand damages the hearth, and requires additional flux. The sandless pig is harmless, and the flux required is a minimum, thus saving material as well as wear and tear. 3. In consequence less fuel is required to convert the sandless pig into steel. 4. This results in an increased output.

The same holds true in remelting in the cupola for Bessemer steel. The sandless pig requires less flux, less fuel, melts more quickly, and results in appreciably less wear and tear in the cupola. No systematic tests have as yet been carried out, but the advantage of the sandless pig iron is easily estimated at 10 cents per ton.

From this I feel warranted to draw the inference that a similar saving, though possibly, owing to the intermittent work, less in degree, should result with sandless iron in the foundry cupola.

The results obtained by Thos. D. West, which were presented at your last meeting, indicate clearly that there is less oxidation from clean iron than from iron cast in the sand, otherwise of identical composition. The average of Mr. West's experiments showed the loss by oxidation in remelting sand iron to be 5.5 per cent., while the loss in sandless iron was only 3.4 per cent. Taking pig iron at $10 a ton the loss on the sand iron would be 55 cents, against 34 cents on sandless pig—a clear gain in favor of the machine iron of 21 cents per ton. These results will require corroboration on a larger scale before they can be taken as absolute, but they indicate what may be expected.

The sandless iron melts quicker and with less fuel than the sand pig. It is less liable to be contaminated by the impurities in the fuel. It will require less flux, and will make a cleaner casting. In short, the indications are that it will prove in every way superior to the sand pig for foundry use.

The State Department has authorized the United States Consul, at Tampico, Mexico, to assist American manufacturers who may be desirous of exhibiting their goods in that place. It is announced that a room at the Consulate will be devoted to the exhibition of samples of soap, grain foods, cutlery, writing paper or any small articles that may be easily handled. It will be necessary for merchants or manufacturers desirous of taking advantage of the opportunity to prepay charges on freight and delivery.

The New York Railroad Commission are entering on an active movement to do away with the 9000 grade crossings in the State. They propose to divide the expense of their abolition, 50 per cent. to be borne by the railroads and 25 per cent. each by the State and municipality. The Finance Committee of the Senate have favorably reported a bill appropriating $400,000 for beginning the work.

STOVE TRADE NOTES.

SHORTS —II.

BY THOS. F. KENNEDY.

FOLLOW BOARDING.

Follow boarding is one of the details of stove making which does not receive the attention its importance deserves. When stoves were first made by the piece the price was put on the whole stove, and a molder or gang of molders had to make every piece before getting credit for a stove. Hence the molder made as great an effort to get the smallest as the largest piece. No doubt there often was complaint about the way the boarding was done, but as the loss of evening up fell on the molders it is not likely it produced much effect. As the number of stoves to be made from one set of patterns in a single day or at a single heat increased a stove had to be divided among an increasing number of molders, until a point was reached where the gang got too large and the result was not satisfactory to either the molder or the manager. The prevailing system was then gradually adopted, and as the loss of evening up fell on the owners of the foundries better boarding plans were slowly evolved.

Greater care was taken in placing deadheads, and where several pieces of different kinds were made on one board an effort was made to keep those on the same board that would work best together. This is the full measure of the progress made in follow boarding in the majority of foundries up to the present time. The fact is the method in vogue is not susceptible of any further improvement. A radical change in method must precede any successful attempt to improve boarding and flasking practice. The change I have in mind would be most sweeping, but its advantages have long been partially recognized in all stove foundries. In a few where it has been more fully developed the practice differs widely. If the rule one pattern or one kind of pattern on each board was adopted it would reduce the number of shorts and greatly lessen the cost of dealing with the remainder.

Before I ever saw a stove foundry it was the regular practice to make four or more covers and four or more legs on one board, until now in the foundries of large concerns the principle of one kind of pattern on each board has been extended to many other pieces. In those works where a large number of stoves are made off a set of patterns and where first cost is not a potent factor in deciding for or against a method this may be all right, but for small concerns the making of two or more patterns for all small pieces, with the work incidental thereto, would be a serious matter. However, this multiplication of patterns which from their size or nature cannot be made in a snap flask and are too small to make one on a board on the floor is entirely unnecessary. It is done for the same reason that several pieces of different kinds are made on one board—that is, because floor molders would rather make three pieces in one flask for 12 cents than the same three pieces one in a flask at 5 cents each. This is a very substantial reason if those pieces must be made on the floor. But must they? Let us see.

Can any one name a single body of workers in any field of human activity who stoop to do work, when it can be avoided, except molders? I could fill this page with a list of trades and arts where there is better reason for stooping to do the work than there is in molding small stove work, and yet means have been found to avoid it. How many molders does the reader know who are suffering from lame backs brought on by stooping?

It is a fact that all floor molders will testify to that small work, no matter how arranged, is much harder on the back than large work. It is a common thing to hear a molder say, "I don't mind the large work, but the small work is killing." And there are plenty of molders who can do a good day's work on large work who could not stand to make small pieces on the floor, though the large work requires far more exertion than the other. A molder making small pieces on the floor must maintain a stooping posture of varying degrees all the time while molding, excepting the short time while ramming, and all don't straighten up then. The molding time varies from six and one-half to eight hours. A man of average hight must work more than one-half of this time bent over at an angle of 90 degrees, and I have seen men making work which required great care in finishing who had weak sight, or, having strong sight in poor light, bent over at an angle of 50 or 60 degrees doing the most particular part of their work. Did the reader ever notice the small percentage of old and elderly men engaged in stove molding, smaller than in any other occupation of which I have any knowledge? There are plenty of molders shortening their lives working on small stove work on the floor who have recurrent attacks of lame back and sore chest. These often become chronic and they are obliged to give up. A very large percentage of these defects would never develop sufficiently to cause inconvenience under normal conditions where a man could stand up straight, or nearly so, all the time.

No wonder statistics collected a few years ago showed that the average length of time spent at the trade by those learning it was 15 years. The first impulse of a young man or boy when he starts to learn the molding trade is to avoid stooping by kneeling down, but the foreman or instructor will quickly tell him that he will never make a molder if he kneels down to any of his work. Jobbing and machinery molders do kneel sometimes, but I know of but one stove foundry where it is a common practice, and there the follow boards are very poor. It is related of the workers in an industry where the large quantities of dust and fumes were a constant menace to health that when a device was invented which promised to nullify their evil effects its use was secretly opposed by the workers on the ground that its introduction and successful use would surely cause a reduction in wages. No doubt this consideration would produce and nourish a hostile sentiment which would cause plenty of floor molders to stand in their own light and deter them, if they were allowed to choose, from taking advantage of an improvement even though it promised to lessen their ills and lengthen their days.

In following out the rule laid down for follow boarding I would eliminate wherever practicable the portion that says one kind of pattern and make it simply one pattern on each board. Any piece which from its size and nature cannot be made in a snap flask, and is too small to be made one in a flask on the floor, will, in 19 out of every 20 cases, make a good job if made alone on a board in a suitable flask on a properly designed movable bench. It is to be anticipated that objections would be made to any such radical departure from long settled practice. Most of the objections are obvious to the experienced stove man. The molders would no doubt, for reasons already touched upon, offer numerous trivial objections. The only one I can think of worthy serious consideration is the raising of the sand an additional 15 or 20 inches and the lifting of the finished mold from bench to floor.

I claim that being enabled to stand erect 99 per cent. of the time trebly compensates for the extra exertion involved in raising the sand and lifting the mold. When he stands erect the molder can perform the parts of his

work requiring delicacy of touch with such precision, accuracy and swiftness as would be impossible on the floor, and the more intricate and complicated the work the greater the advantage. Then, with the class of work that could be made thus he would have but one pattern to deal with instead of two, three or more as on the floor. The difficulty of coping a mold increases in an increasing ratio with the number of difficult points in the mold. For instance, a piece with one bad point on it might be made one in a mold without any trouble, but if we put several such pieces in one mold it may be almost impossible to get a clean lift.

So much for the molders. The manager would object to the increased number of flasks, but in return for the slightly increased first outlay for flasks his small flasks would remain good as new much longer than large ones. I have seen small wooden flasks which after regular but not continuous use for 30 years are still serviceable. Small flasks like snap flasks can be used for a great number of different jobs, and where many different stoves are made this would be an advantage. Every one with any foundry experience knows how much easier it is to "pick up" a flask for a small board than for a large one. When the stove for which a small flask or flasks were provided is no longer made they can be used on another stove often without any alterations.

The small flask made on the bench would, by abolishing mixed boards, remove one cause of shorts and at the same time make it easy to deal with such as could not be avoided. It would often make it possible to reduce the number of patterns required. Where three or four would have to be made, with all the work it entailed, one or two would do for the small flasks. The small flask made on the bench would enable molders who now earn a precarious living at some chance employment to work at their trade, and many of whom are good mechanics, but owing to some weak spot in their make up cannot stand floor molding.

The Chicago Stove Trade.

Some improvement is noted in the Chicago stove trade. A better demand is experienced for cooking stoves and ranges. As compared with the opening months of last year the volume of business for January and February of this year showed a very comfortable gain. Business is now nearer its normal condition than during the dark days of depression in the latter part of 1896 and the beginning of 1897. Better goods are again in demand, showing that people are blessed with greater purchasing power. The spring trade in coal stoves and ranges, however, is not up to what it was in the palmy days of the past, and much doubt is expressed as to whether they will ever return. Business in this line is being more and more concentrated in the fall months, when two or three days will show as large a trade as a whole month in the spring. Nevertheless, a scattering trade develops in the spring which is worth looking after and which manufacturers must continue to cultivate. It would be the hight of unwisdom to discontinue efforts to sell during this season, as those who do so would be out of touch with the trade.

Rathbone, Sard & Co.,

Wabash avenue and Randolph street, Chicago, are displaying samples of new coal cook stoves which have been brought out to meet the demand for moderate priced goods. The Brilliant line represents the fourth grade of cooking stoves made by this company and sells at a correspondingly low price. If such a stove had been offered to the trade four or five years since it would have been classed as a medium grade. It is very attractive in appearance and is well constructed, easily excelling the general run of stoves of its class. The oven is square, which is a feature usually found only in higher priced stoves. The fire pot is oval and has a single or double back as desired. These stoves are furnished with a large front feed or the usual pouch feed, so that buyers can take their choice. Five sizes are made, so that the line is very complete, comprising so many sizes and styles. It is offered by the manufacturers as a desirable line to accompany their higher grade Electric Acorn line. The molding is of the modern style of raised carving, decidedly striking. The same line is furnished with a less elaborate finish, and therefore at a still lower price, under the name of Ruby cooks. The castings are precisely the same, but the exterior is plainer.

Changes in Foundry Mixtures.*

BY EUGENE W. SMITH.

In the discussion before the Western Foundrymen's Association in February, 1897, on "What Is the Proper Amount of Air and Pressure of Same to Melt Iron in the Cupola, and What Are the Effects of Too Little or Too Much Air?" the third division of the question was quite thoroughly discussed. The general opinion was that the changes in iron are probably due to mechanical changes. Mr. Dalton attributed hard iron in the first part of the heat to the condition of the cupola. Mr. Pettigrew claimed that the first iron is softer, providing the cupola is dry. If the conditions are constant, why should not the results be the same? Mr. Coffeen supported the theory of open cupola and excessive blast pressure by his statement that he found it necessary to use softeners in the first part of the heat. Mr. Ferguson advocated using all the blast pressure obtainable, but stated that iron is harder at the beginning of the heat. If the mixture is the same should not the result be attributed to a mechanical condition existing in connection with the cupola? The deductions obtained at that time by Mr. Carter served to show that the figures given were pretty close as to amount of air required—viz., Mr. Sorge, 2500 pounds; Mr. Thompson, 3000 pounds; Mr. Hanna, 3000 pounds of air per ton melted. Thus we see that the members who were prepared to discuss the amount of air required came very near agreeing. The members who discussed the effect of blast practically agreed that there was a difference in the first iron melted, but did not go far enough and find the cause, which the writer thinks might be attributed to some mechanical change, as expressed in this paper.

Mechanical changes which occur in cupola practice often serve to confuse the foundryman who is otherwise very careful as to the charges which he gives to his melter. Every now and then some one gives a theory to explain why the first iron is harder than the last, and another will give a reason why it is softer. Each demonstrates the matter to his own satisfaction in scientific terms, citing the destruction of silicon, combining of carbon, effect of sulphur, &c., but all this only serves to mystify the ordinary foundryman. All conditions being equal, results should be the same, no matter at what period of the heat the charge is melted, the differences being due simply to some mechanical change due to handling. Some of these changes the writer will try to describe in the present paper, showing the absolute care which must be taken in handling to obtain uniform results.

1. A very common source of error occurs in the charging room in weighing up the charges. Sometimes a certain brand of iron is not broken as small as others and the charger is not careful as to balancing his scales, causing variations at different times during the heat.

2. The placing of iron in the cupola in such a manner as to cause uneven melting, allowing one brand to melt and mix ahead of others, frequently causes trouble.

3. Improper drying of the cupola is probably one of the most frequent causes of hard iron in the beginning of the heat, particularly so if the receiving ladle, hand ladles, &c., are not thoroughly dry, or even cold, causing changes in the condition of iron by chilling.

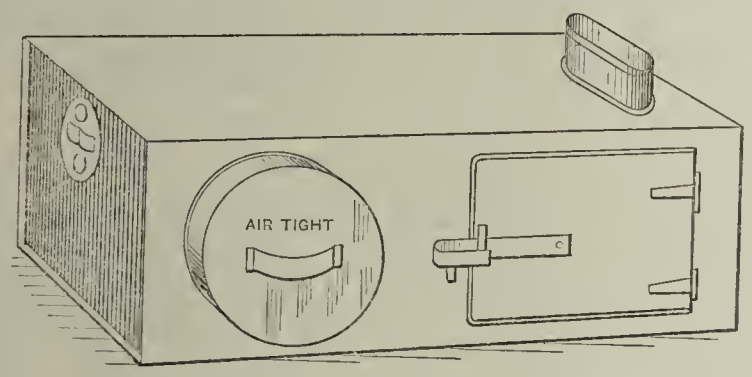
4. Probably the most important cause of change in the first iron melted is the excessive use of blast. The cupola at that time is probably in its very best condition. The fuel resembles an open network, somewhat like a sponge, unobstructed by slag, which does not begin to form until considerable iron has been melted. The tuyeres also remain unsealed, and if conditions are otherwise all right the iron will be exposed to the oxidizing effect of the blast while trickling through the fuel, serving to harden it. This is generally attributed to a chemical change caused by sulphur in the bed charge of fuel. But there is no good reason why the suphur should predominate any more in the first charge than later in the heat, or, as is sometimes the case, on one day more than the next, when the same fuel is used. It is also attributed to the destruction of silicon, which is probably the true effect, but not the cause. It is simply a condition which should not exist, as the heat required is no greater at that time than later on. True, it is hard to draw the line by calling it a mechanical change when the carbon has been combined, no matter by what cause. Still, it may be avoided mechanically, where control of the blast may be had, by reducing the pressure to the lowest point possible without delaying the melting process. This trouble is met with in all foundries more or less, except where large amounts of iron are carried in the cupola. In such cases the effect of blast would not likely be apparent.

* A paper read before the Western Foundrymen's Association.

5. Another source of error, caused mechanically, occurs where the iron is drawn off faster than it is melting, not allowing it to mix properly, thus obtaining hard iron at one time and soft at another.

6. A change in condition occurs where the slag hole is used and the cupola is held too full, allowing the slag to clear off the iron, thus exposing it to the oxidizing effect of the blast.

7. Still another change is caused where the lining of the cupola has been made too hot in drying out, which sets fire to the fuel charges above the melting zone at one side or the other, causing the stock to come down unevenly.



8. Very often the tuyeres are formed unevenly, with larger openings on one side than the other, causing the stock to melt faster on one side, thus giving an uneven result.

9. Another instance occurs where economy in the use of fuel is practiced. The bed may be all right and heat started successfully, but by the excessive use of blast the bed of fuel is gradually decreased, until at last, when charging is all done and the doors closed, the iron melts too close to the tuyeres, which is almost invariably a cause of hard iron. Soft fuel under the same conditions would likely have the same result. In the above case an excess of thin fluid slag, about the consistency of soapsuds, will be noticed, very foamy and light; and if the blast is excessive the slag will be held up by its pressure around the sides of the cupola, also giving off a peculiar puffing sound very easily noticed. It cannot be drawn off until the blast pressure has been reduced, which must be done gradually and carefully, or the slag will flow into the tuyeres first. The hard iron in this case could be attributed to the destruction of the metalloids, nevertheless it is a mechanical change in the mixture which would not have happened if the melting had been done properly.

The above items only apply where the iron melted does not exceed 8 tons per hour and the stack does not exceed 48 inches diameter. Neither do they apply to any particular grade of mixture. The effects would probably be the same whether hard or soft irons were melted.

Clark's Klondike Stove.

One of the requisites of those who are hurrying into the Yukon country in search of gold is a stove of such character that it can be readily carried, that it will occupy but small space, and will stand the wear and tear. A device which is said to have gained a reputation in Dawson City and out on the trail is the stove shown in the accompanying illustration, and which is being manufactured by T. F. Clark & Co., 916 Western avenue, Seattle, Wash. A down draft is used in the stove, and the manufacturers claim that the fire is taken below the fire box and under the oven when the latter is in use, and over the top when the oven is not in use. A slide damper is employed which works in the back part of the stove, the body of the latter being made of steel, ranging in gauge from No. 16 to No. 20. The stove will hold a fire for some time and the company refer to the device as making a good camp stove. The stoves are well adapted for the purpose for which they are intended and are said to have stood the test of practical use with entire satisfaction. Any kind of wood may be employed and the workmanship is referred to as being first-class.

Clark's Klondike Stove.

Kernan's 400th Series Furnace.

An eight-page folder, showing the latest construction in furnaces made by the Kernan Furnace Company, Utica, N. Y., for 1898, is just received from the New York office. It shows the 400th Series, a line of furnaces having a handsomely designed shield front and made in five sizes, and furnished with either all cast iron or steel plate radiator. Half-tone engravings show the furnace complete, and by broken views the construction and fire travel may be readily understood. One illustration shows the parts of the furnace assembled previous to erection. From the engravings it can be seen that the ash pit is high and broad and that the triangular grate can be readily removed or replaced. A large fire pot is corrugated to increase the fire surface, and the feed section and radiator contribute additional surface and effect a long fire travel. It is pointed out that there are few joints and only one exposed to the direct action of the fire. The furnace is said to have all the improvements found in the highest grades and is made of first-class material. The trade are solicited to secure the folder and study the furnace which is presented in it.

ODD PLATES.

The Bower Stove Company of New Madrid, Mo., have been incorporated, with a capital stock of $10,000, by S. S. Bower and others.

The Excelsior Stove & Repair Mfg. Company of Quincy, Ill., have recently certified to a change of name, and the business will hereafter be conducted under the style of Excelsior Stove & Mfg. Company.

The Champion Stove & Furnace Company of Springfield, Ohio, have made rapid progress in getting their plant into operation, and are now actively engaged in turning out work. Instead of starting a foundry of their own, we understand that the company have made arrangements to have the casting done by the Springfield Founding Company, located in the same building. Postmaster T. D. Wallace is vice president and treasurer of the company and will be active in the management as soon as the season is opened.

The Ringen Stove Company, St. Louis, refer very forcibly to the advisability of the dealer handling high grade goods. The following is a portion of the argument they present: "Some dealers are under the impression that hard times are going to last forever, and that as a consequence during the coming season inferior Stoves, which have held the day during our financial depression, are going to sell to almost the exclusion of good Stoves. That is not the case. Inferior Stoves have the only advantage of being cheap—they are absolutely devoid of any other advantage to either dealer or user—and good goods are as sure to come to the surface after the storm is over as the sun is sure to reappear after the clouds have passed."

The Peninsular Stove Company of Detroit, Mich., have been awarded the contract for heating the new school in District No. 1 of Ecorse.

Rathbone, Sard & Co., Wabash avenue and Randolph street, Chicago, are still in the market with a full line of Gasoline Stoves. They are now entering upon their fiftieth year in the Gasoline Stove business. At one time, it will be remembered, nearly all the leading Coal Stove manufacturers also handled Gasoline Stoves, but one by one they abandoned the line for reasons satisfactory to themselves, leaving Rathbone, Sard & Co. as the only large Stove manufacturers who persisted in this trade. This year they offer a line of Gasoline Stoves improved in every way to conform to the latest ideas. It has been their experience that many of their customers are pleased to be able to combine Coal and Gasoline Stoves in the same shipment. Several of the smaller Coal Stove manufacturers also evidently find this trade advantageous to them, as they are continuing to cultivate it.

The Gobeille Pattern Company, Cleveland, Ohio, have taken advantage of the conspicuousness of bright color in calling attention to their business. A postal card paneled in orange and green gives the name of the company, their trade-mark, a list of directors, &c.

Charles W. Day, for many years manager of the Chicago office of Sherman S. Jewett & Co. of Buffalo, N. Y., died early on the morning of February 15 at his residence in Honolulu. He was an old resident of Chicago, Ill., but left that city in 1891 for Honolulu. His son, Dr. Francis R. Day, is at present the port physician of that place.

In the death of Ralph P. Myers of Cleveland, Ohio, the Stove trade has lost one of its pioneers and the city named a well-known citizen. Mr. Myers was born at Sand Lake, N. Y., 78 years ago, and when a young man entered a dry goods establishment in Albany, afterward becoming proprietor of the house. Some time later he moved to Akron, Ohio, and commenced the manufacture of Stoves. In the fifties he went to Cleveland and started what was later known as the firm of Myers, Rouse & Co. Some years afterward he retired from the firm, who changed their title to that of Myers, Osborn & Co. Altogether, Mr. Myers was engaged in the manufacture of Stoves for something like 40 years. He died late Saturday night, February 19, and the funeral services were held at the family home on the afternoon of Tuesday, February 22.

George Auer of Delphos, Ohio, is moving to Toledo, where he will build his Furnace and Steel Range.

The Cook & Van Evera Company, Chicago, are sending out decidedly humorous pictures calling attention to their Jersey Cooks and Ranges. The artist in that company has not disclosed his identity, but he undoubtedly has talent.

TRADE REPORT.

METAL MARKET.

Pig Tin.—There has been a steady increase in prices during the last week, and the market has changed from its unsteady position and has assumed a tone of firmness. Advances have been made in correspondence with the advancing tendency of the London market. The demand is considerably better than that of last week and the fact that the visible supplies have been decreased by 1700 tons during the month of February is having a wholesome effect on the market, and is strengthening prices generally. At the close of the week under review there was a good consumptive demand. Arrivals during the last few days were quite free, but the most of it will be shipped from the dock on previous sales. Shipments of Straights for the month of February amounted to 2950 tons for Europe and America, against 4650 tons for the month previous, and against 4450 tons for February of last year. The statistical position therefore shows an improvement. It is figured by the Metal Exchange as follows : Visible supply on March 1, 1898, 28,800 tons, against 31,137 tons for February 1, 1898. For small lots we quote a slight advance on Straits.

Copper.—An exceedingly strong market is manifest with marked and rapid advances in the wholesale market. Besides the Calumet & Hecla Company, it is said that there are also several other large lake companies who are out of the market at present. There are good inquiries. Spot Copper is very scarce. The prevalent and increasing advance is coming entirely from this country, as the European market has not as yet followed it. It is stated that the home consumption has made urgent demands for deliveries, while the Copper companies claim that they are filled up with orders. Shipments to Europe for the month of February were the smallest of any one month since December, 1895. The February figures as compiled by the New York Metal Exchange are 7793 tons. Notwithstanding this low figure for February, the total exportation since January 1 compares very favorably with that of last year, having been 19,819 tons, while that of the same period last year was but 18,264 tons.

Pig Lead.—The market has been growing easier all the week and business has been quite inactive, as buyers are very reluctant. It is stated that the cutting of freight rates has much influenced the depressed feeling. The price for common domestic has taken a marked downward course, though the price for small lots is not yet affected. Foreign Lead statistics for February as figured by the Metal Exchange are as follows:

Arrivals during February, tons	4,750
Export in bond, tons	4,327
Stock in bond at nearby ports on February 28, tons	4,585

Manufactured Lead continues unchanged.

Spelter.—The market has been quiet but firm during the last week and quotations have not changed materially from those of last week.

Antimony.—There has been a slight increase over last week, the market remaining quiet.

Nickel.—Remains absolutely unchanged, last week's quotations still holding at 33c. to 37c., according to quantity and delivery.

Tin Plate.—The consolidation movement in the Tin Plate trade still demands attention, but there is no evidence that any forward steps have been taken. Consumers are holding back large purchases and business in the wholesale market is very quiet. Spot Plates are in small supply in this market and there is a somewhat firmer tone in consequence, but there is no advance to note.

Old Metals.—The market is very firm, with prices unchanged. Domestic demand is very active and a good inquiry for export is also noted for Brass. Yard dealers in this city and vicinity are paying about the following rates for moderate sized lots, delivered here:

Heavy Copper	per lb. 9⅝c.
Light and Tinned Copper	per lb. 9 c.
Heavy Brass	per lb. 6⅜c.
Light Brass	per lb. 5⅜c.
Lead	per lb. 3⅜c.
Tea Lead	per lb. 3⅛c.
Zinc	per lb. 3 c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$8 25
Heavy Cast Scrap, per gross ton	8.25
Stove Plate Scrap, per gross ton	5.75
Burnt Iron, per gross ton	4.25
Tin Plate Scrap, per ton	2.75

THE IRON MARKET.

The week has brought fresh evidence of how enormous is the tonnage of crude and finished Iron products which the Central West is swinging. In spite of the fact that every great Steel plant in that section is driving at top speed there are indications of a small shortage in Steel, while the Bessemer Pig Iron market displays continued activity. The purchase of the Carrie plant by the Carnegie Steel Company, who bought heavily of the product of the plant lately, takes out of the market one of the few works in the Pittsburgh district which made Mill and Foundry Iron besides Bessemer Pig. The Alabama and Tennessee furnace companies, with the exception of two, have agreed upon an arrangement under which a commissioner will supervise sales, and which may develop some plan of restriction of output. The markets for Foundry Iron need some tonic, to judge from the anxiety displayed in some sections to secure business.

Pig Iron.—The New York market is in an unsettled condition and the prices made are irregular. Nor is the volume of business large. Some of the leading melters in the district, notably the makers of plumbers' supplies, are still idle, and some foundries are carrying enough Iron to last them for some time to come. The Alabama and Tennessee makers, with the exception of Woodward & Dayton, have got together and will have sales handled by a commissioner. There is some talk of a restriction of output. We quote as follows: Northern brands, No. 1, $11 to $11.50; No. 2, $10.50 to $11; No. 2 Plain, $10 to $10.50; Gray Forge, $10 to $10.50. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.50; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

From Philadelphia our correspondent writes : There is not much room for remark in regard to this important interest. There is a fair amount of business being done, but not enough to warrant the assertion that things are better and not enough pressure to sell to say that they are any worse. Unchanged, with a possibility of a slight turn either way, according as events may shape themselves during the next ten days, is probably a fair way of estimating the situation. On the whole, prices have held very fairly, considering the anxiety to realize, but the strain in some quarters is very severe and a more active movement among buyers would be a welcome relief. For the time being there is no attempt to do more than maintain the prices recently ruling, and while this has been successful in most cases, it is conceded that the situation is unusually sensitive. A great deal of Iron is being melted, and still more will be required during the next 60 or 90 days, so that there are some hopeful features, even though they may be a little clouded temporarily. The course of events during the coming week will therefore be awaited with much interest, as they are likely to enable the trade to form a pretty good idea of what is before them for the next few weeks, if not for the whole of the summer months. Prices for seaboard deliveries are about as follows, with the usual rebate according to freights at points within a radius of 100 miles south or west: No. 1 X Foundry, $11 75 to $12; No. 2 X Foundry, $10.75 to $11; No. 2 Plain, $10.50 to $10.60.

At Pittsburgh Foundry Irons are quiet. We quote No. 1 Foundry at $10.40 to $10.50; No. 2 Foundry, $9.90 to $10; Bessemer, $10.30 to $10.40, depending on delivery; Gray Forge, $8.90.

From Cincinnati we have the following report: In general tone the market for Southern Pig Iron has been dull with some very discouraging features. Higher prices seem to be practically out of the question, and if present basis can be maintained it will give good satisfaction. The agreement reached last week by some of the Birmingham furnaces was not shared by all and consequently there are two sets of quotations, with "outside" Iron selling at prices which are disheartening when it is known that concessions regarding payments guaranteed, weights, &c., went in with the transactions. Thus some No. 2 Foundry was sold at $6.75 and No. 3 Foundry at

$6.50, Birmingham. The sales were for delivery in this territory. This is just what has been going on for two weeks at least. From other standpoints the outlook is still very fair. The consumption is excellent and growing. Stocks in consumers' hands are small. There is a fair volume of inquiry, though the actual selling is confined to the normal run of small orders, and it seems impossible to get up any degree of enthusiasm among buyers. They won't be stampeded into the market, and are calmly drifting along in a let to-morrow take care of itself sort of way which to hungry sellers is positively aggravating. We quote, f.o.b. Cincinnati :

Southern Coke, No. 1	$10.00 to $....
Southern Coke, No. 2	9.50 to ....
Southern Coke, No. 3	9.25 to ....
Southern Coke, No. 1 Soft	9.75 to ....
Southern Coke, No. 2 Soft	9.50 to ....
Ohio Silvery, No. 1	12.00 to 12.50
Ohio Silvery, No. 2	11.50 to 12.00
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00

We quote for cash as follows for the Chicago market:

Lake Superior Charcoal	$11.50 to $13.00
Local Coke Foundry, No 1	11.50 to 12.50
Local Coke Foundry, No. 2	11.00 to 12.00
Local Coke Foundry, No. 3	10.50 to 11.50
Local Scotch, No. 1	11.50 to 13.00
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.35 to 10.70
Southern Coke, No. 3	10.10 to 10.40
Southern, No. 1 Soft	10.85 to 11.00
Southern, No. 2 Soft	10.35 to 10.70
Foundry Forge	9.85 to 10.10
Gray Forge and Mottled	9.60 to 9.85
Southern Charcoal Softeners	11.35 to 11.85
Alabama and Georgia Car Wheel	14.00 to 17.00
Jackson County Silvery, according to Silicon	12.50 to 14.50

Our St. Louis advices are: The failure of the furnace representatives to come to any arrangement regarding prices is taken advantage of by consumers to depress prices. The effect is plainly noticeable in the quotations ruling to-day. The attempt to come to any arrangement regarding prices has been viewed with distrust by many large consumers, and the market would be in materially better condition had no meetings been called whatever. The impression now prevails that on account of opposition from certain sources nothing could be accomplished. While this impression may have no foundation in fact, yet the effect on the market is bad. Sales during the week have been moderately heavy and prices a trifle weak and unsettled. We quote as follows for cash, f.o.b. cars St. Louis :

Southern, No. 1 Foundry	$10.00 to $10.50
Southern, No. 2 Foundry	9.75 to 10.00
Southern, No. 3 Foundry	9.50 to 9.75
No. 1 Soft	9.75 to 10.00
No. 2 Soft	9.50 to 9.75

CHICAGO REPORT.

Scrap.—Iron is in good demand and stocks are small. Copper is higher. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7.50	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	5.50	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	10¼c.
Copper Bottoms	....	9¼c.
Copper Clips	....	10 c.
Red Brass	....	8½c.
Yellow Brass	....	7¼c.
Light Brass	....	4¾c.
Pipe Lead	....	3 c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	..	1 c.

Anthracite.—An effort is being made to advance prices 25 cents, and the change may be made this week. The ruling prices of carload lots of 12 tons minimum are as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill.	$4.75	$5.00
Milwaukee, Wis	4.75	5.00
Kansas City, Mo	6.75	7.00
Council Bluffs, Iowa	6.75	7.00
Lincoln, Neb	6.90	7.15
Sioux City, Iowa	7.25	7.50
Aberdeen, S. Dak	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis	6.25	6.50
St. Paul, Minn	7.25	7.50
Burlington, Iowa	6.25	6.50
Des Moines, Iowa	6.75	7.00
Davenport, Iowa	6.05	6.30
St. Joseph, Mo	6.75	7.00
Leavenworth, Kan.	6.75	7.00
Omaha, Neb	6.75	7.00

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

The month of February was undoubtedly, on the whole, an excellent one, and the business of the year thus far is considerably in excess of 1897. Prices are without important change, the market on the whole being fairly steady. Some goods, owing to the desire of manufacturers to effect sales, are sometimes shaded, but, on the other hand, advances in other lines recently made are pretty generally maintained. All things considered, there is little ground for complaint in regard to the tone of prices. The advances for March determined upon last month in Wire Nails, Barb Wire and Plain Wire have gone into effect and these lines are thus quotably higher. The manufacturers are working together with a good deal of harmony and are endeavoring to maintain prices on these goods whether or not the plans for the consolidation of Wire interests are successfully accomplished.

Advices from Chicago.—Shelf Hardware jobbers report an extraordinary increase in their trade for February as compared with February of last year. The changed character of business, however, is notable. Then all orders were small and retailers would not stock up in advance of actual necessities. Now liberal stocks are being carried in all lines and merchants are not afraid to take some risk. The movement at present is quite heavy, and would undoubtedly be larger if country roads were in better condition. All kinds of goods are in demand, even Builders' Hardware, which is usually dull at this season. The orders placed for future delivery on summer goods are exceptionally large. Seldom have so many orders been booked for Refrigerators, Screen Doors, Window Screens, Poultry Netting and such seasonable commodities as at present. The outlook is very encouraging in every direction. A report that the Simmons Hardware Company contemplated the establishment of a branch house in Chicago is authoritatively denied.

Advices from St. Louis.—The Hardware jobbing trade continues to increase in volume, and comparison with the corresponding period of last year shows heavy gains. Prices are in nearly all cases being firmly maintained, and while there are no advances to record, on the other hand we hear of no shading of price. The demand for Wire Goods is very heavy, particularly in Plain and Barb Wire, which are being ordered liberally. Jobbers also report a largely increased demand for Field Fencing, which is now being offered by a number of manufacturers throughout the West. Galvanized Iron is selling freely, the general quotation for small lots being 80 and 5 per cent. discount. The advance in Spelter, which amounts to nearly $4 per ton. will doubtless have a benefiting effect on the price of Galvanized Iron Tin Plates are active, and a heavy demand is reported for Corrugated and Plain Iron Sheets. Screws are active and prices are being well maintained.

NOTES ON PRICES.

Wire Nails.—During the past week the Wire Nail market has not been characterized by as much activity as during the earlier part of the month. This was because of the higher prices named by the manufacturers, at which the trade are indisposed to purchase without some assurance that the market is to be maintained or perhaps advanced. The manufacturers at a meeting held in this city Wednesday confirmed the advance of 5 cents per keg for March. We quote small lots from store at $1.70 to $1.75.

Advices from Chicago.—February was an exceptionally satisfactory month for Wire Nail manufacturers. Shipments were heavy, but large as they were it is understood that manufacturers were unable in all cases to fill their contracts and deliveries will therefore run pretty well into March. Jobbers report a good trade, with many mixed carloads now going out.

Cut Nails.—The market for Cut Nails is in substantially the same condition as at our last report. The demand is moderate, but it is anticipated that it will quicken as the month advances. New York quotations are about $1.30 for small lots from store.

Advices from Chicago.—The movement of Cut Nails continues very light, with small lots from stock quoted at $1.45. The future of Cut Nails will depend very considerably on the outcome of the plan to consolidate the Wire Nail factories.

Advices from St. Louis.—There is quite an improvement to note in the demand for Cut Nails, but prices as yet have failed to respond. Jobbers ask $1.40 to $1.45, base, for small lots from store.

Advices from Pittsburgh.—The volume of business in Cut Nails is fair, but not specially heavy. A movement is on foot among Cut Nail manufacturers to come to some agreement regarding prices. It has been recognized for some time that the difference between Cut Nails and Wire Nails has been too large and that some action should be taken looking to the advancing of prices on Cut Nails.

Barb Wire.—The Barb Wire market is steady, with indications of excellent business as the season progresses. It is characterized by a firm tone, but it is conceded that much depends on the outcome of the negotiations for the control of the manufacture of the rods. If the plans are consummated somewhat higher prices are anticipated, but if they should fail of consummation it is probable that there will be something of a reaction in price.

Advices from Chicago.—Manufacturers report specifications coming in freely on contracts. Merchants everywhere have been taking Barb Wire so as to have good stocks for March in anticipation of the advance announced for this month. Wire Nails and Painted Wire have been selling at the same price for some time, but manufacturers claim with considerable force that Wire should command a higher rate, and if the spring demand proves as heavy as expected it would not be surprising to see them part company.

Smooth Wire.—There is no change in the price of Smooth Wire, except that the advance of 5 cents determined upon for March has gone into effect.

Advices from Pittsburgh.—A fairly good demand for Smooth Wire is reported, shipments in February being quite heavy. Taking effect on March 1, prices on Smooth Wire were advanced 5 cents.

Powers' Automatic Chimney Tops.—Powers Brothers, Streator, Ill., have brought out style No. 2 of their Automatic Chimney Top to meet the demand for a lower priced article. Six sets of iron mounting are packed in a box with pattern for making cover and vane. The following is the list price per dozen set of iron mounts, the list being subject to discount :

6-inch	$6.50
7 "	7.50
8 "	9.50
10 "	12.00
12 "	15.00

Glass.—The movement of Glass from factories shows somewhat of an increase, as jobbers are assorting up stocks in anticipation of spring trade. It is reported that the American Glass Company are restricting the production of large sizes of double strength Glass, owing to decreased demand. This may result from the larger use of cast polished Glass. It is announced that additional Plate Glass factories are to commence the manufacture of thin Plate Glass, which will be likely to further increase its use for the class of buildings in which double strength Glass was formerly used.

There are rumors in Glass circles of an impending advance in the price of Glass by the American Glass Company. When the advance will take place, or whether the report has been circulated to stimulate the placing of orders by jobbers, cannot be learned. It has been the general impression, however, for the past month or more among those interested in the Glass trade that prices are not likely to be reduced, and that the probabilities are that they will be higher before they are lower.

TRADE NOTES.

E. Bissell, Son & Co., auctioneers 12 Murray street, New York City, are to sell, Thursday, March 10, at 10 o'clock, for the Lalance & Grosjean Mfg. Company, several thousand cases of Peerless Enameled Steel Ware, seconds, to be sold in case lots. Also Blue, White and Gray Enameled Ware, to be sold in open lots.

The Ingersoll-Sergeant Drill Company, 26 Cortlandt street, New York, have prepared a pamphlet illustrating a few of their Compressors and presenting a quite extended list of the users of these machines. These Compressors are either steam or belt driven, and are made straight line and duplex, simple and compound. They are provided with improved intercoolers and water circulation all around the cylinders and through the heads. The design insures thorough and automatic regulation of air pressure and speed.

The Tin Plate Decorating Company, Brooklyn, N. Y., announce that they have enlarged their facilities to meet the growing demands of the trade, and finding it desirable to have their office and factory under the same roof, in order to give personal attention to the increasing details of their business, they have given up their former office at 110 John street, New York City, and will be glad to welcome their friends hereafter at their office in their works, 176-180 Front street, Brooklyn, N. Y.

Special Notices.

IMPORTANT

Auction Notice.

E. BISSELL SON & CO.,
Auctioneers.

Thursday, March 10th,

at 10 o'clock, at

No. 12 Murray Street and 15 Park Place,
NEW YORK.

By order of the *Lalance & Grosjean Mfg. Co.* on **Sixty Days' Time** for approved notes.

Several Thousand Cases of Peerless Enameled Steel Ware

(SE ONDS),

To be sold in CASE LOTS only, comprising in part a **Full Line** of Tea and Coffee Pots, Tea Kettles, Wash Basins, Dish Pans, Convex, Stove, Berlin and Lip'd Kettles, Sauce Pans and Sauce Pots, Milk, Pudding and Fry Pans, Milk Boilers, &c., &c.

Also, **Over 15,000** pieces **Blue and White, White, and White and Grey Enameled Ware,** comprising a large assortment, to be sold in **Open Lots.**

This sale will be worthy the attention of the **Trade** and **Everybody** who desires to purchase a line of goods at their **own prices** to serve as **Leaders.** The entire catalogue, **together with duplicates,** will be sold **without reserve.**

Catalogues ready March 5th.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"

office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

FOR SALE. A successful Plumbing, Heating and Tin business in a prosperous country place on Long Island near New York City. Employs three to four men constantly. Will sell outright on easy terms, lease or exchange for good real estate. Reason for selling, poor health. "L. I.," office of *The Metal Worker*, 232-238 William St., N. Y.

FOR SALE.

I will sell cheap an old established Furnace Range, Roofing and Jobbing shop. On leading business street. I am now manufacturing tinware and cannot attend to both businesses. A good chance for one or two men who understand the business. No charge for good will. Work coming in every day.

JOHN W. WALLACE,
329 Myrtle Ave., Brooklyn, N. Y.

FOR SALE.

Second-hand Cornice Brake. In good condition. Cheap.

FRANK J. TYLER,
259 W. 21st St., New York.

MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY
ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY
HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bautier de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographs which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

—A Novel Barometer.—It has taken a clever Frenchman to discover a kind of barometer which may be called unique. An English journal says that it is nothing more or less than the figure of a General made of gingerbread. He buys one every year and takes it home and hangs it by a string on a nail.

Gingerbread, as everyone knows, is easily affected by changes in the atmosphere. The slightest moisture renders it soft, while in dry weather it grows hard and tough.

Every morning, on going out, the Frenchman asks his servant; "What does the General say?" and the man applies his thumb to the gingerbread figure.

Perhaps he may reply: "The General feels soft. He would advise you taking an umbrella." On the other hand, if the gingerbread is hard and unyielding to the touch it is safe to go forth in one's best attire, umbrellaless and confident.

The Frenchman declares that the General has never yet proved unworthy of the confidence placed in him and would advise all whose purse will not allow them to purchase a barometer or aneroid, to see what the local baker can do for them in the gingerbread line.—*Exchange.*

ART OF COPPERSMITHING.

A PRACTICAL TREATISE ON WORKING SHEET COPPER INTO ALL FORMS.

By JOHN FULLER, Sr.

Size, 10 x 6½ inches; 327 pages; 474 engravings. **Price, $3.00.**

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author has acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are 474, and which add much not only to the interest but the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details.

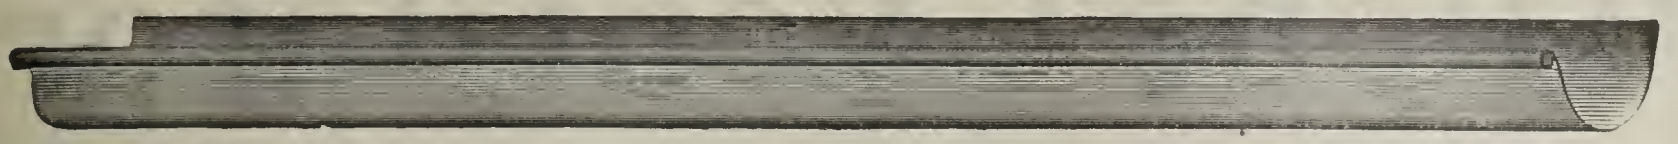

Fig. 107.—Planishing Tea-Kettle Side.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Saucepans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set for Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

Art Metal Relief Co.,

(J. F. WEITZEL, MANAGER).

Covington, Ky.

Confirming our Claims.

One of our representatives writes from a point in Indiana in regard to a customer's experience with GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES, "he was among the first to buy these plates, and made up a lot of coffee pots from them five or six years ago. Just a short time ago two of the pots came in for repairs, bottoms worn out, but otherwise in good condition. One of the purchasers of the pots remarked that his pot was bought five years ago." It's tinware of this character which will bring you back the trade which cheap enameled ware has taken away. Try these plates just once and see for yourself their great value.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Iron Bars, by the good old fashioned hand methods employed 50 to 75 years ago in making charcoal tin plates, insuring absolute freedom from pinholes. No better plate *is* made; no better plate *can* be made. For tinware or roofing they are unequaled. Send for a sample.

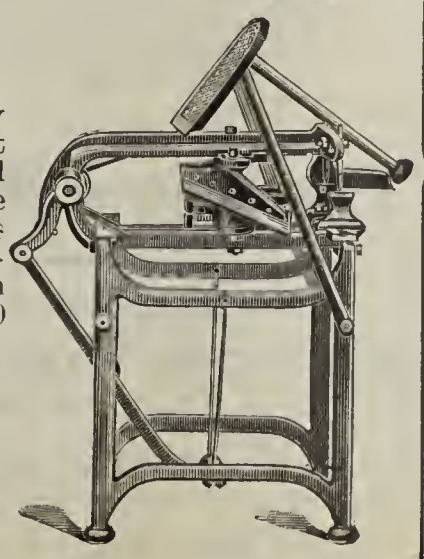
THE REAGAN
Metallic Shingle

The Strongest, Lightest and Most Economical. Reason: The style of pattern makes it strong. Its weight is the lightest and its first cost, together with the rapidity with which it can be put on, makes it the most economical.



The Cincinnati Stamping Co.,
Cincinnati, Ohio.

THE NEW
IDEAL SLATE DRESSER

IMPROVED FOR 1898.

Will cut **OCTAGON, HEXAGON, DIAMOND** or any other desired angle, also two sets of circle knives to cut **CONVEX** and **CONCAVE.** For ornamental work will cut and punch any sized slate from 6 to 16 inches wide and from 12 to 28 inches long and has on the bed plates figures to represent the various sizes, so that an inexperienced hand can set the machine to cut and punch o standard gauge. Will pay for itself in working 100 tquares of slate.

F. R. MARKS,

Sole Manufacturer, ASHLAND, OHIO.

—Cabby Scored as Usual.—A certain well-known gentleman of title is known to be very close, and on one occasion tendered a cabman a shilling for driving him from Bond street to Victoria Station. This roused the ire of the cabby, who, examining the shilling critically, sarcastically inquired whether it was a good one.

"Yes, my man," drawled the Duke, "and I require no impudence, either."

"But, can't you make it eighteenpence?" pleaded the cabman, coaxingly.

"Certainly not," replied the Duke; "besides, you came a long way round. Why didn't you cut through St. James's Park, my man?"

"'Cose it's closed," replied the cabby, after a moment's hesitation, "that's why."

"Closed. Why, how's that?"

"Well, they said as the Dook lost a three-pennypiece in there, and the park is closed until they find it."—*Pearson's Weekly.*

—Anecdote of Speaker Reed.—The speech which goes down into history as Reed's first effort as a child was short, but the one which opened his way to fame as a man was shorter still. It was delivered not long after he began his career in Congress. He had not up to that time taken much part in debate, but one day, while he was making a somewhat labored argument, an old member tried to break him up by putting a question to him suddenly and demanding an immediate answer. Reed gave the answer readily. Then he paused, turned toward the desk, and drawled out: "And now, having embalmed that fly in the liquid amber of my remarks, I will go on again." The House roared. The galleries took it up. The newspaper correspondents sent it flying all over the country, and to his own surprise more than any one's else, Reed found himself a man of note from that hour.—*The Illustrated American.*

218 EAST NINTH STREET, NEW YORK.

—ADJOURNED HIS QUIETUS.—On August 14 two teams of full-blooded Choctaw Indians from the reservation in Indian Territory played in Kansas City a game of Indian ball, which is a cross between tennis and football.

As soon as the game is over, one of the players, Wah Te Nish, will hasten to Tuskahomma, Indian Territory, where he is under sentence to be shot for murder. The fact that one of the players is under sentence of death would probably not have been known had it not been that the Indians had been engaged to play here August 1, and that it was found necessary to postpone the game until next Saturday. Then it turned out that one of the principal players had another engagement for that day—that on Saturday he was to be shot for murder. Application was made to the Choctaw Governor for a postponement of the execution, in order that Wah Te Nish might take part in the bal lgame here, and the request was granted.

Wah Te Nish is under no form of restraint, excepting that if traditional Indian honor, and it will be absolutely on his own motion that he will go from Kansas City to his death next Saturday night.

Murderers condemned under Indian laws in the Territory are never imprisoned, but are trusted to be on hand on the date of the execution, and it is said that only one man has ever failed to keep his appointment.—*New York Journal.*

TIN ATLANTA TERNE

The Worcester Grade Terne Plate we are now making is a really fine plate. It has a very smooth finish. Coating is as even on the sheet as a coat of varnish, could not be more even if it was put on with a brush.

Are sorted very close.

All made from Open Hearth Steel. Are Annealed Dead soft, pliable and easy for a Roofer to work. Every sheet made with "No-Acid Flux." Boxed attractively.

We would like very much to have you try these plates. We feel sure you and your customers will be pleased with them, for they really have merit.

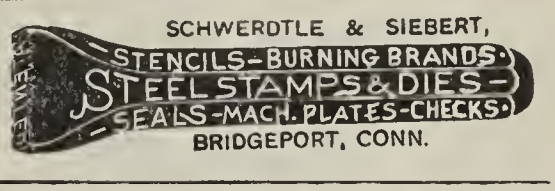
BUFFALO, N. Y.

Gentlemen:—Enclosed please find N. Y. Exchange for $—— to pay for Cornice Brake sent us about six weeks ago. We never paid a bill for tools where we thought we came as near getting our money's worth as we do in paying you for this Brake. The machine is all right, and all you claim for it.



The Brake is now in a distant part of this state where our men are putting in a job of large square galv. piping. Should it get in a wreck and be lost to us, we would order another just like it at once.

All the boys in the shop are anxious to know when that Brake is coming back. For our use we would rather have this than an iron one. We are, Very respectfully yours, LUCAS BROTHERS.

All Sizes from 3 ft. to 10 ft. Indispensable to Cornice makers, roofers, tinsmiths, furnace men, etc.
Send for our latest prices.

THE DOUBLE TRUSS CORNICE BRAKE CO., 259 Grant St., Buffalo, N. Y.

SCHWERDTLE & SIEBERT,

—A STORY was told of Jefferson by Mr. Vest during the Senate debate on the tariff. While Minister to France from the United States, and with the tremendous events of the French revolution going on before his eyes, Jefferson "never for one instant ceased to export by sailing vessels to the United States all sorts of foreign plants and bulbs in order to improve the agriculture of the people of this country." He became interested in the culture of rice, then beginning in the Carolinas, and found a very superior quality of rice in a port of Italy.

"He was not able to procure any of it for export, because the laws of Italy prohibited its exportation, and it is said that the author of the Declaration of Independence filled the pockets of his Virginia overcoat—the old-fashioned Virginia coat, with capes to it, which our grandfathers wore—with the rice, and smuggled it out of the country. The end justified the means, possibly. He carried it to Paris, put it in small packages of five and ten grains and sent it to Charleston, S. C., and that was the basis of the South Carolina rice, the finest now in the world."—*N. Y. Sun.*

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

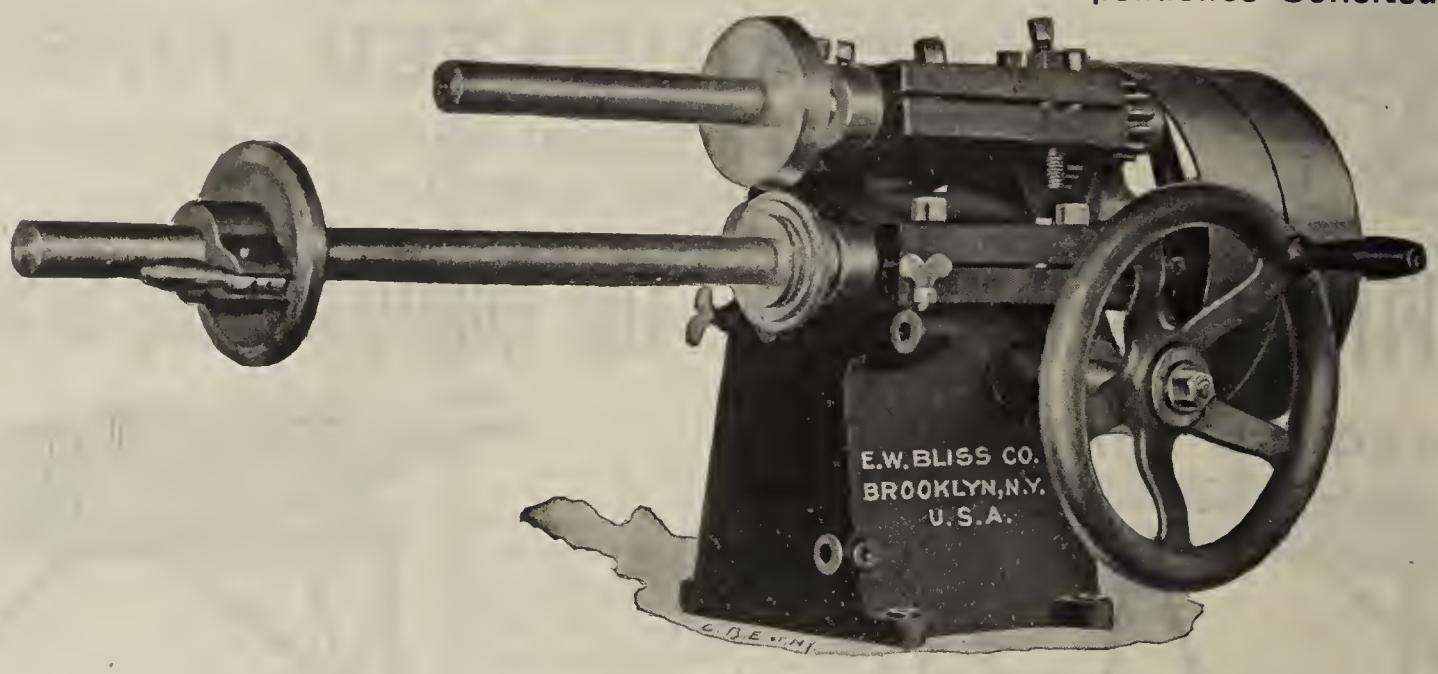
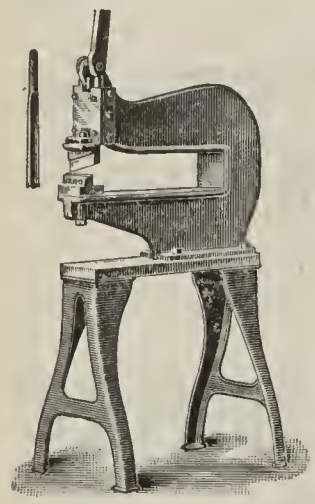
Brooklyn, N. Y.



OWNERS OF THE STILES AND PARKER PRESS CO.

NO. 153B "BLISS" PARALLEL SHAFT BEADING AND FLANGING MACHINE.

In the ordinary type of Beading and Flanging Machine, the shafts open apart by a hinge at the end. Unless the shafts and rolls are adjusted with the greatest nicety, satisfactory work cannot be secured. This is due to the fact that, when the shafts are thrown apart to put on or remove the work, they are farther apart at the outer point of contact than at the inner This also makes it impracticable to shift the position of the rolls to suit cans of various lengths, unless they are of the exact diameter required to bring the shafts parallel. If not so made, when the rolls are brought closer together or moved farther apart, the parallelism of the shafts is destroyed and the rolls do not fit.



To overcome this difficulty, we have designed the machine shown in the accompanying illustration. In it the upper shaft bearings have a hinge parallel to the shafts. When the two shafts are separated their parallelism is not disturbed. Thus the outer rolls may be placed at any point on the lower shaft, making the machine available for a wide range of work. The shafts are brought into working position by the hand wheel shown instead of by the usual foot treadle.

QUICK MEAL

BLUE FLAME OIL STOVES.

The Quick Meal Blue Flame Oil Stove is the youngest member of the Quick Meal family, but it has become just as popular as the Quick Meal Gasoline Stove, the Quick Meal Gas Stove and the Quick Meal Steel Range. Please bear in mind that it has been greatly improved since last year and that it has embodied in it quite a number of points of merit not found in any other Blue Flame Stove—not the least of these being that the Tank is made of two pieces only, jointed with a single seam and leak-proof.

P. S.==Quick Meal Steel Ranges are Great Sellers.

HATBORO, PA., Dec. 26th, 1896.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.
MY DEAR SIR :

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal. Very truly, I. N. EVANS.

The Air Tight Round Oak Range!

A POT OF BEANS!

Read this from a user!

"We placed a crock of beans in the oven upon retiring at night—put in ONE stick of wood—and in the morning found the beans perfectly baked—and live coals enough to quickly start the fire."

BAKED POTATOES—*this from a dealer.*

"There never was a stove sold that I have known anything about—that was half as good in any of the following points: it will keep fire perfectly with one stick of wood all night:—bakes perfectly with two small sticks:—oven can be heated and bake potatoes for breakfast in 30 minutes—and in every way it is far superior to all others. I shall push them another season."

It is all in the painstaking fitting.

Do you like to sell the best?

WARM-AIR GENERATORS ARE "STAYERS."

CORTLAND, N. Y., Aug. 16, 1897.

L. R. LEWIS—Dear Sir: I would say regarding the "Kelsey Generator" that I have used one in my home, and also in the First National Bank, for seven years, and consider them the most durable heater on the market. There has never been one cent spent in repairs on either of them, and the castings are as perfect now as when new. As to economy of fuel, they are unequalled, having thoroughly heated the buildings they are in at a great saving of fuel over the furnaces they replaced. I never fail to advise my friends to purchase a "Kelsey" by all means.

Yours truly,
EDWARD KEATOR,
Pres't First National Bank.

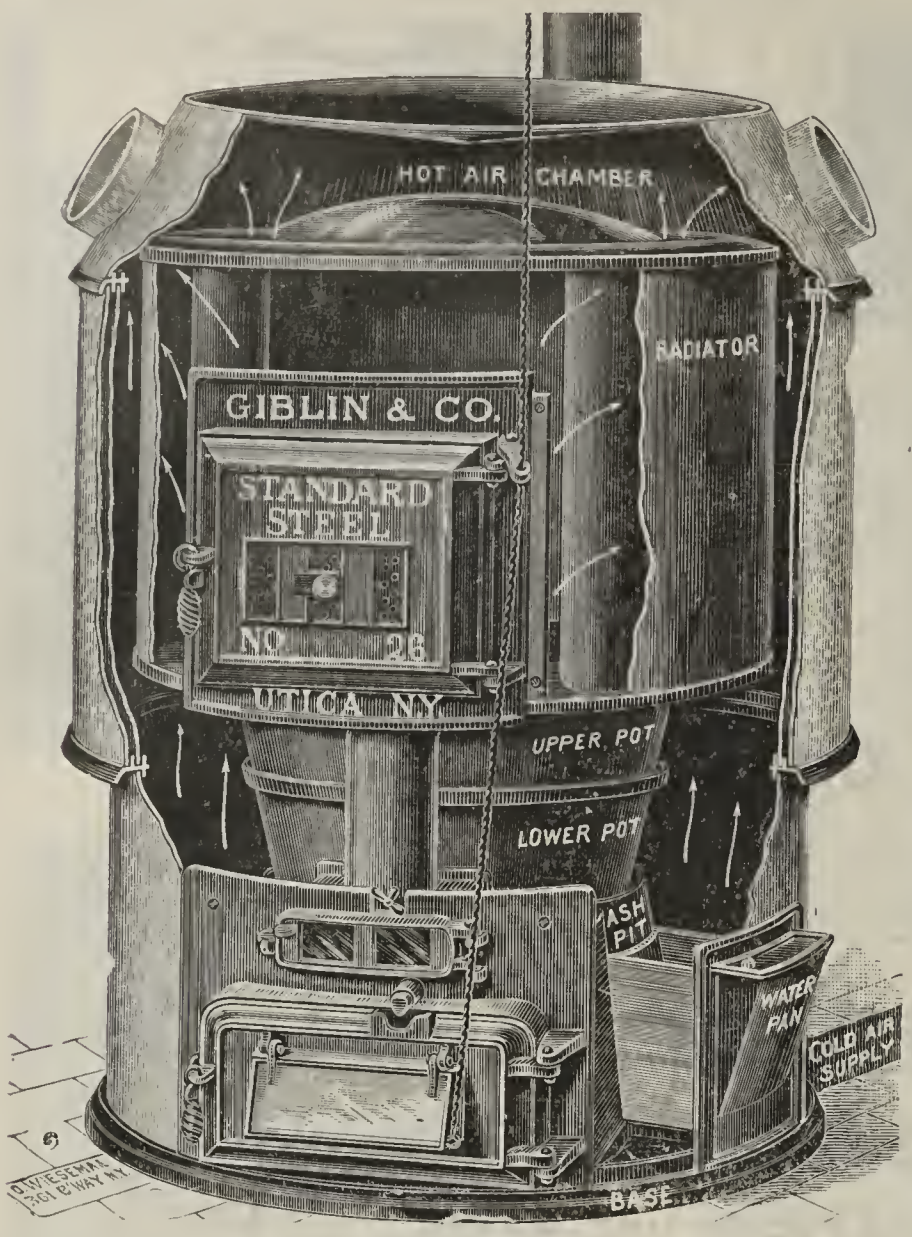
THE PUTNAM FOUNDRY & MACHINE CO., - Putnam, Conn.

The James Allingham Hot Water Heater.

MANUFACTURED BY THE

Rockford Grate Company,



Office and Works, 146 to 160 Bunker Street, CHICAGO.

We have purchased the exclusive right to manufacture the James Allingham Hot Water Heaters, and reconstructed and improved the patterns to such an extent ***that we are now prepared to offer the trade a Hot Water Heater superior to any similar Heater on the market.***

The Boiler is built with a cone flue but without Cast Iron Dome, Mud Ring or Door Frame. The entire Boiler body is made from three pieces of Flange Steel. The Cone is swedged out at the bottom and door. This with the Steel Head allows for the unequal expansion of the Cone and outside sheet and therefore no breaking of Calking Joints, drawing of Rivets, or buckling of Cone, and less liable to leak owing to less number of joints. The superior construction of Grate, large Ash Pit and scientific Draft Openings insure perfect combustion and easy regulation. It will boil water in less time, with less fuel, and the fact of its endorsement by the U S. War Department gives it a superiority over any other boiler made. The Cone Flue construction starts circulation almost as soon as fire is started, as we have only a small amount of water to heat located where the fire is hottest.

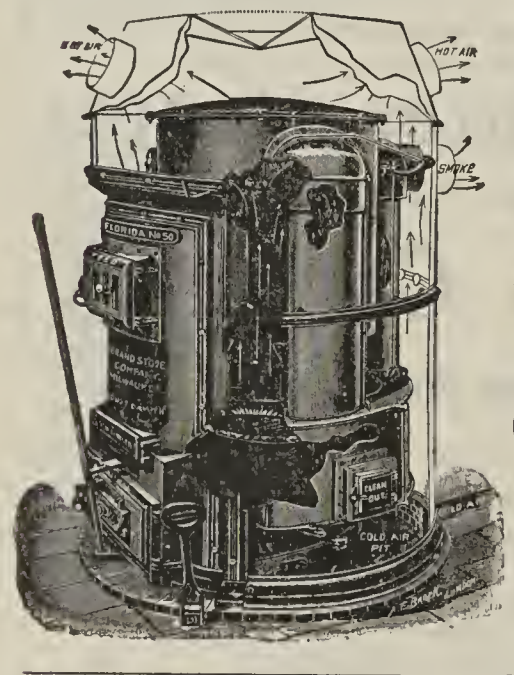
WRITE FOR COMPLETE DESCRIPTIVE CIRCULARS AND PRICES.

We also manufacture an Artistic Line of Round Fire Pot Fire Place Grates for Hard and Soft Coal and Gas.

Our Catalogue tells what the furnaces are and do.

Some Furnaces

Fail to Heat,
Have an Enormous Appetite for Coal,



Require almost a person's whole time to manage,

THE METAL WORKER

Stove Storage Receipts.

FOR the accommodation of Stove Dealers who desire to undertake the summer storage of stoves for their customers, we have printed books of Receipts arranged on a new and ingenious plan. The Receipt to be given to the customer is on one side of the page, and on the other side is a Memorandum of the conditions, needed repairs and storage charges agreed to. *Opposite the Receipt* is its Duplicate, and *opposite the Memorandum page* is its Duplicate. When the leaf which has the Receipt on one side and the Memorandum on the other is torn out for the customer, it leaves Duplicate of Receipt and Memorandum on pages facing each other.

This arrangement has the advantage of bringing the two Receipt pages and the two Memorandum pages opposite each other, before the customer's Receipt is removed, facilitating copying and comparison, so that the Receipt and Memorandum given to the customer may *exactly correspond* with that retained by the person who receives the stove for storage.

Substantially Bound in Canvas.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

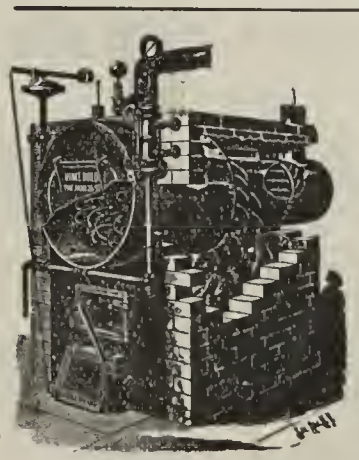
"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importanco in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.



PRICE, $3.00.

AVOID MISTAKES AND LOSS

BY USING THE

CONTRACT and ESTIMATE RECORD BOOK FOR PLUMBERS.

By B. H. JESSUP.

OFFICE EDITION. (Second Enlarged Edition) 200 Pages. Arranged for 100 Estimates, size 9 x 12 inches, cloth, $2.00.

POCKET EDITION. 200 Pages. Arranged for 50 Estimates, size 3½ x 8 inches (oblong), flexible, cloth, $1 00

Plumbers will find the use of the Contract and Estimate Record Books a great saving in money and time.

These carefully prepared books offer a means of recording systematically and with little trouble each estimate or contract and will be of especial value to the trade because they give all the items in connection with each estimate, by which the danger of omission and error is avoided.

Each book contains a list of all material likely to be used in any ordinary house, and parallel columns give space for entering the cost.

OFFICE EDITION.

This edition is specially adapted for desk use The improvements and additions now introduced make this a perfect estimate book.

An alphabetical index is given in the front of this book for entering the names of those for whom estimates have been furnished, together with the number of the page on which the estimate is to be found in detail.

POCKET EDITION.

This book is printed on thin, strong paper, and arranged in the most compact and handy form for pocket use.

At the beginning of each form is a space for the name of the person for whom the estimate is made, and the date.

Plumbers will be well repaid who depart from old or imperfect methods of keeping track of work, and take these books into their shops for practical use.

Sent, prepaid, on receipt of price by

DAVID WILLIAMS CO., Publishers,

232-238 William Street, New York.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

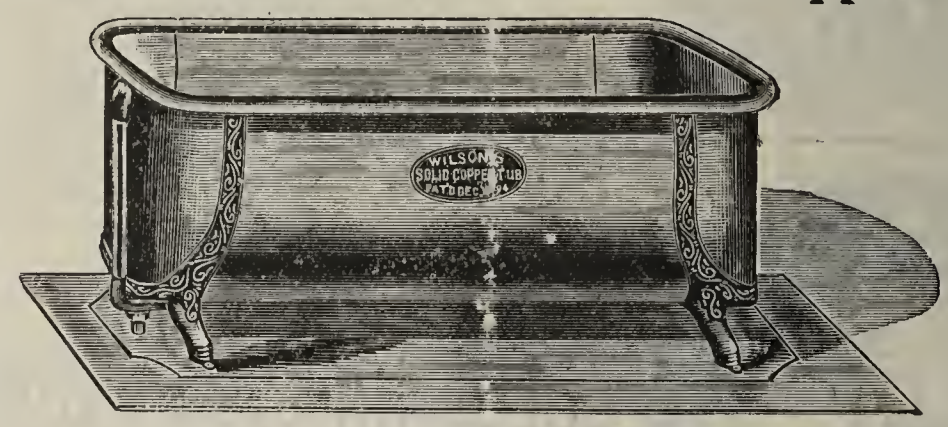
This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.



Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

The Business Situation.

The course of business during the past week has been decidedly encouraging, in view of the unsettled condition of foreign affairs and the continued war talk indulged in, for circulation purposes only, by certain sensational newspapers. The public at large are gradually learning to discredit the reckless fables put forth by this happily small though noisy section of the press, and their irresponsible utterances on public matters exert a lessening influence in business or financial circles. In Wall street the sentiment at this juncture is growing more pronounced that the $50,000,000 appropriation for national defense unanimously passed by both Houses of Congress and signed by the President this week is to be construed as making for peace rather than as a forerunner of war, and its effect has been to renew stability in market values. The stock market has had a series of moderate fluctuations, and the general public has for the time ceased buying securities to a large extent. But the tone of the market is firmer than it was a week ago, and there is an evident disposition on the part of investors and speculators to act cautiously and to quietly await the report of the Court of Inquiry on the "Maine" disaster and other further developments before engaging in new enterprises or investments. The banks are well "loaned up" and have advanced money rates materially. As borrowers are for the time being indifferent, there is something like stagnation in the money market. There have been additional engagements of gold for importation, bringing the total amount for the past two weeks up to $13,000,000. Meanwhile the markets for staples, such as grain, cotton, meat products, &c., are very strong and the demand for manufactured products in general shows a steady increase. Trade reports indicate an excellent business in the West, reaching a larger volume than for several years past at this season. The improvement is not so pronounced in the East, but the feeling in trade circles in this section is decidedly cheerful in connection with nearly all lines of business. Prices, while showing no very notable changes, tend generally upward, especially in iron and metal lines. The strength of copper is particularly pronounced and tin and spelter have gained in value during the week. Payments through clearing houses last week were 28 per cent. larger than in 1892, while compared with last year the gain was 56.2 per cent.

Plumbing Schools Here and Abroad.

Readers of English journals see a good many references to classes in plumbing in different English cities, but there is little definitely known here about the system of instruction as there carried on. Since the establishment of the New York Trade School attention has been more and more directed in the United States to the subject of manual and scientific instruction of plumbers, and as a consequence of this interest a number of schools have been established. We are fortunate in securing from Mr. Ainge of Lansing, Mich., an article which we publish elsewhere in this issue, giving the general features of instruction as followed in the English plumbing classes, and a summary of the American plumbing schools, together with a brief comparison of the methods obtaining in the two countries. The article will be found to present the whole question in a very compact and clear manner, and we commend it to the attention of all plumbing readers who are in any way interested in the advancement of their craft through the instrumentality of trade and technical schools. The recommendation in the closing sentence to the National Association of Master Plumbers will, we are sure, be in keeping with the thoughts of many prominent members of that important body. Whether the association as a whole wish to take official action in this matter is for them to decide, but what seems to call for immediate attention is the absolute lack of schools in the West where instruction in plumbing can be obtained.

The Navy of Spain.

It cannot be denied that at this time the people of our country are eagerly seeking information concerning the relative value of the navy of Spain in an engagement with the naval forces of the United States. To estimate this aright many factors should be taken into serious consideration—not only the ships, the armament and the *materiel;* not only the experience, the discipline and the *personnel*, but also the prestige, the *esprit de corps* and the animus of the two services must be given due weight. Few chapters in naval history are more interesting than those which tell of the rise and decline of the power of Spain on the sea. In 1588, Spain in the plenitude of her naval strength prepared for battle the largest sea fleet ever heard of. It consisted of 130 vessels, of 57,868 tons, mounting 2431 guns and carrying 30,000 men. It sailed up the English Channel, and it suffered a most disastrous annihilation from wind, weather and an inferior English fleet. Incompetent commanders, poor seamanship and badly shaped plans assisted as much in destroying this Spanish Armada as did foul weather and a resolute foe. The complete effacement of Spain as a power on the sea occurred at the battle of Trafalgar.

A reorganization and a rehabilitation of the Spanish Navy was begun in 1837 ; the results, not yet altogether attained, can be seen in the ships and men composing the force about which we now are concerned.

In the way of armored tonnage Spain has on the whole builded well. She has one battle ship, the "Pelayo," of 10,000 tons, formidable in both attack and defense. For the attack she has two 12.5-inch guns, two 11-inch guns, nine 5.5-inch guns and a large number of smaller guns; for the defense, a steel belt and turrets of 18 inches thickness. Her speed is about 17 knots. This vessel is not thoroughly modern; the armor is not nickel faced nor Harveyized, neither is her internal arrangement of the best. Of armored cruisers Spain possesses ready for service perhaps six. One of them, the "Carlos V," is of 9100 tons, about the size of our "Brooklyn." Her battery consists of two 11-inch, eight 5.5-inch and four 4-inch guns. Her protection is a horizontal 6-inch steel deck at the water line, a steel belt 2 inches thick and 10-inch steel turrets. Her speed is 20 knots.

Another fine type of armored cruiser is that represented by the "Infanta Maria" class, of 7000 tons displacement. The names of these six armored cruisers are "Infanta Maria Teresa," "Princesa de Asturias," "Cardenal Cisneros," "Cataluna," "Almirante Oquendo" and "Vizcaya." They have all been launched, but are not all ready by any means. Perhaps four of them could be put into active service in a comparatively short time. They are 350 feet long, 61 feet beam and 22 feet draft. The motive power consists of two sets of triple expansion engines developing 15,000 horse-power and a speed of 20 knots. The coal capacity, 1200 tons, is noteworthy; it will permit these vessels to cross the Atlantic and stay here some time before replenishing, and gives them a radius of action at a moderate rate of steaming of 12,000 miles.

Not less admirable is the arrangement and distribution of the armament. Here are two 9.5-inch guns in turrets, 12 inches thick; ten 5 5-inch rapid fire guns in battery, and over 20 of the smaller caliber and machine guns. The protection of the vessels consists of an armored belt 11 inches thick amidships and tapering to 7 inches at the ends. Ten-inch transverse bulkheads join the extremities, thus making a citadel, within which are the machinery and magazines of the ship. Over this is the armored deck 3 inches thick. In our navy there is no ship like one of these four. There can be no doubt these Spanish ships are good fighting men-of-war, and, properly handled, are capable of fighting long and hard. Not unlike these are the two armored cruisers "Cristobal Colon" and "Pedro Aragon," 6800 tons, purchased by Spain from Italy. The "Colon" is ready. Her water line belt and citadel are 6 inches thick, the sides extending up so as to protect the ten 6-inch guns. The remaining guns of her armament are two 10-inch, one forward and the other aft, in barbettes, protected by shields 5 inches thick, and six 4.7-inch guns protected by shields. Her speed is a good 20 knots.

This closes the list of Spain's effective armored fleet. We gather from it that though small it is excellent. The ships are distinctly good ones of their types. The policy dictating the type has for its object the protection of far distant colonies. Hence the prevalence of the armored cruiser. What part the armored cruiser will play in war time has not been definitely determined by naval tacticians. She is not designed for the line of battle, being as a rule too light offensively and defensively; yet there would appear to be no good reason why a bold captain in the "Maria Teresa" should not lay her successfully alongside the battle ship "Pelayo." On the other hand, the "Pelayo," ship for ship, gun for gun, armor for armor, is the better vessel. But the discipline of the *personnel* of the two may be different, the skill of the commanding officers may be unequal, the maneuvering of the ships may be unlike. These are factors which are quite as valuable as gun power and armor resistance. Indeed, they count for more, for the best ship that ever floated would have to strike her colors if badly commanded, no matter who might be her assailant.

It is a difficult as well as a delicate matter to discuss the seamanship of Spanish sailors—and we may not be altogether competent to do it. There have been great Spanish admirals. Columbus was one, though not a native, and there have been many others; and among the 1200 officers in the Spanish Navy to-day there must be many who know their profession—men possessed of that cool, determined intelligence which leads to victory or to glorious death. The same in a measure must be true of the 15,000 men now behind the Spanish guns, even though for years little has been heard of them, and that little has been lightly spoken. It is well then to indulge in no invidious comparisons in attempting to estimate the naval strength of Spain, ship for ship and man for man. Spain should be accounted the equal of her antagonist, whoever he may be, until the matter has been put to the test.

Only the armored fleet of Spain has been considered above, for the reason that, generally speaking, the armored fleet is the measure of the fighting capacity of a nation. Of unarmored ships Spain has a great number, and it would not be difficult to make additions. There are 18 cruisers, varying in size from 1100 tons to 5000 tons, and 25 of a smaller size, good ships most of them. As able assistants to these cruisers there are 12 torpedo vessels, ranging between 460 and 850 tons in size, and between 18 knots and 28 knots speed. They are a thoroughly efficient lot.

Spain's gun boat flotilla is a large force numerically, over a hundred, ranging in size between 400 and 40 tons. These gun boats have inconsiderable speed, most of them, but they are good vessels for service in Cuban waters, where many of them are now.

Of torpedo boat destroyers the Spanish Navy has four, new, as good in every particular as can be. They are of 380 tons displacement and 29 knots speed. Besides these there are 14 torpedo boats between 60 and 120 tons displacement, with speeds ranging from 19 to 26 knots.

In conclusion, it should be said that we believe the new navy of Spain to be a downright good one. There can be no doubt of the excellence of the ships, armor and guns. Of the experience, the discipline and the *personnel* we are not qualified to speak with certainty, though we know of no reason why they may not be equal to that of any other navy. Concerning the prestige, the *esprit de corps* and the animus, we have to say that we believe Spaniards to be brave, we believe them to be actuated by the highest motives, and we believe that in a determined effort to win once again that prestige which centuries ago made the royal standard of Castile and Aragon the proudest on the seas Spain will fight to her death.—*The Iron Age.*

Traffic officials of many of the Western railroads are again confronted with a great scarcity of cars Traffic is so heavy in both directions that the demand for cars cannot be met as expeditiously as is desired. A car is shipped East loaded. Under ordinary circumstances it could be unloaded and sent back immediately. Now, however, it gets a second load in the East before being sent West again, and of course the detention is considerably longer. Roads find it extremely difficult to borrow from one another to tide them over the present rush. There never was a time, perhaps, when greater vigilance was displayed regarding the movement of cars than right now.

THE LETTER BOX.

Galvanizing Wringer Castings.

From D. W. C., Westville, Nova Scotia.—Will *The Metal Worker* please give the composition used to galvanize wringers and the process?

Answer.—We reprint the following from an article by W. F. Flanders, Nashua, N. H., in *The Metal Worker* of February 1, 1895: I do not claim that the directions given in this article will enable a person to engage in the business in all its branches and carry it on without meeting difficulties that are not contemplated here, as such difficulties will be met and they can only be overcome by experimenting and experience. Galvanizing, as understood in the trades, has no connection with electricity as a part of the process, and is simply a dipping of iron into molten zinc, the iron having been previously freed from scale or sand by the use of acids or by tumbling. To all inquiries as to the best brands of metal to use for galvanizing use only a brand smelted or handled by a reliable concern, and under no circumstances attempt to galvanize with metal whose only recommendation is its low price. For galvanizing malleable iron the metal should be kept at a uniform heat of about 30 degrees above the melting point, and its proper temperature will soon be learned in practice, so that at a glance it will be known by the color. The surface of the metal should be covered with a flux of sal ammoniac to prevent the scum or oxidized metal from adhering to the work. Malleable castings should only remain in the metal until they are of the same temperature as it is. The loss from dross and oxidation is often as much as 50 per cent. of the metal used. If the castings must be freed from sand by pickling they should be placed on an inclined platform, and a solution of 1 pound of sulphuric acid and 3 pounds of water should be poured over them every three hours for a period of from 12 to 36 hours, or until the sand washes off readily. They should then be inspected, and any remaining scale or sand should be removed by a steel casting brush or with a file, otherwise the work cannot be properly coated. Castings that have been freed from sand by tumbling do not require pickling with sulphuric acid, but can be galvanized after immersion in a bath of one part muriatic acid and three parts water long enough to remove any traces of rust. Work of all kinds should be kept covered with water until the galvanizing is to be done. Then it should be taken out of the water and immersed in a solution composed of 1 gallon of muriatic acid, 1 gallon of water and 2 pounds of sal ammoniac. After remaining in this mixture two or three minutes it should be thoroughly dried in an oven that is not hot enough to burn the acid, after which it is ready to be dropped into the molten metal. After the iron has commenced to take the metal it should be thoroughly washed in the flux of sal ammoniac floating on the top of the molten metal to assist it in taking an even coat, and it is important that the flux should be kept liquid, clean and fresh to insure the metal taking as rapidly as possible to the work. The proper consistency of this flux is important to the operation, and its effect on the work should be carefully noted to keep it in as near a perfect state as possible. After the work is thoroughly coated the surface of the metal should be carefuly skimmed aside for a space, and the work should be slowly and carefully drawn out, all the while being sprinkled with powdered sal ammoniac to cause the metal to flow freely from the work to leave it smooth and bright. The work should be held over the metal till it drips; then it should be dipped in clean cold water and held there till the coating sets. If a spangled appearance is desired the work should not be wet until the formation begins, and then dipped quickly into water till the sal ammoniac is all washed off.

Water to Boiler Surface.

From A., New Jersey.—Will you kindly tell in an early issue of *The Metal Worker* what is considered the right quantity of water to 1 square foot of fire surface in a low pressure house heating steam or hot water boiler?

Note.—This is a question which it seems almost impossible to answer, owing to the many types of boilers made, but we shall be glad to have those of our readers who have experimented in this line express their views in reference to it. In consulting a catalogue of a prominent manufacturer and taking a vertical sectional boiler, we find that the intermediate section has a proportion of 3 quarts of water to 1 square foot of surface. On consulting the catalogue of another manufacturer we find that less than 2 quarts of water are provided for 1 square foot of surface. It is generally considered that owing to a hot water heating system being full of water throughout, it is not necessary that the boiler should hold as much water in proportion to the surface exposed as a steam boiler. As to the right quantity of water to be supplied for 1 square foot of surface, it depends upon the character and construction of the boiler. The quantity of water is of less importance than the provision of ample water ways to permit of a free circulation within the boiler, so that the hottest water may readily rise to the highest point. There should be no point where under heavy firing the steam globules in a steam boiler would be prevented from reaching the steam chamber, or globules of steam would form in a hot water boiler and impede circulation.

Repairing Agate Ware.

From J. G. R., San Jacinto, Cal.—Will *The Metal Worker* kindly let me know how I can repair agate ware without soldering, or if it is soldered is there any agate enamel to put on to make it look well after it is repaired? I think I saw something in reference to this in *The Metal Worker* a few years ago.

Note.—We will be glad to hear from any of our readers who can give information on this subject. The articles which have appeared in *The Metal Worker* on repairing agate ware state that the coating should be chipped away from the leak, then the iron scraped bright, so that it can be readily soldered. Nothing has come to our notice for enameling iron ware which could be used for repairing that would stand the heat of cooking. If the hole is a small one a copper rivet can be used with satisfaction in many instances.

What Makes the Radiator Noisy?

From T. B. C., Newark, N. J.—The inquiry of "J. R. M." in *The Metal Worker*, February 26, can be easily answered by himself if he will examine the construction of a globe valve. He will find that the seat of the valve disk will form a dam to hold water up to nearly half the diameter of the pipe to which it is attached when the valve is placed so that the wheel is on the top. I think he will have no more trouble if he turns the globe valves on the second-floor radiator so that the wheels will be on the side. In this position the valves will allow the water to run out of the radiator and stop the noise. A globe valve should always be placed so that it will not hold water.

Laundry Drier.

From G. H., New York.—Answering the inquiry of your correspondent, "C. B. H.," Tariffville, Conn, in *The Metal Worker*, March 5, in regard to a cheap method of building a drying room for a dwelling, I suggest that between the carpenter, the tinsmith and the stove man a very cheap drying apparatus may be constructed in a laundry room or kitchen. From my own experience in building drying rooms I submit the accompanying

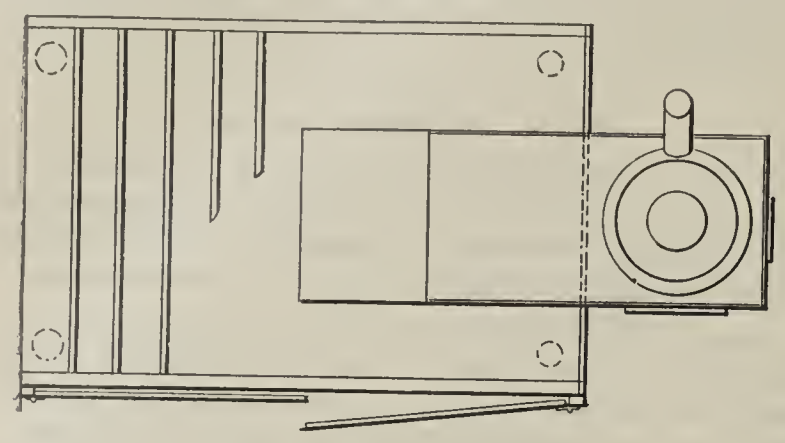

Fig. 1.

sketches, which will, I think, meet the want of your correspondent, Fig. 1 being a plan, Figs. 2 and 3 vertical sections and Fig. 4 the detail of fastenings with the clip and slide for holding the clothes horses. The plan represents a drying room 4 x 6 feet for 11 clothes horses. With continuous drying from six to eight horses is sufficient for small families. The sides and top may be matched ¾ stuff and the framing 1¼ x 2½ pine. The slides for holding the horses may be ¾ x 2 inches, with a rabbeted strip for holding the clips, nailed or screwed to it to form the groove, as shown in Fig. 4. The clips may be made of No. 12 sheet iron and screwed to the stiles of the horses. The rails may be halved and clinch nailed to the stiles. The flat top ironing stove of the stove trade is best suited if placed on the same floor with the drier, and may be so arranged that the sheet iron cover can be removed and the stove used for heating irons.

For safety the stove should be boxed in with sheet iron and a sheet iron apron extended into the room, sup-

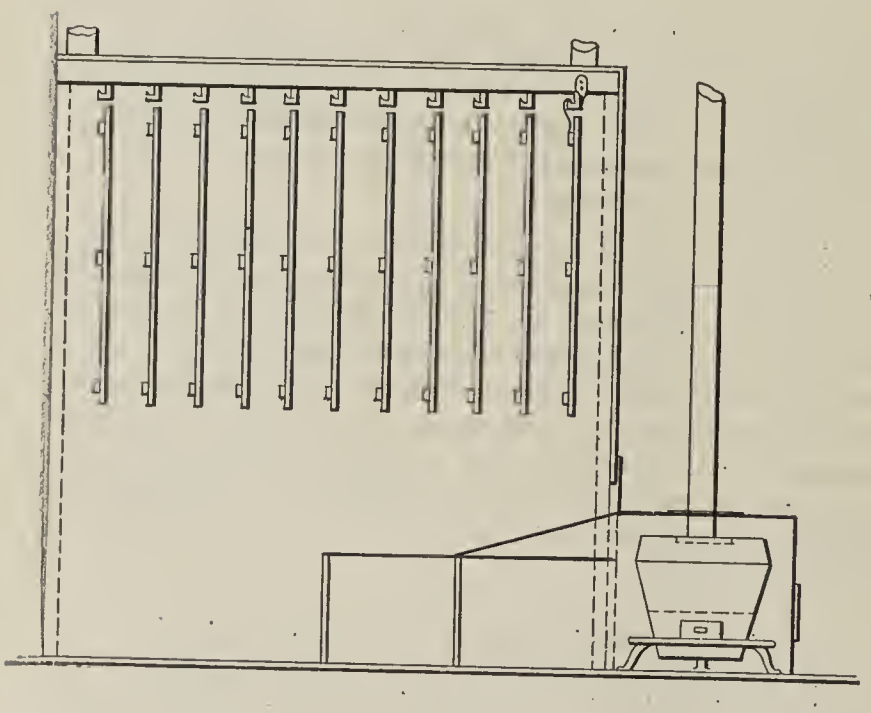

Fig 2.

ported on small stanchions, for equalizing the flow of air. An opening in the sheet iron box opposite the opening into the dryroom serves to impinge the cold incoming air directly against the stove. There should be a stove pipe ventilator at each corner brought together and carried to a chimney flue not used for fire or up through the house to the roof with a hood. If there is room over the drier the partitions may be run up to the ceiling of the room with the holes in the cover of the drier at the corners, and a single ventilator to a flue or to the roof. To charge the dryroom the horses may be unhooked and set at the further end of the room, and one at a time hung and the clothes put on—or if the heat is on, one at a time may be

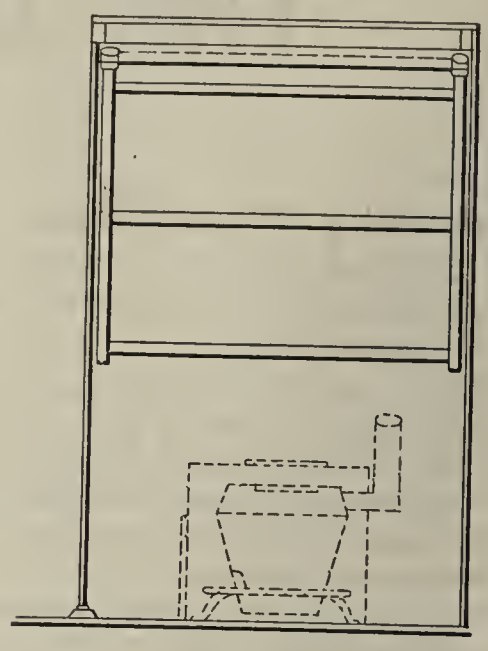

Fig. 3.

drawn out through the door and hung on a pair of hooks outside of the room, charged and slid into place. This makes a convenient and snug drier with no rails extending out into the room, and if the stove can be placed in

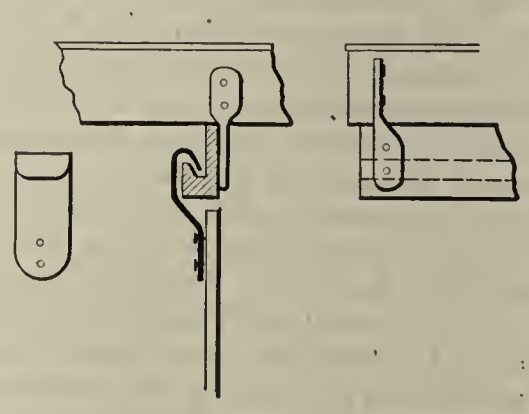

Fig. 4.

the cellar with an air casing leading through the floor the drying room may be made a neat and ornamental adjunct of a kitchen or laundry room.

Lead Lined Tanks.

From C. L., Grand Rapids, Mich.—In this country we have more or less trouble with lead lined tanks. The water has some effect on the lead so that in a short time the bottom of a tank is full of pin holes. In the first place the spots look white and after a while they turn to a dark green color. If then a knife is taken and the spot scraped it will be found that there are holes in the lead. I would like to ask if there is any protection against this trouble. I have lately painted the lining with white lead paint after the tank was ready for use and it served as considerable protection. Is there anything better than white lead, and also does any one know what makes the dark green spots on the lead? The tanks are used for pressure in the attic and are fitted with force pumps. We found at times that a little sand was pumped up and thought perhaps that was the cause of the trouble. Any information on the subject to overcome the trouble I should be very glad to receive.

The work of erecting the new steel arch to replace the upper suspension bridge across the river at Niagara Falls is now progressing with some little rapidity. For a time there was delay in the arrival of steel, but now it is reaching the point of operation in good quantities, and its erection is going forward satisfactorily.

Operations will be commenced soon on a new shaft in the coal mines at Blossburg, N. M. This work will necessitate the installation of considerable new machinery. It is also proposed to erect 18 new coke ovens on the site.

THE RETAIL STORE.

Rockford Grates.

The Rockford Grate Company, 146 to 160 Bunker street, Chicago, are manufacturers of high class fire place furniture. They have recently placed on the market the Leader grate, which possesses so many features of interest that illustrations are herewith given. Fig. 1 is a front view, showing the beauty of the design and the high character of the molded work. It is finished in bright, antique and Japanese copper, bright and antique brass, nickel and Berlin black. Fig. 2 is a front view and Fig. 3 a side view of the Leader back. The combustion chamber is a heavy round fire pot, with a shaking draw center grate, adapted to either hard or soft coal, but having no corners or projections for the lodgment of ashes. The fire pot is not only large, but projects from the tiling, so that heat is radiated sideways as well as in front. The reflecting plate and hood are so arranged that the heat is thrown forward and down, and thus the mantel is not only protected but the heat is placed where it is most needed. The fire pot and grate are made of heavy cast iron and the back of extra heavy cold rolled sheet steel, thus insuring durability in both cases. The dampers are regulated from the outside and are so arranged that when one is closed the other is sufficiently open to allow all smoke and gas to escape. The ash guard and draft slide fit closely, so that the air supply is under absolute control. A grate of this character is the cleanest because the ashes are only dropped in the center, no openings being in front to allow them to sift out. This grate can be readily changed from a coal to a gas grate.

The various styles in which the grate is made, as well as other high-class products of the company, are most attractively illustrated and described in a catalogue now ready for distribution. This catalogue is itself a work of art, being composed of heavy plate paper, the leaves fastened together with a silk cord. It comprises 64 pages, the size of the pages being 9 x 12 inches. Few publications can boast as handsome engravings and letterpress.

Albeck & Dolt, who have recently embarked in business at Manlius, N. Y., as successors of Dewey & Cadwell, are desirous of receiving catalogues, price-lists, &c. They are carrying a varied stock, including Hardware, Stoves and Tinware, House Furnishing Goods, Pipe and Fittings, Bicycles, &c., and also conduct a plumbing and repairing department.

Rockford Grates.—Fig. 1.—Front View of the Leader Grate.

F. W. Berry, Luray, Va., has moved his storeroom with stock 48 feet from the former location. The establishment is 24 x 60 feet, with two 10-foot stories. Mr. Berry has erected a wareroom, 20 x 17 feet, in the rear of the store. He handles Hardware, Stoves, Tinware, Sporting Goods, Agricultural Implements, &c.

J. Sidney Smith, one of the best known traveling men of New England, who has been for the past 27 years with the St. Louis Stamping Company and their predecessors, severed his connection with that concern March 1. Mr. Smith will be much missed by his numerous customers and his fellows on the road, among whom he is very pop-

ular. The trade will regret his retirement, and it is hoped that it may not be permanent. Mr. Smith desires, through the columns of *The Metal Worker*, to thank his

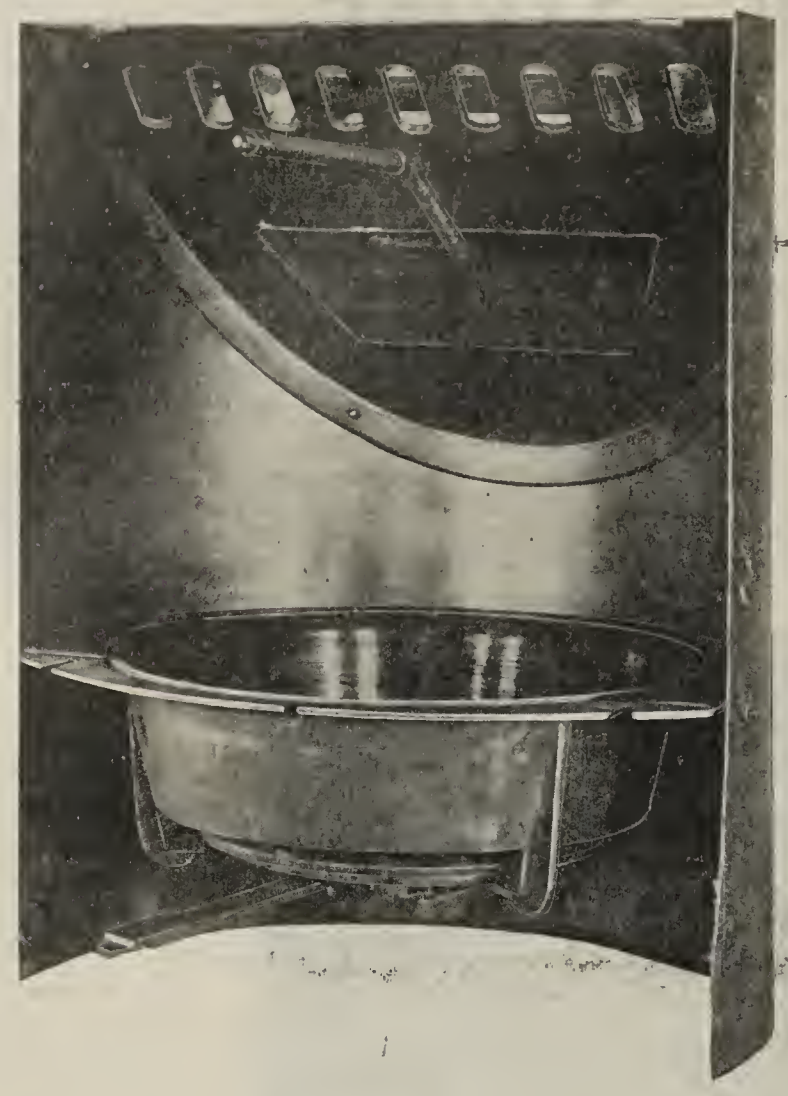

Fig. 2.—View of Back.

friends for their uniform courtesy and loyalty and to assure them of his grateful remembrance.

The Glacier Refrigerators.

The Northern Refrigerator Company, Grand Rapids, Mich., have issued an illustrated catalogue and price-list of what they describe as the famous seven-walled Glacier cold dry air refrigerators of their manufacture. Their catalogue, containing 50 odd pages, presents illustrations

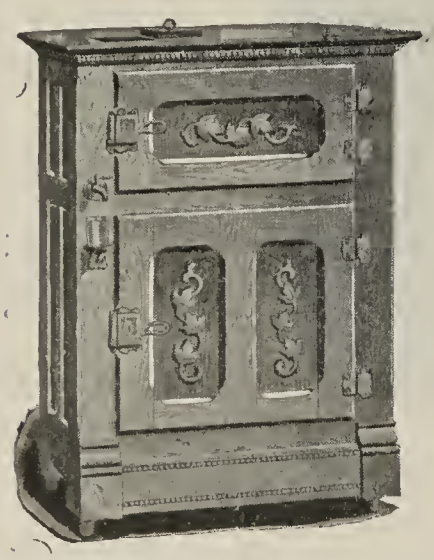

Fig 1.—General View of New Style

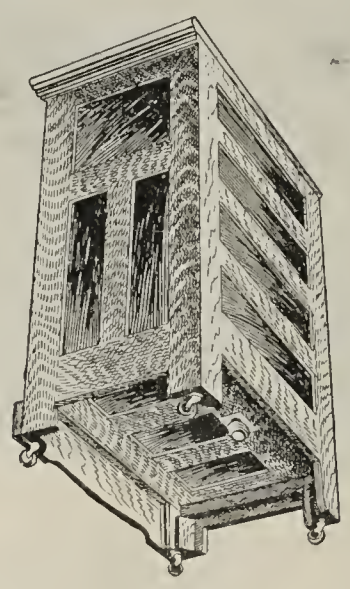

Fig. 2 —Showing Back and Bottom Paneling.

The Glacier Refrigerators.

of all styles and kinds of refrigerators of this type, besides giving descriptive particulars and full price-lists, while at the end of the catalogue are samples of the insulating charcoal sheathing and felt used in the construction of these goods. The manufacturers point out that they have made many improvements in their refrigerators this year, the new style being illustrated in the accompanying cut, Fig. 1, the changes including a complete remodeling of the design. They are now much more ornamental than before, the carvings being raised instead of sunk, and the proportions and moldings have been entirely remodeled. The backs and bottoms of the refrigerators are paneled as nicely as the fronts and sides, an illustration of an overturned refrigerator showing the bottom and back being presented in Fig 2. The manufacturers also allude to improvements in the metal work, especially in the metal ice racks and removable flues. The locks for these refrigerators are made entirely at the Northern Refrigerator Company's factory, and are of solid bronze with a wedge-shaped latch which draws the door into an air tight joint. It is pointed out that the door can be opened or closed with the foot if necessary.

MEMORANDA.

J. M. Martin is about to embark in business in Salem, Iowa. He will handle a general line of Hardware, Stoves and Tinware. Mr. Martin expects to be ready for patrons by April 1.

A. E. Marsh has succeeded to the business of S. R. Gray of Lime Springs, Iowa. The stock comprises Shelf and Heavy Hardware, Agricultural Implements, Stoves and Tinware, Sporting Goods, &c.

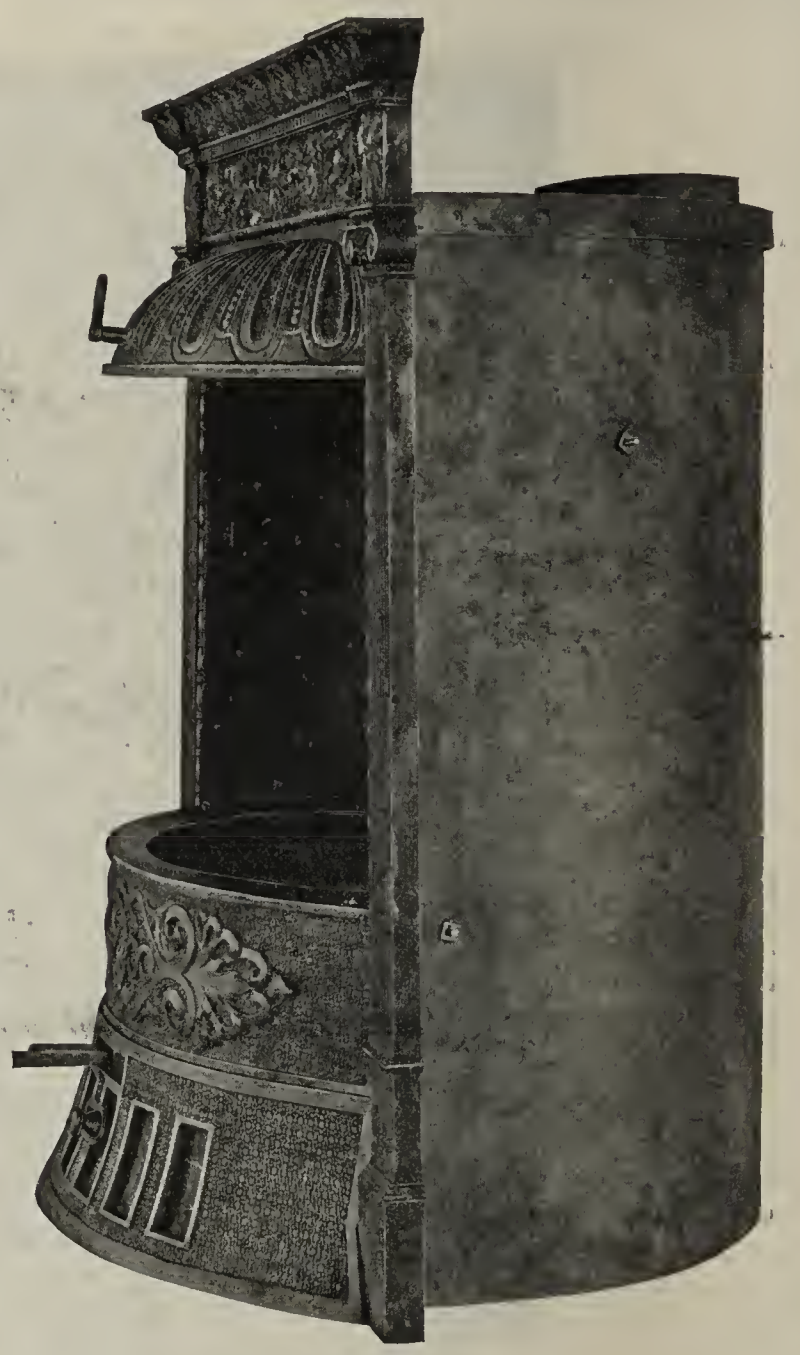

Fig 3.—Side View of Back

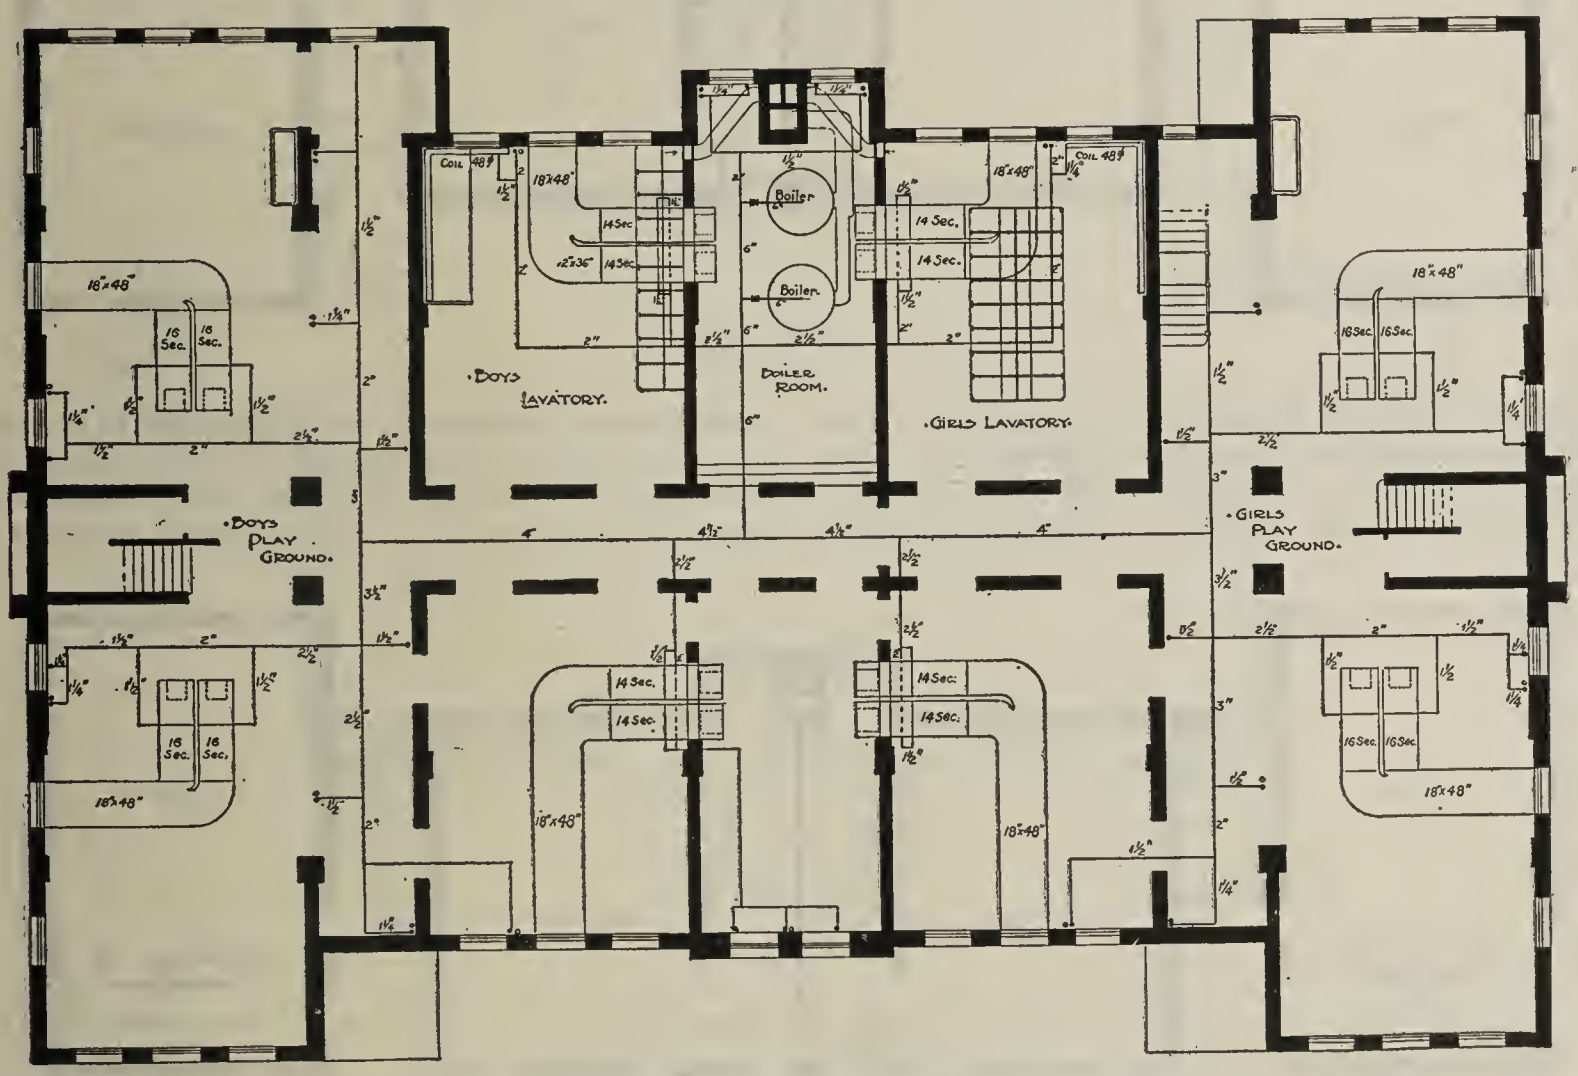
Noble & Hartman began the retail Hardware business in Lyons, N. Y., on February 1. They are carrying both Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

Gilbert & Son have succeeded Gilbert & Hines, wholesale and retail Shelf and Heavy Hardware and Stoves, New Oxford, Pa.

Theodore Sigler expects soon to open up in business in Linesville, Pa. Mr. Sigler will handle Hardware, Stoves, Tinware, Sporting Goods, &c., and will conduct business on a cash basis.

Shaw & Dibblee have bought from D. E. Curry the Hartland tin shop, at Woodstock, N. B.



T. C. Mapes has opened a tinsmithing establishment at Sanilac Center, Mich.

William Koch, Mitchell, S. D., is modernizing his building at the corner of Main and Second streets, and when completed will use a part of it for his tin shop.

HEATING AND PLUMBING.

HEATING AND VENTILATING A BAYONNE SCHOOL.

The new Third Ward School Building at Bayonne, N. J., has been erected from plans and specifications furnished by Architect Hugh Roberts, 76 Montgomery street, Jersey City, N. J. A low pressure steam heating and ventilating system has been installed in the building by Baker & Smith of New York City, using Gorton side feed boilers made by the Gorton-Lidgerwood Company, 96 Liberty street, New York. Fig. 1 presents a plan of the basement of the building, showing the location of the two special No. 38 Gorton boilers, connected with an 18 x 24 smoke flue by means of 12-inch smoke pipe made of No. 12 galvanized iron. The heating main is 6 inches in size when this it will be seen that for each 210 square feet of indirect surface used for heating the inner rooms there is a cold air supply of 433 inches, and the area of the warm air shaft leading from the stack is 324 square inches. The corner rooms are heated by similarly arranged stacks with the same amount of cold air supply and leading into hot air stacks of the same size. The radiators used for heating these rooms, however, are composed of 16 sections and present 240 square feet of heating surface. The cold air supply and the warm air flues connecting with the stacks are so arranged that by means of mixing dampers, operated by levers placed in the various class rooms at the teachers' desks, either cold air, warm air or mixed air can be supplied at will, the damper controlling device

Heating and Ventilating a Bayonne School.—Fig. 1.—Basement Plan.

starting from the boiler and runs as shown in Fig. 1, the returns from the different radiators, risers and coils being one size smaller than the flow connection, and following the line of the main in the return to the boilers where they connect, a check valve being placed on the return at each boiler. Valves are also placed on the flow and return connection, so that either boiler can be shut out of use when desired.

Fig. 2 is a plan of the first floor and Fig. 3 a plan of the second floor. The third floor, which is shown in Fig. 4, is used as an assembly room. The class rooms on the second floor are heated by means of indirect radiation, placed at the base of 18 x 18 inch hot air flues. These heating stacks are located as shown in Fig. 1, the inner rooms being provided with a stack of indirect radiation composed of 14 sections, exposing 15 square feet of surface to each section, or a total of 210 square feet. The stacks to first and second floor rooms are placed side by side, and the cold air for supplying the two stacks is brought in through one large duct, 18 x 48 inches, so arranged that each stack gets its proper proportion of cold air. From being provided with indicators to show the position of the mixing damper and the kind of air that is being supplied. The basement is arranged to be used as a play room for the pupils, and is heated sufficiently by the steam mains and returns, which are left uncovered for the purpose. The toilet rooms or lavatories in the basement are provided with additional heating surface in the form of a coil arranged as shown, each presenting 48 feet of surface.

On the first floor direct radiation is placed in the main hall and direct-indirect radiators are used for heating the cloak rooms, which are also connected with the ventilating flues. On the second floor direct-indirect radiators are used in the cloak rooms and in the teachers' room, and the exposed piping running through the teachers' lavatory furnishes sufficient heat in that room. The third floor is heated entirely by direct radiation, and ventilation is secured by 24 x 36 inch Tuttle & Bailey registers connected with the main vent shafts, which are 48 x 60 inches in size. The vertical vent shafts at the front of the building are connected with the main vent shafts by means of vent ducts running underneath the floor of the third story,

as shown. These vent ducts are each 36 x 84 inches in size. The two lavatories in the basement are also connected with two separate vent flues provided for the purpose, these vent flues being placed so that one side is in contact with the chimney, which heats them sufficiently to produce an exhaust current. The four radiators on the front of the third floor each expose 80 square feet of surface, while all the other direct radiators on this floor expose 76 feet of surface. The direct indirect radiators used in the cloak rooms on the first and second floors and in the teachers' rooms each present 40 square feet of surface. There is exposed in the direct indirect radiators 680 square feet of surface, in the indirect radiators 3600 square feet of surface, and in the direct radiators 1444 feet, making a total of 5724 square feet. This is the actual surface exposed, exclusive of the mains. It is ordinarily supposed that direct-indirect radiation is an additional tax to the boiler over the actual direct surface exposed, and a fair estimate would be in this case that the direct-indirect surface was equal to 816 square feet of direct surface, and that the indirect surface was equal to 5400 square feet of direct surface. When this is added to the 1444 square feet of direct surface it will be seen that the system exposed equivalently 7660 square feet of direct surface, exclusive

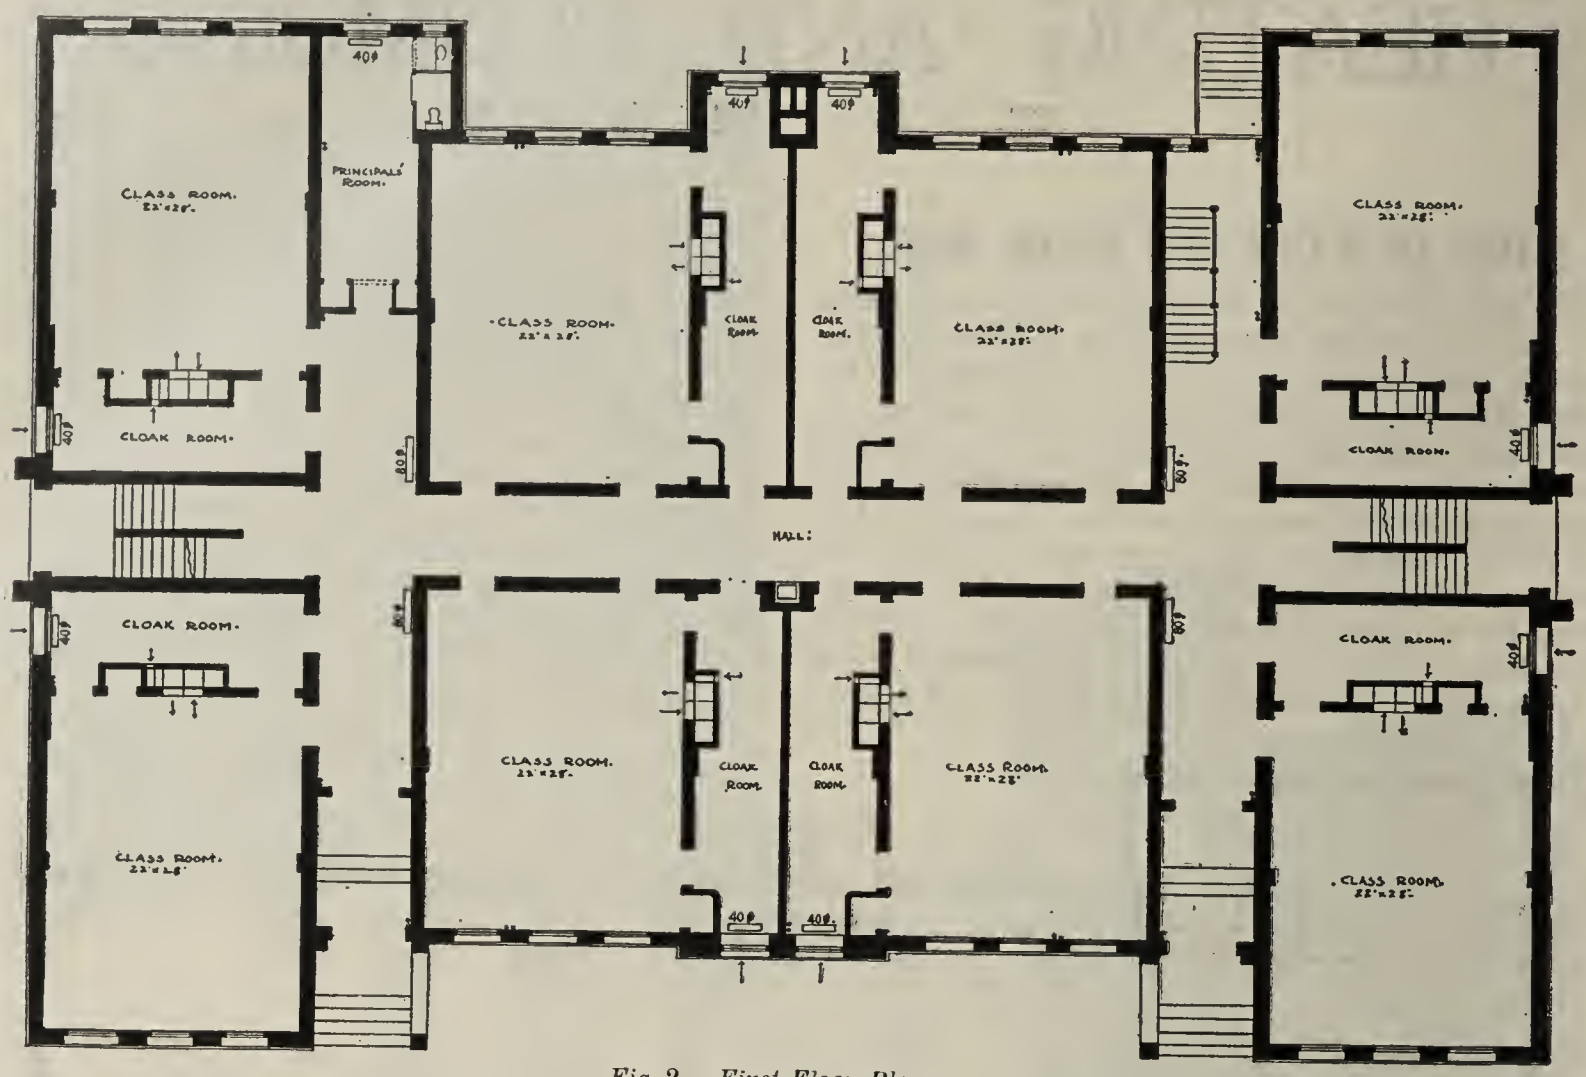


Fig 2.—First-Floor Plan

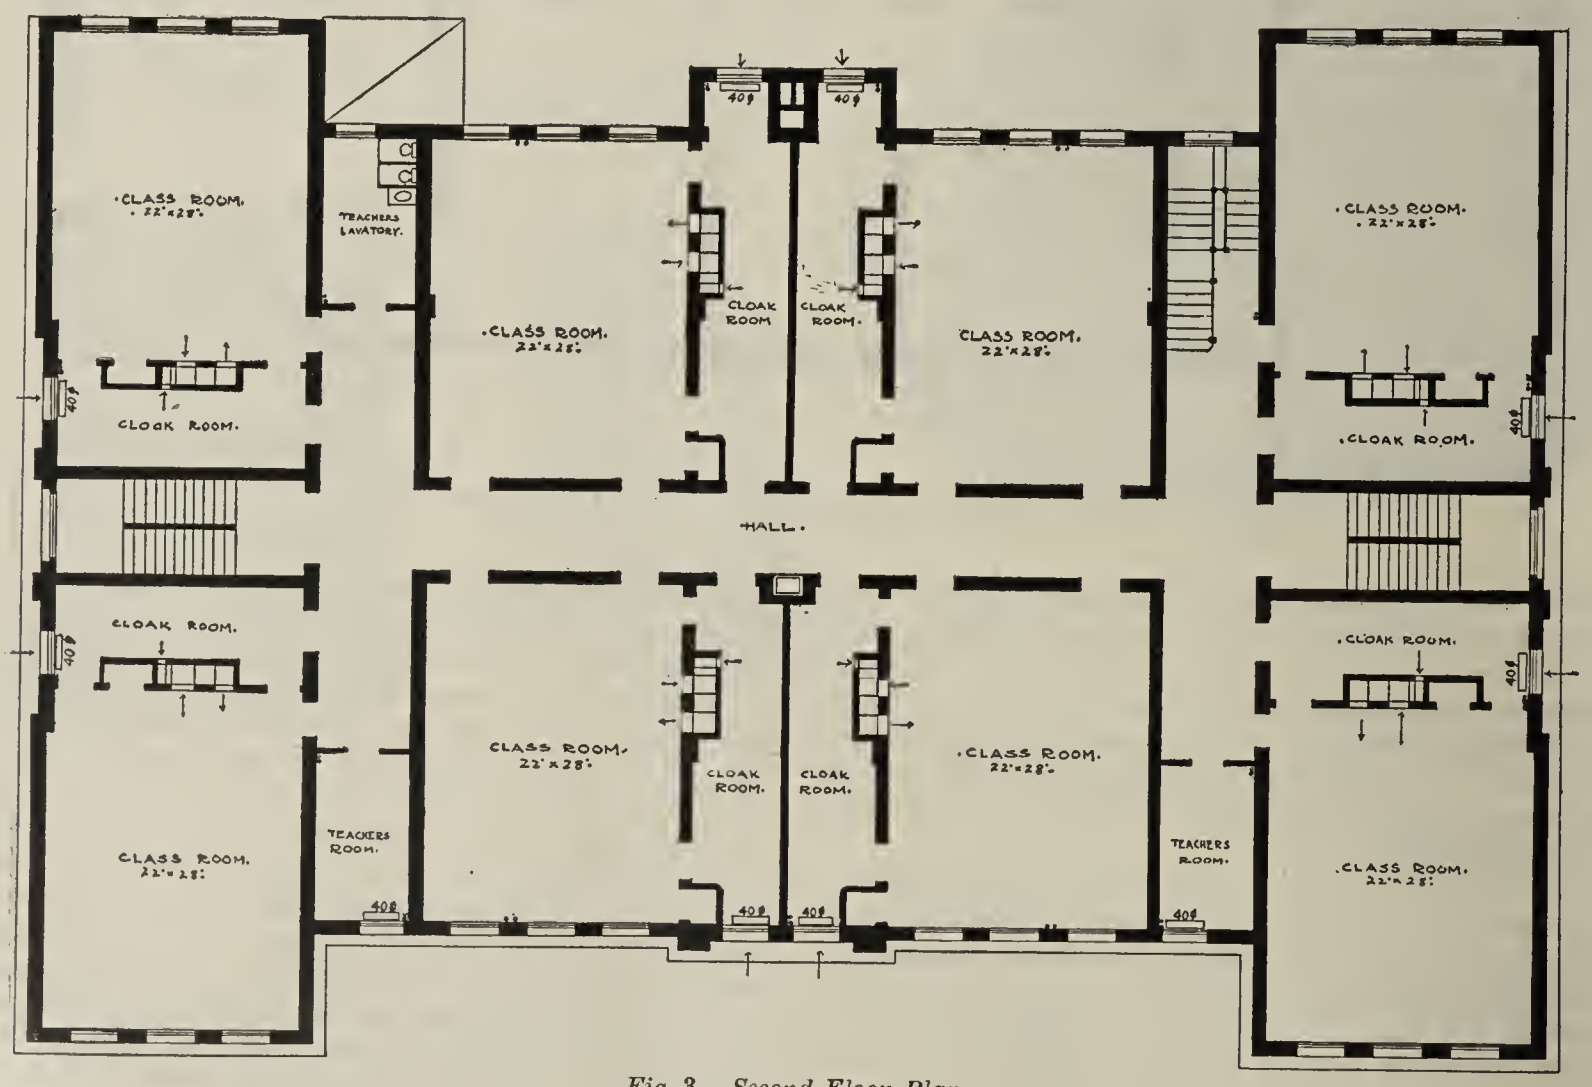

Fig. 3.—Second-Floor Plan.

of the mains and the surface exposed by the coils in the vent shafts.

The two boilers used were specially constructed with a view to the heavy work that they had to perform, and were rated by the manufacturers to be capable of carrying 2700 square feet of direct surface each, or a total of 5400 square feet. Each boiler exposed 440 feet of fire surface, or a total of 880 feet. The boilers have been thoroughly tested during the past winter, and the successful heating and ventilating of the building has demonstrated their ability for much larger work than they were rated to be equal to. This high efficiency is said to be due to the side feed feature of the boilers, the boilers being provided with a grate of 40 inches diameter, but by the construction this does not give a correct idea of the fire surface or the amount of air which may come into the fire. The diameter of the fire pot at the point of combustion is 45 inches, but by the method of feeding the fire here employed a hollow of incandescent fuel is formed, so that a much greater surface of fire is exposed than the area of a 45 inch circle. The boilers are provided with automatic damper regulators and automatic water feeders, the water feeders being arranged with by pass, so that the boiler can be fed direct when necessary.

The indirect stacks are placed in cases made of No. 24 galvanized iron, the casings providing 12 inches of air space above and 12 inches of air space below the radiators. The main cold air ducts are made of No. 20 iron and the branches of No. 22. The vertical heating flues are also lined with No. 24 galvanized iron and are painted on the outside before being placed in position. These heating flues run from the indirect stacks to a point 11 feet above the floor line of the rooms, where they discharge the warmed air. The vent flues are also made of No. 24 galvanized iron, and are provided with a register near the floor and also one near the ceiling. Ample provision has been made for expansion and contraction of all risers, and all mains have been relieved at points where necessary to aid the circulation. The steam connections to the indirect coils are 1½-inch in each case and the returns 1¼-inch. A Jenkins valve is placed on the supply and a Kennedy gate valve on the return to all radiators. Valves are also placed on the supply and return risers throughout the building and on the relief pipe from the supply riser. The Bundy Baker automatic air valve is used in connection with all radiators, and air lines run from each to the basement, where they terminate over a sink. Risers are covered with sectional covering to a point 6 feet above the floor for the protection of the pupils. The radiators and piping exposed in the school rooms are all finished in gold bronze.

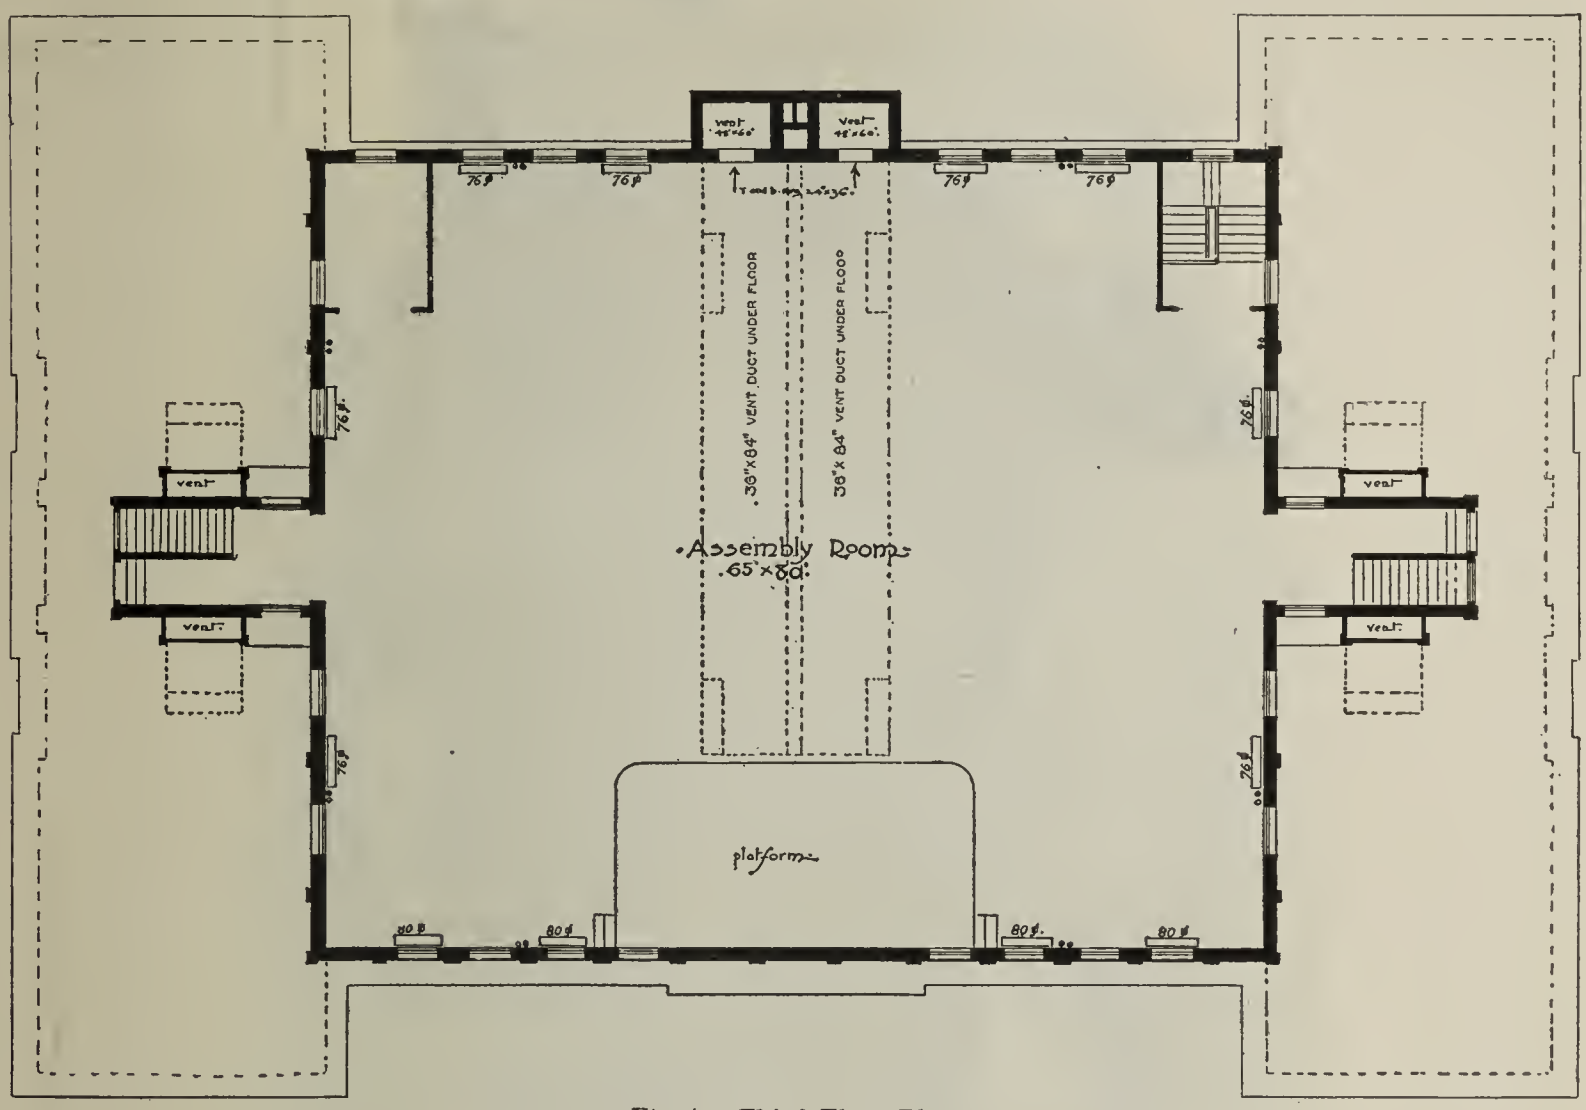

Fig 4 —Third-Floor Plan.

Gas Tied Up in Red Tape.

A Paris correspondent of the New York *Sun* describes the experiences of a Chicago woman and her two daughters who lived in the Americans' paradise for a winter, and among other things tells of the obstacles they overcame in getting the gas turned on in their apartments :

They wanted gas, so Mrs. Brown went herself to the company's office to subscribe for it and to say that she wanted it immediately.

"You shall have it within the fortnight, madame," said the clerk.

"Can't I have it before that?"

"Not a day, madame. We have to obtain permission from the city before we can consider your application. Then we must also have another permit to put it in. These things require time, madame."

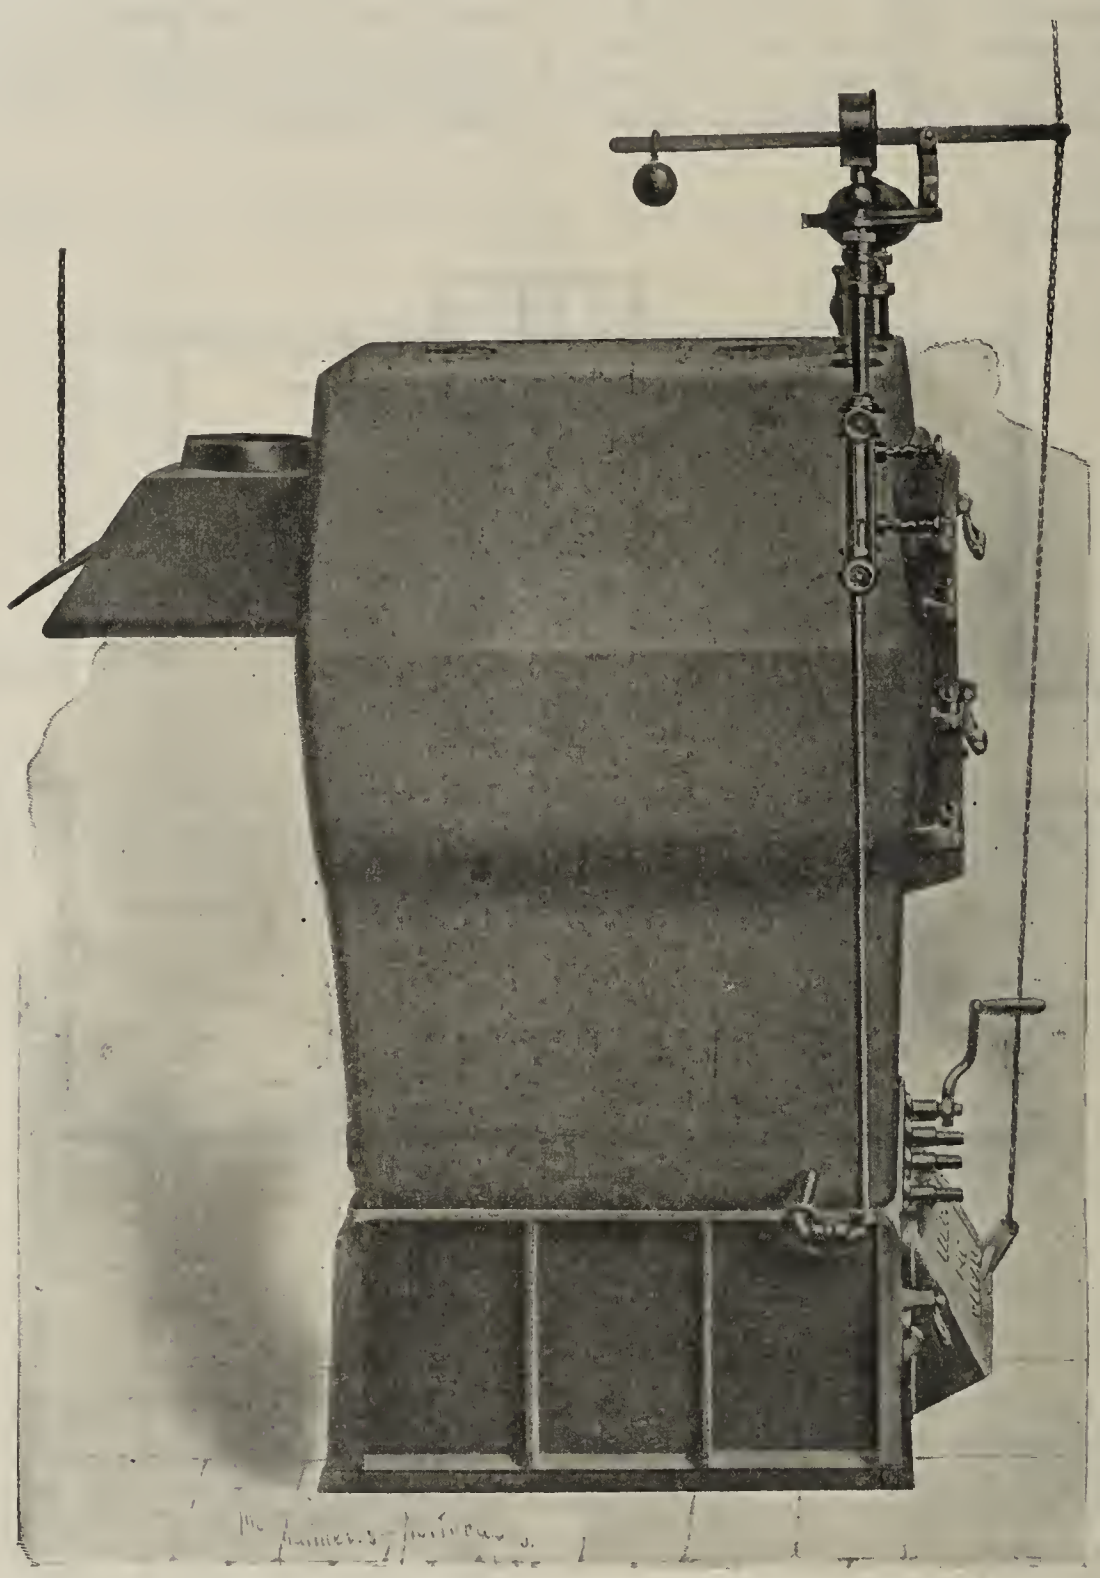
The following day the comptroller of the gas mains in that *arrondissement* made a call, with a portfolio full of papers to sign. An hour after he was gone the deputy comptroller arrived with three workmen, examined all the gas fixtures, called for pen and ink, sat down and wrote out his official report of the inspection, which he signed and called upon Mrs. Brown to sign. Then he took his workmen away. The same afternoon a boss plumber, notified by the gas company, came with two more workmen and made another inspection. Mrs. Brown signed an application for this plumber to examine the gas burners and pipes to see that there was no leak, and the next day three workmen came and spent the afternoon doing this. They wrote out a certificate to the effect that there was no leak, and gave Mrs. Brown a copy of it. There was an interval of two days; then the deputy comptroller arrived, alone, with another copy of the certificate and proceeded to check the work of the plumbers ; he also made out a paper stating that there was no leak. On the same afternoon the boss plumber came back and checked the work once more. Again there was an interval, this time for a whole week, but bright and early on the eighth day the original comptroller made his appearance, his portfolio bulging with papers, and very important. He

spread out before Mrs. Brown nine separate documents, stamped, sealed, red-taped and covered with official signatures; some were white, some pink, some yellow; some consisted of but a single sheet, while others were small pamphlets; all however, bore the common brand of a Government revenue stamp, the denominations of which were from 2 cents to 50 cents. Mrs. Brown's total indebtedness for fees, including plumbing work, was 86 francs.

"Forty francs of this, however," the comptroller assured her, "you will get back when your subscription expires. It is merely a deposit."

"A deposit for what?" asked Mrs. Brown faintly.

"Why, for the approximate amount of your first month's bill, of course," said the comptroller. "The deposit is always graduated according to the number of burners in the apartment."



Mrs. Brown counted out the 86 francs. Then the comptroller, seeing that she had never subscribed for gas in Paris before, good-naturedly explained:

"When your bill comes in at the end of the month you will have no trouble at all, because all the charges are tabulated. The first amount on the bill will be for the gas, the second for the amount of the Government stamp for the receipt, the third the rent of the meter, the fourth the charge for the maintenance of the street mains, the fifth that for the house main, the sixth that for the stop cock in the hall, the seventh that for the stop cock in the apartment, and so on. It is really very simple."

Three days after the appearance of this man two others arrived with the meter; following them was a plasterer to place it, and shortly afterward a plumber to make the connections. The meter was still locked and sealed with a leaden seal. Two days intervened, and Mrs. Brown was about to notify the main office, because she was tired of using lamps, and, anyhow, the two weeks had elapsed. On the next day a man arrived with a book in which the inspector was to write down the record of the monthly consumption. Then in the afternoon, resplendent in gold lace, an entirely new man came on the scene. With a dramatic flourish he broke the leaden seal with a chisel, and the gas was officially on!

The Palace Regent Solid Safety Boilers.

Russel Wheeler & Son of Utica, N. Y., have developed a new type or pattern of heater, suitable for either steam or hot water heating, and designated by them as the Palace Regent safety solid heater. Fig. 1 gives a view of the external appearance of the heater as it is equipped for steam heating. It will be seen that the construction is best described by its name, as from the bottom of the fire pot to the top of the heater it is one piece work. In other words, although the casting is subdivided into many parts, by water ways and flues, yet there are no joints, the whole by means of the cored work being made in one casting. The numerous advantages resulting from this are easily understood by those interested in these devices. The freedom from joints and constant possibility of leaks is certainly acceptable. The difficulty of this work cannot be understood until one becomes familiar with the internal arrangement, which is made clear by reference to Fig. 2, which shows a sectional view with the sides broken away. The manufacturers of this heater embody in all their designs a feature which they claim to be of great value. This is in directing the course of the products of combustion toward the front of the heater, and making one more travel the entire length for the products of combustion to make. In accomplishing this with the Palace Regent safety solid heaters the water ways are arranged to place thin strata of water in close contact with large flue areas and deep fire pots, a combination which, it is pointed out, must result most satisfactorily.

The Palace Regent Solid Safety Boiler.—Fig. 1.—General View of Steam Boiler.

This heater was severely tested during the past season and its work, we are told, has been absolutely satisfactory, although it is not until now that it has been placed before the trade. A new catalogue devoted to this line will be sent to all who apply for it.

PLUMBING CLASSES IN ENGLAND AND IN THE UNITED STATES.

BY THOMAS S. AINGE.

It is noteworthy that in England the plumbing fraternity are in advance of any other body of artisans in recognizing the aims and benefits of technical instruction, and have assisted largely in the building up of the present organized system for carrying it out systematically in all the principal cities and towns in the country. Evening classes for instruction in technological plumbers' work have been in operation upward of 17 years, and such instruction is now generally recognized as a part of the ordinary training of the craftsman. The number of classes varies each year, but is steadily increasing. In 1896 there were 120 classes with 3194 students in attendance, and in 1897, 158 classes and 3533 students. Being well distributed throughout the country, the classes are within the reach of nearly every plumber and those who desire to qualify themselves in the principles of plumbing and sanitation.

INSTRUCTION IN ENGLISH CLASSES.

The classes and examinations are mainly under the direction of the City and Guilds of London Institute for the Advancement of Technical Education, the work of instituting and conducting the classes and the supervision of the examinations being delegated to a "Local Committee" in each locality. The syllabus of subjects for instruction and the papers for examination for each class are prepared by the governing body at London, thus securing a uniform system of instruction throughout the country. A similar movement has been instituted by the Plumbers' Company, but the bulk of the classes are at present under the direction of the first named institute.

As representing the popular opinion, it has been authoritatively stated that "it is not the function of technical education, as understood in England, to teach trades, but rather to supplement workshop practice by a knowledge of scientific or artistic principles connected with certain industries," and while the plumbing classes and examinations have been and still are open to those not engaged in the plumbing industry, it is probable the instruction will, in the near future, be limited to those actually engaged as workmen, or who have had experience in the trade.

The complete course of instruction is divided into three grades, "Preliminary," "Ordinary" and "Honors," and embraces the following subjects: Workshop Arithmetic, including Mensuration; Mechanical Drawing, Elementary Science, including Chemistry, Mechanics, Hydraulics, Hydrostatics, Hydrodynamics, Heat and Electricity; Building Construction, having special reference to roofs and the methods of making them water tight; Sanitation, including principally the water supply, sewerage, drainage, heating and ventilation of buildings; Gas Fitting, Specifications, General Plumbing and Workshop Practice.

Fig. 2 —Broken View, Showing Construction.

To many the list of subjects will appear formidable, but it is not expected that the plumber will enter into a systematic study, in detail, of the subjects of Chemistry, Mechanics, &c, but that he shall acquire a sufficient knowledge of the laws and principles of these subjects in their application to his daily work, especially with reference to sanitation. To quote from a recent syllabus: "He should recognize the energy possessed by a moving body of water, and that the energy must be expended before the water can be brought to rest. He will then readily understand the effect of suddenly checking the flow of water in a pipe, and the application of the same principle to the hydraulic ram. The increase of pressure in front of a moving column of liquid and the diminution of pressure at the side and in the rear will serve to explain the difficulties met with when closets on several floors com-

municate with one stack of soil pipe. The idea of stream lines in a moving fluid can be easily grasped, and from it will follow all the well-known principles of joining pipes so as to avoid eddies and waste of energy, the use of trumpet mouths, of gentle bends," and so on.

In certain cases it may be required of a student in the Preliminary grade that he shall attend a two years' course of instruction in the subjects of a common school education before being allowed to proceed to the higher grades in technology. The practical instruction is designed principally to enable the student to properly bend 1¼ to 4 inch lead pipes; to join lead pipes from ½ to 4 inches in diameter by wiped soldered joints, without the use of a lamp or gas jet, and in such positions as would occur in practice; to boss a piece of sheet lead to a given form, and to execute any other ordinary piece of lead work.

The fees for instruction and examination are nominal, and to those who satisfy the examiners in the entire course certificates are given designating the holder thereof as a practical plumber, or to that effect. Valuable money prizes and silver and bronze medals are awarded to those who obtain the first places in the examination. There is no age limit to the students attending the classes.

Commenting upon the courses of study which I have outlined, the Director of Technical Instruction for the County of Lancaster says : "The syllabus of instruction is specially adapted to apprentices in the plumbing trade, and its aim is to connect continuous and systematic instruction in the principles of science with the practice of plumbing, the instruction being spread over the entire period of apprenticeship, thus making the class work and actual training run, as far as possible, concurrently." In this connection it should be stated that in many parts of England the apprenticeship system still remains in force in the plumbing trade, and efforts are being made for a general revival of the time honored custom, but so far there is no progress to note.

SPECIAL CLASSES FOR TEACHERS

To meet the growing demand for competent teachers, special classes for the technical training of advanced student plumbers to qualify them for the position of teacher (or inspector) of plumbing have been instituted by the Plumbers' Company, and plumbers' workshops and a museum of plumbing, for the use of the students in these classes, have been fitted up under the direction of the veteran plumber, S. Stevens Hellyer.

In the operation of the plumbing classes many obstacles have been encountered, notably the lack of knowledge in the students of the principles of Geometry, Drawing, Elementary Physics and Chemistry, and in some cases of the elements of a common school education. The following extracts from the reports of recent examinations will serve to illustrate this point : "Very few of the candidates knew how to work a simple geometrical problem." "Very few appear to possess any knowledge of the most elementary principles of hydrostatics, and question 7 was in very few cases so answered as to show that the idea of water level was understood." "The candidates generally were unable to distinguish between temperature and amount of heat, and knew nothing of the pressure exercised by head of water, or the distribution of heat by convection, conduction and radiation." "Some persisted in stating that pipes burst at the time of thaw; many gave as an explanation of frost burst a diagram illustrating the change in volume of water between 0 degrees C. and 100 degrees C." "In bending a piece of waste pipe to a certain shape or pitch, they seem to trust too much to the eye, instead of setting out the exact thing on the bench and working to it, which would be the means of the piece of work fitting its intended position." "More than one advocated the use of a hydraulic ram in the question of raising water to a storage tank, overlooking the fact that the source of supply was a reservoir." "Two candidates made so flagrant a mistake as to write that 10 gallons of water could be contained in a cubic foot." "One thought that in working a pump two strokes per minute was quite sufficient, another that 55 might be got through without discomfort, while the amount of water each stroke lifted was made to vary from about ⅓ pint to 8 pints." "Only one candidate put his main drain in question 2 as 6 inches, the others preferred 9 or 12 inches and one 15 inches." "One candidate very rightly said that in testing stoneware drains with water no great head of water should be put upon them, while another would have the head of water not more than 40 feet." Over 60 per cent. of those examined in 1897 failed to obtain the required number of marks. As the candidates in these examinations were student plumbers, many of whom had received considerable class training, the question naturally arises, what would be the result of a similar examination of the vast army of plumbers who have not had the advantage of such class training ?

SCHOOLS IN THE UNITED STATES.

In the United States at the present time plumbing is taught in 12 schools, all of which are located in the Eastern States, five of which are in the State of New York and four in New York City. They are as follows : New York Trade School; Pratt Institute, Brooklyn ; Springfield Industrial Institute, Springfield, Mass.; Master Builders' Mechanical Trade Schools, Philadelphia, Pa.; Baron de Hirsch Trade School, New York ; North End Union, Boston, Mass.; St. George's Evening Trade School, New York ; Y. M. C. A. Institutes at Bridgeport and Hartford, Conn., and Scranton, Pa ; New York State Reformatory Trade School, and International Correspondence Schools of Scranton, Pa. About 540 students are in attendance at these schools, not including the two last named. The International Correspondence Schools have an enrollment of about 1000 students in the School of Sanitary Plumbing, Heating and Ventilation. Day classes are held at four and evening classes at eight schools, with fees ranging from $7 to $100 for the course. An average of nine schools shows that about four-fifths of the time during the course is devoted to manual and the remaining one-fifth to scientific instruction. Classes were formerly held at the Mechanics' Institute, Rochester, N. Y., and the Y. M. C. A. Institute, Bowery, New York, but were not a success.

As many of the schools before named have adopted a course of study somewhat similar to that of the New York Trade School, a brief description of the plumbing course of that school may be taken as fairly representative of the other schools. Day and evening classes are held, the day class consisting of a four months' course of instruction—manual and scientific—in plumbing and gas fitting, including also the drawing of plans. The manual instruction includes the wiping of joints in such positions as would be met with in practice, sheet lead work and the setting up of fixtures. The scientific instruction relates to the proper arrangement of service pipes, boilers, tanks, pumps and plumbing fixtures in general, and the arrangement, construction and ventilation of drain, soil and waste pipes. Diagrams of faulty plumbing are given to the students for correction. The evening classes are held on three evenings per week during six months in the year, two evenings being devoted to manual and one to scientific instruction. The last named classes have been more largely attended than any of the classes at this school.

ENGLISH AND AMERICAN SYSTEMS.

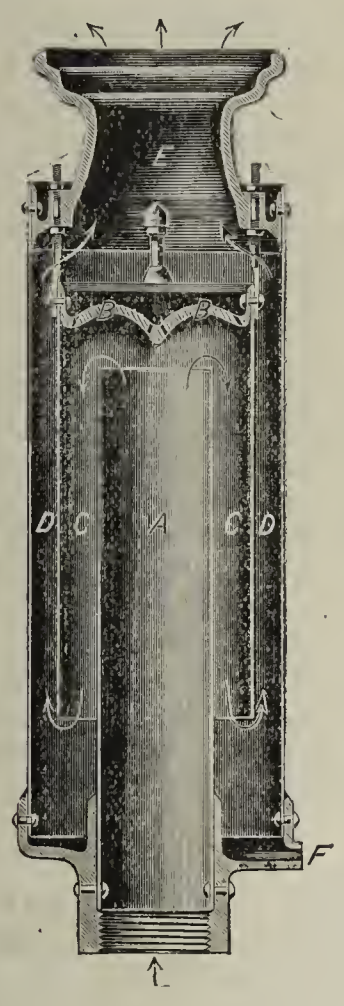
A brief comparison of the systems of instruction in both countries shows :

1. That in England the facilities for acquiring a plumbing education are many, the classes being distributed throughout the entire country and open to persons of all ages, and the fees nominal and nearly uniform ; while in the United States such instruction can only be obtained in a few of the large Eastern cities, in many cases upon the payment of a considerable fee, and in the best schools the classes are limited to young men only.

2. That in England the classes are under the control of one governing body, thus securing uniformity of work, while in the United States the course of instruction is selected by each individual school, and though many of these have adopted the course of the New York Trade

School there is still a lack of uniformity in the subjects taught in each school.

3. That in England the instruction is mainly of a scientific nature—which is in keeping with the popular opinion respecting the aim and scope of technical education—while in the United States, as previously stated, a large portion of the time is devoted to manual instruction in the workshops of the schools.



Apart from the merits or demerits of either system—and each has its redeeming features when viewed from different standpoints—what is required at the present time is a system of instruction particularly adapted to the wants of those already in the trade, very many of whom, though skillful workmen, are lacking in the first principles of technology.

A SUGGESTION TO MASTER PLUMBERS.

The existing laws for the regulation of plumbing in this country, many of which demand an educational test of the plumber's ability to pursue his calling, together with the growing demand for an extension of State and municipal control of this work, render it necessary that the plumber of to day should be well versed in the principles of his calling. The National Association of Master Plumbers has, I believe, been instrumental in securing the enactment of many of the existing plumbing laws, and I would respectfully suggest that this association would confer a lasting favor upon the plumbers of this country by similar effort toward the establishment of plumbing classes in every city in the Union.

Bundy Exhaust Head.

The Bundy exhaust pipe head, which is illustrated by the accompanying engraving, is made by the A. A. Griffing Iron Company, at their works, Jersey City, N. J.

Bundy Exhaust Head.

They also have offices at 66-68 Centre street, New York; 177-179 Fort Hill Square, Boston, Mass., and 702 Arch street, Philadelphia, Pa. The head is made of heavy iron and is so constructed as to cause the steam in passing to change its direction three times without causing, it is claimed, any back pressure upon the engine. The three cylindrical shells of which the head is composed are placed one within the other, and each is of greater area than the one next inside, that full capacity be given throughout, with the element of friction added. The manufacturers point out that there is no crimping of the iron, with its incident weakening at the point where the scale is necessarily broken, and as a result the head is likely to be of long life without any liability of repairs.

Chicago Master Plumbers' Protective Association.

Quite a number of master plumbers in Chicago who do not belong to the Chicago Master Plumbers' Association have formed an opposition organization styled the Master Plumbers' Protective Association. The officers are as follows: President, C. Hudson; vice-president, R. J. Arnold; second vice-president, W. C. D. Gillespie; secretary, J. Wyman, 954 West Madison street; financial secretary, W. Wilkie, 705 West Madison street; treasurer, W. G. Coles, 194 South Western avenue. The members of the new association are principally plumbers having small shops, who claim that the cost of membership in the Chicago Master Plumbers' Association is a serious tax upon them, in addition to their city license fee and State examination. The agreement between the latter association and most of the supply houses, however, prevents the outside plumbers from obtaining goods in a regular way, and they are compelled to purchase through other channels at excessive prices. By organizing they think they may be able to compel recognition from the supply houses. The supply men have for some time been restive under the present arrangement, believing that they should be permitted to sell to all licensed plumbers whether they belong to an association or not. A knotty question may now be presented to them as to whether the new organization is not an association of master plumbers just as well as the old one, and therefore making its members eligible to their recognition.

Baltimore Master Plumbers' Mutual Protective Association.

We have received the following letter from George J. Thaler, 800 North Gay street, Baltimore, Md., first vice-president of the Master Plumbers' Mutual Protective Association :

Referring to your article in the issue of March 5, under Notes, page 45, you say that "arrangements were made whereby the members of the Master Plumbers' Mutual Protective Association can buy their materials at wholesale prices on the co operative plan, the members agreeing not to patronize the Baltimore dealers." It is true, arrangements have been made by which members can purchase material at the right price, which all of them cannot do from the local supply houses, and the names will be given to any member who will apply, but he will not be served on the co-operative plan, neither has any one officially agreed or even said that he would not patronize the local dealers. What our members say or do individually is their own business, and must not be laid at the door of the association. It is to be hoped, however, that the local houses will soon see the folly of their ways and come into line by and by, and sell any plumber in business at the right price, whether he is a member of the local branch of the National Association or not. Just now the dealers will sell only such as are members of the National Association at anything like a fair price, and when they do condescend to take an outsider's money he pays more than fair for his material and always has to pledge himself not to tell from whom he bought the goods. To my way of thinking that is degrading to a free man, and it appears very strange that such a condition of affairs can exist in a free country, and that a body of shrewd business men like the manufacturers and jobbers of plumbing material would allow retailers, and in many cases men of very poor business qualifications, to outline their business policy for them. There are in the Baltimore city directory about 400 names of plumbers and stove men who do plumbing. Perhaps one-fourth of them are members of the local branch of the National Association in "good standing" (that means who pay their dues). Heretofore these gentlemen had things very much their own way regarding prices, the interpretation and administration of the local laws, &c., much to the disadvantage of others following the same line of trade, but who for reasons best known to themselves did not elect to become members of the local branch of the National Association. There is no reason why obstacles should be thrown in the way of the

plumbers and such who are not themselves plumbers, but who employ good, reliable mechanics who have their certificate from the Board of Examiners, just because they are not members of that august body "the local branch." It is but fair that the profit on material should go to the plumber, and that the supply houses protect the plumber, also that the laws governing the erection and maintenance of work be rigidly enforced, but it must be done fairly and impartially, and without discrimination or bias. And that has not been done in our city for some time, and it is high time that a beginning be made to abolish existing evils and bring about a more fair treatment for all, and that was the object in forming the Master Plumbers' Mutual Protective Association.

NATIONAL DELEGATES.

The convention of the National Association of Master Plumbers at San Antonio, Texas, this year will be held April 12, 13 and 14, which is two months earlier than usual, heretofore the annual convention having been held in June. This will make it necessary for the association officers to collect dues from members earlier than usual and pay the per capita tax so as to be able to elect the number of delegates to which their associations may be entitled. Only about a month now remains for this work and the election of delegates, and it should receive prompt attention. Already some cities have attended to this business, as the following will show :

PITTSBURGH DELEGATES.

A letter received from Secretary George Sands informs us that at the regular meeting of the Master Plumbers' Association of Pittsburgh and vicinity, held at the Pittsburgh Builders' Exchange March 4, the following delegates and alternates were elected to represent this association at the National Convention at San Antonio, Texas, April 13, 1898 :

Delegates : John M. Addy, J. J. Kenedy, F. J. Geery, George Addy, Frank McKnight, James Bowman, Thomas Chipp, John Cowling and D. G. Deeley.

Alternates : Charles S. Craig, Frank Tanigan, R. Carson, R. Gould, F. P. Blythe and J. O. McGinniss.

NEW HAVEN DELEGATES.

At the meeting of the New Haven Association of Master Plumbers held Tuesday, March 1, the following delegates were elected to attend the National Convention at San Antonio, Texas, on April 13 : S. E. Dibble, Andrew J. Clerkin, W. H. Hasell, T. A. Potter and Daniel M. Sheehan.

New York State Plumbers.

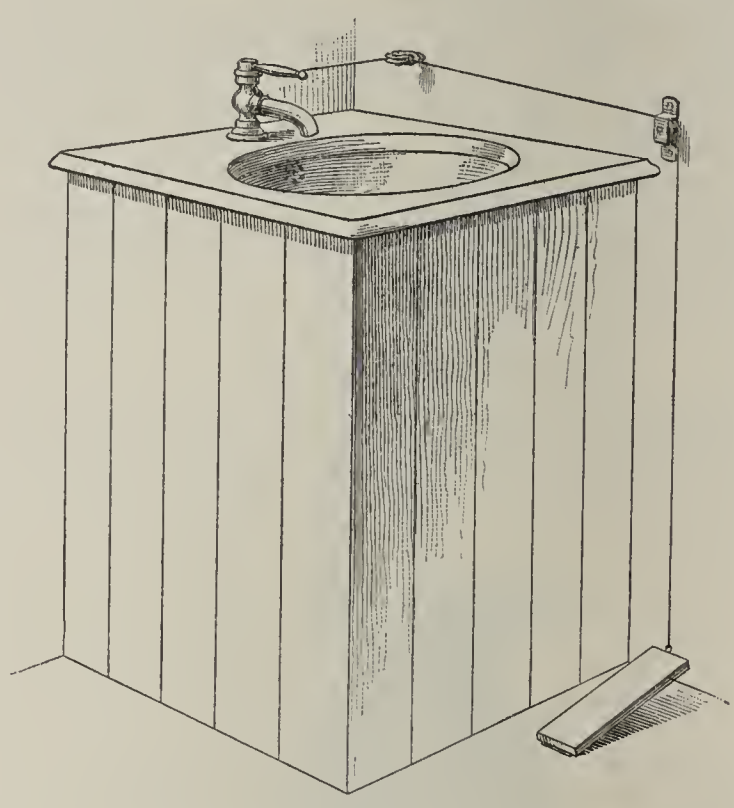
The convention of the New York State Association of Master Plumbers was held at Binghamton, N. Y., this week, and was called to order by President W. G. Reid of Rochester, N. Y. After transacting the regular business Auburn was selected as the place for holding the next convention and the following officers were elected :

President, Horace F. Westcott, Albany.

Finaneial and Recording Seeretary, John E. Dugan, Albany.

Treasurer, A. H. Brown, New York.

Delegates to State Convention : B J. O'Donnell, Syracuse ; W. H. Barnes, Troy, and George Cropper, Binghamton.



Minnesota Examining Board.

The Minnesota State Board of Commissioners of Practical Plumbing will hold examinations for masters and journeymen plumbers at St. Paul, March 21 and 22, and at Minneapolis, March 23 and 24. This will be the first examination that was ever held under the State law where the master plumbers will have to undergo an examination.

There is considerable uneasiness manifested among the master plumbers as to the outcome. As in other cities, notably Milwaukee, about one-third of the masters fail to pass. Secretary Harrington says that the examination will be theoretical and practical, and that the master or journeyman who fails to pass a satisfactory examination will be compelled to give up the business, as the board are of the opinion that the law must be lived up to.

A Convenient Lavatory Attachment.

All who have used lavatories where self closing faucets are supplied have been more or less annoyed by having to wait for water to flow into the bowl when only a small amount of washing is necessary. All prefer to wash under running water where the water supply does not make strict economy necessary. There is a difference of opinion as to the amount of water that is used by washing under running water and by letting sufficient water run into the bowl to do the washing. In the lavatory used in one of the departments of the Wilmot & Hobbs Mfg. Company, Bridgeport, Conn., the method of overcoming the delay caused by a self closing faucet is shown in the illustration presented herewith. A small chain is attached to the lever of the faucet and runs across the slab to a pulley, where a turn is made and connection with

A Convenient Lavatory Attachment.

another pulley which lets the chain drop down to the floor, where it is attached to a light lever or foot treadle, the treadle being hinged to the floor at the other end. The treadle and the general arrangement is such that the spring in the faucet lever is sufficient to close it just as soon a the weight is taken from the treadle at the floor. When any one wishes to use the lavatory, by placing a foot on the lever the water continues to run until the ablutions are completed, and if it is desired to fill the bowl while the cuffs are being removed and preparations are being made for washing, it is easy to place the foot on the treadle and let the water run.

NOTES.

An advance of 10 per cent. in the price of Range Boilers will, it is believed, confront the plumber in buying in the near future, and it is probable that the price of Brass Bibs and Brass Goods will make a movement in the same direction.

At the recent meeting of the Soil Pipe manufacturers the desirability of getting a better price for the goods was thoroughly discussed and a strong disposition to that end manifested, which has resulted in a uniform discount to jobbers, and where low prices had been made the quotations have been withdrawn.

J. M. Kaspers, Sheldon street, Houghton, Mich., is making extensive improvements in his plumbing establishment.

At a recent meeting of the Steam Fitters' Union, composed of steam fitters in Pittsburgh, Allegheny and vicinity, it was unanimously decided to make a demand for $3.50 per day of nine hours, to take effect April 1.

Articles incorporating the Master Plumbers' Association of the District of Columbia have been filed with the Recorder of Deeds at Washington, D. C. The incorporators are William Koch, Henry J. Allen, George F. Schaffer, Edward J. Hannan, Daniel Hannan and Charles E. Barrick.

Vulcabeston is described in a pamphlet by the H. W. Johns Mfg. Company of 100 William street, New York. It is composed of asbestos, india rubber and other vulcanizable gums combined with materials for special requirements. It is valuable for steam packings, electrical insulators, &c., on account of its permanent resistance to heat and immunity from injury by acids, gases, moisture, &c. It can be made in any desired form, is practically indestructible, will not shrink, expand or warp. Two kinds are made—viz., for electrical insulation and for steam packing, &c.

Among recent new incorporations is that of the Self Lighting Gas Burner Company of New York City, with a capital of $5000. The directors named are Max Spier, Percy Jacobs and E. S. Ullmann, New York City.

The Sanitary Committee of the Columbus, Ohio, Board of Trade held an important meeting recently and effected an organization, electing Dr. Otto Arnold chairman and George Dun secretary. Dr. Barbour, a member of the committee, called attention to the urgent need of public water closets in Columbus. The city is trying to secure conventions, is securing a great many, said he, and it is urgent that immediate action be taken on this matter. A special committee, consisting of Dr. Arnold and Mr. Wells, was appointed to investigate the problem as it has been solved in other cities and to report the results to the City Council for their action. Dr. Arnold is to investigate the system in Cincinnati and Mr. Wells that in New York.

C. N. Camp of Hull, Camp & Co., 129 Worth street, New York City, returned this week from a trip through New England in the interests of their specialties and the Cleavaue Air Valves, the Scaif Boilers and their Wrench for radiator unions. Mr. Camp reports the condition of trade to be quiet, but was fortunate in securing some large stock orders.

Joseph F. Moore of the Monitor Iron Works, manufacturers of Soil Pipe and Fittings, at Worth and Centre streets, New York City, is about to enjoy a vacation on the coast of Georgia.

W. E. Newman, Hillsboro Center, N. H., is making a fine display of Sanitary Plumbing in his show windows. Brass and Nickel Plated Piping is used and the mechanical work reflects credit on the workman.

Benjamin C. Smith & Sons of New York have been incorporated to carry on a Plumbers' Supply business, with a capital of $10,000. The directors are B. C. Smith, B. E. Smith and F. A. Smith of Brooklyn. The new company have moved their business to the opposite side of Pearl street from their old stand, and they are now a few doors nearer Beekman street.

The City Council of Toledo, Iowa, have adopted an ordinance requiring the use of water meters, and those who wish to use city water must make application for a meter before May 1. The meters will be furnished at the city's expense.

The Ogden Plumbing Company of Fort Wayne, Ind., have gone out of business, the stock and material having been purchased by Emmett Martin.

The Ohio Brass Company have purchased the plant of the Mansfield Buggy Works, at Mansfield, Ohio, and are placing machinery and making the necessary changes to occupy the plant May 1.

Rankin & Kellogg, architects, 1024 Walnut street, Philadelphia, Pa., have been awarded the contract to prepare plans and specifications for a new post office building, to be erected at Camden, N. J., at a cost of $150,000, which will have a complete system of steam heating and ventilation and a plumbing system. The Hon. Adam Clark Smith of Camden will be superintendent of construction.

The City Council of Omaha, Neb., have appointed Charles H. Kessler, a master plumber, and W. E. Thatcher, a journeyman plumber, as members of the board for the examination of plumbers.

A fire recently occurred in the establishment of L. B. Hartung & Co., plumbers, Canton, Ohio, in a building owned by President McKinley, doing a damage of $2000 to the stock and $1000 to the building.

George Neilsen has leased a storeroom next to the Weber Hotel, on North Main street, Pittston, Pa., for a plumbing shop.

A committee composed of Henry F. Peck, Andrew Shiland, Jr., Frank C. Warren, P. N. Welch and William H. Hart, representing the stockholders of Peck Brothers & Co., New Haven, Conn., held a meeting Friday, March 4, for the purpose of forming plans for the reorganization of the company.

Forest Hooper of Woburn, Mass., has erected a building for the manufacture of his Patent Ball Cock, Patent Clean Out and other articles of interest to the plumbing trade, and for the use of his plumbing business.

John Porsch, Erie, Pa., announces that for 30 days only he will send two of Porsch's Molded Wiping Cloths instead of one for a dollar, just to introduce them. The working surface of these Cloths is made of fine mole skin or herring bone ticking, as the purchaser may desire. The Cloths are used to wipe joints on any size of pipe from ½ to 4 inches.

John Sullivan, a plumber, formerly in the employ of Van Vergell & Co. of Carbondale, Pa., has entered the plumbing business and set up a shop for himself.

The Helios Carbide Specialty Company of Philadelphia, Pa., are erecting a large factory at Pleasantville, N. J., for the manufacture of Brass Specialties necessary for the use of carbide gas.

At the regular meeting of the Master Plumbers' Association of Worcester, Mass., it was voted to secure quarters in the Builders' Exchange as a place for holding meetings and storing the properties of the association.

A. S. Reed has purchased the Pump and Plumbing establishment of C. F. Monroe, on Main street, Vincennes, Ind.

Benz Brothers, Reading, Pa., have purchased a lot, 19 x 115 feet, and will erect a shop and storeroom for their plumbing business. The building will be 19 x 80 feet and three stories in hight. The rear of the lot will be used for a warehouse and stable.

George B. Barron has accepted a position as a salesman with the plumbing supply house of Smith & Webster of Chicago.

Charles Young has been elected city plumber of Alston, Mass., by the Board of Water Commissioners.

Wiltsie F. Wolfe, president of the American Society of Heating and Ventilating Engineers, informs us that the bill for compulsory ventilation passed the Senate of New York State, at Albany, on Tuesday.

The B. F. Sturtevant Company, Boston, Mass., have been awarded the contract to install Heating and Ventilating Plants in the new buildings for the Pennsylvania Institution for the Instruction of the Blind, now in course of erection at Sixty-fourth and Malvern streets, Philadelphia, Pa. The cost will be $60,000.

Tucker & Koester, 116th street and East River, New York City, are making a specialty of manufacturing Incandescent Mantels for use with Weslbach burners. Speaking of the special merit of the Mantels which they make, they allude to the improved machinery which they employ on the work and the excellent material. They also point out that their Mantel and Hood is hung over the burner with an asbestos loop.

A new Plumbing, Tin and Stove business is soon to be established in Malone, N. Y., Frank H. Monaghan and James J. Rice of Johnstown having formed a partnership for conducting such a business. The name of the firm is Monaghan & Rice and the business will be conducted in the vacant store on East Main street.

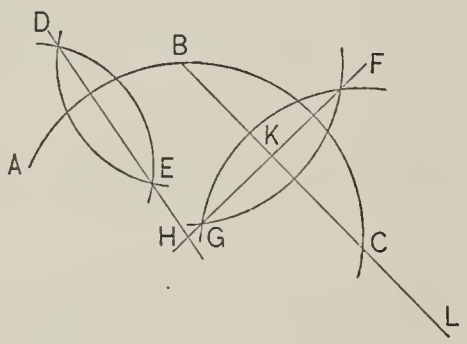
J. B. Moyers and Charles Mollart, plumbers, who have been in the employ of Cleaver & McCarter, have decided to leave Dubuque and go into business for themselves at Decorah, Iowa.

Owen H. Jones, Hartford, Conn., informs us that he has established his rights in a suit before Judge Shumway, sitting in the Superior Court, at Hartford, to patents for the Ball Cock which he is manufacturing, and which has alreadv won a good reputation among the plumbing trade.

Sheahan & Groark, plumbers, of State street, New Haven, Conn., have purchased from the heirs of the Boardman estate the land and the nine-story building at 289 and 291 State street and immediately adjoining their present quarters. The purchase price was in the neighborhood of $15,000. The purchase was made necessary by the increasing business of the firm, and it is the intention to refit the building and convert it into a first-class plumbing establishment. Among the possible changes is the raising of the structure two stories.

The Beery Heating Company, Baltimore, Md., have been incorporated by Otto Bruggeman, William A. Beery, Ira Plumley, Joseph C. Hobbs and James E. Tippett, with a capital stock of $5000.

Henry F. Meyer will go into the plumbing business with J. C. Jahn, at Fort Wayne, Ind.



SHEET METAL WORK.

THERE IS NO NEW THING UNDER THE SUN.

The following letter from A. C. Smith, Camden, N. J., is of more than usual interest, especially to those who care to learn how they did things centuries ago. The revelations of explorers in the East are extraordinary, and, as our correspondent points out, records are brought to light which show that there were men living several thousands of years ago who did many things in pretty much the same way as they are done to-day:

We have been taught to believe that Tubal Cain was the first known cunning workman in metals. He was called by the ancients a furbisher of every kind of vessel and instrument of copper and iron, but by recent discoveries, made under the direction and expense of the University of Pennsylvania on the supposed site of the ancient city of Nimrud, in Assyria, where four cities, one beneath the other, have been uncovered, it would appear that he was not the first in his trade. Among the many wonderful things found in this last city is a coppersmith's shop, the books of which are in perfect condition, they being clay tablets, on which are printed, in cuneiform characters, the history as well as the accounts and contracts of the establishment, besides many curious diagrams, rules and problems. From them we learn that this business was handed down from father to son for 32 generations. The original was one Ham-yan, a Cushite, who flourished 4763 years before Tubal Cain. We are informed that he was acquainted with all the inventions and discoveries of his times.

Through the kindness of Dr. Pepper, Provost of the University of Pennsylvania, I have been permitted to examine copies and photographs of these curiosities, and as many of them will no doubt prove interesting to your readers, I (in acknowledgment of past favors in the way of information received through your valuable paper) take the trouble to forward you a description of some of them. In the first place is a photograph of a machine which resembles in a surprising degree a Robinson cornice brake. I am informed that it is about 4 feet long and made of bronze metal. This, as with all other finds, was turned over to the Turkish Government under agreement.

To Strike a Circle through Three Points.

We find here a rule to strike a circle through any three points not in a straight line, thus: Strike indiscriminately with one leg of the compass three points, as A, B, C; set the compass three-quarters of the distance of A B and strike from the points A and B the double arc D E; repeat between B and C; draw lines through the double arc D E and F G and extend until they intersect at H. Then H will be the center and H A will be the radius of a circle that will pass through the points A, B and C. If the compasses are not at hand the same result may be secured by the common square, thus: Draw a line from B through C indefinitely to L. Bisect B C at K. Place the point of the square at K and the edge of the tongue along the line K L. Now draw a line along the edge of the blade from K to H. Treat the other side in the same manner. Where the lines intersect at H will be the center and H A the radius. It is plain that the center from which a segment has been struck may be found in like manner; also where the chord and rise of an arc have been given. Therefore this rule may be of some consequence to "E. M. B." of Celina, Ohio. (See page 31, *The Metal Worker*, February 5.)

To find the circumference of a circle multiply the diameter by 22 and divide the result by 7.

To find the circumference of an ellipse multiply one-half the sum of the two diameters by 22 and divide by 7.

To square a circle multiply the radius by one-half the circumference.

To find the surface of a cone multiply the side or slant hight by one half the circumference of the base.

To find the surface of a sphere multiply the diameter by the circumference. This rule results in more than the actual measurement, but is nearer correct than the answer given "A. T. S." of New Jersey on page 28 of *The Metal Worker*, February 12, which was 82 5-10 square feet for a quarter sphere, one semicircle measuring 18 feet 9 inches, the other 17 feet 6 inches, with an altitude of 5 feet. This, according to the above rule, gives 93¾ square feet. If we measure this quarter sphere by triangles and allow for arcs on side and base we get 92¼ square feet, as follows: Multiply one-half the circumference of one semicircle by one-half the other—that is, multiply 9 feet 4½ inches by 8 feet 9 inches—this gives 82 square feet. Now add 12½ per cent. for arcs and we have the 92¼ square feet, and this is as near correct as can be calculated.

These ancients were undoubtedly acquainted with the principles of the voltaic pile, as one tablet cautions against using copper in connection with certain other metals for water vessels or cooking vessels, explaining that by certain laws the stronger would destroy the weaker metal. And here we find that the theory of the survival of the fittest is somewhat older than Spencer.

For the last 700 or 800 years every tinsmith, at home and abroad, has witnessed the effect of a copper bottom on a tin boiler, and knocked off these bottoms and replaced them with tin, without ever considering the cause of the effect. While I was an apprentice I made a tin boiler with a sunk copper bottom for a barber to heat his shaving water in. He was making at this time a patent hair restorer of a reddish color. He said to me on one occasion: "This boiler heats the water all right, but at times I don't know whether I am drawing shaving water or hair restorer." Some time after this, and before the water back came into vogue, I fitted up a laundry by placing a copper coil inside of the cylinder of an old heater and conducted the hot water therefrom to the stationary tubs by means of galvanized iron pipes. This gave an abundance of hot water, but in many instances the white clothes were ruined by iron rust. Remembering the barber's boiler, I at once tore out the galvanized iron and replaced it with lead pipe, and this worked like a charm. I am afraid, however, that "Plumber," Pennsylvania (page 31 of *The Metal Worker*, 19th inst.), cannot get rid of his trouble in this way on account of the iron water back. He will have to replace the copper boiler with an iron one.

They (the ancients) also understood the principles of expansion and contraction of metals, and must have had some knowledge of the principle of capillary attraction, as we find rules for the construction of copper gutters and valleys, which ought to be of some use to "C.,"

Mansfield, Ohio, but I fear that my letter will now occupy more space than it merits.

Sheet Manufacturers' Association.

A meeting of the Board of Directors of the Association of Iron and Steel Sheet Manufacturers was held in the Conestoga Building, Pittsburgh, this week. The old officers were re-elected for the ensuing year, as follows: J. G. Battelle, Piqua, Ohio, president; W. T. Graham, Bridgeport, Ohio, vice-president, and John Jarrett of Pittsburgh, secretary and treasurer. No other action of importance was taken.

Baker's Eave Trough Hanger.

The accompanying illustrations show Baker's eave trough hanger, made by J. R. Baker & Sons Company, Kendallville, Ind. Fig. 1 shows the hanger separate, and Fig. 2 shows a section of eave trough supported by them. The simplicity of the hanger will be readily seen, as it consists of a cross bar and roof straps composed of hoop steel, while the strap which goes round the under side of the trough is of galvanized iron. The parts are thoroughly riveted together, as shown, making, it is claimed, a very substantial article. While it is very readily attached to or removed from the trough, it is claimed to be impossible for the hanger to work loose, there being no bolts or nuts either in its construction or fastening to the trough. The only tool required for putting the hanger in

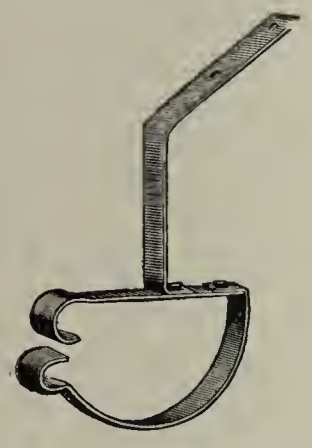


Fig. 1.—The Hanger Separate.

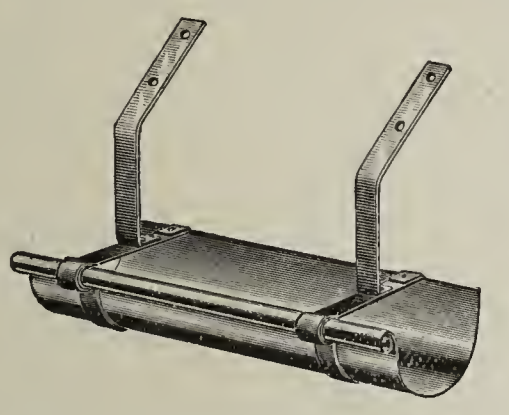

Fig. 2.—Supporting Section of Eave Trough.

Baker's Eave Trough Hanger.

position is a small pair of pincers for closing the eye of the hanger around the bead of the trough, and these pincers are furnished by the manufacturers free with the first order. These hangers are especially recommended for repair work because of the convenience and ease with which they can be put on without taking down the trough. It is furthermore pointed out that there is nothing about the hanger to cause any obstruction in the trough checking the flow of water. The roof straps are of eight different lengths, and the pitch of the trough can be easily regulated. The goods are put up in gross boxes and are furnished for any size trough with either one or two beads.

Peck, Stow & Wilcox Co.'s Catalogue.

The Peck, Stow & Wilcox Company, Southington, Conn., and 27 Murray street, New York, have just issued a complete illustrated catalogue of their goods. In size it is about the same as their 1890 book, but an effort has been made to still further condense and group analogous goods. In the front is a page on which is shown views of their five factories at Southington, Plantsville and East Berlin, Conn., and Cleveland, Ohio. The first section of the book for 130 pages pertains to Tinners' Tools and Machines for hand and power, many new goods being shown, and is followed by Tinners' Material. Next in order are Mechanics' fine Tools, many new patterns of standard goods and other articles entirely new appearing. The balance of the book, there being 487 pages in all, contains Builders' and House Furnishing Hardware, Scale Beams, Meat Cutters, Coffee Mills, Casters, Stationers' Hardware, Carriage Bolts and a multitude of goods in the way of staple lines long made by them.

The G. Drouve Company, Bridgeport, Conn., have completed a Skylight to go to Guadalajara, Mexico, which measures 40 x 45 feet.

FLASHINGS.

The demand for Sheet Iron continues excellent, and exceeds in volume anything in the experience of the manufacturers for years past. All the mills are well employed for some time to come on orders for both Black and Galvanized Sheets. Several concerns who are operating to their utmost capacity are unable to fill orders as fast as desired, and a number of manufacturers are reported to be considering the advisability of materially enlarging their plants. Mills rolling Sheet Bars have also booked a very large tonnage recently, deliveries in some cases running for the entire year, and it is reported that one or two makers of Bars are now practically out of the market. Consequently prices are stiffer all around.

The Chautauqua Hanger Company, Mayville, N. Y., issue circulars illustrating and describing the Chautauqua Eave Trough Hanger of their manufacture. It is a very simple device which can be easily applied and requires no tools to apply it, while neither solder, bolts or nuts are used in the construction or in the fastening. It is specially recommended for repair work, and it is further pointed out that being fastened to the back of the trough it does not jamb the bead, and is so constructed that it will not in any way check the flow of water. In the circular sent out by the company a number of signed and dated testimonial letters speak in the highest terms of the merits of this style of Hanger. They are made for tin trough from 3½ to 5½ inches, and for galvanized iron from 3½ to 7 inches. In the former case for ½-inch bead and in the latter for ⅝-inch bead.

A press report from Carlisle, Pa., says that a company of London capitalists have purchased a large tract of land in the vicinity of Carlisle, from which it is expected good Slate material for roofing can be procured. The product of the quarries, it is said, will be shipped direct to London wharves.

The Reeves Iron Company, Canal Dover, Ohio, manufacturers of Merchant Bar Iron, Black and Galvanized Sheets, are making some additions to their equipment which will considerably increase their capacity.

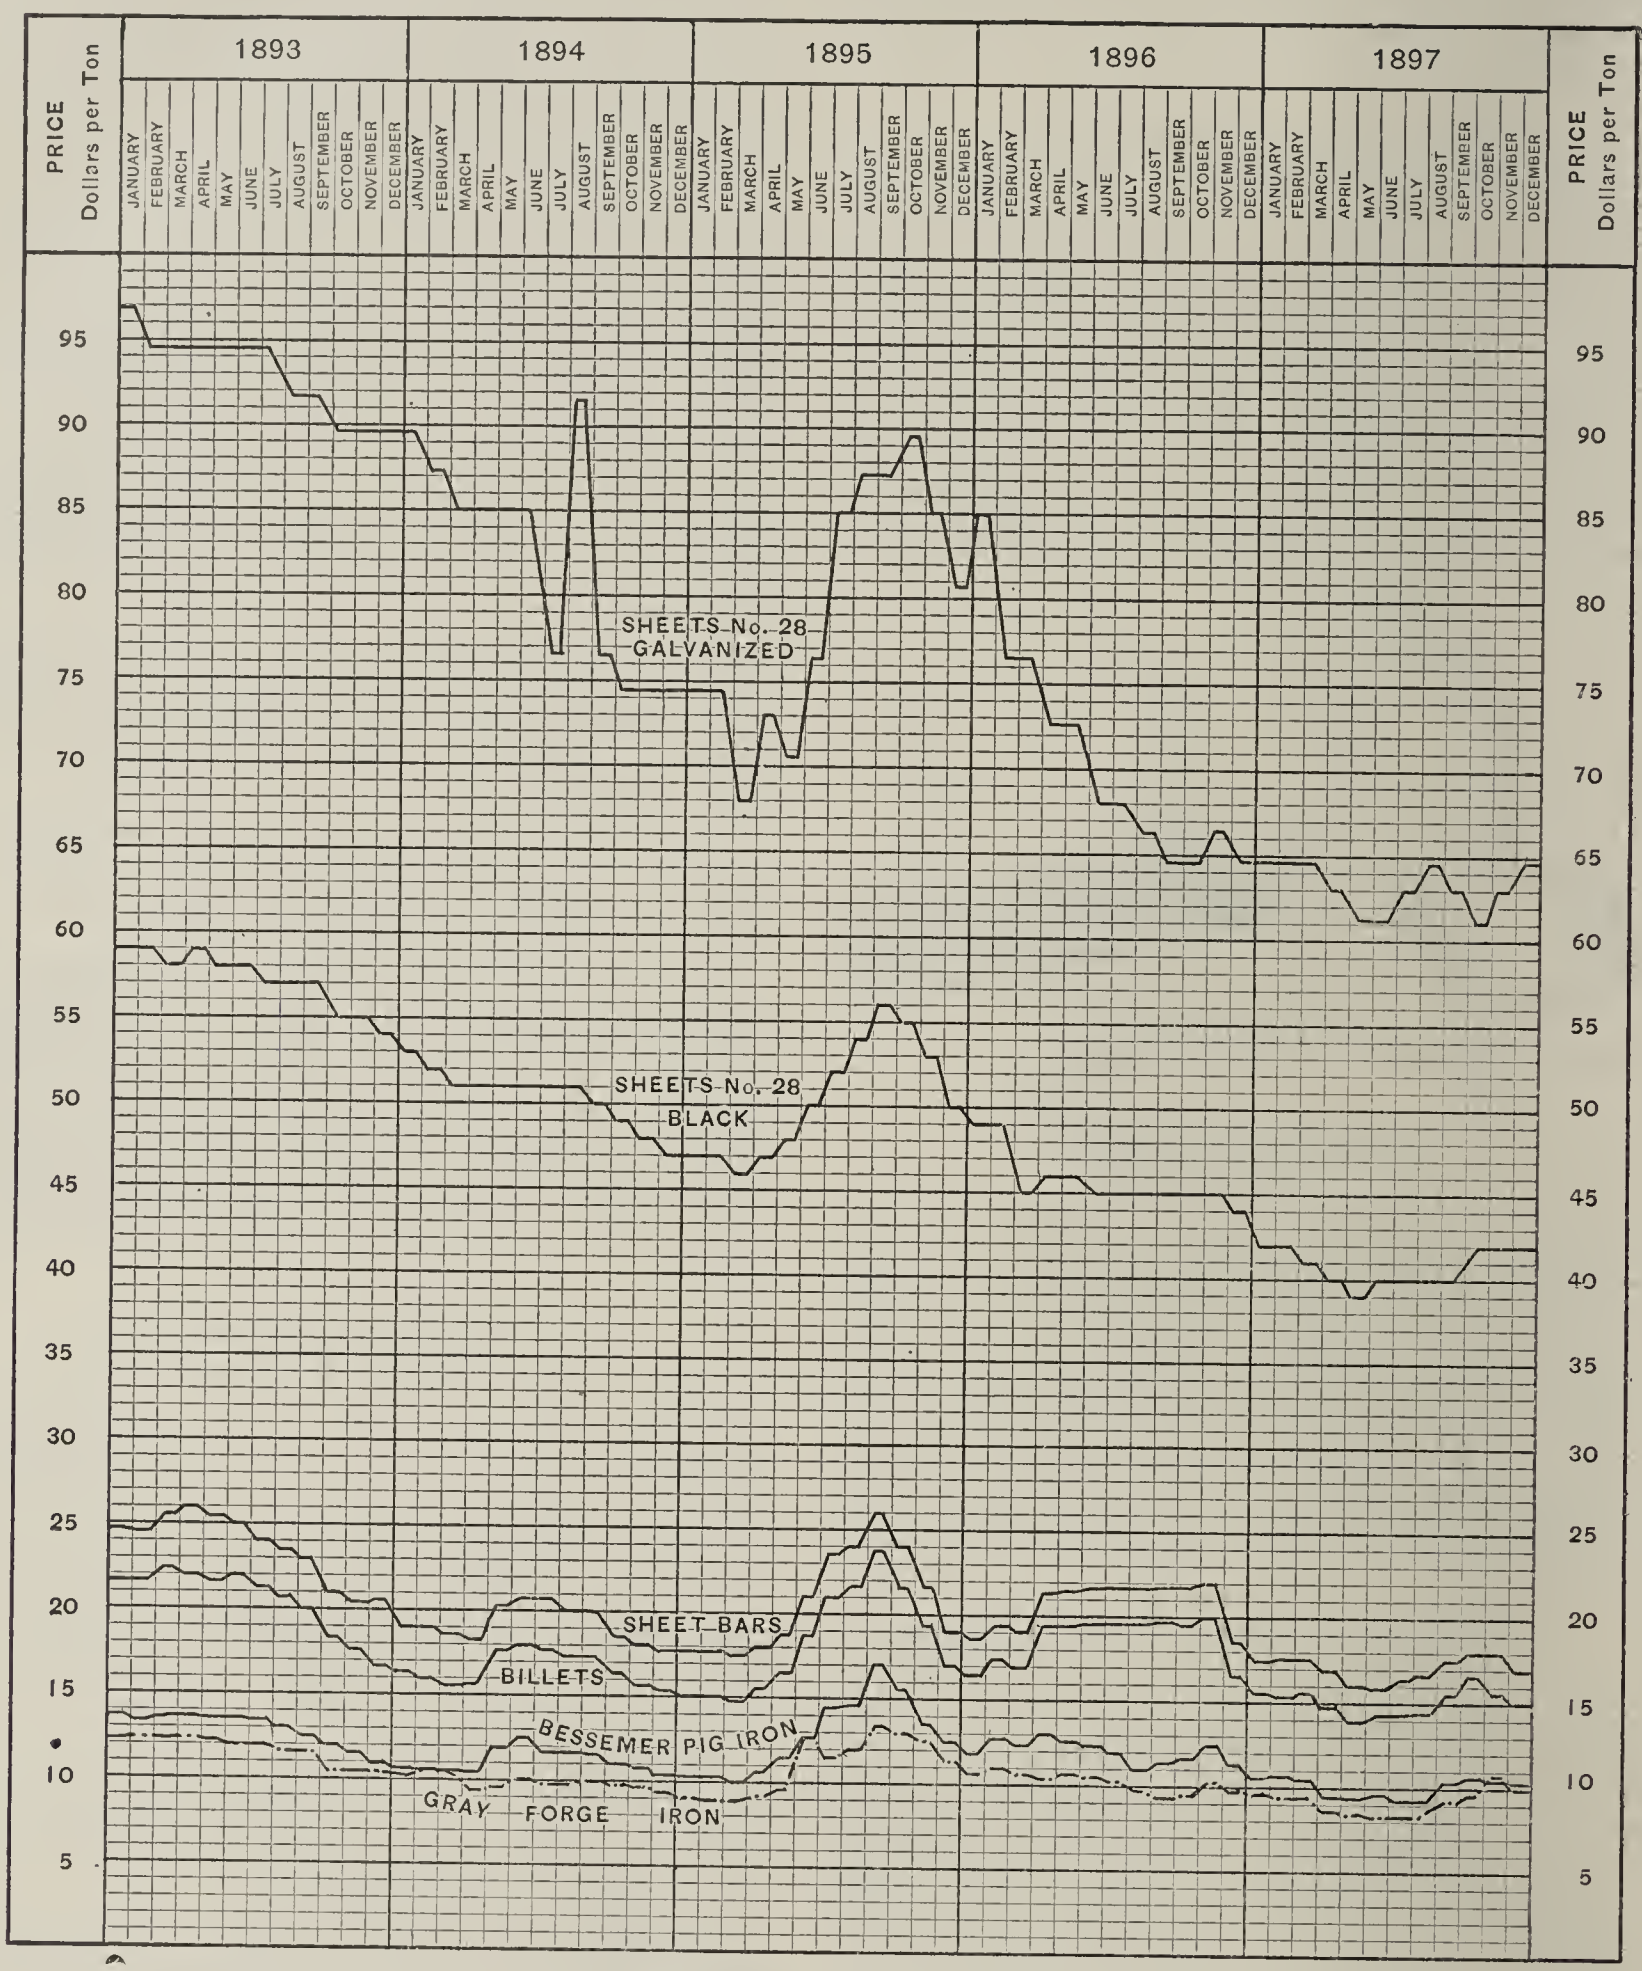
The Ferracute Machine Company of Bridgeton, N. J., manufacturers of Presses and Dies, have recently added a large erecting shop and have placed in it new machine tools, cranes, &c. They keep a force of pattern makers at work who are constantly making new styles and sizes of Presses. They have been building Presses for the Jeffrey Mfg. Company of Columbus, Ohio, for making their Elevator Buckets, Conveyors, &c. They have paid special attention to their line of Drawing Presses, and have obtained most excellent results in producing deep and difficult shapes in thin metals.

The Philadelphia Exposition.

The Committee of Fifteen for the organization and general supervision of the Exposition of the Manufactured Products of the United States to be held in Philadelphia during 1899 has been appointed by the president of the Philadelphia Exposition Association, P. A. B. Widener. This Committee is the result of action taken at a recent conference of the committees representing the Philadelphia Museums and the Franklin Institute, at which time it was recommended to the exposition that the museums, the institute and the association should each nominate five members to represent them on the committee. The result of this action is as follows:

Nominated by the Philadelphia Museums.—Dr. William Pepper, president of the Philadelphia Museums; Dr. William P. Wilson, director; Sydney L. Wright, treasurer; William Harper, chief of the Bureau of Information; William M. Watts, secretary.

Nominated by the Franklin Institute.—John Birkinbine, president of the institute; George V. Cresson, James W. Dodge, Henry R. Heyl, first vice-president; Mr. Garrett.



Nominated by the Exposition Association.—P. A. B. Widener, president; William L. Elkins, vice-president; W. W. Foulkrod, vice-president: Justus C. Strawbridge, chairman of the Finance Committee; Theodore N. Ely, chief of motive power of the Pennsylvania Railroad.

The Michigan State Board of Arbitration met at Detroit on the 2d inst. and reviewed the testimony taken in the matter of the strike of the riveters employed in Wheeler & Co.'s shipyard at Bay City. The board's verdict is that the 1897 rate be paid to all employees, and the riveters' and setters' wages to be $2.50 for a ten-hour day. The rate offered by the company was $2.25, but both sides had agreed to stand by the result of the arbitration.

Fluctuations in the Prices of Sheets.

The Association of Iron and Steel Sheet Manufacturers has compiled an interesting diagram showing the fluctuations during the last five years in the prices per gross ton of black and galvanized sheets and tin plate bars. There has been added to the series the fluctuations in the prices of steel billets, Bessemer pig and gray forge at Pittsburgh.

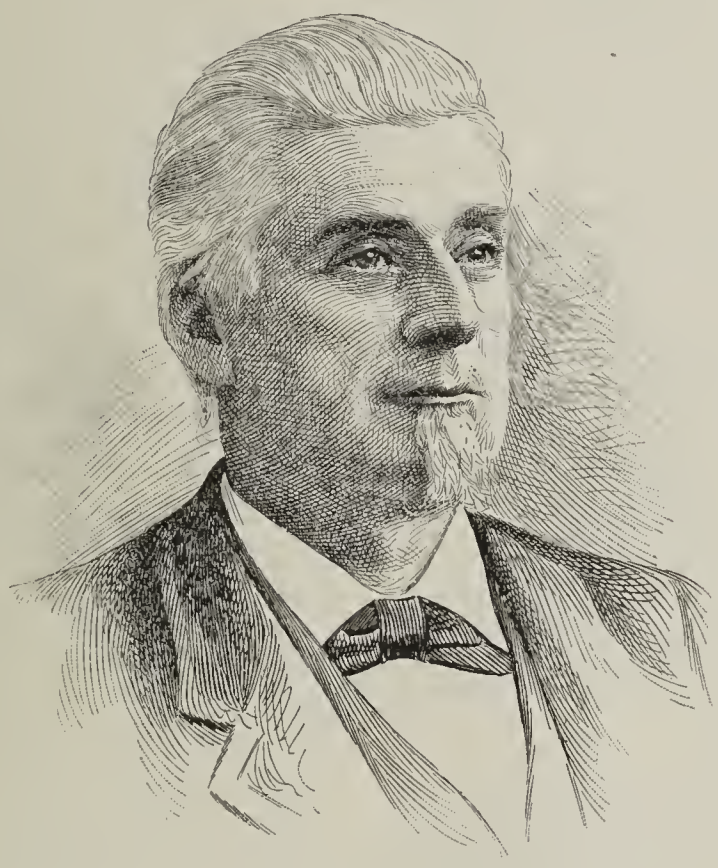
It will be observed how close is the parallelism of the lines between the crude and finished material, subject, however, to a gradual approach, which shows that the "spread" between bars and sheets is decreasing. This is particularly noticeable in the case of galvanized sheets.

FLUCTUATIONS IN PRICES OF SHEETS, SHEET BARS, BILLETS AND PIG IRON.

Gurden Corwith, metal broker, has removed his office from 101 Beekman street to 59 Maiden lane, New York.

The King of Clubs, holding a Dixon pencil, illustrates the March calendar issued by the Joseph Dixon Crucible Company, Jersey City, N. J. A quotation from "The Merchant of Venice" is added: "His scepter shows the force of temporal power."

We learn that "Wright's Trade Directory and Gazetteer," published by George Wright, 121 Fulton street, New York City, is now being compiled for the fifth edition, the first having been published in 1880. This work embraces Australia, India, China, Japan, Central and South America, West Indies, South Africa and Mexico, listing the business men of those countries according to their occupations and containing much information about distances, routes, &c., together with the tariff of the different countries. Each country is printed on a different color of paper and copious indexes are given, making reference easy to the contents. The publisher calls the attention of American manufacturers and exporters to the value of Wright's Directory in bringing their goods to the attention of foreign buyers.



The Central Iron Works, Quincy, Ill., will build a hydraulic elevator for the Government building at Pueblo, Colo.

STOVE TRADE NOTES.

Isaac A. Sheppard.

It is with regret that we chronicle this week the death of another veteran member of the stove trade of this country. Isaac A. Sheppard, head of the firm of Isaac A. Sheppard & Co., Philadelphia, died at his residence, 989 North Sixth street in that city, on the morning of March 6. The immediate cause of his death was heart failure. For many years he had been in failing health, and toward the end of last winter became confined to his house. He suffered from no disease in particular, his breakdown being attributed entirely to habitual hard work, in which he indulged almost to the end.

Mr. Sheppard was born in Cumberland County, N. J., July 11, 1827, and was a member of a very old family, his ancestors having formerly settled in Connecticut, but removed to New Jersey in 1696. The only educational facilities falling to his lot were those afforded by a country school, with sessions three months in the year. At 11 years of age he was thrown upon the world to earn his own living. A year later he went to Philadelphia and became an apprentice in the foundry of Warnock & Leibrandt. He was a most diligent apprentice, applying himself to his trade with that earnestness of purpose which was to be his great characteristic through life. During his apprenticeship he devoted his spare time to improving his education, and being studiously inclined he made the best of the opportunities presented by a residence in a large city. As a molder he enjoyed the enviable reputation of being the best in the land. Some of the feats of work he performed when a young man are to this day considered remarkable.

ISAAC A. SHEPPARD.

In 1859 he started in business for himself, establishing the Excelsior Stove & Hollow Ware Foundry, under the present firm name of Isaac A. Sheppard & Co. The business prospering, he in 1866 established the large branch foundry operated by the firm in Baltimore, Md. Under his watchful care the business grew to its present magnitude, the active management, however, during recent years devolving upon his sons.

Mr. Sheppard was in every sense of the word a public citizen, and was active in religious, financial, educational and benevolent enterprises. He served three terms in the Pensylvania Legislature, in the years 1859, 1860 and 1861. At the breaking out of the War of the Rebellion he was chairman of the Committee on Ways and Means, and drafted the bills under which the Pennsylvania Reserves were raised for the defense of the Union. He was also one of the fathers of the Pennsylvania building association legislation under which the city of Philadelphia has flourished and become known throughout the world as "the City of Homes."

He was in 1867 elected by Councils to be his city's representative on the Board of the Northern Liberties Gas Works Company, and has been re-elected unanimously ever since, at the expiration of a term of office. In 1870 he became active in the organization of the National Security Bank, Philadelphia, serving as vice-president from its establishment, and as president from 1885 to the time of his death.

In January, 1879, he was appointed a member of the Board of Education, and in 1889 was elected to its presidency, and to which office he was re-elected year after year until 1896, when he resigned from the board, his ill health making this step imperative. As president of the board he twice sent in his resignation from the office, feeling that he was no longer able to bear the burdens of the office, but the board each time refused to accept it, preferring to elect an acting president to attend to the duties of the office. The excellent school system of Philadelphia as it exists to day is due very largely to the wise counsel and foresight of Mr. Sheppard. While a member of the Board of Education he was a member for nine years of the Committee on Property, and for six years of the Committee on Night Schools. The remembrance of his own want of educational opportunities in youth made him especially interested in the work of the Committee on Night Schools. He was also a member of the committee appointed to organize the School of Industrial Art and the Central Manual Training School.

His health not improving, he dropped one by one all the offices held by him, with the exception of the presidency of the bank, his attendance at the bank continuing until late last fall.

He was a Master Free Mason, Past Grand Master of Odd Fellows and Ex-Grand Treasurer of the Sovereign Grand Lodge of Odd Fellows. His interest in church work included 25 years' service as superintendent of the Sunday School of Zion Protestant Episcopal Church, at Eighth street and Columbia avenue. At the time of his death he was the rector's warden. He was also a member of the Union League Club and other organizations. Mr. Sheppard was a man greatly respected in business circles. He was possessed of excellent judgment, and his great tact and foresight were used to advantage in the different interests in which he figured. He was an untiring worker and thought no labor too great which tended to advance any of the institutions he was connected with. His personal attraction was such that harmony was assured at any board on which he served. In all his dealings he was most fair and just, and his charity will be long remembered by those among whom it was dispensed. The city of Philadelphia has lost a noble citizen and the stove trade of the country, with one exception, its oldest manufacturer.

Mr. Sheppard was a widower, his wife having died recently. He leaves behind him his two sons, Franklin L. and Howard R. Sheppard, who have been in recent years active in the management of the business founded by their father.

The funeral was held on Wednesday, interment being made at Laurel Hill Cemetery.

The One O'Klok Klub.

Our readers have probably waited with considerable impatience for some further account of the proceedings of the One O'Klok Klub of Chicago. This organization, which has become famous in the annals of the Chicago stove men, has not been disbanded, which might have been inferred from our long silence. On the contrary, it is enjoying more vigorous life than ever, and the daily reunions of the members are full of the true spirit of the times. The members are strongly imbued with the war fever and would go to the front with alacrity in case of hostilities with Spain, especially if a call for volunteers should be received immediately after dinner. At that time their courage is always at fighting heat. They have a choice collection of weapons in their armory, which were presented them for ornamental purposes, but could be used effectively for offense or defense. If the enemy could see some of the fearful curios in their museum they would flee from their presence in terror. At the last meeting of the Klub the redoubtable Grange Sard was observed looking askance at a new life mask of Frank Mixter of the Rock Island Stove Company, which announced his life membership in this select organization. But there are other things even more terrifying.

A New Stove Foundry.

The Bonnet-Nance Stove Company of Quincy, Ill., who have for some time been seeking a location in the vicinity of Chicago, have concluded negotiations for a site at Chicago Heights. They will have about 10 acres of land. Their main building will be two stories high, 50 x 800 feet, constructed of steel frame work and brick and stone walls. It will be used for mounting and storing stoves. The foundry will be 86 x 450 feet, 25 feet high. Switch tracks will run through the grounds and buildings, enabling raw materials to be delivered and stoves shipped out with a minimum of handling. An elevated track will run to the cupola platform, to save the hoisting of raw materials. The power to operate the plant will be furnished by two boilers and a 300 horse-power Corliss engine. The equipment is to be of the most modern and improved character. An effort will be made to get the buildings ready for occupancy by May 1. The officers of the company are as follows: J. J. Bonnet, president; R. W. Nance, vice-president; L. A. Bonnet, secretary and treasurer. Their plant at Quincy was burned some months since, and they concluded not to rebuild at the same location, although they had been in business there since about 1862.

Perfection Gas Stoves and Heaters.

The annual catalogue which has just been issued by the Milwaukee Gas Stove Company of Burrell and Chase streets, Milwaukee, Wis., is a very neatly printed and arranged pamphlet of 48 pages bound in colored paper covers. In their announcement to the trade the company state that on account of steadily increasing sales they have been compelled to secure larger manufacturing facilities, and now have a finely equipped plant for the manufacture of gas appliances, enabling them to turn out a very much larger number of goods than ever before. They have added several new ranges, grates, heaters and radiators to their line this season, all of which embody the latest improvements. Special reference is made to their instantaneous cleanable burner, so constructed that by the simple raising of a lever all accumulation of dirt from overboiling pots and kettles is forced to the surface, where it can be brushed off; telescopic oven burners which, it is claimed, enable the operator to light and regulate the oven flame without stooping down or opening the oven doors; adjustable needle valve, by means of which the air and gas pressure can be regulated independent of each other; star shape burners, which distribute the heat over the entire surface; large ovens, water heater, &c. The Perfection line of gas ranges is described and various styles illustrated together with Perfection portable stoves, Perfection gas water heaters, hot plates, laundry stoves, tinners' soldering furnaces, coffee roasters, gas kilns for firing painted or decorated china, glass ware, &c., Dresden gas kiln, various styles of gas grates, gas radiators and gas heaters. A number of testimonials and a telegraphic code occupy the closing pages of this well printed publication.

Gas Ranges on Trains.

The latest improvement on the Empire State Express, says the Albany *Argus*, is the introduction of gas ranges in the buffet cars, where steaks, chops, broilers, ham and eggs, &c., are cooked as quickly and deliciously as in any metropolitan hotel or restaurant. An idea of the popularity of this new feature of the Wagner service can be obtained from the fact that in the month of January 1243 orders for steaks, chops, broilers, &c., were filled on this one train alone, and to the satisfaction of the passengers. Here are the orders in detail:

Sirloin steaks	593
Tenderloin steaks	38
Mutton and English chops	389
Broilers	151
Quail	44
Ham and eggs	23
Total	1,243

ODD PLATES.

The business formerly conducted under the title and style of M. L. Nyberg & Co., Limited, will hereafter be carried on under the name of the Odin Stove Mfg. Company, Limited, 1216-1218 Peach street, Erie, Pa. The stockholders of the company remain the same, with the exception of the former president, M. L. Nyberg, whose interests have been purchased by C. F. Hoffstetter, who will hereafter conduct the business of the concern as president and manager. The company state that Mr. Nyberg is no longer connected with them in any capacity whatever.

Isaac A. Sheppard & Co. of Philadelphia, Pa., continue favoring their friends in the trade with attractive cards calling attention to their specialties in the heating line. The last one to reach us bears at the left a picture of a burly policeman, whose left hand grasps his club, while the right is raised in a warning manner, as though signaling to "stop." The company evidently use this picture to emphasize the remarks presented on the card, for they say that the cards will be stopped if the senders are notified that they are not wanted any longer. They go still further and say that the cards will be stopped if the dealer feels that he does not want any more business than he now has, or that he does not think it will pay him to sell the Paragon Furnace and the Excelsior Range and that his customers would rather have a cheap Furnace than a good one. The alternative which the company offer is for the dealer to send an order for a sample Furnace and Range, or write them that he is going to try and push the company's goods. Either way, the manufacturers state, will stop the cards, otherwise they will continue coming until both manufacturers and dealers see the same way.

The Atlanta Stove Works of Atlanta, Ga., have commenced operations on their new factory, which when completed will give them more than double their present capacity. The site of the new works is near Edgewood avenue, on the line of the Southern Railroad. The present molding room, we understand, will accommodate 36 molders, while the new one will have facilities for 82. Other departments will be increased from 8 to 15 and from 65 to 150. The molding room will be a frame structure, 70 x 300 feet, covered with corrugated iron. The brick warehouse will be 70 x 160 feet in size and three stories in hight, while the foundry proper will be 40 x 170 feet. We understand that the company have placed their order for a 75 horse-power engine and a 100 horse-power boiler.

The employees of the Dangler Stove & Mfg. Company of Cleveland, Ohio, held their seventh annual prize masquerade ball at Germania Hall on Saturday, February 26. We understand that eight Gas, Oil and Gasoline Stoves were given away as prizes.

The Wakefield Foundry of the Smith & Anthony Company of Boston, Mass., which was shut down for a time, resumed operations on March 1.

At the annual meeting of the Art Stove Company, held in Detroit, Mich., on the afternoon of February 23, the following directors were elected: Neil McMillan, W. H. Fernwood, Charles Campbell, Richard Renther and John O. Campbell. The Board of Directors elected Neil McMillan president, John O. Campbell vice-president and treasurer and Charles Campbell secretary.

Two large schools at Ogdensburg, N. Y., have been successfully heated during the past winter by six No. 62 Kernan All Cast Iron Furnaces made by the Kernan Furnace Company, Utica, N. Y.

The Rutland Fire Clay Company of Rutland, Vt., are distributing some neat folders calling attention to their specialties, including the Rutland Stove Lining, which is claimed to fit any stove and can be put on in a few minutes. The fire can then be started at once. The company suggest that on the outside of the stove Big-box Stove Polish be used, the claim being made that it blacks easier,

blacker and stays black longer than any other Stove Polish they know anything about. The company state that when the dealer has a Vermont Polishing Mitten and some Big-box Stove Polish, blacking the stove becomes an easy, pleasant task, comparatively speaking.

The Vogelgesang Furnace Company of Columbus, Ohio, were incorporated a few days ago, with a capital stock of $25,000. The incorporators include Frank S. Bartlett, D. A. Ebinger, Frank P. Hall, Edward W. Vogelgesang and George B. Durrant.

The Millett Core Oven Company of Brightwood, Mass., favor us with a four-page circular illustrating Millett's Patent Core Oven for use in foundries. This Oven, it is stated, has been in use for a number of years in some of the most completely equipped foundries in this country and Europe, and has given entire satisfaction, especially where quick and thorough baking of small cores was desired. The Oven is constructed of independent shelves, each having two doors, one in front and one at the back, which close the Oven when the shelf is swung out to put in or take out cores, thus effecting a great saving of fuel and heat. As usually made the Oven has six doors, each 5 inches high, and one door 10 inches high, although the manufacturers state that they can furnish Ovens with doors of any hight up to 15 inches. The front and shelves are furnished already put together and in condition to set in the brick, but they do not furnish the fire box, as every foundryman has his own way of heating. The circular shows the Oven both in portable form and for brick setting, and at the same time gives a list of some of the concerns who are using the Millett Core Oven. Among the many foundry concerns we notice some Stove manufacturers, such as the Walker & Pratt Company, Boston, Mass.; Weir Stove Company, Taunton, Mass., and the Magee Furnace Company, Chelsea, Mass.

One of the best dentist stories we have heard for some time comes from a prominent Chicago Stove man. He says that he recently went to the office of a very popular Chicago dentist and took his seat in the reception room to await his opportunity to receive some pleasing attention from the dentist. While sitting there he heard the sound of snoring coming from the dentist's operating room. He could hear the whirring of the drill and afterward the operations of the dentist's hammer mingled with the undoubted snores coming from some sturdy subject. After some time the snoring ceased and a gentleman walked through the reception room whose features were wondrously familiar to our friend. He racked his brain to try to recall who the man could be, but, his memory affording him no solution, he did not claim the attention of the gentleman, and being called to take his place in the operating room he walked in. Saluting the dentist he inquired who the individual was that had just passed through. He was informed that it was Theodore Thomas, the well-known musical director. Our friend inquired who had been snoring just a few minutes previously, and the dentist replied that it was Mr. Thomas, and the fact was then disclosed that so deftly had the dentist been performing his work that Mr. Thomas had actually been able to take a very comfortable sleep in the dentist's chair during this very engaging occupation of having his teeth filled. Could it be possible to conceive of anything more flattering to a dentist's skill than the fact that his subject could take a comfortable sleep and positively snore while undergoing such an ordinarily unpleasant experience?

The Kernan Furnace Company, Utica, N. Y., have secured the contract for and have successfully heated the Calvary Church Chapel, Utica, N. Y., with two of their No. 100 Series Furnaces and the M. E. Church of Paris Hollow with one of their Union Furnaces.

The death is reported last week in Pittsburgh, Pa., of James Graham of the Stove foundry firm of Crea, Graham & Co. Mr. Graham was in the sixty-eighth year of his age, and was formerly a member of the firm of Graham & Co., proprietors of a salt works.

The Yeager Hunter Spring City Stove Works, Spring City, Pa., are introducing a new Range under the name Majestic New Era. It is supplied in three sizes, ovens 16 x 16, 18 x 18 and 20 x 20 inches, either right or left hand. It has a cut top, with reducing covers, and is of sheet flue construction with gas burner attachment. The top and shelf are flush with the top, back and front. It has a cabinet base with 14-inch feet. The grate is removable without disturbing the water back or brick rests. There is an anti-clinker poke hole in the end. The dampers work entirely from the top of the Range, and there is a check draft slide on the top. The oven is fitted inside with roasting hooks. The Range is supplied either with or without a reservoir, and the reservoir is furnished with a spigot. End or front ash pits are furnished, as may be required. The design of the Range is very handsome and the oven door is of oval shape.

The Michigan Stove Company make an important announcement to the trade. After a series of experiments they have at last succeeded in perfecting a process of applying aluminum to oven doors and oven racks. This finish they have applied not only to all of the celebrated Garland line, but to all except the very lowest priced Stoves and Ranges in their assortment. They state that Stoves and Ranges thus treated should be eagerly sought after by neat and tidy housekeepers, as by this process of treatment the brightest and cleanest ovens are obtained. The result of this treatment is that, however thickly the inside of the oven door or oven rack may become incrusted with grease or other products of baking or roasting, all will soon burn off and leave the oven door and oven rack as bright as they were before being used. In other words, it is self cleaning. The grease can also be washed off with soap and water. Consequently a perfectly bright, clean and sweet oven is at all times assured. The company have applied for letters patent on this process of treating the inside of ovens with aluminum. Their agencies are therefore again placed in possession of an exclusive and unique selling feature, the utility of which will no doubt add largely to the sales and popularity of Garland Stoves and Ranges. The Michigan Stove Company are as conspicuous as ever in introducing new and taking features.

SCRAP.

The Ellwood Tin Plate Company, Ellwood City, Pa., are enlarging their capacity considerably.

The Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, are making some very important improvements and additions to their Bessemer Steel plant at Mingo Junction, Ohio. Larger converters are being installed, new rolling mill equipment added, and the plant will be made a thoroughly modern Bessemer Steel plant in all particulars. New blowing engines are also being added to the blast furnace equipment so as to permit the operation of both furnaces at the same time, which heretofore has been impossible owing to inadequate blowing capacity. It is the intention of the firm to run both furnaces to supply metal for the Bessemer plant. This concern are also making improvements in their Sheet mill, Tin Plate and Galvanizing departments, at Bridgeport, Ohio.

Miller Brothers & Co., engineers and contractors, Tradesman's Building, Pittsburgh, Pa., have received a contract from the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., for the erection of eight Sheet and Pair furnaces for the addition to be built to the Tin Plate plant of that concern. They have received a contract for a four-door Heating Furnace for the Ajax Forge Company of Chicago, and also an order for the additional work at the Joliet works of the Illinois Steel Company.

About 30 employees of the National Tin Plate Company, Monessen, Pa., have gone out on strike, and as yet the trouble has not been adjusted. It is expected, however, that a settlement of the difficulty will be reached in a few days, as the differences between the men and the firm are said to be very slight.

The plant of the Pittsburgh Tin Plate Works, at New Kensington, Pa., has been compelled to close down temporarily owing to a break in the water works service.

The Lalance & Grosjean Mfg. Company, New York City, are contemplating the addition of two new hot mills to their Tin Plate plant at Harrisburg, Pa. The plant is running full in all departments at the present time, a fourth tin mill having been recently put in operation. About 300 hands are steadily employed. Nevertheless the existing requirements of the company's factory at Woodhaven, L. I., are so large that the entire output of the Harrisburg mills is not enough to fill them.

The Welsh & Kerry Mfg. Company of Reed City, Mich., have opened a branch factory at Saginaw, Mich., for the manufacture of Tin Plate boxes and other wood specialties. The company have enough orders for Tin Plate boxes on their books to keep this department busy in both their Saginaw and Reed City works for an indefinite time.

W. C. Brown, 36 La Salle street, Chicago, manufacturers' agent for the sale of Bar and Sheet Iron, Tin Plate, &c., is distributing favors among his friends in the trade in the form of excellent lead pencils bearing his name and address.

Although it has been readily understood by the tin plate trade in this country that since its virtual establishment, at the time of the enactment of the McKinley tariff laws of 1890, the industry of South Wales has been suffering materially, the failure of two of the largest mills on the other side came rather in the form of a great surprise. Morewood & Co., the largest manufacturers of tin plate in Wales, have announced the fact that they are unable to meet their payments. This concern possess realizable assets of great value and are a firm of high reputation. The entire force of workmen has agreed to an immediate reduction of 15 per cent. in wages. Directly after the Morewood failure the Morriston & Midland tin plate works closed down, throwing 600 men out of employment.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Only a fair amount of business has been transacted during the last week, but the market has maintained its firmness and prices for large lots have had an upward tendency. Transactions in the London market, however, were large, and the business was probably better than at any time during the year. There has been a total absence of speculative movement, which is indicative of the fact that last week's business was transactive solely for consumptive purposes. Up to this writing arrivals have been small. They amount to 285 tons. There is considerable afloat, however, and as far as can be ascertained at present about 1000 tons can be expected within a week. The demand for Tin in mild quantities has not shown any change, and prices though stiff are not quotably different from a week ago.

Copper.—The market is holding its same strong position and is decidedly in the sellers' favor. It is absolutely devoid of any speculative movement, and all of the metal that is purchased is purchased on account of an absolute necessity to supply consumptive demands. The market is dull, but exceedingly firm. Companies claim a fairly good demand for home consumption, while export demand does not seem to be up to the asking price. Exports so far this month have been small, and amount to 1694 tons for the week closing March 7, as per Metal Exchange returns. The unusual activity of the electrical works in this country occasions what demand there now is at the present high figure. The price for Copper in small lots is unchanged. Sheet Copper is in good demand at unchanged figures.

Pig Lead.—There has been an easy market during the latter part of the week under review and the buyers have all in their favor. Our Chicago correspondent reports heavy sales and steady prices, while from St. Louis we hear of a fair demand at firm prices. In this market there is no change to report in small lots, and manufactured Lead remains at former quotations.

Spelter—Is firm and has an upward tendency. Prices have advanced over last week's quotation and there is a great consumptive demand. In small lots there is no change to record.

Antimony.—The market is firm, with an advance of 10 points in Hallett's, and we now quote Hallett's at 7¾c. and Cookson's at 8c. to 8⅛c.

Nickel.—Is still holding at 33c. to 37c., according to quantity and delivery, and remains inactive and unchanged.

Tin Plate.—There is comparatively little doing just now, as the dealers are entirely nonplussed regarding the movements of the committee which is promoting the proposed consolidation scheme. Many rumors have been afloat regarding the subject, but none have as yet stood verification. The rumor that P. Armour proposed interesting himself in the scheme to the extent of the much needed $3,000,000 was emphatically denied by him last week. In our endeavor to confirm the rumor that the Western makers were bringing the "combine" to a close independently of the "Big Four" in New York, and that another Chicago capitalist had decided to do what Mr Armour refused to do, our correspondent telegraphed us: "He is not working on consolidation scheme; nobody at work here as far as can be learned; local makers say they have no faith in the scheme." Nevertheless, rumors persist in certain quarters that a scheme of regulation of some sort is not dead, and even that the plan for selling out the works as broached in New York a month or two ago still has a spark of life in it. There is a strong feeling with some that action should be taken toward harmonizing the work of the mills, if to no other end than that the crossing of orders and the consequent waste of money for freight charges might be saved. By districting the country, it is pointed out, there would be the saving of long distance freight charges, each region being supplied from nearby mills. Plans of this sort have been carried out in other departments of the Iron and Steel trade, but it remains to be seen how far the Tin Plate trade can follow any plan of co-operation. There is only a fair demand for Tin Plate in small lots at unchanged prices. Stocks of Coke Plates in this market are somewhat broken, but prices do not stiffen.

THE IRON MARKET.

Between the conflicting statements relative to the consolidation of the Wire interests the truth lies midway. Far from having been accomplished, as announced, the negotiations have taken an adverse turn. The Pittsburgh Wire Company have withdrawn altogether, but a final rupture has not yet taken place between the bankers and one very important concern, whose own estimate of the value of their property and business, as represented by the option given, differs widely from that placed upon it by the accountants, on the basis of which the bankers have made an offer. Whether these differences cannot be reconciled may develop at an early date. It would be going too far to say, however, that the whole plan has fallen through. If it does interesting developments may be expected in the Steel market, out of which the Wire interests have kept, so far as covering for future delivery is concerned. From Pittsburgh comes the report that that movement has already begun in a moderate way. Whether the Wire trade generally would be adversely influenced is discussed with some interest, although it hardly seems reasonable that personal differences should tell.

A little better feeling is developing in the Cast Iron Pipe trade, which is so influential a factor in shaping the destinies of Foundry Iron. Our monthly statistics show an increase in current make on March 1 over February 1 of about 5300 tons weekly. A partial stock report indicates an increase of 22,600 tons during February, which proves that while the demand is very heavy it is not yet capable of absorbing our whole product.

Pig Iron.—The market in New York continues in an unsettled condition, without any improvement in prices. We quote as follows: Northern brands, No. 1, $11 to $11.50; No. 2, $10.50 to $11; No. 2 Plain, $10 to $10.50. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.50; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

In Philadelphia the Pig Iron market has been dull and uninteresting all through the week. Sellers have been able to move a fair amount of material, but the best that could be done was to maintain last week's prices. There is a continued pressure to secure business, and the outlook for the immediate future is not encouraging. It will not take many days, however, to settle the question as to which way the market will move, but the market has got to move out of the rut before there can be anything like general activity. Prices for seaboard deliveries are about as follows, with the usual rebate according to freights at points within a radius of 100 miles south or west: No. 1 X Foundry, $11 75 to $12; No. 2 X Foundry, $10.75 to $11; No. 2 Plain, $10.40 to $10.50.

The demand for Pig Iron in Chicago shows no abatement and good business is continually coming up. Large inquiries are in the market for Foundry Iron, one of them calling for 3000 to 4000 tons. Good sales of local Coke Iron have been made. One house reports having had the largest week's tonnage for this year, notwithstanding higher prices are asked than for Southern. These transactions were not confined to a few large consumers, but buyers were quite numerous. The situation of the local manufacturers is now very strong, and they are inclined to advance quotations still further. The sales of Southern Coke may not have been quite so large as during the previous week, but they amounted to a very respectable tonnage. We quote for cash as follows:

Lake Superior Charcoal	$12.00 to $13.00
Local Coke Foundry, No 1	11.50 to 12.50
Local Coke Foundry, No. 2	11.00 to 12.00
Local Coke Foundry, No. 3	10.50 to 11.50
Local Scotch, No. 1	11.50 to 13.00
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.35 to 10.70
Southern Coke, No. 3	10.10 to 10.40
Southern, No. 1 Soft	10.85 to 11.00
Southern, No. 2 Soft	10.35 to 10.70

The market for Pig Iron in the Pittsburgh district has been quiet the past week, and aside from several sales of Bessemer Pig for March and April delivery very little has been done. The furnaces there are very firm in their views as to prices for second and third quarter. Foundry Irons continue very dull. We quote f.o.b. Pittsburgh, the rate from Valley being 65c.: No. 1 Foundry, $10.40 to

$10.50 ; No. 2 Foundry, $9.85 to $10; Bessemer, $10.30 to $10.40.

Cincinnati advices report that the market in Pig Iron for the past week has been rather unsatisfactory to all agents representing those Southern furnaces which are interested in the recent combination to maintain prices. About all the business that has been done on the $7.25 basis for No. 2 Foundry has been small orders running from carloads to 50 tons. There has been a good deal of Iron sold, however, by those furnaces not in the pool, and also by parties holding warrants. The outside furnaces are getting $7 for No. 2 Foundry. The warrant Iron is being sold on even a lower basis than this. But little business is expected during the coming week, but the probability is that after these outside companies have filled themselves, which will probably be in a week or so, business will resume its normal current. The deliveries are going on about as usual, and fair minded parties are quoted as regarding the market satisfactory and normal in the main. In Northern Irons the situation has been unchanged, and probably it may be truly said that the general situation, both as to North and South, is steadier than it has been. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.25 to 9.50
Southern Coke, No. 3	9.00 to 9.25
Southern Coke, No. 1 Soft	9.50 to 9.75
Southern Coke, No. 2 Soft	9.25 to 9.50
Southern Coke, Gray Forge	8.50 to 8.75
Southern Coke, Mottled	8.50 to 8.75
Ohio Silvery, No. 1	12.00 to 12.50
Ohio Silvery, No. 2	11.50 to 12.00
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00

The market in St. Louis continues without material change. There continues to be more or less weakness in prices and furnaces are apparently quite anxious for business; at least some of the prices which have been made would seem to indicate that their order books are quite bare. Sales during the week were not heavy, being confined largely to carload lots with an occasional sale of 100 to 200 ton lots. We quote as follows for cash, f.o.b. cars St. Louis :

Southern, No. 1 Foundry	$10.00 to $10.50
Southern, No. 2 Foundry	9.75 to 10.00
Southern, No. 3 Foundry	9.50 to 9.75
No. 1 Soft	9.75 to 10.00
No. 2 Soft	9.50 to 9.75

CHICAGO REPORT.

Scrap.—Cheap grades of Iron are in strong demand, but best grades are quiet. Metals are active. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7.50	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	5.50	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.50	....
Old Gas Pipe and Boiler Tubes	6.00	....
Cast Borings	3.50	....
Turnings	5.00	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	10¼c.
Copper Bottoms	....	9¼c.
Copper Clips	....	10 c.
Red Brass	....	8½c.
Yellow Brass	....	7½c.
Light Brass	....	5¼c.

Zinc	....	3¼c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	..	1 c.

Anthracite.—Shippers have advanced the schedule 25 cents. Although the demand is light, the advance is well maintained. The prices of carload lots of 12 tons minimum are as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	7.00	7.25
Council Bluffs, Iowa	7.00	7.25
Lincoln, Neb	7.15	7.40
Sioux City, Iowa	7.50	7.75
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.55
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6.75
Des Moines, Iowa	7.00	7.25
Davenport, Iowa	6.30	6.55
St. Joseph, Mo	7.00	7.25
Leavenworth, Kan.	7.00	7.25
Omaha, Neb	7.00	7.25

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

There continues to be an excellent volume of business in the West, reports indicating very satisfactory activity and a more liberal movement of goods than for several years at this season. In the East there is not the same improvement noticeable, but the market is feeling the effect of the increased demand from the interior and, on the whole, the indications are favorable for good business. The talk of war has doubtless had some effect in restraining enterprise and keeping back business. The failure thus far of the plans to consummate the consolidation of the Wire Rod interests has the effect of giving a slightly weaker tone to the products directly affected. In general, prices in Shelf and Heavy Hardware are unchanged and apparently awaiting a marked increase in the demand before taking a turn upward. Collections generally are satisfactory.

Advices from Chicago.—Spring trade in Shelf Hardware now seems to be in full tide of activity. The local jobbing houses found their orders on Monday of this week far in excess of anything known for many months. The demand for some kinds of goods is reported phenomenal. A very heavy business has been done in all kinds of Steel Goods and all sorts of Garden Tools. Some lines of House Furnishing Goods have also been called for so heavily as to test the capacity of the manufacturers. The movement of seasonable goods is beyond expectations. Bad roads are interfering with business in some sections of the West, but good drying weather has prevailed over other localities and consequently the general volume of business does not seriously feel the effect of this unfavorable influence. Heavy Hardware jobbers are also in receipt of a good trade, which covers all kinds of Wagon and Carriage Stock as well as Iron and Steel.

Advices from St. Louis.—The Hardware jobbing trade report a most excellent demand for all lines of goods and the present month promises to show a heavy increase over the corresponding month of last year. In Builders' Hardware a heavy business is reported and the amount of building throughout this section is enormous. Shelf Goods, Edge Tools, Files, &c., are selling very freely, particularly Files, which are being ordered in larger volume than for months past. Screws, Carriage and Machine Bolts, Corrugated Iron and Terne Plates are all good sellers just now. Prices are being well maintained, and in Barb and Plain Wire and Wire Nails advances have been made which are being firmly adhered to. The general conditions are excellent. Collections are excellent.

NOTES ON PRICES.

Wire Nails.—There has been no important change in the Wire Nail market and during the past week the volume of business was moderate, owing to the liberality with which orders were placed last month, prior to the advance which went into effect March 1, and also to the feeling of uncertainty that prevails in regard to the consummation of the plans for the consolidation of the Wire interests, the outcome of which is at least problematical. Notwithstanding the delay in the consummation of the plans and the serious difficulty which it is understood is being encountered, the market for Wire Nails continues fairly steady. New York quotations are on the basis of $1.70 to $1.75 for small lots from store.

Advices from Chicago.—The situation is rather uncertain and probably will be so until something definite is known concerning the proposed consolidation. Jobbers have enjoyed a good demand for small lots, but have not advanced their prices to correspond with the full rates named by manufacturers. Small lots from stock are quoted at $1.65, but all sellers have not adhered closely to this price. The Mississippi River jobbers are understood to have advanced their rates to $1.80 for small lots.

Advices from St. Louis.—The market is in a firm position. Jobbers report a heavy demand and quote $1.65 to $1.70, base, for small lots from store.

Cut Nails.—The Cut Nail market remains steady. Some efforts are being made by the manufacturers to work together so as to obtain a slightly higher figure in sympathy with the condition of the Wire Nail market. The price in New York is $1.25 to $1.30 for small lots from store.

Advices from Chicago.—The demand is very limited and the light trade moving is being done at the old price of $1.45 for small lots from stock.

Advices from St. Louis.—There is some improvement in the demand for Cut Nails, but prices are inclined to weakness. Jobbers ask $1.40 to $1.45, base, for small lots from store.

Barb Wire.—The Barb Wire market presents few new features. The trade are not disposed to buy freely at present, awaiting some definite outcome of the Wire Rod negotiations.

Advices from Chicago.—Manufacturers report absolutely no stock on hand and shipments from factory continuing very heavy on old contracts. The future of this branch of trade will, of course, depend on the result of the deliberations over the consolidation. Jobbers continue to quote small lots from stock at the same price as that asked by manufacturers for carload lots, and report a very good demand from the retail trade.

Advices from St. Louis.—The demand for Barb Wire is exceptionally heavy. Mills report a larger volume of business than for months past. Jobbers report a steady increase in the demand, and quote small lots at $1.70 for Painted and $2 for Galvanized.

The Peck, Stow & Wilcox Company. — Under date March 1 the Peck, Stow & Wilcox Company, Southington, Conn., and New York, have issued a discount sheet applying to their 1898 catalogue, reference to which is made in another column.

Glass.—Local demand for Window Glass continues limited. Jobbers at some of the Atlantic Coast points recently agreed to hold Window Glass in less than carload lots at 85 and 10 per cent. discount, a price which has been obtainable for some time past. This agreement, however, has not materially strengthened the market, as 85 and 15 per cent. discount is now given in some cases. Various rebates are to be allowed by the American Glass Company for different quantities of Glass purchased by April 1. This was supposed to indicate that advanced prices would go into effect at that time, but no announcement of higher prices has been made. Demand from factory is reported as being strong ; also that a number of jobbers are still holding off for lower prices.

White Lead.—The distribution has been in a jobbing way, covering immediate and nearby requirements. Prices and terms remain unchanged, with no indications of any upward or downward movement.

Red Lead.—Nothing outside of ordinary business is being done, but this is fair in amount, with prices steady for both domestic and foreign products.

Linseed Oil.—There is a very commonplace demand, jobbers being conservative in their purchases. Under ordinary circumstances present price of raw material would result in higher values, but outside competition is depressing the market to some extent.

Color Photography.

At a recent meeting of the Royal Photographic Society in London, Prof. Gabriel Lippman described his system of color photography, whereby a photograph showing the colors of nature is obtained by a direct process and with only one exposure of the plate. The film, which might be of any sensitive substance, he explained, was exposed, developed and fixed in the usual way. Two conditions, however, must be observed. The film must, in the first place, be transparent and grainless, and in the second it must be in contact with a metallic mirror during exposure. The effect of the mirror, which was formed by running a layer of mercury in behind the plate, was to reflect back the incident colored rays and thus make the incident light waves stationary. These stationary vibrations, falling in the interior of the sensitive film, impressed their own structure upon it, and by virtue of the structure thus imparted to it the brown deposit of silver, when viewed by reflected white light, appeared clothed with the same colors as were possessed by the image in the camera. The colors were produced by "interference" in the same way as those of the soap bubble or mother of pearl. That this was their cause M. Lippman said was proved by the fact that the tints of a negative changed if it were damped in consequence of the gelatine swelling slightly and thus altering the structure of the silver deposit. The colors produced by this process were true and bright, provided that exposure and development had been properly conducted. They were, moreover, completely fixed, and resisted the action of light and time. He had not yet succeeded in taking prints from his negatives, but was convinced that to do so would be found possible.

Luxfer Prisms as Fire Shields.—The use of Luxfer prisms for fire shields was tested publicly last week in Chicago. The prisms stood the effects of a hot fire and streams of cold water without breaking, and those who saw the experiment came to the conclusion they would be highly serviceable as fire screens in large warehouses and factories. Experiments along this line have been privately made for a number of weeks by the Luxfer people. About a dozen insurance men and manufacturers and Chief Swenie of the Fire Department witnessed the public exhibition. When the fire was hottest streams of water were turned on the glass, and while the prisms cracked none of them broke, and not even a splinter of glass fell from the frame work. This is thought to prove conclusively the serviceableness of the material for fire windows. It has the great advantage over fire shutters that the firemen can see through it and that in case of necessity it is easily and quickly broken.

In their advertisement elsewhere in this issue Follansbee Brothers Company, 328, 330 and 332 Second avenue, Pittsburgh, Pa., direct attention of the trade to Tinners' Tools and Machines. They state that they can furnish anything desired in this line, and at attractive prices. The inquiries of the trade are solicited.

COPPER AND BRASS CLIPPINGS, BRASS BORINGS AND TURNINGS,

Scrap Copper, Brass, Lead, Zinc, etc., of every Description.

In writing for prices kindly give description and quantity of scrap.

DETROIT SMELTING & REFINING CO.,
Detroit, Mich.

Special Notices.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"
office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

FOR SALE. A successful Plumbing, Heating and Tin business in a prosperous country place on Long Island near New York City. Employs three to four men constantly. Will sell outright on easy terms, lease or exchange for good real estate. Reason for selling, poor health. "L. I.," office of *The Metal Worker*, 232-238 William St., N. Y.

FOR SALE.

I will sell cheap an old established Furnace Range, Roofing and Jobbing shop. On leading business street. I am now manufacturing tinware and cannot attend to both businesses. A good chance for one or two men who understand the business. No charge for good will. Work coming in every day.

JOHN W. WALLACE,
329 Myrtle Ave., Brooklyn, N. Y.

Register For Sale.

The patentee of a new Improved Dustless Register wants to either sell same or interest manufacturers who can make same. This register can be manufactured 8 to 10% less than any other register on the market and has strong selling points over any other.

A. L. CANFIELD,
284 Pearl Street, New York.

OWING to the death of the proprietor, a Stove, Heating, Plumbing and House Furnishing business is offered for sale, in Claremont, N. H. A growing manufacturing town of over six thousand inhabitants. This is a first-class opportunity for any one wishing to engage in this business.

A. C. STONE, Administrator,
Claremont, N. H.

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper in all Forms.

By JOHN FULLER, Sr.

327 Pages, 474 Illustrations, 7 x 10 Inches, Cloth. Price, $3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker,* and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has been published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

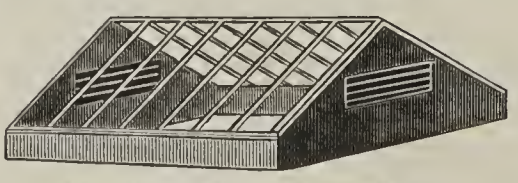
PAYNE'S BUSINESS AND SOCIAL LETTER WRITER

Containing Commercial Forms and Specimen Letters on Business and Social Topics with Appropriate Answers.



This is not the only *Letter-Writer* published, but it is the only one we know of that contains model letters for all the occasions of Social life and of Business life. The specimens given are really models in every respect—in address, in phraseology, and signature, as well as in the use of capitals and punctuation marks. There are letters of favor; letters of introduction, congratulation, and advice; invitations, acceptances, regrets, and excuses; letters to accompany presents—in short, letters of all sorts to all sorts of people. Follow these models and you cannot go wrong. More than this, the book gives rules for spelling and punctuation, the postal laws, a dictionary of abbreviations, and the Latin, French, Spanish, and Italian words and phrases that may be used effectively by writers in English.

Containing 350 Pages, 12mo, Cloth. Price, $1.00, postpaid.

Insures a pure atmosphere at all times. Furnishes immunity from suffocation or asphyxiation. Carries off all smoke, steam and noxious odors. Recommended by architects, builders and housekeepers. If your jobber does not keep them, write us for particulars and prices.

Paxton Hardware Manufacturing Co.,

PAXTON, ILLINOIS.

The architect of a large building block in a town in Ohio specified GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES for use on the roof. He said, when the job was completed, "I am pleased with the plates—satisfied in every way. If I had to go over the job again I would put IX plates on instead of IC." These plates were selected for the job on account of their great lasting qualities and immense superiority over all other plates in the market. Just try a box or two on your work—pick out hard places for them, valleys, gutters, and so forth—and watch them closely, leaving them unpainted that you may see weather has no effect on them. *Then recommend them for your best jobs.*

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Iron Bars, by the good old fashioned hand methods employed 50 to 75 years ago in making charcoal tin plates, insuring absolute freedom from pinholes. No better plate *is* made; no better plate *can* be made. For tinware or roofing they are unequaled. Send for a sample.

GUMMEY, McFARLAND & CO., PHILADELPHIA.

Send for Catalogue and Prices.

Anchor . . Ventilators

ARE SUPERIOR TO ALL OTHERS.

Are stormproof and durable, and unexcelled for ventilating schools, churches, mills, factories, etc.

TIN ATLANTA TERNE

The Worcester Grade Terne Plate we are now making is a really fine plate. It has a very smooth finish. Coating is as even on the sheet as a coat of varnish, could not be more even if it was put on with a brush.

Are sorted very close.

All made from Open Hearth Steel. Are Annealed Dead soft, pliable and easy for a Roofer to work. Every sheet made with "No-Acid Flux." Boxed attractively.

We would like very much to have you try these plates. We feel sure you and your customers will be pleased with them, for they really have merit.

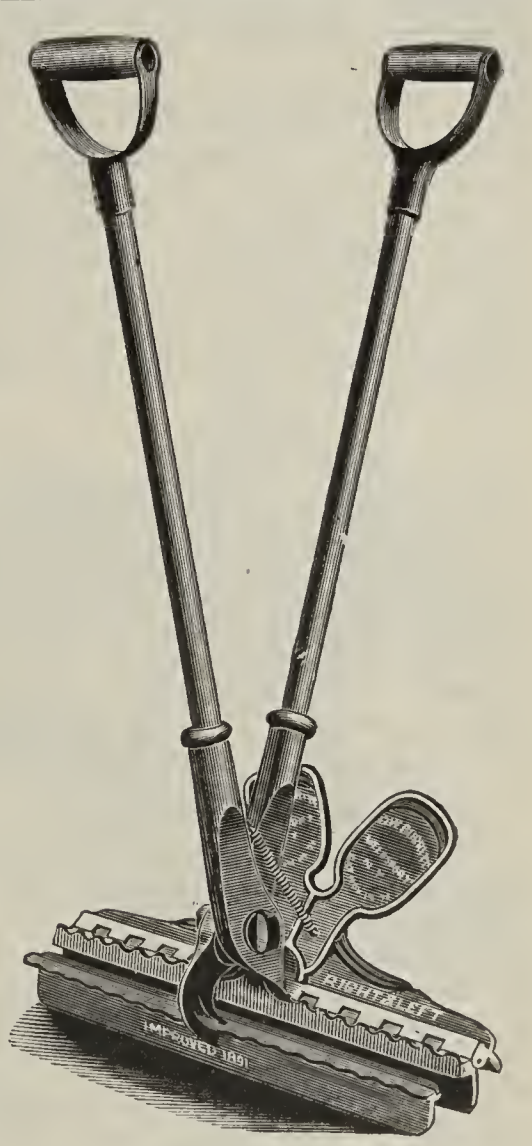
MINNEAPOLIS, MINN., Dec. 9th.

DOUBLE TRUSS CORNICE BRAKE CO.,
BUFFALO, N. Y.

Gentlemen:—Enclosed please find N. Y. Exchange for $—— to pay for Cornice Brake sent us about six weeks ago. We never paid a bill for tools where we thought we came as near getting our money's worth as we do in paying you for this Brake. The machine is all right, and all you claim for it.

The Brake is now in a distant part of this state where our men are putting in a job of large square galv. piping. Should it get in a wreck and be lost to us, we would order another just like it at once.



All the boys in the shop are anxious to know when that Brake is coming back. For our use we would rather have this than an iron one. We are, Very respectfully yours, LUCAS BROTHERS.

All Sizes from 3 ft. to 10 ft. Indispensable to Cornice makers, roofers, tinsmiths, furnace men, etc.
Send for our latest prices.

BRIDGEPORT, CONN.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

—RESISTING A "RAISE."—Mr. L., a good-natured German, was the proprietor of a clothing business in a country town. He had in his employ one John S., whom he had advanced from cash-boy to head clerk. Since his promotion John had several times asked for an increase of salary, and each time his request had been granted. One morning he again appeared at the old merchant's desk with another request for an increase of $10 a month.

"Vy, Shon," said Mr. L., "I dink I bays you pooty vell alretty; vat for I bays you any more?"

"Well," replied John, confidently, "I am your principal help here. I know every detail of the business, and, indeed, I think that you could not get along without me."

"Is dot so? Vy, Shon, vat vould I do suppose you vas to die?"

"Well, I suppose that you would have to get along without me then."

The old Teuton took several whiffs from his big pipe and finally said:

"Vell, Shon, I guess you petter gonsider yourself dead."—*Youth's Companion.*

PORTABLE COOKING RANGES

are going to be more popular than they were, while the stationary kind will not be demanded so much.

The Excelsior Range is made in many styles, both portable and brick set, and it has every good quality that a good range should have.

It took us thirty years to learn to make the Excelsior Range. It does not take long to make one now, but all our thirty years' experience goes into every one.

A part of that experience has taught us that it pays dealers to sell them, just as well as it pays us to manufacture them.

Makers also of Paragon Furnaces. ISAAC A. SHEPPARD & CO., Philadelphia and Baltimore.

QUICK MEAL

GASOLINE STOVES.

A strong and distinctive feature of the "Quick Meal" is **Simplicity**. Simple in Construction—simple in Operation—simple in Explanation. No intricate and complex parts for "talking points."

Simplicity made the "Quick Meal" famous, made it popular, and made it sell and stay sold. Dealers everywhere appreciate this, and the enormous sales of "Quick Meal" stoves amply prove it.

The "Quick Meal" always satisfies every demand made upon it. That's why the users in over a half-million homes are unanimous in declaring it "The Recognized Standard of Excellence."

THAT'S WHAT THEY ARE.

CORRESPONDENCE SOLICITED IN UNOCCUPIED TERRITORY.

which is a peculiarity in the construction of

THIS FURNACE.

READ!!!

CARTER FILTER COMPANY,
LOCKPORT, N. Y., Feb. 25, 1898.

CARTON FURNACE CO.,

Gentlemen:—I feel it my **duty** to write you relative to the **merits** of **your** furnace. Mr. Moran placed one in my residence (**28-inch fire-pot size**) last year and it does seem as if I was **stretching it a little** when I say that **2 SHOVELS** of **coal** and **SMALL ONES** at that (I am referring to the **small ash shovel** you send with your furnaces) heated my house of **11 large rooms** and **2 large halls** to 75 degrees the **coldest days** we have had this winter. All I have to do is to bank the fire at night, shake it in the morning, and **no more coal until the next night.** I have never let the check draft down only when putting on fresh coal and have never opened the front draft in the ash-pit door. This heater is the most **remarkably economical** heater I have **ever seen or heard of.** This heater could not consume less coal unless it consumed **none at all.** The heater in every other respect is **equally satisfactory.**

Yours respectfully,
FRANK C. FARNELL.

Send for our GOLDEN JUBILEE FURNACE CATALOGUE.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.

MY DEAR SIR :

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal.

Very truly,
I. N. EVANS.

The Monarch Line And The Successful Merchant.

The successful merchant is he who studies his business minutely and recognizes the important fact that his stock should consist of such goods as are widely different from "the other fellow's" as can be secured, picks out a line that is progressive, up-to-date and superior as to special features, then gets them in early, does not get woozy about liberally displaying a complete assortment so as to impress his trade with the confidence that he possesses, familiarizes himself with every detail of construction, sets a good fair price and sticks to it, talks quality and does not scatter his fire all along the line.

Five minutes of good strong talk will bring profits. Don't buy goods because they are cheap, but seek for merit only. Hundreds of merchants have adopted this course in pushing **MONARCH** Vapor stoves and **MONARCH** Asbestos-Lined Ovens, and are reaping the benefit thereby; but there are still hundreds who have not even got the book that tells the story of **MONARCH** goods, and hence do not know what they are like.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.

Sole Producers of "FERROSTEEL."

TWO WORKS are now in operation by **THE FERROSTEEL COMPANY**—one, devoted exclusively to the manufacture of

Ferrosteel Warm Air Registers and Ventilators,

the other, to the manufacture of

Ferrosteel Special Cold Handled Sad Irons,

and "Mrs. Potts" Irons.

To facilitate distribution we have established branches at NEW YORK CITY, BOSTON, CHICAGO.

Jobbers at nearly every prominent center of trade are making a specialty of FERROSTEEL PRODUCTS.

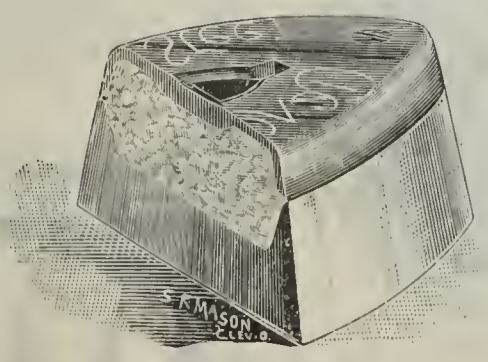
THE

"BLUE BOOK for the REGISTER TRADE,"

1898 Edition,

SHOULD BE IN THE HANDS OF EVERY USER OF REGISTERS.

PLEASE WRITE FOR COPY.



The No. 20 Ferrosteel Special Iron

having a smooth top is easily kept clean.

The Asbestos Fibre Lining protects the top from excessive heat and also the handle—and as the heat does not escape through the top, it is deflected to the base, thus adding to the ironing power.

The construction of the handle enables it to be easily kept clean.

The top and handle are electro-plated in Antique Bronze, making finish very attractive.

Sectional Cut showing Asbestos Fibre Lining.

THE METAL WORKER

Stove Storage Receipts.

FOR the accommodation of Stove Dealers who desire to undertake the summer storage of stoves for their customers, we have printed books of Receipts arranged on a new and ingenious plan. The Receipt to be given to the customer is on one side of the page, and on the other side is a Memorandum of the conditions, needed repairs and storage charges agreed to. *Opposite the Receipt* is its Duplicate, and *opposite the Memorandum page* is its Duplicate. When the leaf which has the Receipt on one side and the Memorandum on the other is torn out for the customer, it leaves Duplicate of Receipt and Memorandum on pages facing each other.

This arrangement has the advantage of bringing the two Receipt pages and the two Memorandum pages opposite each other, before the customer's Receipt is removed, facilitating copying and comparison, so that the Receipt and Memorandum given to the customer may *exactly correspona* with that retained by the person who receives the stove for storage.

Substantially Bound in Canvas.

100 Receipts and 100 Duplicate Records, $1.00.

—THE following, writes a contributor, has been told of the Rev. Lyman Beecher: One summer day on his way from home, several miles out, he met a couple in a buggy. They reined up and exclaimed, "Oh, Doctor, we were going to your house to be married." "All right," said the Doctor, "jump right out. Standing under this tree we will perform the ceremony as well as anywhere else." Muttering thunder announced a storm. No time was lost getting into position. A nearer, louder sound appeared to inspire the Reverend. He addressed the couple—in slow and solemn tone:

"Under this tree—in this stormy weather—
I join this man and woman together
By the God who makes the thunder,
Let no one put them asunder."

PRACTICAL HINTS
— ON —
JOINT WIPING,
FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages
Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Domestic Electrical Work.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down any one without the slightest knowledge of electricity should be able to do the work described.

PALMER'S HAMMOCKS STILL LEAD.

Again ahead of the world in variety of colors, styles and sizes, in our elegant lines of *Perfection and Arawana Hammocks.*

INFRINGERS ARE BEING PROSECUTED.

The New Hammock.

PALMER'S UTOPIA.
Position easily varied, ranging from sitting to sleeping,

See our catalogue for special assortment of bales for small buyers.

THE LATEST LEADER.

PALMER'S NEW UTOPIA HAMMOCK.

Superior to all others.

MANUFACTURED BY

Send for 1898 Catalogue.

I. E. PALMER, - - MIDDLETOWN, CONN., U. S. A.

New York Office, 62 White St.

Also Manufacturer of Canopies, Mosquito Nettings, Crinoline Dress Linings, Window Screen Cloth, School Bags, etc.

THE NEW METAL WORKER PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given,
75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

Sent, Express or Postage paid, on receipt of price, FIVE DOLLARS, by

The Business Situation.

In spite of the persistent and elaborate "war news" served up daily and nightly by certain sensational papers and the unusual activity of the Army and Navy Departments, which in the minds of thinking persons is the best guarantee of peace, the general business of the country goes on growing in volume and activity. The advance of the season and the early setting in of mild, spring-like weather has given increased impetus to the movement of manufactured products all over the country. The demand for goods in nearly all lines shows a steady increase. Spring trade in the West and Northwest is opening up almost a month ahead of time, and from the Southwest come very favorable reports. In the East, too, there is more activity in general business. Although it does not yet measure up to the level of the more favored West, where the increased prosperity of the farmers creates an especially lively demand for merchandise, yet it is getting into better shape. The manufacturing industries generally are busier than for years past, and there is a much larger employment of labor than has been the case since before the depression of 1894. The railways are gaining right along, showing an average increase in net earnings of about 18 per cent. as compared with a year ago. Grain exports continue in unchecked volume, notwithstanding the higher prices for cereals, and are nearly double in volume the exports for last year at this season. Wheat prices have fallen 2¼ cents a bushel during the week, but still hold well above the dollar mark. The iron trade moves along steadily with a demand that keeps step with the enormous production of pig iron. A very large tonnage has been placed for iron and steel during the week, some of which was on Government account. In metals, copper shows great strength. The prices of manufactured copper and brass have been advanced in sympathy with the raw material. The other metals are generally firm, and even tin plates begin to show signs of betterment, although the market remains somewhat dull. The failure to carry out the big consolidation of wire interests has imparted a weaker tone to wire products, but the demand is so large that no radical declines in this department are looked for. Following the sensational declines of last week in the stock market came a sharp reaction during the week under review. The calmer aspect of the Cuban complications, renewed strength of American securities abroad and continued importations of gold, which amount to over $25,000,000 since the movement began, conspired to send up stocks to about the level of two weeks ago. Government and railway bonds also shared in the improvement.

The Waste of Natural Gas.

The Supreme Court of Indiana handed down a decision last week in Indianapolis, which declares that the waste of natural gas is a public nuisance, and can be abated by injunction on the part of the State. The case which called forth the judgment was that of a suit for injunction brought by the State against the Ohio Oil Company, a branch of the Standard Oil Company, who, it was alleged, have been permitting the gas from their wells near Alexandria, Ind., to escape into the air, in contravention of the law. The Madison Circuit Court sustained the demurrer of the company, alleging insufficient facts to constitute a cause of action, but this judgment was reversed on the appeal of the State's attorneys. The law of the State prohibits the escape of natural gas from any well for more than two days after the gas or oil is struck under a penalty of $20 a day fine for each well. This law the State intends to enforce to the fullest extent; and it is reported that if the oil companies do not immediately comply by anchoring their wells and conserving the flow of gas, the work will be done under the direction of the county sheriffs. The decision of the Supreme Court, which was concurred in by all the justices, has caused great rejoicing among the thousands of private consumers and the manufacturing industries of the Indiana gas belt, who have a vital interest in the preservation of the natural gas supply. Since the discovery of natural gas in Indiana the pressure in the wells has fallen from 350 to 150 pounds, indicating the possibility, if not the probability, of exhaustion in the course of time. Consequently, the persistent and reckless waste of the gas by the oil companies caused a strong feeling of indignation throughout the district. The oil men, it is reported, intend to take the case to the United States Supreme Court and will fight it to the last. Meanwhile steps are being taken to collect the accumulated fines, which amount to $5000 or $6000 in some instances.

A Novel Educational Enterprise.

The intelligent enterprise which characterizes the management of the International Correspondence Schools of Scranton, Pa., has taken a novel direction. With the object of calling public attention to the educational work they are doing, they have caused to be built a handsome railway car, which is about to be dispatched on a tour through the manufacturing centers of the country. The car, which is fifty feet long and ten feet broad, is fitted with living accommodations for eight persons, including R. J. Foster, the president of the schools, his assistant, John G. Forsythe, and six instructors. The scheme proposed is to locate the car for a time in the immediate neighborhood of large manufacturing establishments and give to those interested a practical demonstration of the work of the schools. For this purpose the car is

equipped with a large reception room fitted with bookcases, tables and chairs and all requirements for reading and writing. A large store of books and school supplies is to be carried, covering the wide range of technical subjects in which instruction is offered by the schools. The fittings of the car, both outside and inside, are of the most elaborate and attractive description, and inscriptions on the exterior are calculated to draw the attention of the public to its mission in a most effective manner.

Spain Against the United States.

BY R. HUNT.

Affairs between this country and Spain have certainly reached such a critical stage that we feel justified in assuming that we have come to the parting of the ways. This is to be greatly regretted on every account, not only because of the desolation and destruction that will be wrought, nor of the setback to that prosperity we were beginning to feel after years of stagnation, nor yet because war is sinful, but also because of the unsettling of the public credit, the disturbing of our sense of security, the interference with our plans of advancement. The war itself—the time to be devoted to actual fighting—cannot be of long duration, for it may be truly said without arrogating to ourselves any undue superiority that our fleet is a better fleet than Spain's. We have a larger number of ships, of greater tonnage, carrying thicker armor and mounting more guns. Ship for ship we outclass Spain, and when consideration is taken of the fact that we will operate our forces from their own native ports while Spain's ships will have to come 3000 miles to reach the theatre of the war, the odds against her meeting with any success are decidedly great.

Heretofore in telling our readers about the navy of Spain and the navy of the United States we have avoided placing the fleets of these two countries in juxtaposition, the one against the other, for we have all along hoped the occasion for such a comparison would be lost, and that whatever difficulties might exist between the two Governments would be amicably settled.

Spain has a fleet composed of 12 armored ships; ours consists of more than 30 armored ships. Of unarmored ships, cruisers and gunboats, of a displacement greater than 500 tons, the lists give to the Spanish Navy 38, and to ours 50 or more. For purposes of comparison too much reliance must not be placed on these figures, numbering as they do not only the old worthless ships with the newly built effective ones, but also the hulks, and the ships building, that could not possibly be entered into active service for a year or more. The exact condition of our own navy is pretty accurately known. Such, however, is not the case with the Spanish fleet. None the less, in the comparisons we are about to institute, full justice will be done the Spanish ships, the benefit of every doubt being willingly accorded them.

To begin with, let us pass in review the armored ships of the two rival navies, for by considering the number and character of this armored tonnage we ought to arrive at a tolerably fair estimate of fighting strength. Doing her very best Spain can mobilize now, at the outside, not more than eight armored vessels of all classes. We can put into service a good 24, a proportion of three to one in our favor. But this armored force needs differentiating. Two of Spain's ships are old, obsolete, with poor armor and slow speed, but with good modern batteries. Ten of our ships are antiquated monitors, with inferior armor, inferior speed, inferior batteries. On the other hand the 14 vessels remaining in our fleet are more modern, and therefore better armored, armed and equipped, than the six new vessels Spain can bring to bear against us.

Spain has but a single battle ship, the "Pelayo." We have four, the "Indiana," "Oregon," "Massachusetts" and "Iowa." Some interesting particulars of these opposing battle ships are here given:

	"Pelayo."	"Indiana."
Displacement, tons	10,000	11,000
Speed, knots	16	15.5
Armament	Two 12.5", two 11", twelve 4.7", one 6".	Four 13", eight 8", four 6".
Total energy of fire in foot-tons	134,000	213,500
Armor	Complete belt, 18 to 12". Barbettes, 18".	Partial belt, 18". Barbettes, 17".

In estimating the energy of fire the same initial velocity and weight of shot have been assumed for the guns of both ships. This we believe to be perfectly fair to the gun power of the Spaniard. From the data above we gather that the "Pelayo's" one point of superiority is speed. Speed in a battle ship is not a requisite. It never yet won a fight, and to win fights is all that is demanded of the type. The "Indiana's" gun energy is vastly the greater, and her armor is nickel steel to the other's hardened steel.

Another excellent ship in the Spanish Navy is the "Emperador Carlos V," just completed. Our new armored cruiser, the "Brooklyn," is something like her, and to a less extent so is the armored cruiser "New York." The interesting data pertaining to these three ships we place side by side:

	"Brooklyn."	"Carlos V."	"New York."
Displacement	9,250	9,100	8,500
Length	400	380	380
Armor belt	3	2	4
Gun armor	8 to 5	10	10 to 7
Armor deck	6	6	6
Speed	22	20	21
Coal supply	1,650	1,700	750
Complement of men	500	535	485
Armament	Eight 8", twelve 5".	Two 11", eight 5.5", four 4".	Six 8", twelve 4".
Total energy of fire in foot-tons	85,700	71,900	54,600

The cardinal differences observable between these three ships lie in the armor and the armament, and these are irreconcilable. The "Brooklyn's" armor is the latest development of Harveyized nickel steel; that on the others is not so. The 11-inch guns of the "Carlos" ought to enable her to engage a heavier antagonist than the "Brooklyn;" on the other hand the "Brooklyn's" thicker side armor ought to enable her to stand to her work better than the "Carlos." This is equally true of the "New York," though the battery of the "New York" is inferior in energy of fire to either of the others. Looking at the ships from a theoretical point of view, we should say that the "Brooklyn" ought to overcome the "Carlos," and the "Carlos" the "New York."

Another type of Spanish armored cruiser is that represented by the seven 7000-ton ships, four of which, we believe, can be put quickly into commission. We have no corresponding type in our service; indeed it was with the hope of securing some similar ships that we approached the foreign shipbuilders. Our nearest approach in size is to be found in our second-class battle ship "Texas." How she compares with the "Oquendo," one of the Spanish class now at Havana, is as follows:

	"Oquendo."	"Texas."
Displacement	7,000	6,400
Length	340	301
Belt armor	12	12
Gun armor	10.5	10 to 12
Deck armor	3	4
Speed	20	18.5
Coal	1,200	800
Complement	500	400
Armament	Two 11.2", ten 5.5".	Two 12", six 6".
Energy of fire in foot-tons	78,000	77,760

Although the fire energies of these two ships are about equal, yet for all round purposes the battery of the "Oquendo" is preferable. However, we should not lose sight of the fact that the "Texas" is a battle ship, not a cruiser, and would be expected, by reason of the different distribution of her armor, to hold more than her own in an engagement with the "Oquendo."

As stated elsewhere, Spain has four of this "Oquendo" class. To tackle the three others we would have three battle ships, one armored cruiser, six monitors and a ram. This list includes the battle ship "Oregon" and monitors "Monterey" and "Monadnock," now in the Pacific. We might with propriety exclude these from our count, and we might even go so far as to increase the armored force of Spain in our waters by adding to her six excellent ships her two old-fashioned broadside ironclad frigates, bring-

ing the number of her fighting ships up to eight; yet have we here, to-day, in the Atlantic, under Admiral Sicard's command, 12 fine vessels to oppose to them. The two armored fleets then would stand opposed to one another as follows:

	Spain.		United States.	
	No. of type.	Guns in main battery.	No. of type.	Guns in main battery.
Battle ships	1	17	4	56
Armored cruisers	7	86	2	38
Monitors	..	..	4	24
Rams	..	..	1	..
Totals	8	93	11	118

It is difficult to avoid concluding from this evidence that in the sea we are a decidedly stronger power than Spain, and if it be true, as the late Admiral Aube, Minister of the French Navy, said, "That, other things being equal, that nation which has the greatest number of ships afloat at the beginning of hostilities will be the mistress of the seas," then must our navy dominate Spain's.

We must next consider the unarmored ships of the two nations. Spain has 30; we have 50. Rating these according to displacement tonnage we find as follows:

	Spain.	United States.
First-rates, 5,000 tons and over	2	3
Second-rates, 3,000 to 5,000 tons	6	11
Third-rates, 1,000 to 3,000 tons	9	29
Fourth-rates, 500 to 1,000 tons	13	7
Totals	30	50

How many of these 30 unarmored Spanish ships are available for duty cannot be ascertained; but 36 of the American vessels of this class are now in commission on duty. Out of this number the Atlantic fleet alone has 23. It is but fair to presume that this is a larger number than Spain can muster in these waters, for we know she has several cruisers in the Philippines, some in Africa and the South Sea Islands, and there must be a few of them laid up. So we take it that our cruiser strength is greater than Spain's.

In the way of gunboats, small craft of less than 500 tons displacement, Spain has 80, all good, so states a Spanish newspaper; but good or bad, this is an immeasurably superior force to ours, for we have never a one. However, this type of craft is easily improvised. A single gun, supplemented by a couple of machine guns, mounted on one of our big tugboats will make her more than a match for almost any one of these Spanish gunboats. These gunboats may be divided as follows: Displacement, 100 to 300 tons, 40; 50 to 100 tons, 20; 25 to 50 tons, 20.

Quite a large number of these little boats are already in Cuba, but they cause the Navy Department of the United States no apprehension. Within a week a fleet of armed yachts and tugs double this number could be in Cuban waters.

In the way of a torpedo boat force we are distinctly inferior to Spain. She has six destroyers and 20 boats; so we are informed by one authority. This must mean boats of every class, small harbor boats unfit for sea as well as large seagoing ones. A Spanish paper gives the number as 14; this is probably correct. The six destroyers are splendid craft. Four of them are reported as being now on their way to Cuba. These boats have a speed of 28 and 30 knots, and are in every way fit to go with the sea fleet. It was hoped our emissary, Captain Brownson, now in Europe for the purpose of buying ships, would be able to secure some of this class. The other ten boats we can meet, boat for boat.

Finally, in the way of auxiliary cruisers we are decidedly better off. Spain can impress into her naval service 30 first-class steamers of the Spanish Transatlantic Steamship Company, and perhaps 30 more besides. Our Navy Department has a list of over 100 American steamers every whit as good, which they can convert into war ships within a week.

There is no need to longer tell of the two rival navies. Though ours is the larger it does not therefore follow that Spain will not fight it, and fight it long and well. Indeed, there is every reason for thinking she will die hard—if die she must. Aye, there's the rub! for what will it profit us to gain Cuba and subjugate Spain? Will not this fair land of ours suffer too? Will not our brows be bound with scars as well as with victorious wreaths? Is—to put the question in a phrase—is the candle worth the burning? Can no adequate means be yet found, even at this eleventh hour, to save a nation's honor?—*The Iron Age.*

Export Trade in Zinc Dross, Skimmings and Sal Ammoniac Skimmings.

BY EXPORTER.

The demand for export covering these by-products continues, and there appears to be a market abroad for all that are produced in this country, the shipments being made to England (Swansea, Bristol and Liverpool) and to Rotterdam and Antwerp. The dross, which is shipped in the form of slabs, averages 92 to 94 per cent. of metallic zinc, and the zinc skimmings vary from 60 to 75 per cent. metallic zinc, while the sal ammoniac skimmings run from 50 to 55 per cent. of metallic zinc. All these are the by-products of galvanizing works in their different operations of galvanizing, and are derived from the melting of Western and remelted spelter, the sal ammoniac being added as a flux in the galvanizing. The dross is drawn off from the bottom of the pot and the skimmings taken from the top. The slab dross weighs 70 to 75 pounds. A slab and the skimmings are packed in boxes or barrels, ready for shipment. From the running down of old and new scrap zinc, also, which is becoming quite an industry, remelted spelter is produced which is a good marketable article. A by-product covering this line of work also are zinc skimmings, which test 64 to 69 per cent. metallic zinc.

The uses made abroad of these by-products are various. Manufacturers of paint and chemical works consume large quantities, and also spelter makers, who extract the zinc by a process which they keep secret. The majority of the large concerns that produce these by-products have followed the policy of making yearly contracts to the highest bidder at flat prices f.o.b. steamer seaport, or f.o.b. works. The buyers make their bids on the percentage of zinc contained, usually having the lot tested in this country. Sal ammoniac skimmings carry 15 to 25 per cent. chloride of zinc, which can be extracted as well as the zinc, thereby enhancing the commercial value of this grade of skimmings for certain purposes. The present market prices covering the different lines as stated, f.o.b. steamer, are: Zinc dross in slabs, 2.70 cents per pound; zinc skimmings, according to percentage, 1.10 to 1.75 cents per pound; sal ammoniac skimmings, $20 to $24 per ton.

Antwerp Ivory Sale.—Consul Lincoln of Antwerp, under date of February 8, 1898, reports that the first quarter auction of ivory for the present year was held in that city on the 1st inst. The sales covered 126,639 pounds, against 131,638 pounds disposed of during the first quarter sales of 1897. The following were the qualities of ivory disposed of at the auction of the present year: Kongo, 90,409 pounds, of which 2205 pounds were "soft;" Angola, 34,398 pounds; Ambriz, 1543 pounds; Senegal, 293 pounds. The prices, as compared with those realized at the sale of last quarter, showed an advance of 9 cents per pound for heavy tusks and an advance of from 18 to 27 cents per pound for tusks of from 30 to 80 pounds. A decrease occurred in the price of tusks for bangles of 9 cents per pound for the heavy tusks and of 18 cents per pound for light tusks. Flat tusks were in less demand and showed a decrease of 27 cents per pound in certain cases. The prices of tusks for billiard balls were weaker, while the prices for scrivailles of all weights and qualities showed an increase of from 4 to 9 cents per pound. The stock left on hand amounted to 81,585 pounds. The next auction will take place on May 3.

The two new Government torpedo boats, the "Gwyn" and the "Talbot," just completed by the Herreshoffs, were tried for speed on the 3d in Narragansett Bay under favorable conditions, and both exceeded their contract speed, the former making an average of 20.9 knots per hour and the latter 21.1 knots. The company figured that as the "Gwyn" had been in the water about ten days, and the "Talbot" only two, the slight roughness on the former would account for the difference between the two boats, and that they are practically equal.

THE LETTER BOX.

Tinning Cast Iron.

From J. I., Indianapolis, Ind.—Please give me in *The Metal Worker* some information on the process of tinning cast iron.

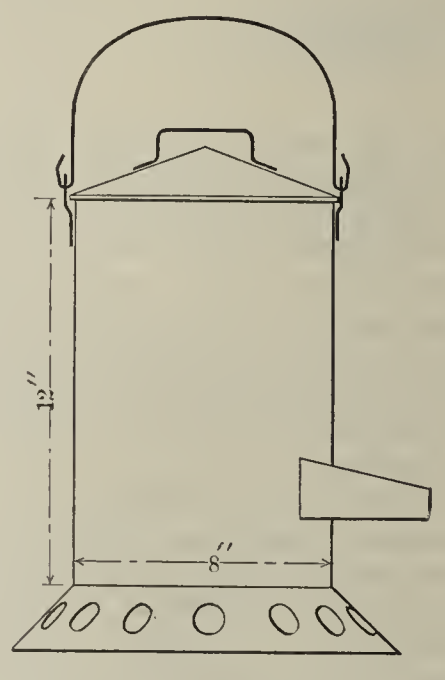
Answer.—For the benefit of our correspondent we reprint the following from *The Metal Worker* of April 4, 1891. He will find a longer article on the same subject in the issue for November 11 of the same year:

I have often seen inquiries in *The Metal Worker* for information about tinning cast iron, and while I cannot attempt to fully explain the process in a letter, some remarks on the subject may prove of interest and value. A number of difficulties are to be encountered in tinning cast iron, one of which is the difficulty of securing castings that are alike in all respects. The last iron taken from the cupola may not be like the first, as it has been subjected to the action of the heat a longer time. Two lots of castings from the same foundry may also differ, and a similar variation is found in castings from different foundries. The castings to be tinned should be first cleaned from oil or grease, which can be done by boiling in caustic soda water, after which they are to be rinsed in clear water. For the purpose of removing the scale the castings are to be placed in a pickle composed of sulphuric acid and three or four parts of water. After the castings have remained in the pickle for a few days the scale should be so loosened as to be easily removed by washing in clean water or by friction. The scale can also be removed by turning or filing. If it is not convenient to proceed with the tinning after the castings have been cleaned, they should be kept under clean water to protect them from the action of the air. For a flux, take ordinary soldering acid, to which add one-tenth part by weight of sal ammoniac. The cleaned castings are to be dipped in this solution, quickly dried, and then dipped in the melted tin, the surface of which is to be kept from the action of the air by being covered with tallow. While the above is a theoretical method for performing the operation, it may not result successfully, as the iron may not be of such a quality as to take the tin properly. This point can only be determined by actual experiment. Care should be taken during the work to prevent the melted tin from becoming too hot, otherwise the articles will be discolored.

Pay and Work of a Tinner.

From S. R., Sedalia, Mo.—Please inform me through *The Metal Worker* what an up to date tinner is supposed to do—that is, what kind of sheet metal work? I am a tinner myself, but have had an argument with a friend as to the requirements of a modern tinner and would be glad to know what the trade have to say. I would also like to know what wages are paid to sheet metal workers, such as tinners, cornice makers, coppersmiths, &c.

Note.—We leave this inquiry to our readers and should be glad to have replies to it for publication in *The Metal Worker*.



Doing Plumbing Work in Greater New York.

From A. S. R., New York City.—Can a licensed plumber of New York City do plumbing work and put in sewers and water mains in any part of the Greater New York without getting a license in each place before doing the work? If he can I would like to know if it is necessary to register in each place. I would also like to know where I can get a good book that would give questions and answers to the questions that are likely to be asked by the Civil Service and Examining Board of Plumbers.

Answer.—For information as to the scope of a license the inquiry should be addressed to the Department of Buildings, Eighteenth street and Fourth avenue, New York, which has jurisdiction over the plumbing officials. A book by F. W. Tower, entitled "Plumbers' Text Book," can be furnished by our book department, and has been compiled for the purpose of aiding those who desire to pass an examination.

Tinners' Fire Pots.

From Pearl, Newton, Mass.—In answer to the inquiry of "E. E. H.," in *The Metal Worker* of January 22, in reference to fire pots, we contribute the following from

Tinners' Fire Pots.—Fig 1.—Fire Pot for Light Work.

our experience. We make a fire pot for jobbing and small roofs, as shown in Fig. 1. The body is 8 inches in diameter and 12 inches high. The ears to which the bail or handle is attached are riveted on the front and back so that in moving it around or carrying it the weight of the coppers will not tip the fire pot and let the coals slide out into the pan in front. This pan is made in the form of a

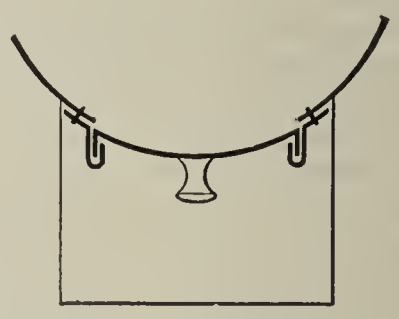


Fig. 2.—Method of Attaching Draft Door.

hearth and is turned up about ¾ inch at the front to keep any coals from blowing out on the roof. We make a slide to cover the mouth when not in use and to regulate the draft, as shown in Fig. 2. We rivet at each side of the opening for the insertion of the coppers a sheet iron guide bent as shown. This runs from the bottom of the opening up above the opening sufficiently high to permit the slide to be kept in place when it is not down and closing the opening. The slide is bent as shown to work in the guides, and has a knob by which it can be raised or lowered.

For big jobs of roofing or for heavy shop work we make a fire pot of the same shape, but 9 inches in diameter and 18 inches high in the body, with a grate and a

back draft. A damper is provided on the pot so that when it is full of coal and the draft adjusted it will heat the coppers as fast as they can be used without stopping to put in coal except about once an hour. The connection for the back draft pipe should be made about ½ inch above the grate line and the pipe should be about 2 inches in diameter. A bottom is put in the fire pot under the grate and a drawer provided at the front for taking out the ashes. A perforated rim is riveted on the lower portion of the body to serve as a stand for the pot and to allow a circulation of air under it. For both fire pots we use a flaring sheet iron cover with a rim, the same as used on a kettle lid, around the bottom, to make it fit tight in the pot. By attaching the back draft pipe as described the fire will burn across from the front of the pot

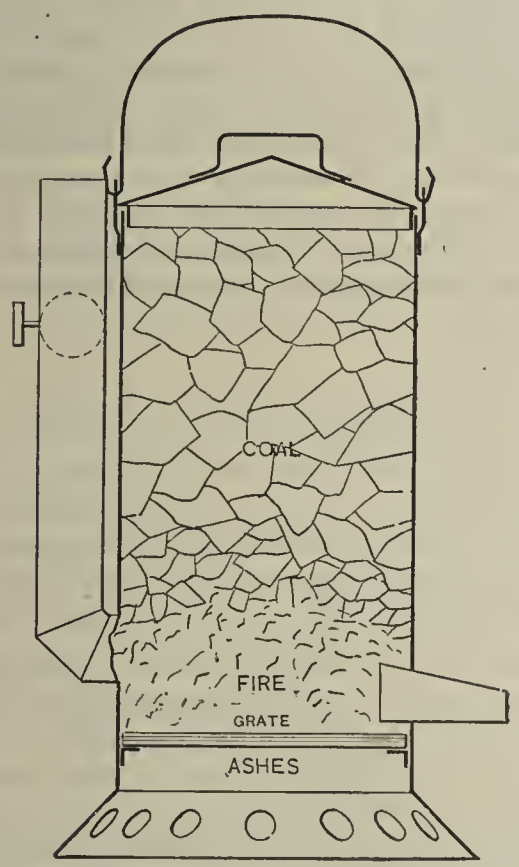

Fig 3.—Fire Pot for Large Work.

to the back without burning the coal above, which will be fed down as required. I make the body of the pots of No. 22 iron and the cover and pipe of No. 24.

Sheet Metal Boats.

From A. T., York, Pa.—Will *The Metal Worker* or some of its readers please give me the necessary information for constructing a rowboat of galvanized sheet iron? What gauge should be used and what would a boat of good proportions, 16 feet long, carry? I have no doubt that some of the readers have had experience in the subject and can contribute a letter that will be of interest to others as well as myself.

Note.—We hope the inquiry of this correspondent will bring out some letters on the construction of boats made from sheet metal. In the meantime we would refer him to illustrated articles on the subject which give considerable information, which appeared in *The Metal Worker* of July 29, 1893, and April 10, 1897.

Lead Lined Tanks.

From H. S., New York.—Answering "C. L.," Grand Rapids, in *The Metal Worker* of February 12: The pitting of sheet lead when used for the lining of tanks is but little known in the Eastern States. The growth of low forms of vegetable life on the surface of the lead has a tendency to develop vegetable acids in contact with the surface of the lead and set up chemical action. In many localities the water is impregnated with carbonic acid gas, which attacks lead in connection with acids developed in the minute fungoid growth, starting pit holes at the points of attachment. The white spots are probably carbonate of lead, which becomes colored by the vegetable matter. Frequent and thorough cleaning of the tanks helps matters some, but painting the interior with red oxide of iron paint and linseed oil, two coats, drying one before the other is put on, will preserve the lead lining a long time. This is a sanitary paint. White lead and oil should never be used; it is a source of lead poisoning.

Attachment for Plumbers' Force Pump.

From J. S., Lockport, N. Y.—Can *The Metal Worker* inform me where I can secure a device that can be placed over a sink strainer and attached to a force pump for the purpose of forcing obstructions out through a sink waste?

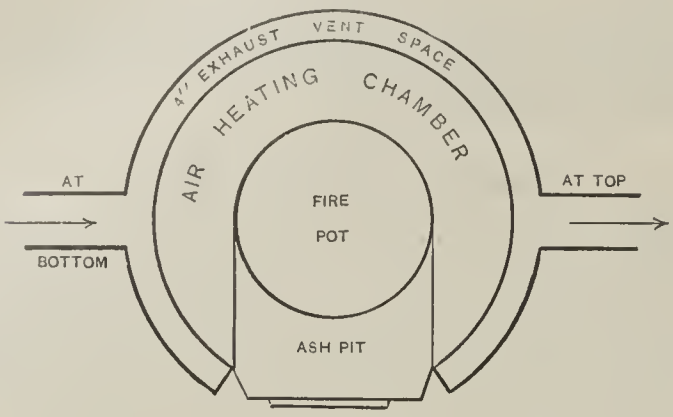
Answer.—A pump specially designed for this work is manufactured by J. H. Lawless of Jersey City, N. J. Special pumps made for this work can be secured from any dealer in plumbing goods.

Trouble from Rusty Water.

From J. P. L., Vacaville, Cal.—I wish to state to your correspondent, "Plumber," Pennsylvania, whose letter appeared in *The Metal Worker* of February 19, that if he will discard that cast iron water front and make an ordinary water back from galvanized iron pipe, or black iron pipe he will get over his trouble. I prefer galvanized iron. I have been connecting hot and cold water for the past ten years and never had any trouble with rusty water yet. Years ago, however, I experienced the same trouble with a cast front in Waltham, Mass., but never has it been repeated since I used pipe. I have connected from one to four ranges a day in San Francisco, Oakland, Alameda and other places, and was on the go all the time, but never once had any trouble with rusty water. The cast water front, in my opinion, has too much space or surface inside to rust. Rust settles below the inflow, and as the water flows through keeps it agitated, and as the front heats it throws off the rust, which settles to the bottom, and when some one draws water it throws it in the boiler and the result is rusty water.

Relieving Air Bound Rooms.

From C. T. M., Philadelphia, Pa.—Almost every hot air furnaceman has experienced difficulty some time during his practice in getting a sufficient volume of hot air into a room to warm it to a comfortable temperature. I have noticed in *The Metal Worker* the different ventilating systems that have been shown in connection with hot air furnaces, and am satisfied that they would assist the furnace in its work wherever they are used. I have sometimes provided an exit for the air in the room, so that the warm air can enter, by cutting an opening in the base board of the rooms between two studs and put a small register over the openings in order that the exit of air through the opening may be controlled. The opening should be made into one of the partitions of the building, and in one which runs at least two floors in hight before it connects with the space beneath the roof or the floor of the top story. Some may be skeptical as to the efficiency of this method of exhausting air, but to them I would nevertheless suggest a trial of this method when they have difficulty, and am satisfied from my experience that it will afford them relief. The warm condition of the inside partition is conducive to upward air currents, and the volume of air flowing out of the room into the partition will be found sufficient to greatly increase the velocity of the warm air which enters through the register, and in my experience has been sufficient to secure successful heating where before there was failure.



Combined Bath and Laundry Tub.

From K. A., Newark, N. J.—Will *The Metal Worker* please inform me who makes a combined wash tray and bathtub?

Answer.—Goods of this character are made by the Union Granite Company of Weehawken, N. J., and the Robinson Stone Ware Company of Brooklyn, N. Y.

Ventilation in Connection with Furnaces.

From W. L. S., St. Louis, Mo.—It seems to me that the plan I describe herewith might work with jacketed furnaces to cause ventilation and purify the air of rooms heated. My observation of jacketed furnaces is that the casing becomes hot—too hot, when the furnace is run with draft on, to hold the hands against it. This heat is radiated into the cellar, and while not absolutely lost does not answer a very useful purpose, and its loss is unsatisfactory at best. I would propose to put a galvanized iron jacket

Ventilation in Connection with Furnaces.—Fig. 1.—Plan, Showing Proposed Attachment.

around the outside of the casing of the furnace, as shown in Fig. 1, beginning at the iron front at the level of the grate and running around the jacket about 4 inches from it to the other edge of the iron front, extending up to the top of the jacket, then closed in to the casing and closed at the bottom edge, thus forming a closed pocket all around the jacket except at the iron front. From the coldest parts of the rooms heated I would run tin flues, say 4 inches in diameter, to feed into the bottom of this

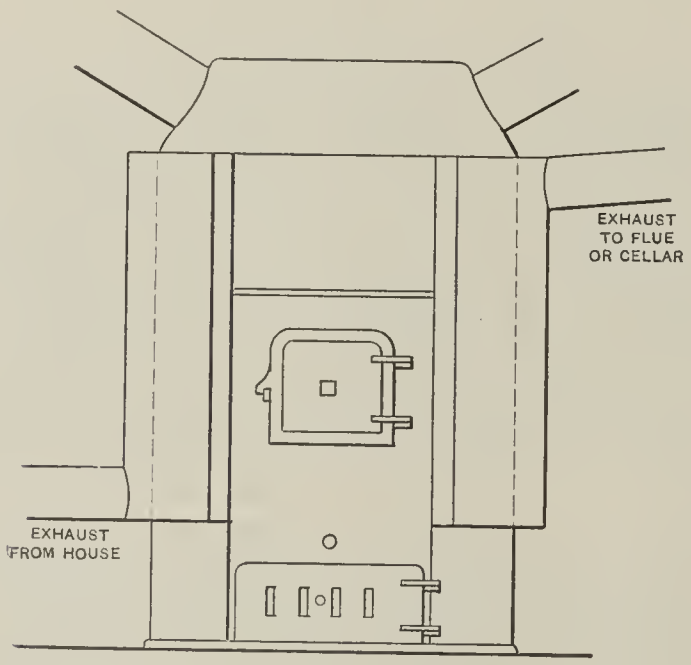


Fig. 2.—Elevation, Showing Inlet and Outlet.

pocket, as shown in Fig. 2, and from the upper edge of the pocket I would run an exhaust flue 8 x 9 inches in diameter to the chimney flue. Circulation would then be established from the room and the air would be warmed and pass out by the exhaust flue. Even if no chimney connection was made with the exhaust flue, and only a 9-inch hole was made near the top of the pocket to allow the escape of the heated air into the cellar, there would be a gain in the heating capacity of the furnace and an improvement in the quality of the air in the living rooms. The air passing out at the top of the pocket would cool and drop down and be gradually carried up through the grate bars, fire and smoke pipe, and away. The adoption of such a plan by furnacemen would save them the necessity of making misrepresentations to buyers that the jackets of the furnaces do not get hot.

Repairing Iron Pumps.

From S. J. S., Maurertown, Va.—I will be glad to have the readers of *The Metal Worker* discuss the methods they have employed for extending the usefulness of iron pumps by repairing them and the valves.

Note.—We trust that the request of this correspondent, being made at the time of the year when not much is going on, will bring out descriptions of the various contrivances that have been devised for repairing not only iron pumps, but other pumps as well. It is not infrequent that the cylinder where the piston valve works becomes worn so large that it seems almost impossible to fix the valve so as to secure satisfactory work from the pump. In some cases a new cylinder of smaller capacity has been placed inside of the pump, and in other cases a cylinder has been attached below the pump and the piston rod lengthened to meet the requirements. When the valves have become so worn that a good seat cannot be made with ordinary tools new valves have been put in where it has been possible. These suggestions may be of some use to our correspondent, but we are inclined to the opinion that he would be more deeply interested in the description of the repairs applied to special cases and hope that the readers will contribute freely.

Capacity of Flaring Tank.

From A. S. R., New York.—Please let me know through *The Metal Worker* how many gallons a tank will hold 4 feet at the top, 5 feet at the bottom and 5 feet high? You gave the rule some time go, but I could not use it very well and would like to have a simpler way.

Answer.—We are afraid there is only one rule for finding the capacity of a tank of the shape our correspondent furnishes, and, while it is a little complicated, we believe by carefully following it out step by step the correspondent will have no difficulty in applying it. The rule given is for a round tank of the dimensions given by our correspondent. Add together the square of the top diameter, or 16, the square of the bottom diameter, or 25, the product of the two diameters, or 20, making altogether 61; multiply that by one-third of the hight, which is five-thirds, and that by 0.7854. The result will be the answer, which is 79.85 cubic feet. As there are 7.48 gallons to a cubic foot, the total capacity of the tank in gallons will be 597¼.

New Publications.

MECHANICAL HEATING AND VENTILATION. By M. C. Huyett. Size, 6 x 8½; profusely illustrated; 155 pages; bound in leatherette. Published by Henry O. Shepard & Co. Price, $3.50.

The above is the title of a book which has just been received treating on the heating and ventilation of buildings by the use of fans. The book avoids the use of algebraic formulas, and presents the matter in a simple manner, providing tables to be used in connection with the rules for determining the proper proportions for various portions of a heating and ventilating system, so that they may be readily understood. It also treats of the various motive devices for operating fans and of the different types of coil heaters for use in connection with them. Illustrations show by means of half-tone sectional views the methods of arranging mixing dampers and devices for automatic regulation. Several types of fans or blowers are shown and tables are presented giving the proportions and sizes of the pipes used in blower systems to accomplish given results and also the weights of the pipes. The book also shows by means of half-tone views buildings in which heating systems have been tested, and the data are arranged for the information of those who are interested in the subject.

The fire loss of the United States and Canada during the month of February as compiled by the New York *Journal of Commerce* reached a larger total than for a number of recent months, amounting to $12,629,300, as against $8,676,000 in February, 1897, and $9,472,000 in January of this year. The principal loss during the month was at Pittsburgh, where a cold storage plant and other buildings contributed nearly $2,000,000.

HEATING AND PLUMBING.

SOME FACTS IN THE HISTORY OF THE BLOWER SYSTEM.—I.

BY WALTER B. SNOW.

The present prominence of the blower system of heating and ventilation certainly lends an interest to the steps by which it has gradually been brought to its present state of perfection. In its general acceptation the term "blower system" is understood to indicate that method of heating and ventilation by which air, tempered to the

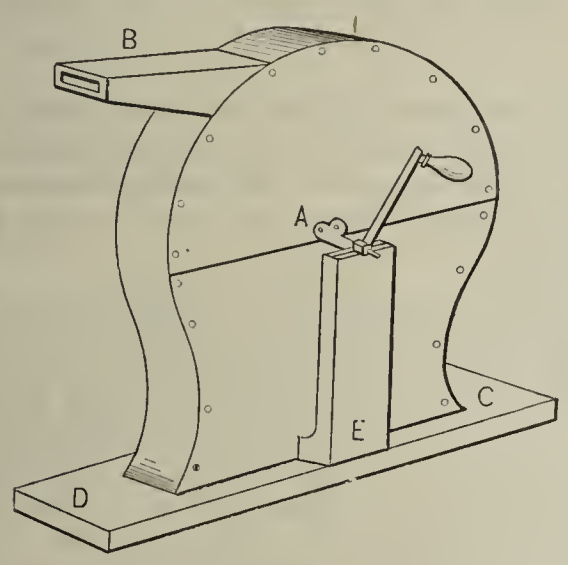

Fig. 1.

proper degree, is forced by a fan blower to the various apartments of the building to which the system is applied. Although the past 15 years have witnessed the real and effective development of this system, yet its origin dates back nearly two centuries.

Just when a fan blower was first actually employed for the purpose of ventilation will probably never be known, but, apparently, the first record of its employment is that to be found in an ancient work by Agricola, first published in 1546. Various cuts indicate the construction of the fan and its application for the ventilation of mines, but, obviously because of the character of this application, there was no means of warming the air.

Although the necessity of ventilation was recognized by many of the early scientists, there seems to have been

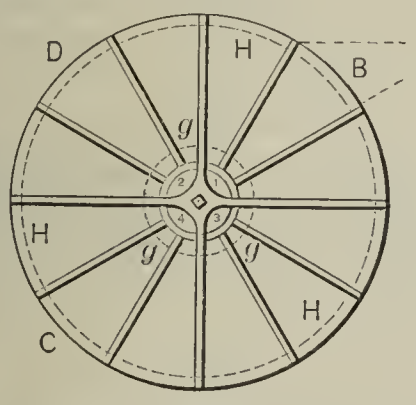

Fig. 2.

no definite move in the introduction of mechanical means for the purpose until the early part of the eighteenth century. An attempt was made in 1660 by the architect, Sir Christopher Wren, to secure satisfactory ventilation in the Houses of Parliament, at London. His plan consisted of nothing more than openings in the ceiling, with, apparently, no provision for admitting fresh air. That this arrangement did not prove satisfactory is evidenced by the fact that in 1723 Dr. J. T. Desaguliers, a noted scientist of that time, was authorized to improve upon it. He first attempted to utilize Sir Christopher's arrangements, but about 1727 began to experiment with fans for this purpose, and in 1735 presented before the Royal Society of London three papers relating to the subject. The first of these was entitled "An Account of a Machine for Changing the Air of the Room of Sick People in a little Time, by either drawing out the foul Air, or forcing in fresh Air; or doing both successively, without opening Doors or Windows."

Accompanying this paper were illustrations, here reproduced in Figs. 1, 2 and 3, of which Fig. 1 is described as representing "a case, D E C B, containing a wheel of 7 feet diameter and 1 foot thick; being a cylindrical box, divided into 12 cavities by partitions directed from the circumference toward the center, but wanting 9 inches of reaching this, being open toward the center and also toward the circumference of the case, in which the wheel turns by means of a handle fixed to its axis A,

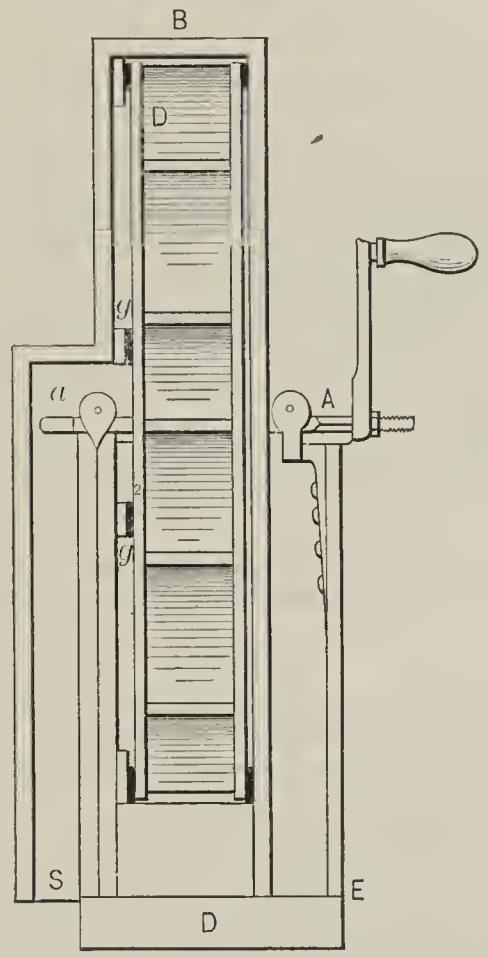

Fig. 3.

turning in two iron forks, or half concave cylinders of bell metal, such as A, fixed to the upright timber or standard A E." The further features of the fan are evident from the illustrations, and the extremely small inlet, or "Sucking-pipe," as Desaguliers calls it, is particularly noticeable.

The first suggestion of the blower system appears to lie in his remarks that "this machine would be of great use in all hospitals, and in prisons; it would also serve very well to convey warm or cold air into any distant room." He suggests that the air might be perfumed, but gives no hint as to how he would warm it. Here, then, appears to be the first recorded intimation of a method of heating by which warm air was to be forced by a fan to the designated apartment. How far, if at all, this idea was put into practice it seems impossible to ascertain at this day. But it is certain that the fan which he introduced in the House of Commons in 1736 was employed for exhausting only, was operated by hand, and was practically independent of the method of heating.

In the year 1758 there was published in London a quaint volume entitled "A Treatise on Ventilators, By Stephen Hales, D.D., Clerk of the Closet to her Royal Highness the PRINCESS OF WALES, F.R.S., and Member of the Royal Academies of Sciences at *Paris* and *Bolognia*." This work, which in the now curious diction of its author runs all the way from morals to mechanics in the consideration of the subject, bears upon its title page

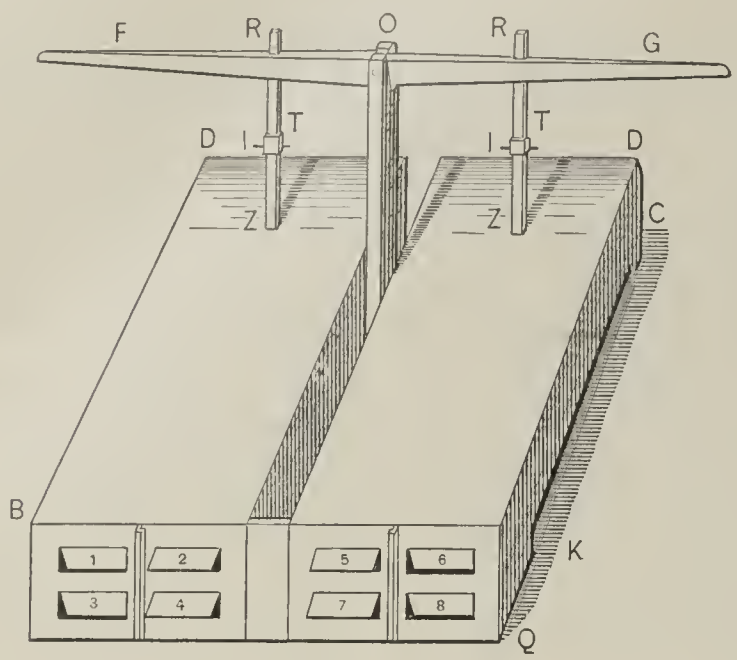

Fig 4.

the statement—whose character warrants its reproduction—that

"An account is given of the HAPPY EFFECTS of Many Trials that have been made of them; which has occasioned their being received with general APPROBATION and APPLAUSE on account of their UTILITY in many ways, to the great Benefit of Mankind, *viz.*

"In refreshing the NOXIOUS AIR of SHIPS, HOSPITALS and MINES to the better Preservation of the Health and Lives of Multitudes,

"In preserving the TIMBERS of SHIPS Much longer from decaying,

"In easily sweetening stinking CASK WATER and curing the ill Taste of MILK, from some food of COWS,

"In new Methods of distilling Plenty of good water at SEA,

"In refreshing the air and keeping up and regulating, the Warmth of Melon and Cucumber Frames, and Hot Houses,

"And in several other useful IMPROVEMENTS."

This account is, in fact, a reprint of a paper presented by the reverend gentleman at a meeting of the Royal Society on June 9, 1743, and from this date we must reckon the inventions which he describes.

The wonderful means of increasing human happiness which he describes is nothing more nor less than a double bellows, of which one form, reproduced from one of his illustrations, is presented in Fig. 4. This huge bellows was arranged to be worked by two men, one at either end of the handle bar. The arrangement of valves was such that air was pumped both by the upward and downward action of the handles. That he realizes the lack of novelty in the application of the bellows on a large scale for the movement of air is evident from his reference to the much earlier work of Agricola, in which are described bellows arranged to be operated by water or horses. He, however, claims an improvement because of the construction of his machine.

Although the hygienic advantages of ventilation were realized in that day, yet the meagerness of the ventilation proposed is vividly presented by such remarks as

"If the Air of Hospitals were changed every Day, Morning and Evening, for a little Time, so as not to have Time to putrify, it is probable many Patients would recover sooner, and that fewer would die in such purer air."

The first trial of Dr. Hale's ventilators in a hospital was made in the county hospital at Winchester, England. The diaphragms were each 7 feet long and 3 feet broad. The air was drawn out of the ward through a large trunk reaching nearly up to the ceiling, in order that the patients might not be incommoded by the velocity, which Dr. Hales asserts was "so great as to twirl fast round a little wind mill placed at the Mouth of the Trunk." This twirling wind mill was more than a mere ornament, for it was "found to be of considerable use in diverting, and thereby encouraging those who work the ventilators to persist in working; without which sensible amusement they are apt to be discouraged." Can one wonder that under these conditions of motive power ventilation at morning and evening should have been deemed sufficient? The chilly comfort of a hospital of those days is evidenced by a report of the effect upon the temperature resulting from the operation of these ventilators. Upon a December day the conditions were as follows:

	Degrees.
External air above freezing	4
In the ward	18
After ventilating 5 minutes	17
After ventilating 10 minutes	15
After ventilating 15 minutes	15

These ventilators were applied in a number of hospitals, on shipboard, and in buildings of varied character, in some cases a wind mill being provided to operate the bellows. They were also introduced for creating a circulation of air in the drying of salt, grains, malt, clothing, &c.

In this connection appears the first practical application of the idea of forcing warmed air, which was suggested by Dr. Desaguliers. Dr. Hales describes a box a foot square, with a bottom of canvas, which was filled with gunpowder. Under this

"Was fixed at the Hole in the Side of the Box the upper part of a Worm-pipe of a distilling Worm Tub, which was filled with twenty-two gallons of boiling hot water. To the lower End of the Worm-pipe was fixed the hose of a common pair of Kitchen Bellows, whose lower Handle was strapped down with a Piece of Leather to the Board on which the Blower sat, by which means the Bellows were worked with great Ease. The heat of the Air which came through the Worm-pipe was 150 Degrees, 212 of which is the Heat of boiling Water; so that it was very near three-fourths of the Heat of boiling Water. And having placed a mercurial Thermometer in the Powder I could observe how the Heat increased Still more as it dried; so that at the End of Two Hours the Heat was increased to 120 Degrees."

The general external form of the worm tub described and illustrated by Dr. Hales is presented in Fig. 5. Upon a larger scale 50 pounds of gunpowder was dried, the ventilator being of the midriff form, and the suggestion is made that it might, if near a stream, be driven by water power, and further that there is in this idea "a

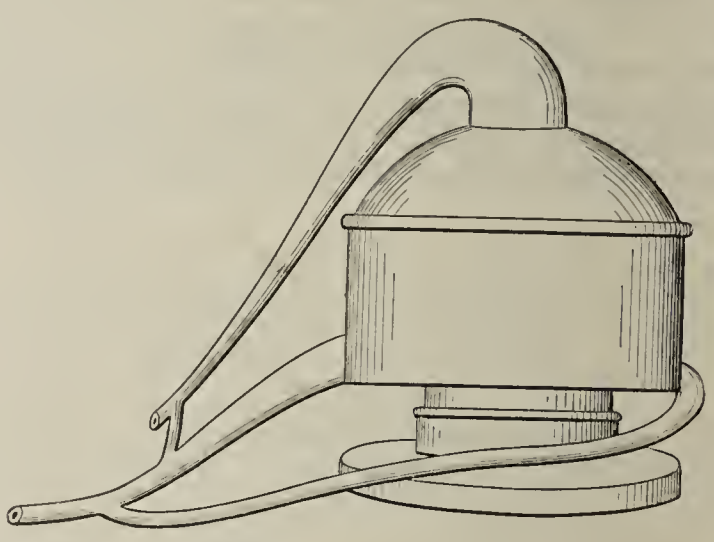

Fig. 5.

Hint for drying several kinds of Things, as Corn, &c., without communicating to them any Fume of Fire, *viz.*, by conveying plenty of hot dry air among them by means of a large Worm-pipe fixed in a large caldron, when a small fire would keep the water in a constant Scalding Heat . . . the hot air to be impelled through the Worm-pipe by Ventilators of proper size."

Dr. Hales further suggests that "Ventilators might also be of use to those who wash large Quantities of Linen in great Towns, if the Linen were hung in low, long, narrow Galleries."

THE PENNSYLVANIA MASTER PLUMBERS AT PITTSBURGH.

On Tuesday, March 15, at 10 o'clock a.m., in the banquet hall of the Monongahela House, Pittsburgh, Robert Drummond, president of the Pennsylvania Association of Master Plumbers, called their fourth annual convention to order. About 40 delegates were in attendance at the opening session, and this number was considerably increased later in the day. S. Louis Barnes of Philadelphia was secretary. John M. Addy of the East End, Pittsburgh, on behalf of the master plumbers of Pittsburgh and Allegheny, welcomed the delegates and explained briefly the topographical advantages of Pittsburgh, and also the position of that city in the iron, steel, coal, natural gas and other industries. The remarks of Mr. Addy were extremely interesting and were closely listened to by the delegates. President Drummond responded to the address and the business of the convention was fairly opened.

The first business transacted was the appointment of a Committee on Credentials, as follows: J. B. Doyle, Scranton; Frank J. Gray, Pittsburgh, and John S. Leslie. The chair also appointed Chas. F. Bradshaw sergeant-at-arms and G. Wallace Smith reading clerk. An Auditing Committee was also appointed, consisting of G. Wallace Smith, Philadelphia; W. H. Williams, Braddock, and O. L. McCartney, Altoona. Letters of regret were read from S. L. Malcolm, vice-president of the National Association, and W. E. Goodwin of Milwaukee, treasurer of the National Association On motion the further reading of letters from delegates and others unable to be present was dispensed with. The Committee on Credentials having completed their work, reported the following delegates in attendance:

J. H. Birchall, Allentown, Pa.

Martin Foster, O. L. McCartney and G. R. Stone, Altoona, Pa.

W. J. Butler, M. J. Campbell, J. H. Lyons and F. J. Miller, Erie, Pa.

O. H. Tebay, Leechburg, Pa.

H. R. Dunlap, New Castle, Pa.

S. Louis Barnes, W. S Clark, William H. Doyle, Robert Drummond, M F. Elliott, John E. Eyanson, Joseph V. Reagan, Samuel H. Ritch and G. Wallace Smith, Philadelphia.

John M. Addy, C. F. Bradshaw, Chas. Craig. H. Schlemming, Thos. Chipp, John Colling, W. H. Williams, G. D. Deedy, F. J. Gray and Jos. G. Weldon, Pittsburgh.

Jas. B. Doyle, Jos. Evans, T. F. Mullen and John Nolan, Scranton, Pa.

P. W. Bell, Shenandoah, Pa.

A committee was also present representing the Northwestern Plumbers' Association, consisting of Thos. Stone, M. C. Judd, John S. Leslie and F. D. McCue. In addition to the above a few other delegates were present whose names were not secured by the committee. Following the report of the Committee on Credentials the report of the Sanitary Committee, consisting of John S. Leslie, Fred. S. Miller and O. L. McCartney, was presented and was as follows:

REPORT OF SANITARY COMMITTEE.

The science of sanitary plumbing has well been placed next to that of medicine, and the profession of sanitary plumber as second only to that of the medical man in the preservation of health, without which "life is not worth the living." Many plumbers do not realize the great benefit which they can be to humanity by doing their work in a scientific and sanitary manner, many caring only to do the work absolutely necessary without a care for the result from a sanitary view. He seems to care only for the money to be made from the one system then being installed, and nothing for the health of those made to innocently suffer disease and possibly death on account of his neglect or willful deception, while he realizes not that he is responsible in at least this one way for his brother's keeping, though he should be responsible in the eyes of the law also. Others there are who fail to do their work properly on account of lack of knowledge but there is to-day a growing demand for sanitary plumbing, the people of all classes are becoming educated to realize the great importance of sanitary plumbing, and the educated sanitary plumber is the one who will succeed in the future. The uneducated plumber can only be made to realize the responsibility devolving upon him by education. The dishonest plumber, does only what is absolutely necessary to fulfill specifications by compulsion. To protect the public from this latter class was one of the objects of the laws of this and other States, requiring Boards of Health of all cities and towns having systems of water works or sewerage to pass rules and regulations compelling all persons engaging in the plumbing business to qualify for such work, and to install all plumbing work according to rules established with the view of obtaining the best possible sanitation. Many of our cities and towns receive practically no benefit from their Boards of Health, they having become merely berths for some petty politicians, and having rules and regulations that, instead of governing the work intended, in a manner just to all, have loop holes through which favored partisans can and are permitted to escape. Many of the Boards of Health of the smaller cities and towns are practically dead, the rules laid down by possibly some former more active board being null and void as far as the present board is concerned, and the public suffer in consequence. Some of our members complain that persons not qualified to practice the art of plumbing are ruining their business by doing cheap and consequently poor work in their locality. If these members took but a few moments to consider, they would see that the trouble lay partly with themselves and was certainly within their reach. If they would see to the organization of the Board of Health, and see that the members of same were chosen for their fitness for the position and knowledge of sanitation, the trouble would to a great extent be remedied. Do not allow some ward politician to have a good member of the board or inspector removed to make place for some one to whom he owes a favor, unless such person knows at least something about the first principles of sanitation. When you get the proper kind of people on the Board of Health, there is not a city or town in this commonwealth where the plumbers cannot have the boards make proper rules and regulations for plumbing work if they so choose. Our State laws require that they shall make such rules, and it is our duty to see that they do so. Bring the Board of Health to see that the public welfare demands the best possible sanitary plumbing, and have rules formulated which will compel workmen to do their work in a scientific manner, and you will be rid of the incompetent competitor, the standard of work will be elevated, the result will redound to the advantage and credit of the citizens of your community, but in a much greater degree will it redound to the advantage of the legitimate sanitary plumber. Your committee, in submitting their report, beg to suggest that some means be devised for impressing upon Boards of Health throughout this State the necessity for the promulgation of suitable rules and regulations for the government of plumbing where such do not now exist, and in all cities or towns where suitable rules are now in vogue or may hereafter be established we respectfully urge upon our members the duty which they owe to their fellow citizens of seeing that such rules are enforced, inasmuch as they themselves will receive the greater benefit.

The reading of this paper brought about considerable discussion, participated in by a number of the delegates, after which it was referred to a special committee for further action. The reports of the officers for the year were then read, that of President Drummond being presented first. In his paper the president reviewed the work of the association for the past year, and made a number of suggestions which he believed, if carried out, would be of considerable benefit to the association. S. Louis Barnes, secretary, then made a brief report showing the condition of the association. The report of John H. Birchall, treasurer, was then read, showing the receipts from all sources for the entire year to have been $1205.14, expenditures $901.04, leaving a balance in the treasury of $304.10. After the reading of the reports of the officers the association went into executive session until about 12.30, when an adjournment was had for lunch. This was provided by the master plumbers of Pittsburgh and Allegheny, and was thoroughly enjoyed by the delegates.

The association reconvened in executive session about 2 p.m. At the afternoon session matters of considerable importance were under discussion, in which nearly all the delegates took part. Among matters considered were the relations of the master plumbers to the plumbers' supply houses and also to the manufacturers. The afternoon session was undoubtedly most interesting and beneficial, and a number of suggestions were made which if followed out will no doubt be of considerable benefit to the members. During the afternoon the Auditing Committee appointed at the morning session made its report, finding the ac-

counts of the treasurer absolutely correct, and the committee was discharged with thanks. The election of officers for the ensuing year took place and resulted as follows:

President, Frank P. Blythe, Pittsburgh.

Vice-Presidents, Jas. B. Doyle, Scranton; M. J. Campbell, Erie, and John S. Leslie, Sharon.

Secretary, Jos. A. Weldon, Pittsburgh.

Treasurer, John H. Birchall, Allentown.

Delegates at Large, S. Louis Barnes, Philadelphia, and Robert Drummond, Philadelphia.

The convention next year will be held at Scranton, Pa. After the transaction of some other routine business the convention adjourned. In the evening a banquet was held at the Monongahela House, tendered by the Master Plumbers' Association of Pittsburgh and Allegheny. Representatives of various manufacturing and supply houses and the plumbing inspectors of Pittsburgh and Allegheny were present by invitation. John M. Addy of Pittsburgh was toastmaster. Toasts were responded to as follows: By Joseph Weldon, Pittsburgh, on "Our Country;" Thomas Stone, Greenville, "Our National Association;" Francis J. Torrance, Allegheny, "Plumbers' Enameled Goods;" Robert Drummond, Philadelphia, "Our State Associations;" James Hay, Allegheny, "National and State Associations; Manufacturers and Jobbers in Their Relation to Master Plumbers and Consumers;" W. T. Taggart, Pittsburgh, "Inspection of Plumbing;" S. Louis Barnes, Philadelphia, "Local Associations;" Joseph V. Reagan, Philadelphia, "Local Memberships;" Joseph Evans, Scranton, "Sanitary Plumbing;" W. S. Clark, Philadelphia, "The Plumbers of To-day;" Joseph B. Doyle, Scranton, "The Ladies." The banquet was thoroughly enjoyed, the festivities continuing until a late hour.

On Wednesday, through the courtesy of the Standard Mfg. Company of Pittsburgh, manufacturers of plumbers' and enameled goods, a steamboat excursion was taken, the route being up the Monongahela River past Braddock, Homestead, Duquesne and other important manufacturing centers. On the return trip the boat went down the Ohio River as far as Davis Island dam and then returned to the landing at the works of the Standard Mfg. Company, located on Preble avenue, Allegheny, Pa., where the delegates were taken in charge by members of this concern and shown through every part of their establishment, said to be the largest in the world devoted to the manufacture of enameled baths and plumbers' goods. The trip was thoroughly enjoyed by the delegates, the return to the Monongahela House being made about 6 p.m. The convention will go on record as being one of the pleasantest yet held by the Master Plumbers' Association of Pennsylvania.

New York State Steam Fitters.

The third annual convention of the Master Steam Fitters' Association of the State of New York was called to order at 3.30 o'clock March 8, in the Bennett, by President William N. Tobin of Syracuse. Secretary Wm. F. Quinn of Troy read the minutes of the last annual meeting, in Rochester. The president presented a brief report, and Secretary Quinn reported that as yet the New York and Buffalo local unions had not affiliated with the State organization, and said that without them the organization was imperfect.

A resolution was adopted that it was the sense of the meeting that the National Association be requested to so amend their constitution that the New York and Buffalo locals shall be forced to join the State Union, or else the State Union would withdraw from the national organization. The following committee was appointed to bring this matter to the notice of the national organization: John A. Creelman of Rochester, W. H. Gaylord of Binghamton, John H. Sadler of Elmira, W. N. Tobin of Syracuse and W. F. Quinn of Troy. The present officers were continued until after the meeting of the National Association in New York in June, when the course of the State organization will be decided upon. The officers are: President, Wm. N. Tobin, Syracuse; vice-president, John A. Creelman of Rochester; secretary, Wm. F. Quinn of Troy; treasurer, P. C. Dougherty of Poughkeepsie.

Delegates were present from Rochester, Syracuse, Auburn, Troy, Albany, Binghamton, Elmira, Poughkeepsie and Lansingburg.

A New Low Down Self Closing Basin Cock.

In the accompanying illustration we show a new low down self closing basin cock, made under the Broughton patent by the E. Stebbins Mfg. Company, Brightwood, Mass. It will be noticed that this faucet is arranged to set down on the slab to which the lavatory bowl is attached, so as to present no considerable obstruction to a free use of the lavatory. The faucet is made in two styles, one arranged to be operated with a ball wheel, as shown, and the other to be operated by means of a yoke lever attached to the spindle which works the cock. The cocks are adapted to stand high pressures, are said to be made of first-class material and are furnished in brass, nickel or silver plate, and also in solid silver metal. A circular describing these cocks and giving prices can be secured on application.

A New Low Down Self Closing Basin Cock.

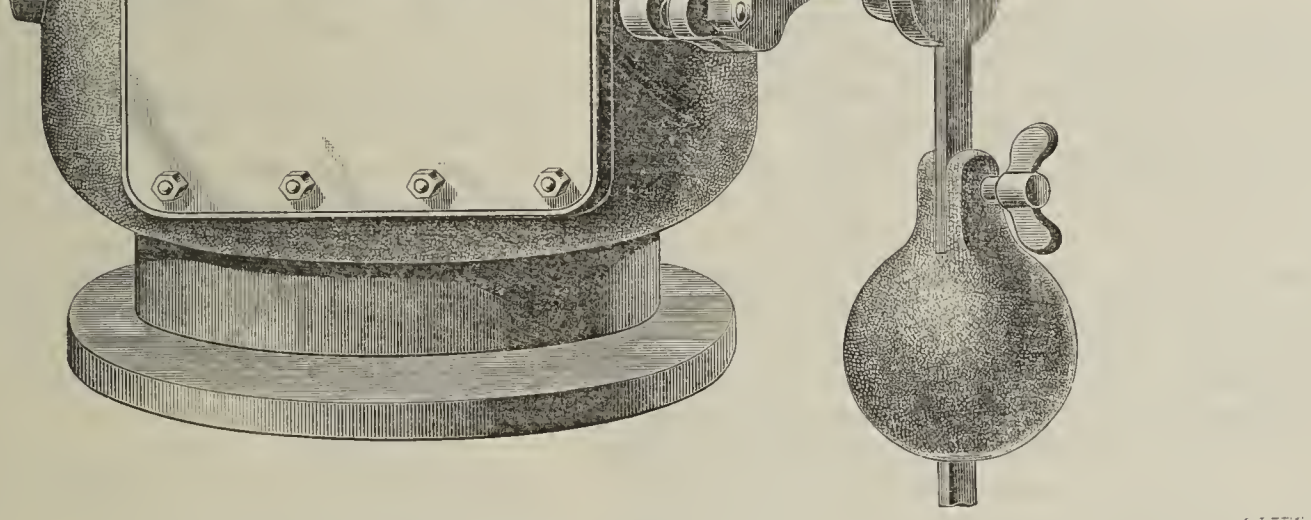
Rival Associations.

A committee of 30 select members from the Master Plumbers' Mutual Protective Association of Baltimore, Md., visited Governor Lowndes last week, bearing a numerously signed petition recommending the appointment of James Robinson, Henry D. Koethe and John A. Wilson as the new Board of Commissioners of Practical Plumbing. The board, as suggested, is the same as the present, with the exception of John A. Wilson. He is indorsed as the successor to Henry Kerr, who declines reappointment. The action of this association is in opposition to the Master Plumbers' Association of Baltimore, which has given its support to George Nipp and Richard Caruthers. The former association claims that the board, as at present constituted, has proven itself so pre-eminently fair and impartial to all persons engaged in the plumbing business that their conduct has elicited marked commendation.

There is said to be a steady and growing demand for small sized Wrought Iron Pipe from Great Britain. Several carloads have been shipped there from New York in the past few weeks. Another branch of trade which is developing with Europe is that in Brass Valves and Fit-

tings of American manufacture. Shipments of these goods are being made thither weekly.

California Master Plumbers.

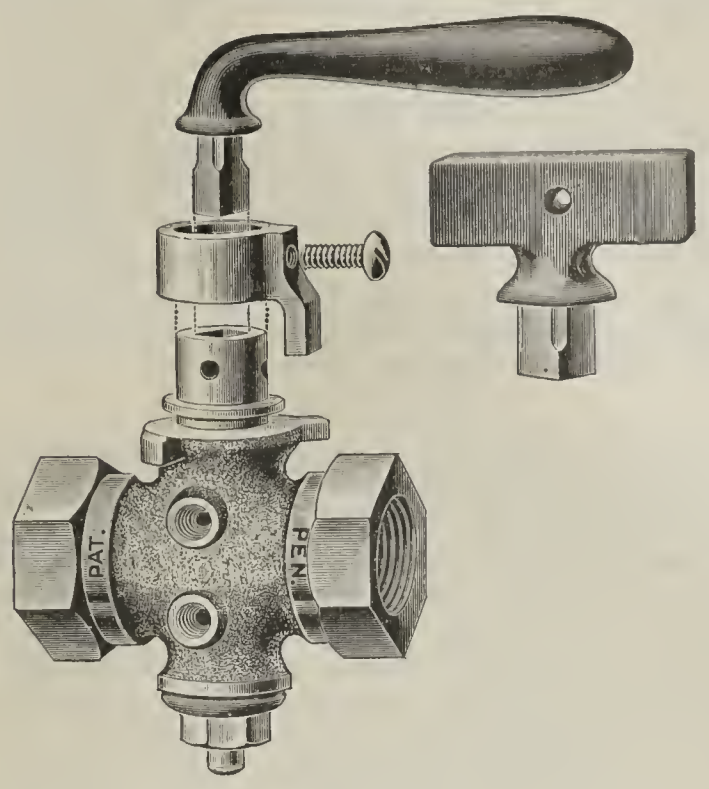


The State convention of the Master Plumbers' Association of California will be held in Los Angeles on March 23, and there will be from 150 to 250 delegates from all parts of the State in attendance.

The association will, it is said, endeavor to secure the convention of the National Association of Master Plumbers, which meets this year in San Antonio, Texas, for Los Angeles in 1899.

To this end the local association will send to San Antonio L. A. Scholes, J. H. Parker, T. J. Stephens, W. P. Vandegrift and Thomas Hooker as its representatives, and John Crimmins, vice-president of the State association, and C. T. Paul, president of the local association, both residents of Los Angeles, will accompany the delegation.

A Noiseless Back Pressure Valve.



In the accompaning illustration we show a new noiseless back pressure valve which is being placed on the market by the Judson A. Goodrich Company, 120 Beekman street, New York, as one of their high grade steam specialties. The construction is such that it can be used either vertically or horizontally, and the valve is of the piston type, controlled by eccentric connections, so that a very small weight is all that is required, and a counterbalance may be connected with the lever when necessary. The area of the valve is full size of the steam pipe, and, being made of the best bronze metal, it is claimed it will not stick or corrode. The valve can be adjusted to a few ounces or atmospheric pressure by the adjustment of the weight on the lever. By removing the face plate shown the internal parts of the valve, which are very simple in arrangement, can be entirely removed for any attention that may be necessary. When needed for condensing engines for vacuum systems the valve is made to close on a seat. It is made in all sizes, from 2 inches to 16 inches. A circular giving full particulars, dimensions and prices can be secured on application.

A Noiseless Back Pressure Valve.

Anti-Freezing Stop and Waste Cock.

In the accompanying illustration we show Lyon's patent anti-freezing stop and waste cock, manufactured by the Cleveland Bronze & Brass Works, 1144 Hamilton street, Cleveland, Ohio. In Fig. 1 we show the stop and waste cock as used for iron pipe and in Fig. 2 as used with lead pipe. It is stated that the cocks are made of the best material and are ground into the seats. They are tested under a pressure of 250 pounds. A feature which is pointed out is that the cock will drain pipes without opening any of the cocks on the fixtures, owing to the vent provided for the purpose of admitting air. It has two waste holes, as shown, allowing the air to enter the pipe to occupy the space from which the water is to be emptied. Another point is the simple mode of changing the stop cock from right to left or *vice versa*, it only being necessary to withdraw the screw about ¼ inch and slide the ferrule around to the proper place, then screw up tight again and the waste is changed, so that the cock can be reversed under pressure without removing the clamp or handle. The construction admits of the use of either a lever handle or a key to be operated by a wrench, as preferred. It is also pointed out that the waste holes cannot

Anti-Freezing Stop and Waste Cock.—Fig. 1.—Stop for Iron Pipe.

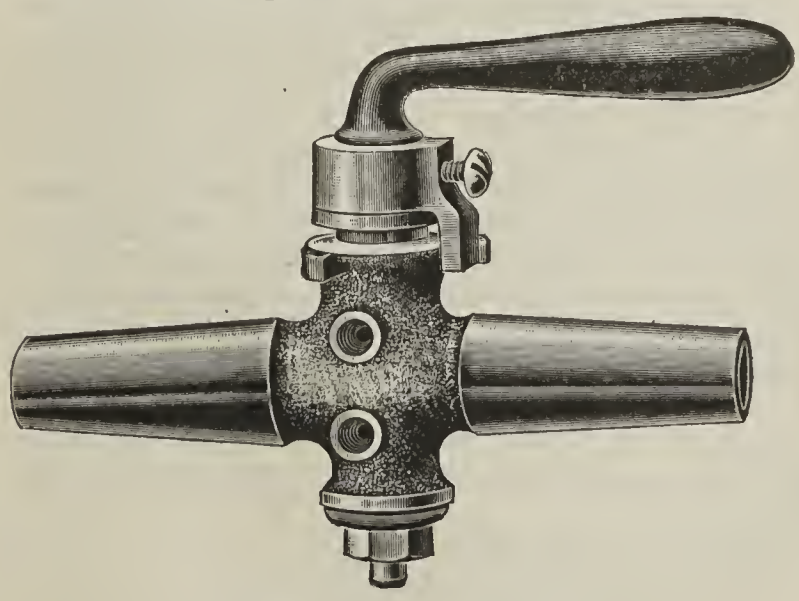


Fig. 2.—Stop for Lead Pipe.

be turned to the live water side. Circulars giving full information can be secured on application.

NATIONAL DELEGATES.

NEW YORK STATE.

At the convention of the New York State Association of Master Plumbers, at Binghamton, N. Y., last week a resolution to form an Eastern League of the plumbers' associations in the Eastern States was adopted and the following delegates to the national convention were elected: Jonas Rossman, New York; W. G. Reid, Rochester, and Horace F. Westcott, Albany.

PHILADELPHIA.

The Master Plumbers' Association of Philadelphia has elected the following delegates to represent the Philadelphia Association at the sixteenth annual convention of the National Association of Master Plumbers, meeting at San Antonio, Texas, April 13, 14, 15: S. Louis Barnes, J. E. Eyanson, F. P. Brown, E. H. Mackay, R. Drummond, George F. Uber, S. B. Fleming, W. McCoach, W. L. Owens, L. J. Sommers, A. M. Hicks, D. R. Burns, A. G. Bond, M. Thompson, J. J. Furlow, M. F. Elliott.

NORTHWESTERN PENNSYLVANIA.

At a meeting of the Master Plumbers' Association of Northwestern Pennsylvania, held at Sharon, Pa., March 10, William McCormick of Sharon was elected a delegate to the national convention at San Antonio, Texas, in April.

WASHINGTON, D. C.

The following members of Washington Master Plumbers' Association, Washington, D. C., were elected delegates and alternates to the annual convention of the National Association, to be held at San Antonio, Texas.

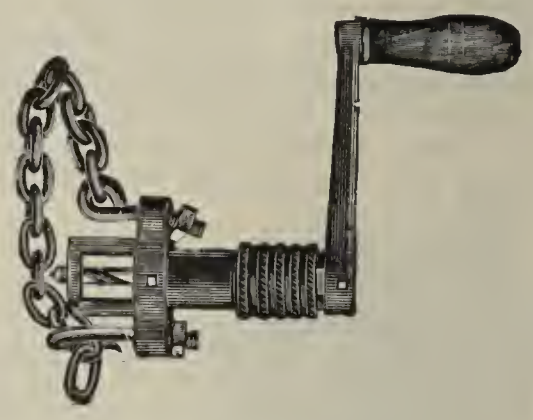
Delegates: Wm. Koch, Ed. J. Hannan, Daniel Hannan, James Ragan, Joseph R. Quinter, Charles Barrick.

Alternates: D. J. Murphy, R. A. Beuchler, A. S. Dent, John Gaghan.

BALTIMORE DELEGATES.

The annual meeting of the Master Plumbers' Association of Baltimore, Md., held in the Builders' Exchange Building March 10, elected the following officers and delegates: P. T. Barry was elected president; J. J. Pirie, first, and Lloyd Mitchell, second vice president; George W. Addison, recording secretary; Chas. H. Frederick, financial secretary, and Daniel N. Sullivan, treasurer. Delegates to the national convention, which meets in San Antonio, Texas, April 13: John Trainor, Lloyd Mitchell, P. T. Barry, P. N. Sullivan, J. C. Mitchell, C. H. Frederick, August Eidman, Allen W. Beam, J. S. P. Carey, D. N. Sullivan, H. C. Bowman, William Dunnett, John A. Graham, J. J. Pirie, A. Stidham and Walter W. Rowles; alternates, James J. Connolly, Martin Delaney, Charles Clifford, A. G. Hassel, Samuel Bennett, W. J. McCrea and Joseph B. Harig.

CONNECTICUT STEAM FITTERS.



The annual convention of the Connecticut State Association of Master Steam and Hot Water Fitters was called to order by National State Vice-President S. E. Dibble at the Builders' Exchange, at New Haven, Conn., on Wednesday, March 16, with a good attendance. National President E. D. Smith of New York addressed the convention on the benefits of the association and National Secretary Henry B. Gombers explained the duties of the officials. The treasurer's report showed a financial condition which allowed the dues to the State Association to be remitted for the year. The Committee on Constitution and By-Laws reported progress, and S. H. Beard was appointed to fill a vacancy on the committee. After disposing of the regular business the following officers were elected:

President, John Creedon, Hartford.
Vice-President, John M. Page, Naugatuck.
Secretary, S. H. Beard, New Britain.
Treasurer, S. E. Dibble, New Haven.
Executive Committee: F. A. Curtis, New Haven; M. J. Daly, Waterbury, and Wm. Vanderman, Willimantic.

After the convention S. E. Dibble entertained the National and State officers at an informal 5 o'clock lunch.

The Porter Power Hand Drill.

A portable drill, which is herewith illustrated, has just been placed on the market by the J. E. Porter Company, Ottawa, Ill. The cut shows the drill as used for boring pipe, but it is adapted to a great variety of work in drilling metals. It can be adjusted to handle any size of pipe, and is held solidly to its work by a heavy chain. It is fitted with a universal chuck, which will hold a drill of any size up to 1 inch. The crank is worked with one hand, while the feed is operated by the other. The feed

The Porter Power Hand Drill.

is produced by a screw, which in connection with the crank enables drilling to be done very rapidly. One size is made at present, weighing about 10 pounds.

NOTES.

A firmer tone is apparent in almost all lines of Plumbers' and Steam Fitters' Supplies. Galvanized Iron Range Boilers have made a slight advance during the week, as noted in our trade columns. A further advance in these goods is looked for in the near future and an announcement of higher prices is also expected in Plumbers' Brass Goods at an early date.

In Wrought Iron Pipe prices are stronger and there has been a fractional advance in retail quotations, particulars of which will be found elsewhere in this issue. The current demand for Pipe is referred to as fairly active. The mills are all busy on orders and the outlook in this department is regarded cheerfully.

The Bradley & Hubbard Mfg. Company of Meriden, Conn., have the contract for the gas and electrical fixtures for the new Hotel Winchester, at Winsted.

The Sewer Committee of Meriden, Conn., has recommended that new sewers be built, which will aggregate 24,000 feet in length.

Isaac Teasdale, New Haven, Conn., has moved his place of business to one of the new stores in the Pitkin Block on Pitkin and Orange streets, where he is prepared to contract for heating work.

Joseph E. Stannard, for many years in the employ of Curtis & Pierpont, has opened a store on Whaley avenue, New Haven, Conn., and is prepared to do a general tinning and heating business, making a specialty of sheet metal work.

Taylor & Nichols, Bridgeport, Conn., have removed their plumbing establishment to 50 Cannon street.

P. H. Abbott of M. Abbott's Sons, heating contractors, 137 Eighth avenue, New York City, is combining business with pleasure at Atlantic City, N. J.

A letter from G. A. Richards, president of the Master Plumbers' Association of Grand Rapids, Mich., informs us that L. Semeyn has succeeded to the plumbing business hitherto conducted by Henry Griffin.

Lowden Steam Regulator Company have been organized at Portland, Maine., for the purpose of manufacturing and dealing in machinery and fixtures used in light and heat plants, with $25,000 capital stock. The officers are: President, James J. Lowden of Everett, Mass.; treasurer, A. L. Delesdernier of Boston, Mass.

The Stockholders' Committee of the Peck Brothers' Company, New Haven, Conn., have levied an assessment of 15 per cent. on the stock held by the stockholders. The money raised, it is understood, will be used to form a working capital for the new company. The assessment will put $90,000 into the hands of the stockholders with which to run the factory.

The certificate of incorporation of the Walker Bros. Plumbing Company of Denver, Colo., with a capital stock of $10,000, has been filed with the Secretary of State by F. W. Walker, H. A. Walker and Nellie E. Walker.

Two meetings have been held by 15 or 20 plumbers of Cleveland, Ohio., outside of the master plumbers' organization, for the purpose of forming an organization of their own.

D. R. McCallum of the Novelty Iron Works, Canton, Ohio, was in New York this week in the interest of their line of Steam and Hot Water Heating Boilers.

Dr. Leavitt, chairman of the Board of Health ; E. J. Ryan, master plumber, and George Carson, the journeyman member of the Board for the Examination of Plumbers of Danville, Mass., are conducting the examination of plumbers in that city.

An attractive catalogue is published by Russel Wheeler & Son, Utica, N. Y., in the interests of their Palace Regent Safety Solid Heaters for steam and hot water. This boiler, which was illustrated in *The Metal Worker* of March 5, is completely shown in the catalogue in question by general, sectional and broken views of the steam and water types. The Steam Heaters are made in eight sizes, with grate area from 12 x 12 to 20 x 36 inches, adapted to supply from 150 to 750 square feet of radiation. The Hot Water Heaters with grates of similar area are made in eight sizes also and adapted to supply from 225 to 1125 square feet of radiating surface. Special illustrations at the end of the catalogue show the smoke bonnet and check draft door, also the ash pit and grate used with these Heaters. The catalogue is bound in dark colored paper with gilt side title and trade-mark. while the 16 pages within are of fine paper, bringing out perfectly the excellent halftone engravings of the apparatus.

The United States Radiator Company, West Newton, Pa., are about to erect a new foundry, 100 x 50 feet, and a machine shop of similar dimensions.

A letter from John Gormly, 1433 Columbia avenue, Philadelphia, Pa., informs us that he can make it profitably interesting to any man who can aid him in collecting an indebtedness of about $1500 from an absconding debtor.

Thomas P. Collins has opened a plumbing shop in Shaw's Block, 425 High street, Medford, Mass.

Colvin & Hause have opened a plumbing establishment on Front street, Melton, Pa.

The plumbing establishment of Walter T. Perkins, at Dover, N. H., was destroyed last week by fire, the loss being partially covered by insurance.

The establishment of Matthews & Dubson Mfg. Company., Royersford, Pa., manufacturers of tinners' and plumbers' supplies, was destroyed by fire last week at a loss of $8000, which was covered by insurance to the amount of $5000. The plant will be rebuilt as soon as the loss has been adjusted.

L. E. Ballou, Enfield, Mass., is about to move his plumbing establishment to the store formerly occupied by Howe Brothers.

The Edward J. Brandt-Dent Company, Watertown, Wis., have issued a very neat catalogue and price-list of staple dipped and polished Gas Brackets and Pendants, standard staple brass Gas Fixture Fittings and related goods. It is interleaved throughout with blank pages for memoranda.

"The First Shot" is attached by a string to a card sent out by W. S. Haines, 136 South Fourth street, Philadelphia, referring to the Heintz Steam Trap.

J. O. Wilson, 92 Walker street, manager of the New York office of the R. M. Wilson Mfg. Company, Rome, N. Y., is displaying one of the Mohawk white enameled cast iron Bathtubs in his show window, decorated with a wide gilt band.

W. M. Mackay, 235 Water street, New York, the manager of the steam and hot water department of the Hart & Crouse Company, Utica, N. Y., was one of the prominent persons at Washington, D. C., this week.

Treasurer Wm. T. Isaac of the Gurney Heater Mfg. Company. Boston, Mass., visited I. G. James, manager of the New York office, at 48 Centre street, and presented him with an advance copy of the new Doric Steam and Hot Water Heaters, which will be of interest to the heating trade. The company have recently issued a card giving notice of the removal of their Boston office to much larger and convenient showrooms at 74 Franklin street, where they intend displaying their complete line of Steam and Hot Water Heaters and Radiators. A souvenir of the change is a convenient little book which gives a complete calendar for 247 years, from 1753 to 2000.

Tyler & Conant, dealers in Agricultural Implements, Pumps, Fittings, &c., Bangor, Maine, have been succeeded by C. M. Conant Company.

Fred. Bangs of Brewer, Maine, has opened up a Hardware and plumbing business in Harmony, Maine.

The rear store of the J. M. Ives Company, Danbury, Conn., was burned out a short time ago, and the company are doing business in the main store. They are no longer interested in plumbing and heating, having disposed of this branch of their business to the Danbury Hardware Company.

Trustees of the Presbyterian Church, at Williamsport, Pa., have selected a Gorton Boiler to take the place of a Boiler which was recently destroyed by accident.

Defective Plumbing.

The following comments on the evils of defective plumbing and the means of preventing it are made by a Hoboken paper and are opportune, as a bill for the regulation of plumbing is now before the New Jersey State Legislature. After calling attention to the existence of defective plumbing, the writer says:

The reason can be readily arrived at—incompetent plumbers. When the only necessary qualification for license in this city is that a man shall be known to the Water Commissioners as a plumber (good, bad or indifferent), and can get some landlord to go on a bond for so many dollars—a bond not to protect the property owners in case of unsanitary work, but the city and Water Commissioners, for any accident which occurs through the licensee's negligence in opening and filling in street and sidewalk ditches—what else can be expected ?

There is no law or penalty which can be enforced against incompetent men for doing plumbing work. What we need in this city is a legislative enactment compelling applicants for licenses in the plumbing business to submit to an examination before a committee composed of members of the Board of Health and practical plumbers of undoubted integrity and some knowledge of sanitary science. If successful, the committee to grant a certificate of competency, fortified with which the applicant can then appear before the Water Commissioners and proceed in the regular manner required and take out the license they demand. If unsuccessful in examination no license should be granted. The community would be the better off.

Plumbers licensed at the present time should also be made to take the examination. The fact of a man having spent a number of years at the plumbing trade as a journeyman and boss should not exempt him. People who have been botching work all their trade days will still continue to do so. Some through ignorance and some through greed. Journeymen plumbers should be registered at the office of the Board of Health also.

There is a code of rules or laws or something or other relating to the plumbing business issued by the Board of Health of Hoboken, which seems to be ineffective, as conviction and the infliction of a penalty seem impossible under it. There should be penalties attached and means to enforce them for violating the above which would deter people from practicing the plumbing business (or profession), such, for instance, as are prescribed in the cases of physicians and dentists.

It is announced that the annual convention of the National Association of Credit Men will meet in Detroit, Mich., in the latter part of June.

The United States Consul at Ningpo, China, in a report to the State Department says that vast untouched beds of sheet mica lie within 50 miles of Kiao-chow Bay. The extent of these mica deposits is as yet unknown; but, so far as he has investigated, they promise to handsomely repay those who are fortunate enough to obtain a franchise for working them. The rolling, sandy hillocks, under which the mica lies, are but poor lands for cultivation, and hence their use for mining purposes detracts nothing from the cereal producing capacity of the region. The mica crops out at intervals over some 50 square miles, and in veins sometimes 10 feet thick. Of course, much of it is discolored by foreign minerals, but what he has seen assures him that there are vast quantities of good commercial material.

A press dispatch from Grand Encampment, Wyoming, reports the discovery of a rich deposit of mica in that vicinity. The croppings of the vein are exposed on the surface 50 feet wide and 200 feet long, and the mica taken out is said to be in blocks ranging from 8 to 12 inches square and of a clear white color. Arrangements are being made to begin workings on the property.

Thirty-five States, so far, have agreed to participate in the Trans-Mississippi Exposition at Omaha. All of them will, it is expected, place important State exhibits.

THE RETAIL STORE.

The Erie Gas Range.

In the accompanying illustrations we present views of two styles of the Erie gas range, which has just been

The Erie Gas Range.—Fig. 1.—Range with Two Improved Burners in Top Surface and Special Burner Under Oven.

brought out by the Griswold Mfg. Company of Erie, Pa. In Fig. 1 of the illustrations is shown the range with two improved burners in the top and a special burner under

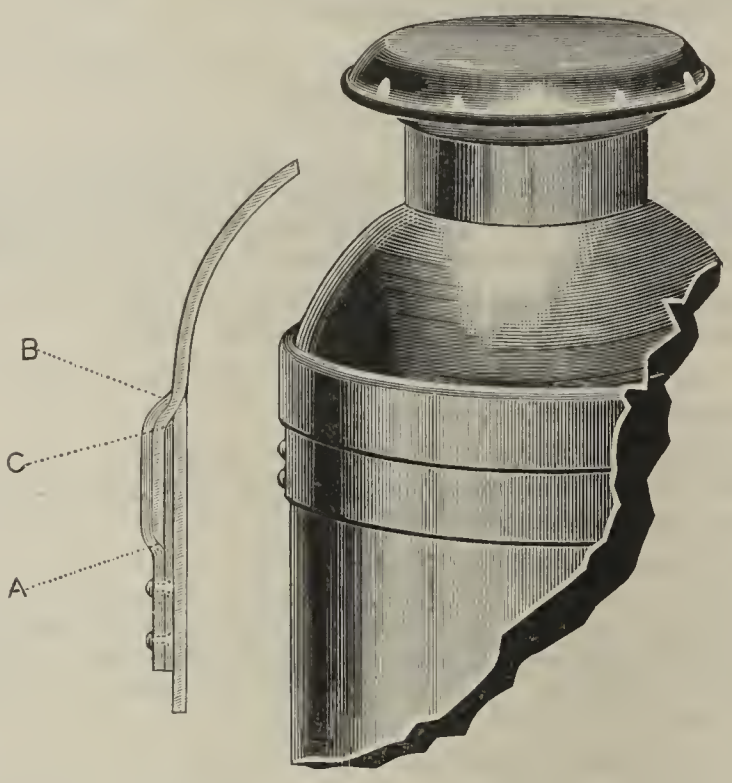


Fig. 2.—Erie Range with Broiler.

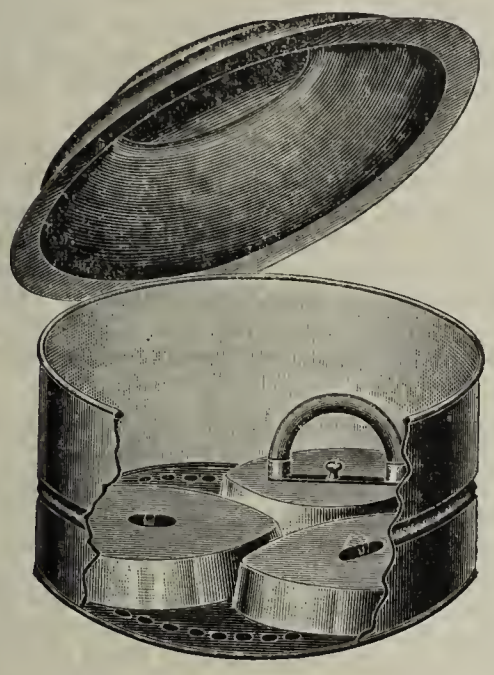
the oven which is movable for lighting. The range has wrought iron frame neatly japanned, nickel plated supply pipe, cocks and name plate, planished sheet iron oven, tin lined, and a strong catch on the door. The range stands 31 inches in hight, and has a top measuring 25 x 14 inches. The oven inside is 19 inches long, 12½ inches deep and 12½ inches high. In Fig. 2 is shown a view of the same stove, but having in addition a broiler. In this case the range is 33 inches high, with same size of top and oven as indicated in connection with the range shown in Fig. 1. The size of the broiler, inside measurement, is 12 x 15 inches. The company have issued a very neat illustrated catalogue and price list showing several views of this range, some of the sizes having three and others four burners in the top surface. Attention is also given to Erie, Liberty and Victor hot plates, Erie ovens, waffle irons, fire place grates, &c.

New Milk Can Breast.

Sidney Shepard & Co., Buffalo, N. Y., have brought out a new milk can breast, the special features of which are shown in the accompanying cut, which presents a general view of the can and also a section through the joint. The feature, as will be seen by examining the sectional view, is that the breast is located between the sec-

New Milk Can Breast.

tions of the hoop in such a way that it is practically impossible to displace it without tearing the can to pieces. After being securely fastened the whole is retinned. The breast, as shown, is firmly gripped between the shoulder A and the top of hoop, which is turned inward at B, and it is also supported by the hoop C. The manufacturers advise us that they will send sample pieces of the breast to any interested dealer to show clearly the method of construction, which they consider pre-eminent for strength and durability.



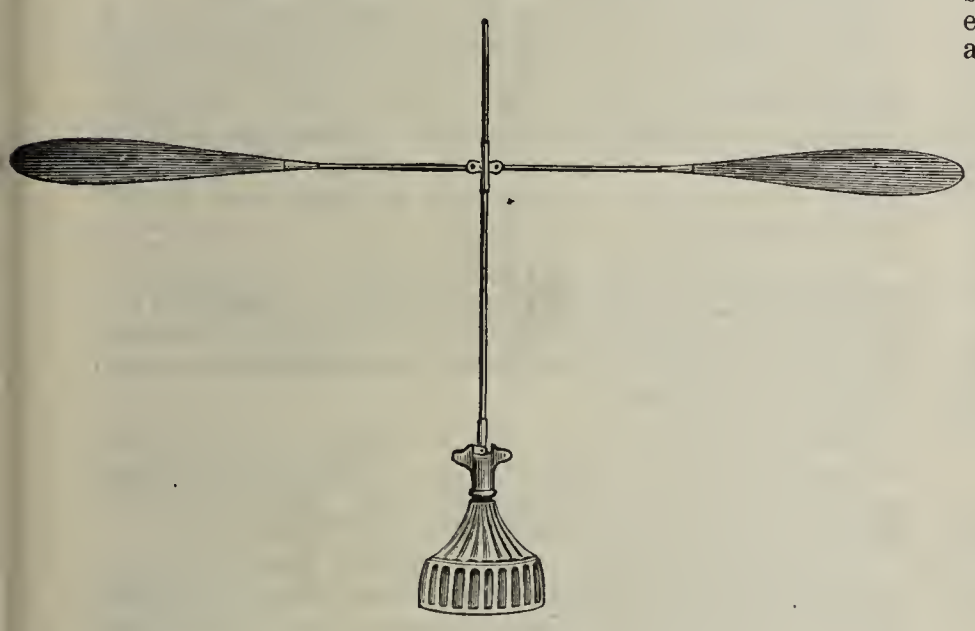
Spray Pumps.

We are indebted to the Berger Mfg. Company, Canton, Ohio, for an interesting and seasonable pamphlet entitled "The Result of Spraying." The whole tendency of modern farming and gardening is toward greater care in cultivation as distinguished from the old time way of careless methods and large areas. Directly in this line can the results of the labors of entomologists be employed, who have given practical directions for destroying insects on trees and plants, and the common method of destruction is by using a chemical mixture applied by spray pumps. Recognizing the demand for pumps of this kind the Berger Mfg. Company make a number of different styles of spray pumps and issue the catalogue referred to giving illustrations of various styles of pumps and directions for their use, together with valuable information upon the mixtures for spraying and the manner of application. The pumps shown in the catalogue are the Novelty force and spray pump, the Monarch spray pump, the Fountain spray pump, the Advance bucket or barrel

spray pump and the Wizard brass bucket spray pumps. Other applications of these pumps for cleaning windows, extinguishing fires, washing carriages, &c, are illustrated in the catalogue, which is neatly printed and embellished with pretty designs in light blue in addition to the regular illustrations.

Champion Sad Iron Heater.

We show in the accompanying illustration a broken view of the Champion sad iron heater, made by the Champion Novelty Company, Cleveland, Ohio, the purpose of the device being to heat sad irons on gas, gasoline or coal oil stoves. The heater is made of steel lined with asbestos so as to prevent the escape of heat, the flat irons



Champion Sad Iron Heater.

being placed in the bottom and are thus warmed from all sides, the result being, it is claimed, that they will retain their heat a much longer time than if they are merely heated on the bottom in the old way. The cover of the heater is fastened with a hinge with an iron projecting over it, and by pressing on it a little with a sad iron the cover will open without touching it with the hand. When through ironing the sad irons can be left in the heater and the whole stored away. It is especially pointed out that by the use of this device the irons are kept perfectly clean from soot and grease.

The Fowler Improved Fly Fan.

The accompanying illustration shows the improved keyless fly fan which Matthai, Ingram & Co., Baltimore, Md., are offering to the trade. The improvement is mainly in the base, which, besides being less cumbersome and of better shape than the old pattern, is shorter and

The Fowler Improved Fly Fan.

allows of the wings being brought close to the table when required. The wing holder is adjustable, allowing the wings to revolve at any angle required. An automatic stop catch prevents unwinding of the spring when the wings are removed. The winding attachment is simple and easily operated, and being operated without a key is a decided convenience. The makers state that the price of the improved article is sufficiently low to insure for it a good sale.

Buzzacott's Portable Cooking Equipment.

Illustrations are herewith given of a new portable cooking equipment designed by the well-known Buzzacott and manufactured by Henry Giessel & Co., 43 and 45 Franklin street, Chicago. This equipment is intended for use by miners and others who live in camps and are obliged to pack much in little space, yet desire as many of the comforts and even luxuries of life as conditions will

Fig. 1.—Buzzacott's Portable Cooking Equipment.

permit. Fig. 1 shows the outfit packed, everything being inside the stove. This outfit is 18 inches square over all, weighs but 50 pounds, and has a cooking capacity for 6 to 12 persons. It consists of 18 complete parts—namely, one portable steel cook stove and heater, with a four-hole top and lids and double shelf doors; one double shelved extra size removable steel oven; one telescopic pipe, 8 feet, with damper and spark arrester; one 3-quart miners' solid lip coffee pot, with bail and cover; one 4-quart stamped steel

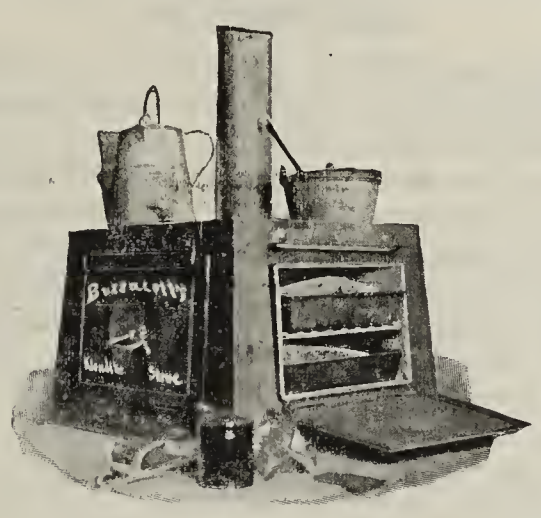


Fig. 2 —Cooking Equipment in Use.

stew pot and kettle, retinned, with bail and cover; one shelf and grating, to be used in oven when desired; two combination roasting, baking and frying pans; one each cook's spoon, fork, turn over, ladle and ladle strainer, all with solid handles, retinned and extra heavy and strong; salt, pepper and flour dredges and two lifters to handle everything when in use. All the utensils are specially adapted for camp use, everything being doubly riveted

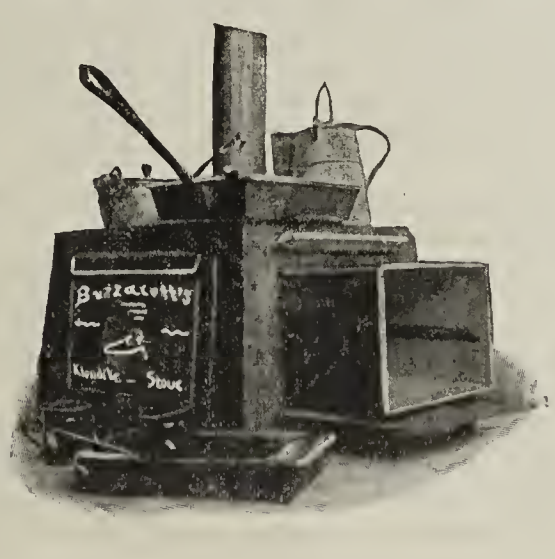

Fig. 3.—Cooker Converted Into a Heater.

no solder being used on spouts or other parts to melt off. Fig. 2 shows the stove in use, with two pans in the oven. Fig. 3 shows how the oven can be removed, instantly converting the cook stove into a heater of great capacity, which will accommodate a chunk of wood large enough to keep fire all night.

M. S. Mench of Wilkinsburg, Pa., has removed to Chattanooga, Tenn., and will on April 1 open up a Tinware store at 820 Market street.

Fire at Keen & Hagerty's Factory.

The large factory of Keen & Hagerty, manufacturers of tin, japanned and galvanized ware, at Ostend, Race, Clement and Creek streets, Baltimore, Md., was seriously damaged by a fire which broke out on the third floor of the building on Saturday last. The two upper floors, to which the fire was almost entirely confined, were gutted, and a considerable amount of stock and valuable machinery was destroyed. The total loss incurred is placed at between $150,000 and $200,000, which is understood to be covered by insurance. The factory is a large and substantial brick structure of four stories and basement, built about three years ago at a cost of over $100,000. The top floor was occupied by the japanning, soldering and paint departments, and the third floor, on which the fire broke out, by the spinning and light pieced ware departments. Both of these contained a large amount of stock, all of which was lost.

The lower floors, where the heavy stamping machinery is located, were not much injured, except by water, and it is expected that that part of the factory will be again in running order by April 1. Meanwhile the rebuilding of the burned out portion of the factory will be rapidly proceeded with. The roof is already nearly in place. The galvanizing and tinning department, which is located in an adjoining building, was uninjured, as is the large new enameled ware factory, which is in course of erection alongside the tinware factory. The stamped goods department was practically unaffected, and deliveries in orders for stamped ware will be made right along. Keen & Hagerty have issued a circular to their customers saying that all orders in hand will be taken care of, and they expect to be ready to take new orders after April 1.

MEMORANDA.

Manufacturers of Hot Air Registers are much encouraged by the volume of inquiry for these goods and look for a favorable year in their business. A tendency is noted toward the use of the better grades of goods in new buildings. Architects are paying considerable attention to the artistic qualities of the Registers put into the buildings now in course of construction, particularly those of a public character. A number of new and handsome designs will be a feature of this year's trade. The higher range of prices initiated on January 1 is being well maintained by all the makers.

Rich, Munk & Co., located at 180 South Hugh street, Columbus, Ohio, have just started in the Stove and Furnace business and intend to carry a large line of Stoves, Furnaces and Kitchen Utensils. The firm are composed of Hiram M. Munk and George Rich, who were formerly connected with the firm of Bradley, Munk & Co.

The Aluminum Mfg. Company, Two Rivers, Wis., have issued a catalogue of Aluminum Novelties, comprising Gear Cases, Bicycle Guards, Advertising Devices, Trays, Razor Handles, Key Chains, Match Safes, Name Plates, House Numbers, Combs, Hair Pins, &c.

E. Lehr & Co. are a new firm composed of Edward Lehr, Mrs. Minnie Weigand and Mark Lesser, who will open a general House Furnishing business April 1 at 1900 Third avenue, on the southwest corner of 105th street, New York City. Mr. Lehr and Mrs. Weigand have been for many years in the employ of Rieser & Co., 473 Broadway. Mr. Lesser is an old furniture man, having been for many years with Baumann Brothers.

Thompson & Southerland have opened a new Hardware and Stove store at Westville, N. Y.

The Hammel Oil Burner Company of Los Angeles, Cal., have been incorporated, with a capital stock of $50,000. The directors are W. C. Patterson, Chas. A. Hammel, Levi Booth, J. A. Kenworthy and Thos. Haverty, all of Los Angeles.

The Standard Stamping Company are about to put up an important addition to their plant at Broadway and Chambers street, St. Louis, Mo.

Frank Bowman has opened a new tin shop at Rothville, Pa.

The Gille Hardware & Iron Company, Kansas City, Mo., one of the largest jobbing houses in that city, have leased a factory 50 x 100 feet, with four stories and basement, on St. Louis Avenue and Santa Fe street, where they will manufacture an extensive line of Tinware and Sheet Metal and Galvanized goods.

William Walker has purchased the Hardware, Stove and Tinware business of John C. Stanley, at Newburyport, Mass., and will occupy the premises in the Stanley Building, 15 and 17 Water street.

The Burbanks Hardware Company, Cohoes, N. Y., have been incorporated, with a capital of $8000 and the following officers: Paul H. Andrae, president; C. E. Pearce, vice-president; A. G. Burbanks, secretary and treasurer. The company are retailers of Shelf Hardware, Stoves and Tinware, Bicycles, Paints and Oils, &c., a plumbing and tin roofing department being also conducted. Business is done principally on a cash basis, limited time being granted in the sale of Stoves.

S. R. Miles and H. E. Runyon, under the style of Miles & Runyon, are successors to John Lee in the Hardware and Stove business, 205 South Main street, Mason City, Iowa. The new firm advise us that they have remodeled the entire interior of their store, largely increasing the shelf room, thus enabling them to carry a much more complete stock than was carried by their predecessor. They are also adding an indexed catalogue case to their equipment, and are desirous of receiving catalogues and other printed matter from manufacturers in their line.

Arthur Lee of Lapeer, Mich., has purchased an interest in the Hardware business of his brother, H. J. Lee, Milford, Mich., and the firm will hereafter be known as H. J. Lee & Bro. It is intended to remodel the establishment throughout with a view to bringing it down to date. The stock comprises Shelf Hardware, Stoves, Tinware, Agricultural Implements, Bicycles, &c. The firm advise us that they would be pleased to receive catalogues and circulars from the trade.

The Brown & Dowd Mfg. Company, Meriden, Conn., issue their 1898 catalogue, showing Can Openers, Tack Pullers and Claws, Potato Masher and Beater, Cleaver, Mincing Knives, Meat Tenderers, Egg Beaeetr and Cream Whip, Kettle Scraper, Fish and Griddle Cake Turners, Ice Picks, Coal and Oyster Tongs, Towel Rack, Clothes Line Pulleys, Tack Hammer, Scrapers, Nut Crackers and Picks, Screw Drivers, Glass Cutters, &c. They call special attention to their Never Slip Can Opener and King Can Opener with Corkscrew.

The Simmons Hardware Company, St. Louis, have added to their already extensive line a full and complete assortment of Ready Mixed Paints, which will be offered to the trade under the name of "Deerfoot."

A. H. Totman, Fairfield, Maine, has purchased the stock of Hardware, Paints and Oils, Farm Implements, Stoves, &c., of S. H. Blackwell, his only competitor.

Taber, Carey & Reid, Augusta, Maine, have recently enlarged their stock by the addition of a complete line of Carpenters' Tools and Builders' Hardware. They are also dealers in Stoves and Plumbing Supplies.

H. L. McNamara will open a new store in the Armory Block, Janesville, Wis., about April 1. Mr. McNamara, who traveled on the road for 18 years for L. Gould & Co. of Chicago, will handle a varied line including Builders' Hardware, House Furnishing Goods, Wooden Ware, &c.

Potter & Nattress Hardware Company are successors to Marshall, Potter & Son in the Hardware and Stove business in Storm Lake, Iowa. The company are also manufacturers of Copper, Sheet Iron and Tinware.

J. F. Bigelow, 19 Foster street, Worcester, Mass., is offering the Bigelow wire fly killer for the season of 1898. This device is in the form of a small wire broom, and it kills but does not crush the fly or other insect. The manufacturer states that the insects can be killed on the most delicate wall or ceiling without soiling. The wire fly killers are put up in attractive packages, and display stands are furnished to set on show cases or in windows; also, as an additional advertising feature, the manufacturer furnishes display forms to hang up. These come in several different styles, and each makes an attractive display. The length of the fly killer is 16 inches, and they are packed in boxes of one dozen and shipped in one, two and three gross cases.

William Geuder, president and founder of the Geuder & Paeschke Mfg. Company, manufacturers of tinware and stamped goods, Milwaukee, Wis., has received the Republican nomination for Mayor of that city.

Lalance and Grosjean Mfg. Company, New York City, have gotten out a handsome advertising sheet for the benefit of the retail trade, giving illustrations of their Pearl-Agate Ware in its natural colors. The assortment of colors consists of violet, chocolate, salmon, russet and sage, with which the articles are enameled on the outside in bright mottled colors. The inside coating is a fine white porcelain.

Bell & Anderson, Portland, Conn., have sent us a catalogue of their Anderson Lead Pipe Coupling, a device by which any mechanic can connect lead pipe so that the joint will stand any pressure. A number of new applications of the Coupling are shown for waste and vent as well as service pipes.

TIN PLATES.

The Welsh Tin Plate Failure.

Much sympathy is expressed for E. Morewood & Co. of Llanelly, South Wales, in their present difficulties. The firm were one of the oldest and most influential tin plate manufacturing concerns in Wales, and the founder, the late Edmund Morewood, was always prominently connected with the development of the Welsh industry. The firm were founded in the early sixties, and down to May, 1897, they were a private company, trading under the name of E. Morewood & Co. They were then converted into a limited corporation, with a capital of $833,700. The South Wales works of the firm, at Llanelly, comprise four large steel furnaces and 15 tin plate mills, with tinning and galvanizing plant, over 1200 hands being employed. At their Cwmbwrla plant there are two steel furnaces and eight mills, and at these works some 700 are ordinarily employed.

The suspension of the firm is attributed, in a circular letter sent to the creditors by J. H. Rogers, the managing director, to "the depression in the tin plate industry, the loss consequent upon the recent strike among the company's workmen at Cwmbwrla and labor difficulties in Llanelly, and the lockups of capital in plant and stock in connection with the sheet and galvanizing industry which we recently instituted." The belief is expressed in the same circular that the assets of the company, which are very large, if judiciously realized, will be more than sufficient to provide payment in full of all the company's obligations and leave a surplus for the shareholders.

At a meeting of the shareholders, held at Llanelly, it was unanimously decided to wind up the company and T. B. Peat of London was appointed liquidator. The share holders expressed the desire, however, to continue operations at the works, and every effort is to be made to carry this out and to run the works for the benefit of all concerned. A reduction of 15 per cent. in wages was called for and it is understood was agreed to by the workmen.

The plant of the Morewood Company, at Gas City, Ind., is in no way affected by the Llanelly failure. The two concerns are entirely separate and distinct. The Gas City plant is reported to be in an exceptionally flourishing condition.

The Canning Industry of California.

Referring to an article on the "Canning Industry," in *The Metal Worker* of February 19, a correspondent at San Jose, Cal., who signs himself "Can Maker," complains that it ignores the Pacific Coast. "Our canning industry," he says, "is larger than our Klondike boom. Even in this little city we have five canneries for fruit and two for oysters, with capital invested to the amount of $5,000,000, employing 4000 people in the season. Other fruit towns are equal to this, and most of the salmon catch of Alaska is salted and shipped to San Francisco for canning. Give us a jolt once in a while." We willingly make the *amende honorable* to the Pacific Coast canning industry, special mention of which was omitted in the article in question from lack of reliable data.

SCRAP.

While the volume of business in Tin Plates shows no material enlargement here, the feeling in the trade exhibits some signs of improvement, and the probability of higher prices is more commonly referred to . The situation seems to be considerably more favorable in the West than in the East.

Work on the consolidation project appears to be suspended for the moment, although, by all accounts, the scheme is still a live possibility. The members of the committee having it in charge are scattered at the present time. Two of the four are in the South for rest and recreation and one is in the East undergoing medical treatment.

Mackintosh, Hemphill & Co., Pittsburgh, Pa., are busy in the construction of 30 hot mills and 27 cold mills for the Shenango Tin Plate Company, New Castle, Pa., the largest single order for Tin Plate machinery ever placed.

Richard R. Quay of the Monongahela Tin Plate Company, Pittsburgh, Pa., who is one of the special committee charged with the task of arranging a plan for the consolidation of the Tin Plate industry, has gone to Florida for a month's vacation.

The depressed condition of the Welsh Tin Plate industry, which has led to the financial embarrassment of E. Morewood & Co. of Llanelly, the largest manufacturers of Tin Plate in Wales, is further emphasized in the latest reports from the other side, which indicate that over 20 Tin Plate mills at Morriston, Llanelly and Llangennech had suspended operations. This will have a material effect on production, taking nearly 15,000 boxes a week out of the market. It is thought that the restricted production may lead to a hardening of Tin Plate prices on the other side.

Several Welsh Tin Plate concerns are turning their attention to other products. The Cwmfelin mills are devoting their efforts to the manufacture of Black Plate for special purposes and the Foxhole works are being adapted to the rolling of galvanized sheets.

The entire nine-mill Tin Plate plant of the La Belle Iron Works, Wheeling, W. Va., is reported to be in active operation. The six new mills give a trebled capacity to the works, enabling them to fill all orders promptly. One of the new mills is equipped with 36-inch rolls, while the others are of 26-inch measurement.

The British Board of Trade returns for the month of February, 1898, show that 8924 tons of Tin Plate were exported from Great Britain to the United States last month, as against 8883 tons in January last and 9678 tons in February, 1897.

That some of the leading Welsh Tin Plate makers do not take a sanguine view of the situation is evidenced by the fact that the men at the Old Castle, the Old Lodge and the Western Tin Plate Works, at Llanelly, have been informed by the managers that unless they are willing to submit to a continuance of the reduction of 15 per cent. in wages until the end of June those works will be closed.

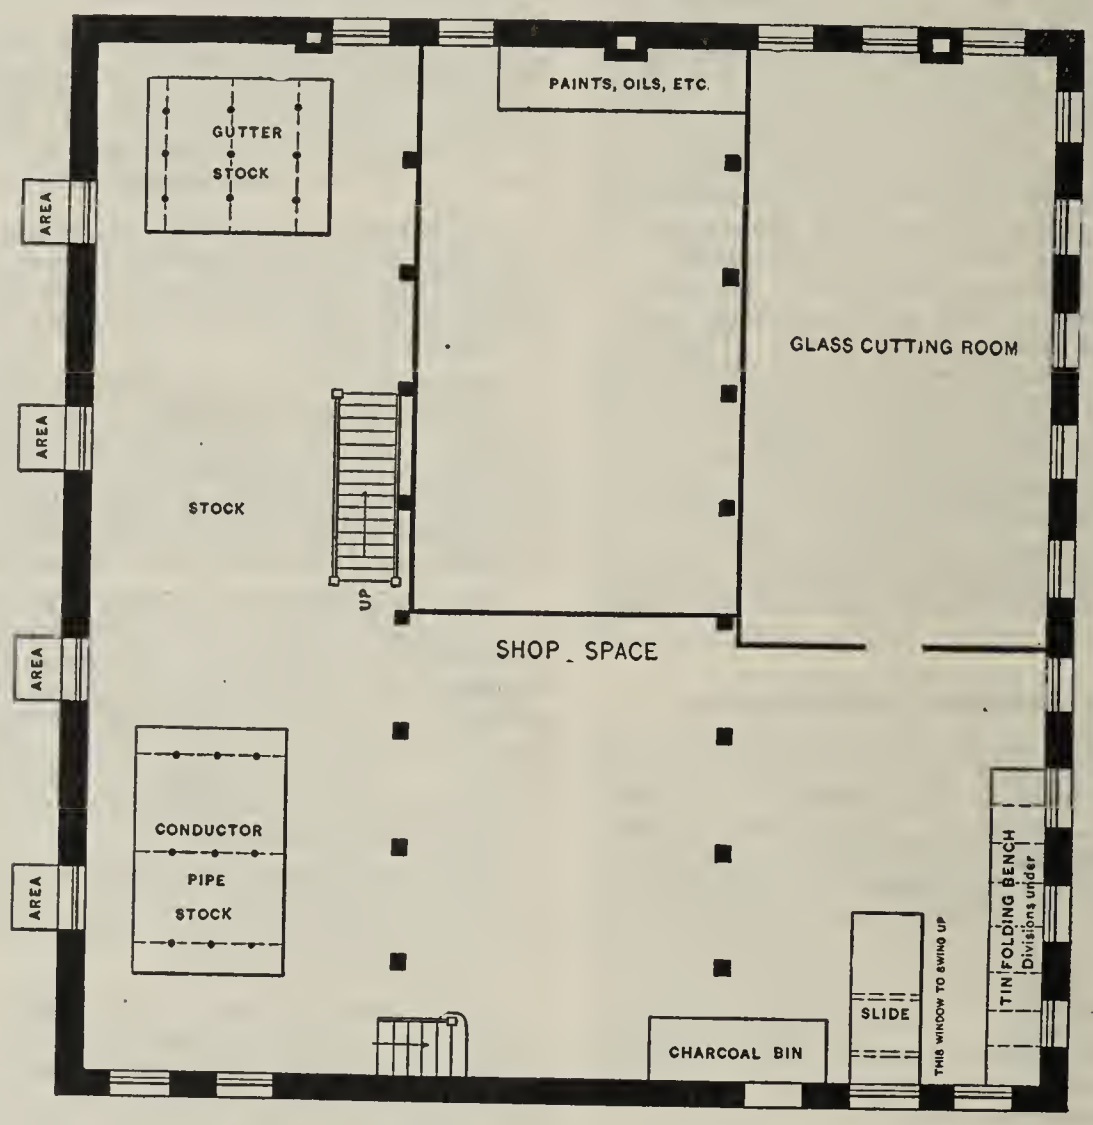
The Rock Island (Ill.) *Union* says that two representatives of a large Eastern Tin Plate concern recently visited that city, with the view of establishing a branch Tin Plate works there. Negotiations were opened up with the representatives of local interests and the outlook is regarded as favorable for the erection of the plant in Rock Island County. Cheap fuel and excellent transportation facilities are among the recommendations of the locality for the establishment of the industry.

The Monongahela Tin Plate Company of Pittsburgh, Pa., have opened an Eastern office at the Market and Fulton Bank Building, Fulton street, New York City, under the charge of J. Wildberg.

The Leechburg Foundry & Machine Company of Pittsburgh have received an order from the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., for three stands of hot mills, 24 x 32 inches, and two stands of hot rolls, 30 x 30 inches. Also six 36 inch doubling shears with electric motor attached to each, and three 36-inch squaring shears of their heavy design. The Leechburg Foundry & Machine company have more work on hand at the present time than ever before in their history, and are operating their large shops full time in all departments. They are also adding to their equipment a number of new machine tools which will considerably enlarge their capacity for turning out work.

The Boston office of the Nashua Iron & Brass Foundry Company of Nashua, N. H., has been removed to 85 and 87 Pearl street and is in charge of Homer F. Livermore, selling agent. The above concern succeeded the Nashua Lock Company, and have a well equipped plant for the production of Iron, Brass and Aluminum Castings.

The Senate Committee on Public Buildings and Grounds has made a favorable report on the following amendments to the sundry civil appropriation bill : Extending the limit of the cost of the public building at St. Paul, Minn., to $250,000 ; extending the limit of the cost of the building at Stockton, Cal., to $156,000, and appropriating $50,000 for the purchase of a site for a public building at Butte, Mont.



SHEET METAL WORK.

SHEET METAL WORKERS' SHOP.

An example of a well arranged and complete shop for the manufacture of sheet metal work for buildings in all its branches is the one erected for C. G. Brunnckow, Providence, R. I., the arrangement of which is shown by the floor plans presented herewith. Mr. Brunnckow was a partner in the firm of Leo J. Schletger & Co., at 50 Point street, Providence, who began business in 1888, and he assumed entire control of the business in 1894. The growth of his trade made it necessary to secure larger quarters, and he therefore decided to erect a building entirely devoted to sheet metal architectural work.

The shop is located in the manufacturing district of Providence, at 227-229 Globe street, and is easily reached by three different lines of electric railroads. Mr. Brunnckow took possession of his new quarters May 15, 1897, and is now in position to carry a force of from 75 to 125 men should the state of business warrant it. The building covers an area 75 x 72 feet, and gives three working floors, the basement, first and second floors. A plan of the basement floor is shown in Fig. 1. As the divisions on the plan indicate, a large part of the basement is given up to stock. The basement is well lighted by area windows along the left side, while the slope of the ground gives a full window depth on the opposite side and good light also at the front and rear. The hight of the basement is 8 feet and the upper floor is supported by a double row of hard pine posts 10 inches square. Just at the right of the entrance is the bin for storing charcoal, while near it, alongside the right wall, is a tin folding bench, and the adjacent corner is given up to a glass cutting room, as marked on the plan, while near it, at the back, are stored the paints and oils. The entire left side of the basement is given up to stock, conductor pipe, gutters, &c.

The second floor, a plan of which is shown in Fig. 2, is 11 feet high, and here the main work is done. It will be noticed that there are ample window space and large doors at front and rear for the removal of completed work and the entrance of stock. The main office, a room 22 x 14 feet, is at the left of the entrance, and toilet rooms both for the office and for the shop are at the rear, while beyond is the foreman's room and in the corner is the gilding room, secluded from the shop to prevent the entrance of dust. Along the back and remaining sides of the shop are benches and in the middle space is a full assortment of sheet metal working tools and other machinery, including gutter beaders, brakes, shears, crimpers, hammering machine for circular moldings, punches, lathes, anvil and forge, &c., a large open space in the middle of the room being reserved for two benches, one of which is 23 x 3 feet and the other 22 x 3 feet. The whole shop is open, the only obstruction being the double row of 8 x 8 hard pine posts.

Sheet Metal Workers' Shop —Fig. 1.—Basement Floor Plan.

The upper floor, a plan of which is presented in Fig. 3, is where the work is set up. Benches are provided on more than half of the wall space and there are two large benches in the middle and a smaller one at the left, the only machinery being an 8-foot brake. Closets and toilet rooms for the men are provided in this room, and wide sash doors open at either end, with outriggers for handling the completed work. This upper floor is further lighted by a large skylight, measuring 17 x 10 feet, placed over the center. In keeping with modern methods, the power for this shop is electrical, the motor to drive the machine tools being located in the middle of the second floor, as shown on Fig. 2.

As an indication of the class of work done by Mr. Brunnckow the following are a few of the contracts completed during the past three years, and which include all the sheet metal work necessary on the buildings: Baltic Power Company's mills of Baltic, Conn.; Rhode Island School of Design, West Side High School, St. Vincent de dormitory and gymnasium, St. Francis Xavier's Convent, Home for Aged Men, State Normal School, Anthony & Cowell Company's building, all of Providence, R. I.; St. Mary's Convent, Pawtucket; Pawtucket High School, Bristol High School, depots for the N. Y., N. H. & H. R. R. at Brockton and Campbell's, Mass.; Columbia Paul Asylum, addition to Providence Public Library, Hotel Norman, Lederer Building, Columbia Building (Col. A. Pope), Metcalfe Building, Brown University Building, Boston; R. C. church, Lowell; Gould Paper Mills, Lyons' Falls, N. Y.; Art Museum of Worcester, Mass., &c.

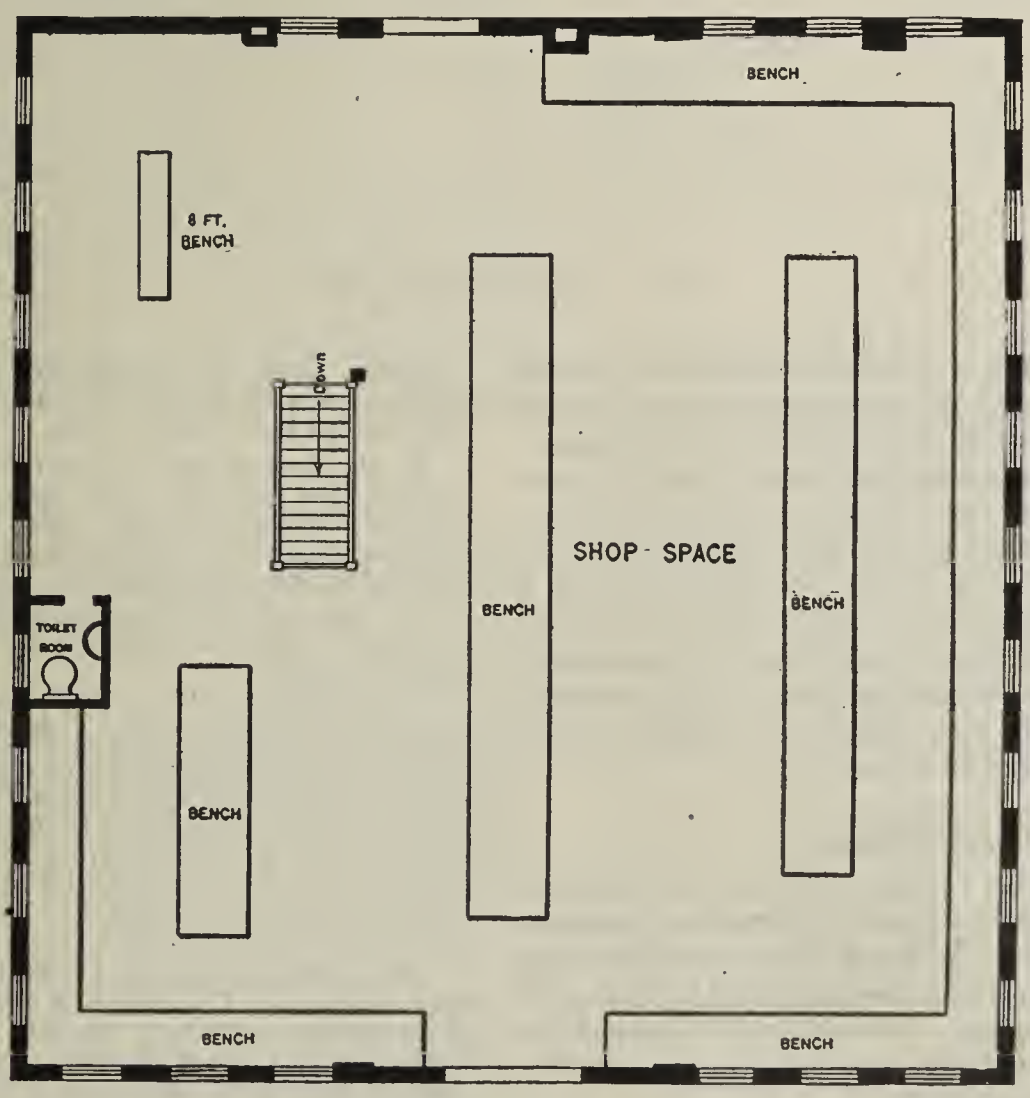

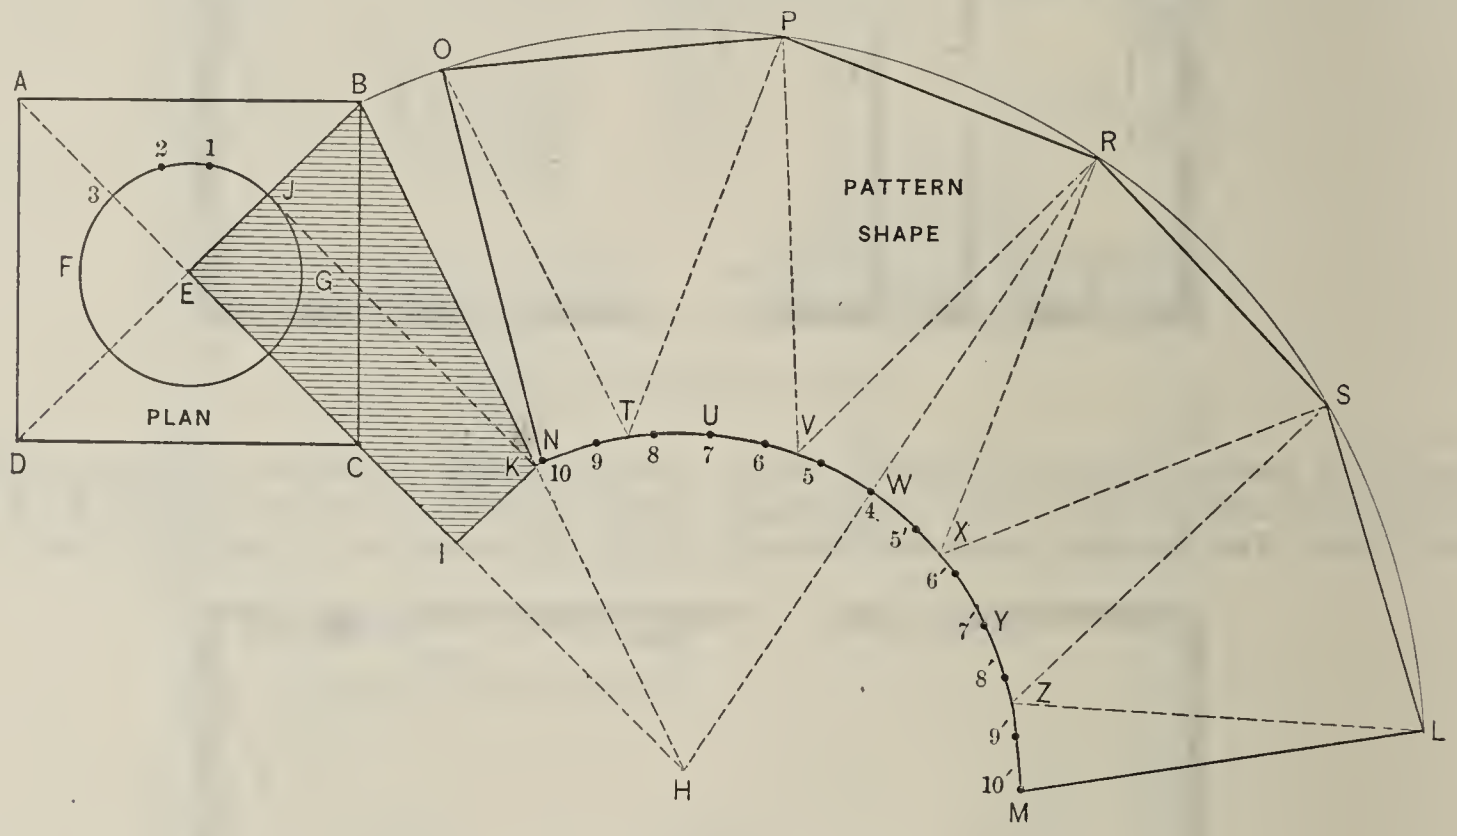

Fig. 3.—Second-Floor Plan.

SHORT RULE FOR CHIMNEY BASE.

BY W. N.

When a ventilator is placed over a chimney flue and a chimney base is required, it would involve too much time and labor to lay it out by the cone or triangulation method, and would not pay when there are a number of flues, each being of different size. A short rule can be employed, and while not strictly accurate will answer all practical purposes.

Let A B C D in the accompanying sketch be the size of the base at the bottom. Draw the diagonal lines A C and B D, intersecting at E. With E as center, and with the required radius, describe the circle F G, which represents the size of the pipe at the top. Now at right angles to B E draw the lines E I and J K equal to the hight of the article; connect the points I K and K B. Then will B E I K represent a section standing perpendicular on the line B E. Extend the lines E I and B K until they intersect at H. Now with H as center, and H K and H B as radii, describe the arcs N M and O L. Let the dividers equal A B or A D; and, commencing at O, step off four spaces, as P, R, S, L. Connect with lines as shown from O to L. From the center of the spaces, as R, draw a line to the center point H. Divide the quarter circle in plan into equal spaces, as shown by J, 1, 2, 3, which divide the quarter circle into three spaces or the full circle into 12. Set off six spaces on the arc N M, commencing at the intersection W, either way, as shown from 4 to 10 and from 4 to 10′. Draw a line from O to 10 and from L to 10′. Now, divide the arc shown from M to N into eight equal spaces, as shown by T, U, V, W, X, Y, Z. Connect L to Z and Z to S; skip Y and connect S to X and X to R; skip W and connect R to V, &c., until all points have been connected. Then will O L M N be the pattern shape. When forming bend slightly on dotted lines, making the top round, while the bends O, P, R, S, L die out at the top.

Short Rule for Chimney Base.

FLASHINGS.

The strength of raw Copper has been accompanied by a sharp advance in the price of all kinds of manufactured Copper and Brass. As noted in our trade columns the price of Sheet Copper has been advanced by the makers about 1 cent a pound. A considerable demand for Cornice Copper is noted and the outlook in the department is regarded very favorably.

Peden & Co., Houston, Texas, jobbers in Tin Plate and Roofing Materials, report having sent out 500 carloads of freight during 1897, which was an advance on their business of previous years. The present year, moreover, promises to greatly exceed this, as during January and February their shipments amounted approximately to 200 carloads. The territory covered by the house is Texas, Southern Louisiana, Indian and Oklahoma Territories and part of old Mexico. The company with characteristic enterprise have recently sent out a novel form of advertising circular, being a map of the Yukon district, showing the various routes to the Klondike. The bearing of this advertising circular on the business of Peden & Co., as stated, is that gold will be both saved and made by patronizing a Texas house for Roofing Materials, Tinners' Supplies, &c., and also that a person coming to Texas and calling at 1013 Franklin avenue, Houston, will not find a cold reception. Incidentally reference is made to the extensive line of Roofing Materials handled by this concern.

S. E. Dibble, New Haven, Conn., has taken the contract for roofing the Candee Rubber Company's packing room and storage house, amounting to 25,000 square feet of surface.

The Lewis Roofing Company of Rock Island, Ill., have been incorporated, with a capital stock of $25,000, by Frank J. Lewis, Edward W. Lewis and Henry A. Koenig.

W. J. Burton & Co., Detroit, Mich., send out advertising cards stating that owing to low prices they increased their sales in February 159⅓ per cent. over the corresponding month of 1897. They add that they will endeavor to repeat it each month by making bottom prices and quick shipments of all kinds of Metallic Roofing and Siding, Eastlake Shingles, Gutter and Conductor Pipe, Galvanized Iron and Tin Plate, Cornices, Skylights, &c. The firm have just completed the contract for copper work and tile roofing on the new depot for the Wabash Railroad, at Montpelier, Ohio.

R. H. Herron & Co., who have purchased the Los Angeles Iron & Steel Works, Los Angeles, Cal., will, it is reported, shortly put the plant in operation again. In addition to the sheet mills the plant has equipment for corrugating and galvanizing.

The Reeves Iron Company, Canal Dover, Ohio, will, it is reported, add three more sheet mills to their already extensive plant.

C. G. Hussey & Co. of the Pittsburgh Copper & Brass Rolling Mills, Second avenue, Pittsburgh, Pa., direct attention of the trade to Brass and Copper, which they are prepared to furnish in many different forms. Announcement is made that they can furnish Copper rolled to all thicknesses and cut to all sizes and shapes, Brass in sheets, rolls, bars and wire. This is one of the oldest concerns in Pittsburgh, having been engaged in the Brass and Copper trade in that city for many years.

The different expanded metal companies held a two days' meeting in Philadelphia this week for the purpose of discussing matters of interest to the expanded metal trade in general. On Monday evening many of the principal architects and engineers of Philadelphia, by invitation of James S. Merritt of Merritt & Co., Philadelphia, attended an evening session of the meeting at the Engineers' Club. Walter Hill of New York delivered a lengthy address on "Steel in Combination with Concrete," illustrating his points with blackboard drawings. The address was followed by a lengthy discussion in which a majority of those present participated.

STOVE TRADE NOTES.

A Notable Hotel Contract.

The Brand Stove Company of Milwaukee, Wis., have just competed and installed a line of cooking apparatus for the remodeled Sherman House, Chicago, which is worthy of description. In the main kitchen they have placed a hard coal wrought steel and nickel trimmed 20-foot range, having five square fire boxes and five ovens, each of the latter 24 x 25½ x 16 inches, with drop doors. Above the range is a double shelf. In the kitchen are also placed one 36 and one 30 inch charcoal broiler; one steam heated plate warmer 10 feet long, 2 feet wide and 5 feet high, of galvanized iron, having four perforated shelves; one 30-gallon and one 60-gallon copper jacket steam heated kettle for general cooking purposes and two steam heated galvanized egg boilers. The serving room is fitted with one steam heated 16-foot copper carving table, having six meat dishes, two soup tureens, five gravy bowls and eight vegetable pots, with a galvanized iron plate warmer beneath containing two perforated shelves: also a steam heated galvanized iron plate warmer, 12 feet long, 2 feet deep and 5 feet high, with four perforated shelves: battery of four oyster and two milk bowls, set on a copper covered wooden board and steam connected: one set battery of steam heated nickel plated copper urns, comprising one 12-gallon hot water, two 10-gallon coffee and one 5-gallon tea: galvanized iron cup warmer, with three perforated shelves: one 6-foot gas range, containing two roasting ovens and a broiling oven; one triple bar saucepan rack, 12 feet long: an 18-foot cook's steam heated table, oak top, with copper bain marie pan, 60 x 30 inches; a cast polished hot plate, 48 x 36 inches by ¾ inch thick, resting on a steam coil, and a gas cake griddle, 36 x 24 inches.

The lunch room contains four 20-gallon combination coolers for water, cream and milk, made of heavy planished copper; two batteries of urns, each set consisting of 12-gallon hot water, two 10-gallon coffee and two 5-gallon tea urns, all nickel plated and steam heated; two Russia iron roll warmers, 3 feet long, 2 feet deep and 2 feet high, with two perforated wooden shelves, double swing doors and trimmed with brass hinges and springs; one gas cake griddle, 36 x 24 inches, and one steam heated galvanized iron egg boiler with six wire egg baskets. The sales counter has a nickel plated steam heated 10-gallon coffee urn and 6 gallon tea urn.

The order for these was taken February 1 by F. M. Whitson, representing the company in this line, at 183 Lake street, Chicago, who has been in the business of furnishing hotel implements for culinary purposes for 14 years, and has been connected with this company since January 1. In the short time elapsed since taking the order these goods were made according to specifications given. This is the line of work which the Brand Stove Company purchased from Seavey Brothers of Chicago some time since and are developing with marked success. They have furnished quite a number of important hotel outfits.

Peck-Williamson Laundry Drier.

The Peck-Williamson Heating & Ventilating Company, Cincinnati, have issued a most attractive catalogue illustrating and describing their new laundry drier. The apparatus brought out by this company is a combination laundry stove, water boiler, clothes drier and iron heater, operated by one fire. The laundry stove used with this drier has two 8-inch holes on top, which may be used with any ordinary cooking utensils for cooking purposes. Much of the heat from the fuel is thus utilized which would be ordinarily wasted. These driers are made of any size, from the smallest, for use in a residence or in the kitchen of a residence, to the largest size, for public laundries, hotels, hospitals or any public or private institution. Four or five standard sizes are commonly used in private residences, but the length, width, hight, number of racks, &c., may be varied to suit any required needs. These driers can be adapted to use coal, wood, gas, steam or hot water for heating. They are constructed throughout, front, back, both sides and top, of galvanized sheet steel. The racks on which clothes are hung are made of galvanized iron gas pipes, neatly put together, and slide in and out on a frame of wrought iron bars. The interior is so made that it will not stain, rust or become foul. A man hole door is placed on the side, so that every part of the apparatus is easily accessible. A wire grill of inch mesh separates the drier part from the heating drums underneath, so that clothes which by accident fall off the racks cannot fall on or be injured by the hot surfaces. Every care has been taken to utilize as thoroughly as possible the heat from smoke and other products of combustion, so as to make the apparatus economical in its operation. Everything about the drier is fire proof and rust proof. Care is also taken to secure thorough ventilation during the process of drying clothes, by which it is claimed that they are bleached as well as thoroughly and completely dried. A drier with four racks, it is claimed, can dry the washing of four ordinary families in one day, as each hanging is thoroughly dried in 15 to 20 minutes. Attachments of the same character are made on a smaller scale, to be attached to kitchen ranges, to enable small articles to be daily dried without requiring any extra heat. Illustrations are given of handsome residences in which the Peck-Williamson laundry driers have been installed, and accompanying them are testimonials from pleased purchasers.

Coal and Gas for Cooking.

In discussing a paper read before the New England Association of Gas Engineers, Boston, February 16 and 17, 1898, Mr. Roper presented the following tables to show the loss in weight and time occupied in cooking the several articles named, first by the use of a coal stove, and then by the use of a gas stove:

Coal Stove.

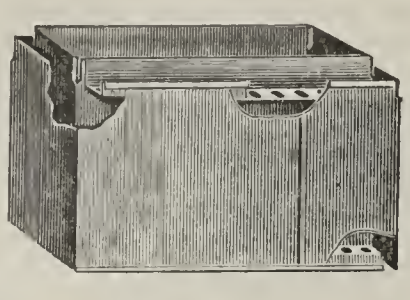
Articles, and how cooked.	Weight.—Before cooking. Lbs.	Before cooking. Ozs.	After cooking. Lbs.	After cooking. Ozs.	Loss. Ozs.	Time. Hrs.	Time. Mts.
Bread, baked	2½	..	2	6½	1½	..	35
Beef, roasted	3	7	2	4½	8½	1	15
Steak, fried	1	4½	1	3	1½	..	8
Chops, fried	....	12	..	10	2	..	11
Chicken, broiled	....	22	..	15	7	..	45
Fish	....	10	..	7½	2½	..	17

30 pounds coal at 8 cents, + kindling, 1 cent, = 9 cents.

Gas Stove.

Bread, baked	2	7	2	5½	1½	..	35
Beef, roasted	4	1	3	9	8	1	..
Steak, fried	....	21	..	19	2	..	8
Chops, fried	....	18½	..	12	1½	..	9
Chicken, broiled	....	16½	..	12½	4	..	14
Fish	....	16	..	13	3	..	14

Cost of gas, 6 cents; quantity consumed, 40 cubic feet; rate, $1.50 per 1,000.



A New L. & H. Catalogue.

The A. J. Lindemann & Hoverson Company, Milwaukee, Wis., favor us with a copy of their 64-page catalogue of stoves and sheet metal goods, showing a varied line of products. They give the leading place in this publication to the L. & H. Crown steel ranges, of which they make a full line in all the standard sizes. These ranges are suited to any kind of coal, and are furnished with a duplex grate which can be inverted for wood. The body is made of polished steel, the walls are lined with asbestos, the oven door is well counterbalanced, the oven is ventilated and much taste is shown in the decorations. L. & H. Junior gasoline stoves with stationary tank come next, followed by L. & H. Star Juniors with removable safety tank, L. & H. Star step Juniors, L. & H. Superb stoves with burner similar to the so-called Process and removable safety tank, L. & H. Superb with step, L. & H. Process stoves with solid German silver valves, L. & H. Process stoves with step, L. & H. Process cabinet stoves, L. & H. lamp stoves, L. & H. Blue Flame oil cooking stoves, L. & H. Blue Flame step stoves, L. & H. Calumet gas ranges, L. & H. gas hot plates, wall torches, ovens for gasoline or gas stoves, roasters, bakers, elbows, stove pipe; L. & H. hard wood refrigerators, &c. The company announce that another and more comprehensive catalogue will be issued by them in July.

The Excelsior Steel Furnace Company, 38 West Monroe street, Chicago, are experiencing a decided boom in business. During the week ending March 12 they booked four carload orders for goods of their manufacture in addition to over 200 smaller orders. Such activity is very unusual at this season of the year.

The Excelsior Sectional Wall Pipe.

Illustrations are herewith given which show the principal features of the new furnace pipe which has just been put on the market by the Excelsior Steel Furnace Company, 38 West Monroe street, Chicago. The Excelsior sectional wall pipe is not only a safety pipe, being made double, so as to provide a protecting air space between inner and outer pipes, but it has the following special points: It ventilates into the partitions and not into the living rooms, is made in very long sections, any

The Excelsior Sectional Wall Pipe.—Fig. 1.—A Section 5⅛ Inches Long.

length of pipe can be had without cutting, the ventilation is so arranged that it cannot be cut off in any manner, and it is claimed to have the best slip. These points are stated more elaborately as follows:

There is no communication between the space between the inner and outer pipes and the registers or living rooms, so that no odors or noxious gases can pass from the basement to the apartments above. A basement which is wholly or partly under ground, and consequently

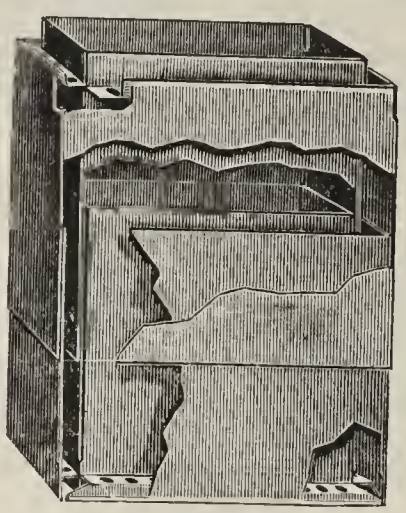


Fig. 2.—The Adjustable Joint Section.

shut out from sunshine, and is used for the storage of vegetables and odds and ends, is not a healthy place from which to take air to be breathed by young or old, and therefore, from a sanitary standpoint, the Excelsior sectional wall pipe is offered to the trade as a distinct advance in furnace pipes.

The Excelsior sectional wall pipe is made in the following lengths: 3⅞, 5⅞, 8⅞, 12¾ and 18¾ inches and 8 feet. Each section is furnished with slip and socket ends, as shown in Fig. 1, and by using the 8-foot sections in con-

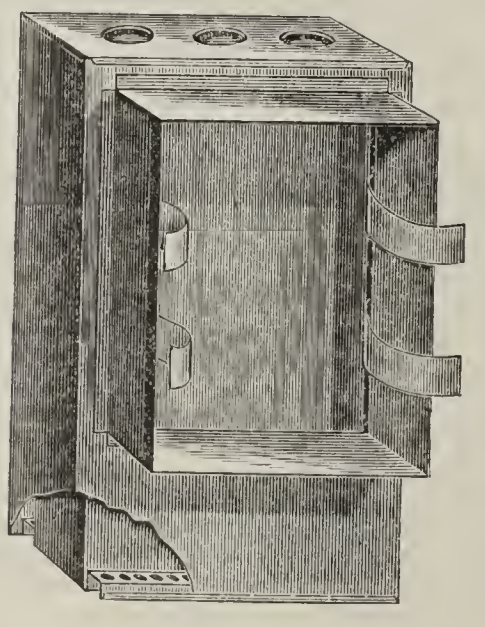

Fig. 3.—A Stack Head

nection with the shorter lengths and with the adjustable joints combinations of any desired length can be made with little labor.

With the Excelsior pipe any desired length, even to $\frac{1}{100}$ inch, can be obtained without cutting. This is accomplished by means of adjustable joints, shown in Fig. 2 (for which patents have been applied). These will be found a long felt want in the sectional pipe trade, for there are numberless places where it is necessary to have a length of pipe to a fraction of an inch, and in the past this could not be obtained without cutting the pipe, and to cut sectional pipe is practically to ruin it, as the slip and socket ends are put on by machinery and they cannot be taken off and put on again properly by hand.

The ventilation is supplied by numerous perforations around the bottom of the boot, and the total area of the openings and their position at the bottom of the foot piece, and near the point where the warm air pipe from the furnace enters the stack, insures ample and absolute ventilation at all times.

The slip on the Excelsior sectional wall pipe is made so that it fits tightly into the socket end prepared to receive it. This enables a tight connection to be made and

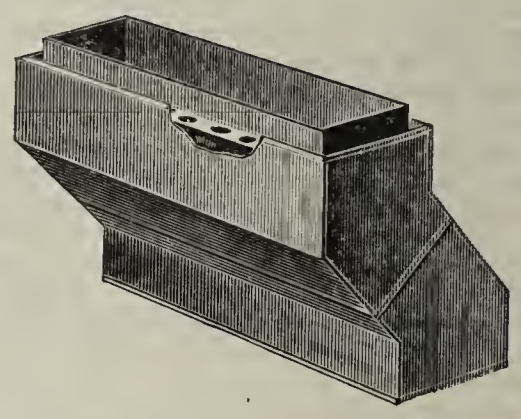

Fig. 4.—Stack Elbows Making an Offset.

reduces the labor and cost of soldering when the sections are soldered together.

The company make the adjustable joints in two lengths, one to adjust from 17 to 10 inches and the other to adjust from 13 to 6½ inches. By the use of these joints it is not necessary to take measurements down to an inch, as one joint to each riser pipe enables the workman to obtain any desired length. These joints are listed with the wall pipe fittings and the saving in time and in the finish of the work will make their liberal use profitable to the dealer.

All combinations possible with the Excelsior standard double pipe and fittings, with which the trade has been long familiar, and with other forms of sectional safety wall pipe, can be made with the Excelsior sectional wall

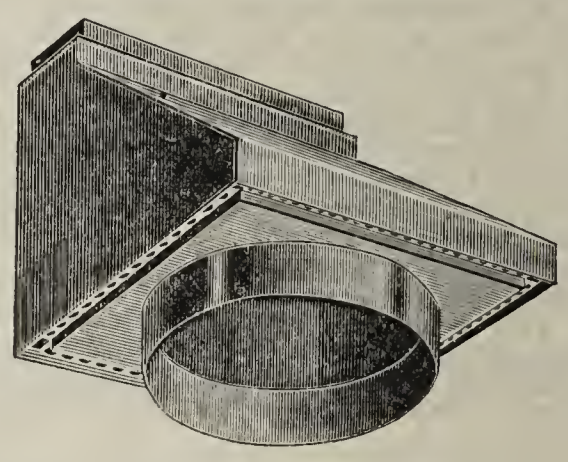

Fig. 5.—A Foot Piece.

pipe, and a few illustrations of various combinations are presented—Fig. 3, a stack head; Fig. 4, stack elbows, and Fig. 5, a foot piece.

The company will carry a large stock of the Excelsior sectional pipe and will be in a position to furnish promptly any quantity which may be desired. For dealers who wish to keep the pipe in stock, crates are put up containing about 50, 75 and 100 feet each. The 50-foot crate contains the following: Four 8-foot lengths, eight 18¾-inch sections, and two each of the smaller sections, making a total of 49 feet 8¾ inches. The 75 foot crate contains one-half more than the above and the 100-foot crate just twice the quantity named.

The Excelsior line of standard wall piping, of which many millions of feet have been sold during the past 12 years, will still be made on the same scale as heretofore, and the new sectional pipe is simply an addition to the company's general line and will in no way interfere with the manufacture and sale of the old line of double and single stacks.

A. C. Barstow of the Barstow Stove Company, Providence, R. I., visited Judson A. Goodrich, manager of the New York office, this week.

ODD PLATES.

The Fuller & Warren Company of Troy, N. Y., favor us with a copy of illustrated catalogue and price-list D, describing French or Flat Top Ranges, especially adapted for the use of "particular cooks who desire to make delicate, delicious, palatable and healthy dishes." These Ranges are made in both brick and portable form, and are easily and quickly changed from one to the other. They have right or left hand fire box, and are fitted with sheet flues arranged so that the products of combustion pass immediately under all six top boiler holes and come in contact with five sides of the oven, thus insuring even baking, quick operation and making each of the boiler holes available for cooking. Other features include triangular grate, which is easily removed through the ash pit without disturbing the water heater or plumbing; large bailed ash pan, wrought steel ventilated oven, cut long center; Reed's check draft damper, large drop broiling door and large warming closet. The pamphlet shows a number of styles of these Ranges, each illustration being accompanied by tables giving various dimensions and enumerating important features of construction.

The contract for building the foundations of the new addition to the Stove works of Rathbone, Sard & Co., at Aurora, Ill., has been awarded to Fred. Esser, who is pushing operations as rapidly as possible. The new structure, intended for use by the offices, will be 29 x 95½ feet in size and three stories high above the basement.

Eugene Munsell & Co. have just received at their offices in New York and Chicago samples of the Yukon Folding Lanterns, in which mica is used to a very large extent. The Lantern is a very neat affair and when folded can be easily carried in the pocket, Munsell & Co. having furnished large quantities of mica to the manufacturers of these Lanterns, of which hundreds are made and sent to the Klondike regions. The company state that a very clear and lustrous mica, of which they make a specialty, is necessary for this work.

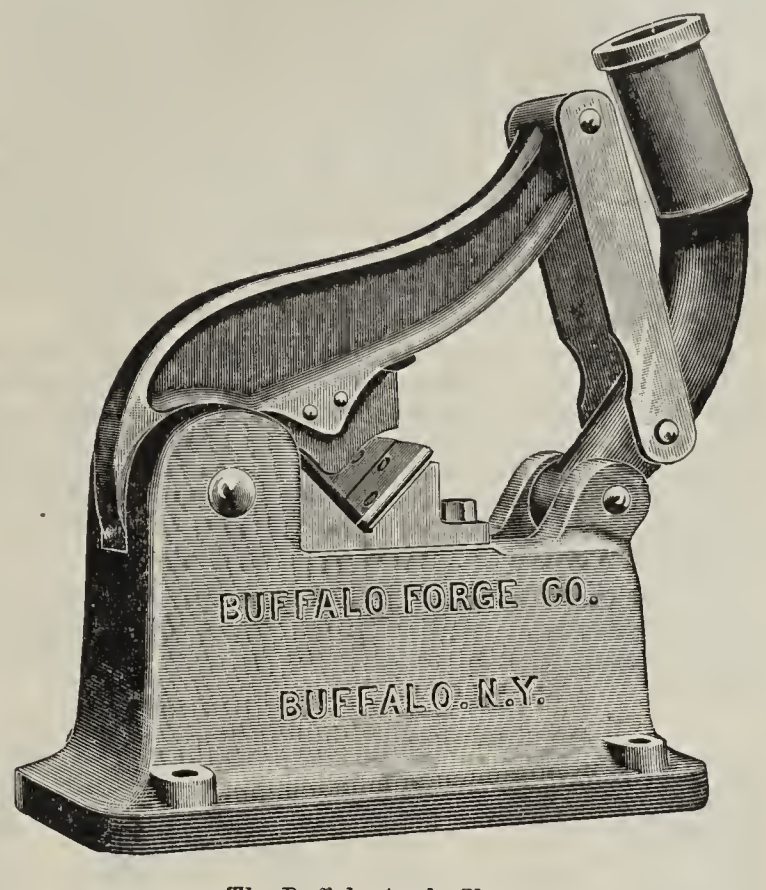
The Minnesota Stove Company of Shakopee, Minn., have recently brought out a Steel Range which is known as the Matchless Steel Coral, having large ventilated oven, cast iron reservoir, oval fire box, heavy ventilated linings, combination duplex grate, high closets, end shelves, &c. The oven doors are balanced by springs concealed within and which tend to prevent the doors from dropping suddenly. The grate can be easily put in place or drawn out through a drop door opening, and there are other features likely to interest the trade. We understand that the range is meeting with a good demand and that the manufacturers are making shipments every few days.

A catalogue of 24 large pages which has just come to hand shows some very handsome specimens of Wood Mantels and Tile Fire Places which are being manufactured by the Conway Cabinet Company, St. Paul avenue, Twentieth and Twenty-first streets, Milwaukee, Wis. Various designs of Mantels are presented in well executed half tone engravings, while the accompanying text gives the principal dimensions, together with directions for setting.

It is reported that Bridgeford & Co. will shortly begin the manufacture of Steel Ranges at Fifth and Main streets, Louisville, Ky.

Isaac Everitt, founder of the West Superior Stove Works, West Superior, Wis., died on March 9, at his home in West Pittston, Pa., aged 79 years. Mr. Everitt was largely interested in the West Superior Stove Works at the time of his death. He was also connected with the Pittston Stove Company of Pittston and with a number of other enterprises in the Wyoming Valley.

We are indebted to the Peninsular Stove Company of Detroit, Mich., for a copy of a circular or folder which they are distributing among dealers in the trade, showing the estimation in which Peninsular Stoves and Ranges are held by some of those who have handled them in a commercial way. The folder is illustrated with views of some of the Peninsular goods, the list including the Active Peninsular Planished Steel Range, the Granite Peninsular Steel Oven Six-Hole Range, the Reliable Peninsular Wood Cook and the Family Peninsular Coal and Wood Cook. The testimonial letters are from sections both East and West and speak in very flattering terms of the Peninsular line. Another feature of the folder is a *fac-simile* of the guarantee bond given by the company with every Stove, Range and Furnace which they manufacture.



The D. M. Steward Mfg. Company of Chattanooga, Tenn., have recently doubled their capacity for foundry facing and iron workers' crayons. The goods are now being sold in many foreign countries.

S. E. Newhall, well known to the Stove trade through his connection with the Magee Furnace Company, Boston, was recently elected selectman of Hyde Park, Mass., for a third term. Mr. Newhall was chosen chairman of the body, but declined to serve owing to pressure of other business.

The Ideal Stove & Foundry Company of Daleville, Delaware County, Ind., were recently incorporated, with a capital stock of $25,000. The directors are George B. Jones, Charles Bartholomai, William J. Smith, Lewis W. Moats, Frank Graham, John T. Connolly and George P. Barber.

The Buffalo Angle Shear.

The angle iron shear built by the Buffalo Forge Company of Buffalo, N. Y., is adapted especially for sheet and structural iron workers and cornice and fence makers, as well as bridge builders. It is compact and powerful and the operator can work without a helper. The design of

The Buffalo Angle Shear.

the tool will be understood fully from the engraving. The No. 16 shear will cut up to 3 x 3 x ¼ inches angle iron or steel.

TRADE NOTES.

The attention of our readers is directed to the advertisement of the Ferrosteel Company of Cleveland, Ohio, elsewhere in this issue. The business of this concern has attained a large volume and the goods manufactured are referred to as of high quality, not only in the metal, but also in the workmanship. They claim to have made a very marked success in electroplating in colors and call attention to the particularly large list of sizes which they make. Their Ferrosteel Special Sad Iron works are being operated successfully with special facilities devised by the company. The new Blue Book for 1898 is a most interesting little publication, and any one desiring to see it should write the Ferrosteel Company for a copy.

The Eureka Metal Works of New York City have been incorporated, with a capital of $2500, by Alexander Stern, Marx Blum and Nathan Gutman.

A shipment of 115 tons of Virginia Spelter was made last week to Calcutta, India, on an order from the East Indian Ordnance Department. The requirement was for Zinc of exceptional purity.

The brass foundry at Worcester, Mass., which has been owned and operated since 1882 by Luther Shaw & Son, was sold last week to W. E. Oakley & Son, and hereafter will be run under that name..

Dufferin, Shurman & Co. of Detroit, Mich., have been incorporated, with a capital stock of $10,000, to manufacture and sell Diamond Gloss Stove Polish and other articles. The incorporators are Otto H. Schnepper, George F. Shurman, Edith Dufferin and Carl Schnepper.

A. Mugford, who for about 20 years has been established in Hartford, Conn., and has a wide connection with the Hardware, machinery and metal trades, has now opened a branch house at 120 Liberty street, New York, where he will carry on a similar business in wood engraving, half-tone, photo-zinc etching, wax engraving and electrotyping. This department of the concern while soliciting trade from any in need of their services will pay especial attention to New York, New Jersey, Pennsylvania and Ohio territory. The business in this city is in charge of Henry Mugford.

TRADE REPORT.

METAL MARKET.

Pig Tin.—During the past week the market has not changed materially. At one time prices seemed to have a tendency to sag, as the result of heavier arrivals here and exceedingly large shipments from the Straits Settlements in the first half of this month, but the consumptive demand and jobbers' purchases, both of which have been fairly liberal, have served to steady the market again. Speculative interest, however, has been tame. In a retail way Straits Pig is firm at 14¾c. to 15¼c. per lb. The Metal Exchange figures the arrivals so far this month at 1260 tons, with 3225 tons afloat. The shipments from the Straits for the first half of the month are figured at 2720 tons, against 1465 tons at the same period last year.

Copper.—The market during the entire week has been quiet, and, despite rumors to the contrary, it is understood that no sales of especial importance have been made in the week. Nevertheless, wholesale prices are still held very firmly, and the strength of the metal has extended to jobbers' prices, which have been fractionally advanced. Lake Ingot in small lots from stock sells at 13¼c. per lb. and Ansonia grade Casting Copper at 12½c.

John Stanton reports the Copper production in the United States and of the foreign reporting mines and United States exports as follows, in gross tons of 2240 pounds :

	Reporting mines.	Outside sources.	Total U. S. product.	Product foreign mines.	U. S. exports.
First half 1895....	70,612	9,100	79,712	42,484	34,215
Second half 1895..	84,885	6,600	91.485	43,674	30,507
Total 1895...	155,497	15,700	171,197	86.178	64,722
First half 1896....	94,180	7,200	101,380	42,255	58,216
Second half 1896..	95,314	7,200	102,514	43,941	67,287
Total 1896.....	199,494	14,400	203,894	86,196	125,503
First half 1897....	103,651	5,000	108,651	44,263	64.870
Second half 1897..	100,555	6,900	107,455	44,007	64,340
Total 1897.....	204,206	11,900	216,106	88,270	129,210
January, 1898.....	16,544	1,200	17,744	5,556	11,030
February, 1898....	16,072	1,250	17,322	7,303	9,611

Sheet Copper.—Purchases have been of very fair total amount and the volume of inquiry, especially in connection with the building trade, is such as to encourage the hope of a very satisfactory business in Cornice Copper during the coming season. In sympathy with the strength of the raw material dealers have advanced the price of Sheet Copper 1c. a lb. In retail quantities from store it is now quoted at 16c. per lb. basis. Copper Bottoms, Pits and Flats have been likewise advanced to 20c. per lb. basis.

Pig Lead.—Buyers are still the masters of the situation. They have been a little scarce during the last week too, and whenever one wandered within the reach of a seller he had things pretty much his own way. Business has been very quiet and the consumptive demand in this section is of very ordinary proportions. Small lots of American Pig from store are quoted by jobbers at 4⅛c. to 4¼c. per lb.

St. Louis advices are as follows: Pig Lead continues exceedingy active. Offerings are limited and buyers find it impossible to shade the market. As a rule, consumers are practically uncovered and must soon enter the market.

Lead Pipe and Sheet.—There is rather more life in this department, athough the total business effected by the dealers was hardly up to expectations. The outlook is better, however, and inquiries indicate a reviving interest on the part of consumers. Jobbers' prices in this section are unchanged at 5½c. per lb. for Lead Pipe and 6½c. for Sheet Lead, subject to the customary discount.

Spelter—Is quiet but firm. The large exporting which is still going on via Southern ports is still keeping the market in a good position. Supplies for home consumption are rather limited, but seem to be adequate to the limited consumptive demand. Jobbers' prices for good Western brands in small lots from store are rather higher at 4.65c. to 4¾c. per lb.

St. Louis advices are as follows: There is very little Spelter being offered for March delivery, and sellers evince no disposition to sell for later delivery except at higher prices. The market is in excellent shape and higher prices are predicted.

Sheet Zinc.—Sales are of routine type and the demand shows no special animation. Prices show no variation, jobbers quoting 600-lb. cask lots at 5⅝c. to 5¾c. per lb. and smaller quantities at 6⅛c. to 6¼c.

Antimony.—The situation as regards this metal is unchanged. A fairly good demand and light stocks combine to keep prices firm. Small parcels from stock are quoted at 8½c per lb for Cookson's, 7¾c. to 8c. for Hallett's and 7½c. to 7¾c. for Japanese.

Nickel—Is quoted at 37c. per lb. for small lots.

Aluminum.—The demand for this metal is referred to as good. Prices are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100 lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb.; 100-lb. lots, 30c.

Tin Plate.—Although wholesale prices are about the same as last week, there is an approaching feeling of steadiness in the trade. It is felt that the large consumers who have been holding off on account of the uncertainty regarding the proposed consolidation of Tin Plate mills must shortly come into the market for their supplies, and the rush then expected should send prices materially above the present low level. The early spring-like weather which prevails all over the country promises, unless a severe frost ensues, to insure large and early crops, and the canning trade is looking for an unusually heavy and early pack The requirements of those canners and can makers, which are not yet covered, are believed to represent a very heavy amount and a number of the manufacturers of tinware are also understood to be in a similar position. This should mean a large purchasing movement before long, and on this development the better tone of the market is based. In many quarters, indeed, a scarcity of Tin Plates in the coming summer is regarded as among the probabilities. Taking these influences together, it would seem that at least a moderate advance in prices must be looked for in the near future. The consolidation scheme seems to be in abeyance for the time, as most of the committee having it in charge are absent on vacation. Nevertheless, it is asserted in some quarters that the plan is not dead, but has assumed tangible shape in Chicago. In any event, it is becoming recognized by consumers and the trade at large that, even if carried through successfully, the consolidation can exert no real influence on the market this season. A fair retail business is noted, which is stimulated by the advent of spring-like weather. Jobbers' prices are unchanged. Small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20. $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are selling slowly, and prices are largely nominal.

Chicago advices are as follows: As far as can be learned all the Tin Plate factories in this vicinity are sold up until July, if not further. Prices are very firm.

Sheet Iron.—There is a continued good demand, although perhaps not quite as heavy as earlier in the month. Nevertheless, the mills are running full, and some have all the orders for Black Sheets they can take care of for the next two or three months. The demand for Galvanized Sheets is quite heavy. Prices, while firm, show no quotable change. Jobbers in this quarter quote small lots of No. 27 Common Black Sheets at 2.40c. and 80 per cent. off for Galvanized Sheets.

Chicago advices are as follows: The Sheet market is quiet. The mills, however, are reported very busy on old orders and prices are unchanged. Jobbers continue to quote small lots from stock at 2.30c. to 2.40c. for No. 27 Black and 80 and 2½ to 80 and 5 per cent. off for Galvanized.

Old Metals.—The makret for almost all varieties of Old Metals is very firm, with an advancing tendency in prices. Home consumers have been urgent buyers of round lots of light and heavy Brass and Copper, taking all the supplies in sight. Available spot stocks are reported very light. The export business has been lighter, on the other hand, as exporters offering figures fall considerably below those paid by home buyers. The Scrap Tin market is weak and flat. In Scrap Iron some articles are stronger than others, but the demand is good and holders are enabled to maintain a higher level of prices. Yard dealers

in this city and vicinity are paying the following rates for moderate sized lots, delivered here:

Heavy Copper	per lb. 9⅞c.
Light and Tinned Copper	per lb. 9¼c.
Heavy Brass	per lb. 6½c.
Light Brass	per lb. 5½c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 3 c.
Zinc Dross	per lb. 2.70c.
Zinc Skimmings	per lb. 1.10c.
Sal ammoniac Skimmings, per ton	$20 to $24
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$8 25
Heavy Cast Scrap, per gross ton	8.25
Stove Plate Scrap, per gross ton	5.75
Burnt Iron, per gross ton	4.25
Tin Plate Scrap, per ton	2 25

THE IRON MARKET.

The Iron trade has moved along steadily during the past week, in spite of the troubled times. We cannot discover many evidences that business has been held back awaiting developments. On the other hand, orders for the raw material for war equipment are shrouded with much secrecy. It is a fact, nevertheless, that considerable tonnage has been placed for Pig Iron and for Steel. Thus we hear of one block of 5000 tons of Special Pig for a projectile concern.

Quite a number of meetings of manufacturers have been held during the past week all looking to some scheme to take off the keen edge of unbridled competition.

A group of Wire makers of the West and Central West are trying to put the finishing touches on a consolidation, the parties interested being the Consolidated, Salem, American Wire Nail, Elwood, H.P. and American Wire companies. The latest advices are that the meeting has been postponed until Friday to enable two companies to get the necessary preliminaries adjusted. All the others named as going into the new consolidation have signed the agreement. The new company will probably not be formed till after April 1, as some hope is still felt that the great consolidation may be accomplished. The companies going into the new deal are said to have earned 80 per cent. of all money made by Wire interests of the country in 1897.

The representatives of the majority of furnaces in Alabama and Tennessee are in session working at their gentlemen's agreement. At least four plants are not represented. Some good is expected through the better understanding growing out of a frequent comparison of notes.

Pig Iron.—Aside from a round block of about 5000 tons taken by a Pipe shop, there have been only small sales in the New York market, and prices are no better. A number of the representatives of Southern interests have been in session in this city. We quote as follows: Northern brands, No. 1, $11 to $11.50; No. 2, $10.50 to $11; No. 2 Plain, $10 to $10.50. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.50; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

In the Philadelphia Pig Iron market competition for new business is extremely close, but it is only here and there that cut prices are made. Some brands are held at absolutely firm figures, others usually because of exceptional circumstances can be had once in awhile without much regard to the general market. There ought to be a more active movement during the next few weeks, but the indications in that direction are not as clearly defined as the trade would like them to be. Meanwhile general quotations for seaboard delivery are about as follows, with the usual rebate according to freights at points within a radius of 100 miles south or west: No. 1 X Foundry, $11.75 to $12; No. 2 X Foundry, $10.75 to $11; No. 2 Plain, $10.40 to $10.50.

While inquiries are still coming in for considerable quantities of Pig Iron in Chicago actual sales have been light for several days. The local furnaces, however, are hardly in a position to take more orders. All of them are sold up for months to come and are having trouble to make deliveries to satisfy their customers. Even off grades are now taken eagerly by consumers who are usually very exacting in their requirements. Most of the business placed in the past week has been secured by Southern furnace companies. They are alleged to have shaded prices to some extent, but this hardly seems necessary, considering the well filled order books of most of the furnace companies doing business in this locality. The scarcity of malleable castings is as pronounced as before. We quote for cash as follows:

Lake Superior Charcoal	$12.00 to $13.00
Local Coke Foundry, No 1	11.50 to 12.50
Local Coke Foundry, No. 2	11.00 to 12.00
Local Coke Foundry, No. 3	10.50 to 11.50
Local Scotch, No. 1	11.50 to 13.00
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.35 to 10.70
Southern Coke. No. 3	10.10 to 10.40
Southern, No. 1 Soft	10.85 to 11.00
Southern, No. 2 Soft	10.35 to 10.70

There is not much inquiry in the Pittsburgh Pig Iron market. Foundry Irons are neglected. The foundry trade seems to be drifting toward Cleveland, some of the foundries in the Pittsburgh district only running about half time. We quote, f.o.b. Pittsburgh: No. 1 Foundry, $10.40 to $10.50; No. 2 Foundry, $9.90 to $10; Bessemer, $10.35 to $10.50, depending on delivery.

In the Cincinnati district the market for Southern Pig Iron has presented no very striking features during the past week. Business has been quiet even to the verge of dullness. The usual run of small orders has continued, but throughout this field there has hardly been a sale or even an inquiry of any moment. The question of price does not seem to cut any figure in the situation just now. Buyers seem indifferent both as to outside and inside quotations. Deliveries of Pig Iron are all that could possibly be asked. Quotations remain nominally unchanged. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.25 to 9.50
Southern Coke, No. 3	9.00 to 9.25
Southern Coke, No. 1 Soft	9.50 to 9.75
Southern Coke, No. 2 Soft	9.25 to 9.50
Southern Coke, Gray Forge	8.50 to 8.75
Southern Coke, Mottled	8.50 to 8.75
Ohio Silvery, No. 1	12.00 to 12.50
Ohio Silvery, No. 2	11.50 to 12.00
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00

The St. Louis Pig Iron market is referred to as practically featureless. Prices continue to be unsettled and there is nothing in the immediate future to warrant the prediction that prices are likely to improve. That the output for the month of February is not being absorbed is evidenced by the stocks on hand, which show an increase of 23,410 tons on March 1 in comparison with the stocks on hand February 1. Sales during the week have been largely confined to carload lots for immediate shipment. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.00 to $10.50
Southern, No. 2 Foundry	9.75 to 10.00
Southern, No. 3 Foundry	9.50 to 9.75
No. 1 Soft	9.75 to 10.00
No. 2 Soft	9.50 to 9.75

CHICAGO REPORT.

Scrap.—The situation is unchanged, the demand being good and prices fairly firm. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7.50	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	5.50	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.50	....
Old Gas Pipe and Boiler Tubes	6.00	....
Cast Borings	3.50	....
Turnings	5.00	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	10¼c.
Copper Bottoms	....	9¼c.
Copper Clips	....	10 c.
Red Brass	....	8⅛c.
Yellow Brass	....	7½c.
Light Brass	....	5¼c.
Pipe Lead	....	3 c.
Tea Lead	....	3 c.
Zinc	....	3¼c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	..	1 c.

Anthracite.—The demand is light, as usual at this season. The prices of carload lots of 12 tons minimum are as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	7.00	7.25
Council Bluffs, Iowa	7.00	7.25
Lincoln, Neb	7.15	7.40
Sioux City, Iowa	7.50	7.75
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.55
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6.75
Des Moines, Iowa	7.00	7.25
Davenport, Iowa	6.30	6.55
St. Joseph, Mo	7.00	7.25
Leavenworth, Kan.	7.00	7.25
Omaha, Neb	7.00	7.25

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

With the advance of the season and the coming of spring-like weather there is an increased activity in the demand and a more liberal movement of goods, particularly in seasonable specialties. In the parts of the country, however, in which trade is assuming normal proportions there is an evident improvement in Builders' Hardware and in Shelf Goods generally, indicating a more prosperous condition of trade than for some time. Prices show some changes, there being a weaker tone in the lines directly affected by the failure to unify the Wire interests, and Wire Nails, Barb Wire and Wires generally are quotably lower. The efforts made by the manufacturers to maintain prices may perhaps check this, especially as the season for active demand is at hand. The higher prices ruling in Copper have affected this line favorably, and prices for Sheet and Bolt Copper, Copper Rivets and Burrs, Brass and Copper Wire, &c., are higher and the market for this line has a firm tone. On the great bulk of goods there are no quotable changes to report. Those in contact with business in the West and Southwest refer enthusiastically to the improvement which is noticeable in that section. In some parts of the country there is still a good deal of complaint of the sluggishness of trade, a condition to which the talk of the possibility of war contributes something, as its natural influence is to postpone the contemplation of enterprises and deter the immediate adoption of a more vigorous prosecution of business, which would otherwise be in order. There is little doubt, however, that trade throughout the country is getting into much better shape in view of the increased prosperity of the people and the larger employment of labor. The Hardware trade, both jobbers and retailers, are certainly in a better condition for the satisfactory conduct of business because of the attention which has recently been given to the necessity for the correction of practices which have militated against their success, and for the adoption of wise and enterprising methods. In addition to the protection which both of these classes of merchants seek to secure for their own interests, the consideration of business methods and the educating influence of their associations are beneficial results which come from such organizations. The desirability of having these movements extend further among the retail trade is thus emphasized, especially as retailers are not organized nearly as generally or as efficiently as are the jobbers. The success of the retail associations in several States certainly gives substantial encouragement to their establishment in others.

Advices from Chicago.—Jobbers report trade decidedly active. The demand is quite general, seasonable and staple goods, Tools, Builders' Hardware and House Furnishing Specialties figuring in almost every order. The trade in Nails and Fence Wire is increasing with the advent of spring. The drying of country roads and the mild weather are having a stimulating effect. The packing and shipping departments of the local houses are now obliged to work at night in order to keep up with the movement of goods. Tinware and Metals have been in much better demand. The movement of such merchandise is now up to the expectations of the season. Galvanized Sheets are being taken more freely by consumers, and Roofing Tin is also going out better, but the trade in the latter is running to the cheaper grades. Black Sheets are quiet, the only orders now booked being for future delivery. Heavy Hardware jobbers probably never had a better demand for Wagon Stock than at this time. Their shipments are very large. The demand for Iron and Steel, however, is stated to lack vigor, being affected by the apparent weakness in mill prices, yet jobbers assert that they are unable to secure prompt deliveries from the mills, and their stocks are broken.

Advices from St. Louis.—The Hardware trade continues to show daily improvement. The trade from Kansas, Nebraska and Texas is larger than for years past, and a favorable feature of the situation is the number of accounts which are being discounted by dealers who have heretofore made 60 days' settlement. The demand for Shelf Goods is extremely heavy, and orders for new stocks are becoming so plentiful that they now pass without comment. Bicycles are commencing to move, and the indications are that a larger number of high grade wheels will be sold than last year. There are plenty of cheap wheels on the market, however, and the coming summer is likely to find a heavy increase in Bicycle riders. Builders' Hardware and Mechanics' Tools continue free sellers, and the open weather which has prevailed for two weeks past has caused a heavy demand for Garden Tools. Collections are most excellent, and, as above stated, many accounts are being liberally discounted.

NOTES ON PRICES.

Wire Nails.—The past week has been characterized by more or less irregularity in the Wire Nail market, owing to a weakening in prices on account of the failure to consummate the consolidation of Wire interests. As a result the market is lower than for a number of weeks, and is at present a little unsteady. What the future course of the market may be remains to be seen. A number of conferences have been held by leading manufacturers with a view to coming to some kind of an agreement more or less formal with the object of maintaining the price, and some plans are under consideration for forming an organization including some at least of the leading mills. In view of the fact that the negotiations for controlling Wire products are generally understood to have reached an unsatisfactory termination the trade are indisposed to purchase at all freely in the lines immediately affected, and consequently have been holding aloof from the Nail market, except as their necessities compelled them to purchase. The competition between the different mills is in some respects especially active, and more or less irregularity in price results. This is the case in the New York market, where prices on dock and from store are lower than usual as compared with the factory price. Small lots from store are quoted at $1.65 to $1.70.

Advices from Chicago.—Jobbers quote small lots from stock at $1.55 to $1.60. The outlook is reported very good by all jobbers, as the demand has not only increased considerably since the appearance of spring weather, but retailers have bought quite conservatively for some time and it is not believed that the country is stocked to any extent.

Advices from St. Louis.—The market continues in excellent condition. There is a heavy demand for Wire Nails and the price is being firmly maintained. With a heavy spring trade in sight, dealers are likely to find prices considerably higher before the month is out even if there is no combination formed. Jobbers ask $1.65 to $1.70, base, for small lots from store.

Cut Nails.—Unaffected by the fluctuations which have occurred in the Wire Nail market, Cut Nails continue steady. The volume of business is fair and increasing with the advance of the season. Prices in New York are as follows: Small lots from store, $1.25 to $1.30.

Advices from Chicago.—A little improvement is noted in this line, orders being rather better than during the opening months of the year. Prices on small lots are unchanged at $1.45.

Advices from St. Louis.—The Cut Nail market continues unchanged. Jobbers ask $1.40 to $1.45 for small lots from store.

Barb Wire.—The Barb Wire market reflects to a certain extent the condition of things which prevails in Wire Nails, but prices are somewhat better maintained. The demand continues good and the prospect for a large business during the season is excellent.

Advices from Chicago.—Manufacturers and jobbers report this branch of trade in good condition, shipments from factories being very heavy, while jobbers find that their customers are purchasing more freely. Small lots from stock are selling at $1.60 to $1.65 for Painted and $1.90 to $2 for Galvanized.

Advices from St. Louis.—Mills report a very heavy demand for Barb Wire and are shipping their output as soon as it is on the reels, having practically nothing to put in their warehouses. Prices are well maintained. Jobbers are in receipt of liberal orders and quote Painted at $1.70 to $1.75, with the usual advance for Galvanized.

Copper Rivets and Burrs.—In sympathy with the advance in Copper, the manufacturers of Copper Rivets and Burrs have advanced their prices until the market is now represented by discount 60 and 10 and 10 per cent. It is characterized by a firm tone.

Sheet and Bolt Copper.—On account of the condition of the Copper market the prices on Sheet and Bolt Copper are quotably higher, having been advanced ½ cent to 1 cent a pound.

Sheet Brass, Brass Wire, &c.—On account of the advances which have taken place in Copper, higher prices are named by the manufacturers on Sheet Brass, Brass Wire, &c. The quotations now ruling are represented by the following discounts, which relate to quantities of 100 pounds or more in one order:

	Per cent.
Roll and Sheet Brass	40
Patent Leveled Sign Brass	30
Platers' Metal, thinner than No. 38	40
Slitting Charges (Brass)	40
Sawing Charges (Brass)	40
Jewelers' or Gold Metal	40
Printers' 2 x 4 Sheets and Galley Sheets	40
High Brass Rods	40
Wire in Coils (No. 20 or coarser), excepting Copper Wire	40
Spooling Wire (Brass)	40
Brazed Brass Tubing	45
Brass Moldings	45
Door Rail	45
Iron Lined Brazed Tubing	47½

3000 to 5000 feet, 47½ and 5 per cent.; 5000 to 10,000 feet, 47½ and 10 per cent. discount; over 10,000 feet, 47½ and 12½ per cent. discount.

	Per cent.
Brass Segments	40
Brazed Taper Tubes	45
Angle and Channel Brass	45
High Brass Scrap	7½ cents net.
Low Brass Scrap	8½ " "
Gilding and Rich Gold Metal Scrap	9½ " "

Terms of payment, net cash 30 days, or ½ per cent. off for cash in ten days from date of invoice.

Freight paid in lots of 100 pounds or over to points in the United States on or east of the Mississippi River.

Wrought Iron Pipe.—Prices on Wrought Iron Pipe are somewhat higher this week. For retail lots, three 10's above the base discount are quoted instead of four 10's as heretofore.

Soldering Coppers.—Following the advance in the price of raw material, Soldering Coppers show an advance of about 1 cent per pound. Dealers quote them now at 16 to 17 cents.

Range Boilers.—An advance of about 5 per cent. has been made in the price of Galvanized Iron Range Boilers this week. The following are the discounts now quoted by dealers:

	Per cent.
Galvanized Iron Range Boilers to and including 52-gallon	70 and 5
Galvanized Iron Range Boilers above 52-gallon	60
" " " " extra heavy, to and including 52-gallon	65 and 5
Galvanized Iron Range Boilers, extra heavy, above 52-gallon	50 and 5

Glass.—The local market is spiritless and devoid of special features. Demand is limited, 85 and 15 per cent. discount having become quite a common quotation, and reports are current of this price being shaded. It is understood that a large Cleveland concern, jobbers of Glass, have purchased a Glass factory, at which they will manufacture Window Glass with which to supply the trade. The cause of this purchase is attributed to dissatisfaction of the course pursued by the American Glass Company toward jobbers.

White Lead.—The demand for White Lead in Oil is fair, having shown some improvement with the advent of fair weather. Prices remain unchanged. Manufacturers are accepting orders for delivery not later than May 1. This does not necessarily mean an advance, as Pig Lead values are the factor in the price of White Lead.

Red Lead.—The movement of Red Lead continues moderate, with prices firm.

Linseed Oil.—The demand for Linseed Oil is limited, but shows some improvement over the corresponding date of last month. Western and other out of town competition has a tendency to depress values.

Spirits Turpentine. —Local buying is confined to small lots, the recent speculative manipulation of the Savannah market having a tendency to restrict purchases. Buyers are covering immediate requirements only, and express confidence in lower prices for the future.

Old Rags, Paper, &c.—A fair amount of activity prevails in Paper Stock, with most grades in good demand. Local dealers are paying about the following rates for New York City delivery:

No. 1 White Rags	per lb.	2⅝ to 2¾c.
No. 2 White Rags	per lb.	1¾ to 1⅝c.
Mixed Rags	per lb.	1 c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1½c.
No. 2 White Book Shavings	per lb.	¾ to 1 c.
Light Book Shavings	per lb.	½ to ¾c.
No. 1 Mixed Shavings	per lb.	¾ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1 c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to 3/5c.
No. 1 Manila Paper	per lb.	⅝ to ¾c.
No. 2 Manila Paper	per lb.	⅜ to ½c.
Bogus Paper	per lb.	⅜c.
Common Paper	per lb.	¼ to 3/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	½ to ¾c.
Hemp Twine	per lb.	1⅜ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	¾ to ⅞c.

Old Rubber.—A fair demand is noted and prices show no quotable change. Local dealers are paying about the following figures:

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb	4 c.
White Syringes, per lb	4 c.

A London cable dispatch announces the death, on Monday, March 14, of the inventor of the Bessemer process, Sir Henry Bessemer, whose name is inseparably connected with the development of the steel industry. He was 85 years of age.

Larsen & Carpenter, dealers in Farm Implements and Fuel, Crookston and Fosston, Minn., have bought the Hardware business of the late O. E. Stovern, at McIntosh, Minn., which will be carried on there under the firm style of Larsen, Carpenter & Co. Paul Carpenter, associated with the Fosston store for several years, will take charge of the McIntosh establishment. The stock thus acquired comprises Shelf and Heavy Hardware, Tinware, Agricultural Implements, &c.

Pittsburgh COPPER AND BRASS Rolling Mills,

Second Avenue, Pittsburgh.

Special Notices.

Brass Plant.

$3000 cash will buy a small brass plant, practically new and in first-class running order. The presses are of the most modern make and everything is complete. Situated in good locality with good arrangements for power.

Address GEORGE W. ELKINS,
31 Pine St., New York City.

FOR SALE.

The Hardware, Stove and Tin business of the late George Baker of Philmont, N. Y. This is an old established business, and a first-class opening for a live hardwareman. For further particulars address

MRS. C. W. BAKER,
Executrix.

A GOOD CHANCE.

An experienced Stove Foundry man with some capital can obtain control of a well established Stove Foundry at one of the best distributing points in the West. This is a rare opportunity for a man with enterprise and some money. Address,

"STOVE FOUNDRY,"

office of *The Metal Worker*, 59 Dearborn St., Chicago.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"

office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

Special Notices.

COPPER AND BRASS CLIPPINGS, BRASS BORINGS AND TURNINGS,

Scrap Copper, Brass, Lead, Zinc, etc., of every Description.

In writing for prices kindly give description and quantity of scrap.

DETROIT SMELTING & REFINING CO.,
Detroit, Mich.

FOR SALE.

I will sell cheap an old established Furnace Range, Roofing and Jobbing shop. On leading business street. I am now manufacturing tinware and cannot attend to both businesses. A good chance for one or two men who understand the business. No charge for good will. Work coming in every day.

JOSEPH DIXON CRUCIBLE CO., - JERSEY CITY, N. J.

Approved Methods of Arranging and Displaying Hardware.

The American Hardware Store.

By R. R. WILLIAMS, Hardware Editor of *The Iron Age*.

450 PAGES. 500 ILLUSTRATIONS. PRICE $3.00.

This is the only complete work on the subject.

It gives practical suggestions in regard to the arrangement of the store—office, shelving, counters, racks, bins, sampling, window display, etc.

It describes the practice of Hardware merchants in all parts of the country, and many different methods of accommodating and displaying leading goods.

Illustrations and detailed descriptions with measurements are given so that Hardware merchants can readily adopt the methods described in the volume.

This book with its mass of practical and detailed information will be of great service–

To progressive Hardwaremen who are desirous of improving their stores;

To those who are intending to open new stores;

To those who want information as to the best methods of displaying and accommodating any given class of goods;

To those who wish to know how other merchants arrange their stores;

To those who are interested in the question of window display;

To those who are extending their business in any direction;

To those who desire practical suggestions in regard to the arrangement and sale of the different Hardware articles.

Don't grieve

when you look over your stock of tinware and realize how small a part of it, if any, is the product of your own hands. The retrospect certainly is not cheering. But instead of repining for the "good old times" it would pay you to turn your thoughts to "good old time tinware." There's where your opportunity to reclaim old trade comes in. People like tinware for cooking purposes as well as ever they did; it cooks quicker, and is not open to the objections made to vessels of iron coated with chemicals—but they don't like to buy new outfits every month or so because the tinware commonly sold is not serviceable. We can furnish the "good old-fashioned tin plates"—GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES, made by the same methods that were employed in tin plate making years ago—and you can then make tinware which will last years instead of months, and sell it at a reasonable price, with your guarantee as to its durability. Try a box of these plates, it is impossible to "overpraise" them.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Iron Bars, by the good old fashioned hand methods employed 50 to 75 years ago in making charcoal tin plates, insuring absolute freedom from pinholes. No better plate *is* made; no better plate *can* be made. For tinware or roofing they are unequaled. Send for a sample.

GUMMEY, McFARLAND & CO., PHILADELPHIA.

TIN ATLANTA TERNE

The Worcester Grade Terne Plate we are now making is a really fine plate. It has a very smooth finish. Coating is as even on the sheet as a coat of varnish, could not be more even if it was put on with a brush.

Are sorted very close.

All made from Open Hearth Steel. Are Annealed Dead soft, pliable and easy for a Roofer to work. Every sheet made with "No-Acid Flux." Boxed attractively.

We would like very much to have you try these plates. We feel sure you and your customers will be pleased with them, for they really have merit.

J. L. PERKINS & CO., - - 243 Lake Street, Chicago.

—In Europe prejudice against horseflesh as food diminishes year by year, and in France and other Continental countries great attention is given to the fattening of wornout horses for the market. European societies for the prevention of cruelty to animals are interesting themselves in the subject, and are offering inducements to farmers to utilize their spare horses for food. The substance is said to be as nourishing and palatable as beef, and in some respects authorities of the cuisine give it the preference. Every year there is more or less of a panic in regard to the short supply of beef, and in the countries which have become accustomed to its use horseflesh comes in as a substitute. In France the price of beef is from 25 to 40 cents a pound, while horsemeat may be had from 5 to 8 cents. The pot-au-feu, disused in thousands of French homes on account of the high price of beef, has, through the cheapness of the latter meat, assumed its former importance in the domestic economy of that people. In this era of mechanical propulsion an increasing number of horses are thrown out of business, and their utilization as food, if it cannot be said to open a new career to them, brings their existing one to a useful close. According to current statistics it will not be many years before the world's supply of beef will fall short of its requirements, and if relief is not found in utilizing the horse as a substitute it is difficult to conjecture where it is to be looked for, short of a general adoption of the practice of vegetarianism, which has always been the diet of the subject, and never, so far, the ruling of progressive races.—*New York Tribune.*

—Employer—"I dismissed my last watchman on account of his intemperate habits. Now, are you sober?"

Applicant—"Yes, sir; very often."—*Pick Me Up.*

THE NEW
IDEAL SLATE DRESSER.
IMPROVED FOR 1898.

Will cut **OCTAGON, HEXAGON, DIAMOND** or any other desired angle, also two sets of circle knives to cut **CONVEX** and **CONCAVE.** For ornamental work will cut and punch any sized slate from 6 to 16 inches wide and from 12 to 28 inches long and has on the bed plates figures to represent the various sizes, so that an inexperienced hand can set the machine to cut and punch to standard gauge. Will pay for itself in working 100 squares of slate.

F. R. MARKS,
Sole Manufacturer, ASHLAND, OHIO.

10-Ft. Eave Trough Rolls.

Used by the Largest Manufacturers in connection with our **all-steel Beader,** and **Slip Joint Machine.** Makes all sizes by instant adjustment.

Rolls are made of best quality of steel, heavy and well supported.

Weight,, 1,800 lbs. Capacity, with 3 men, 22.000 ft. per 10 hours.
Can be operated by Hand or Belt Power. Can make Double Bead in connection with Beader.
In construction is not a cheap affair. Price the lowest.

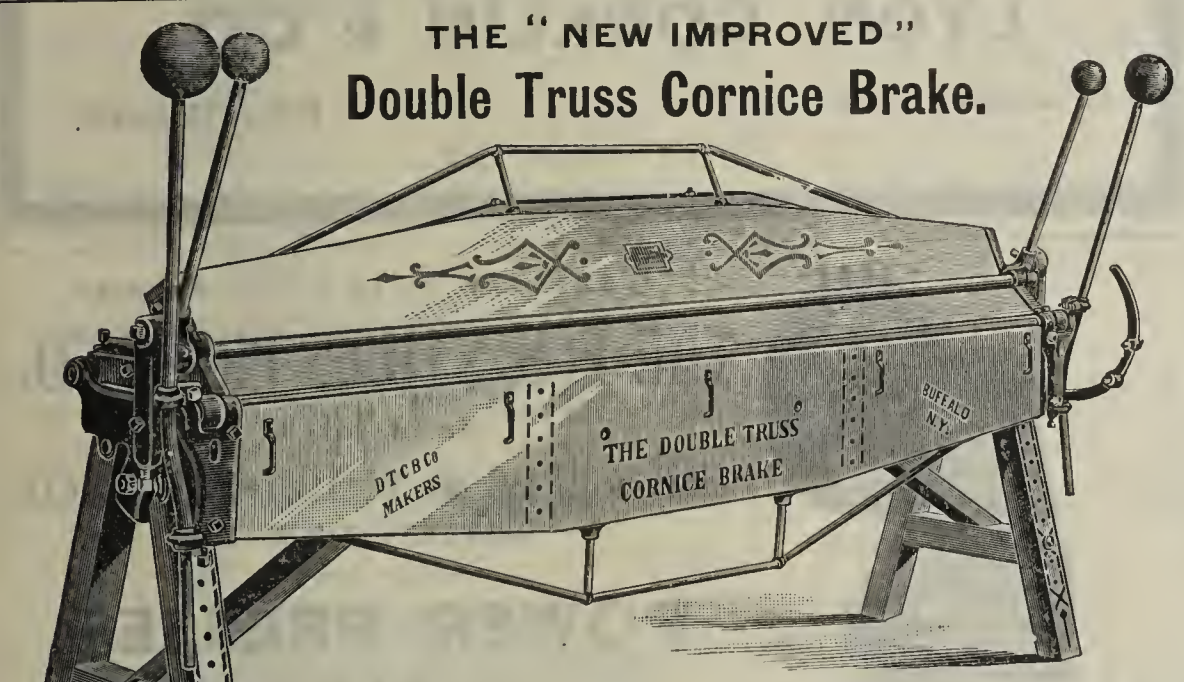
Tinsmiths' and Roofers' Tools, Shears, Presses, Dies, and Special Machinery for Sheet Metal Work.



Niagara
Adjustable Pipe Folder.

It has been found that the old style Stove Pipe Folders (Wright's, &c.) cannot be relied on to turn locks of even and uniform widths. The Folder herewith shown overcomes this difficulty entirely. The edge of the sheet is inserted and clamped the same as usual. It is folded by swinging the bar and blade, between which the material is clamped, towards the operator, and while passing the upper edge of the frame the material is bent around the folding blade. To prevent the edge of the frame from being worn off, a steel rod is inserted to protect it. This rod can be renewed at a trifling expense.

The Niagara Adjustable Pipe Folder is sure to produce a lock of uniform width the entire length, as variations in the hardness of the material have no influence whatever. Furthermore, the Folder possesses the advantage of having an adjustable gauge for locks from 3-16 to ½ inch wide. Length 30 inches.

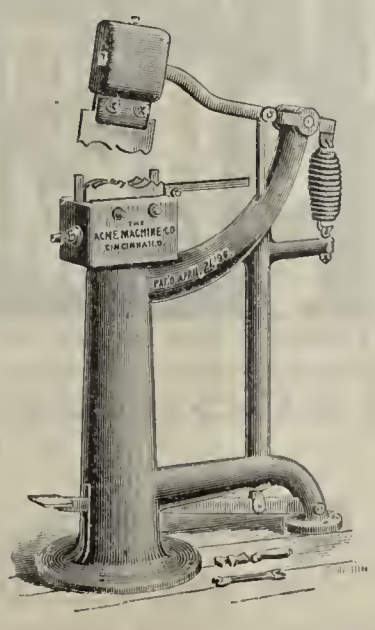
MINNEAPOLIS, MINN., Dec. 9th.

DOUBLE TRUSS CORNICE BRAKE CO.,
BUFFALO, N. Y.

Gentlemen:—Enclosed please find N. Y. Exchange for $—— to pay for Cornice Brake sent us about six weeks ago. We never paid a bill for tools where we thought we came as near getting our money's worth as we do in paying you for this Brake. The machine is all right, and all you claim for it.

The Brake is now in a distant part of this state where our men are putting in a job of large square galv. piping. Should it get in a wreck and be lost to us, we would order another just like it at once.



All the boys in the shop are anxious to know when that Brake is coming back. For our use we would rather have this than an iron one. We are, Very respectfully yours, LUCAS BROTHERS.

All Sizes from 3 ft. to 10 ft. Indispensable to Cornice makers, roofers, tinsmiths, furnace men, etc.
Send for our latest prices.

BRIDGEPORT, CONN.

—WANTED TO UNDERSTAND.—At a clinic of nervous diseases in a certain medical college of Chicago Professor B., an irritable man, was conducting. The exercises were nearly finished when an assistant brought in word of a peculiarly interesting patient who had just arrived. The attendant was eager to have the new case exhibited.

"Well, be quick about it," said the doctor, who proceeded to emphasize some previous remarks concerning the influence of occupation upon nervous conditions, which point he proposed to illustrate in the case to be presented.

The patient, an awkward Swede, having been hustled into a chair, was now confronted by Professor B., with the admonition to be brief and accurate in his replies, as time was limited.

"Now, sir, what do you do?" he began.

"Aw am not vera well."

"No! I say, what do you do?"

"Oh, yas. Aw verk."

"Yes, I know; but what kind of work?"

"Oh, eet es hard verk."

"Yes; but do you shovel" (illustrating with gesture), "or drive a car, or work at a machine, or do——"

"Oh, yas. Aw verk at a masheen."

"Ah! What kind of machine?"

"Oh, et ees a big masheen."

By this time the students were grinning broadly and whispering pleasantries, all of which caused the professor to redden and break into a volley at the poor Swede.

"Now look here, sir, I want no more of this! You answer the questions I ask you, or go home. What do you make on this machine?"

A ray of intelligence lit up the face of the Swede, and with a confident smile, he said. "Oh, now Aw understan' yo'. Yo' vant to know vat Aw mak' on the masheen. Eesn't et?"

"Yes, sir; that is it. What do you make?"

"Aw mak' 17 cents an hour," and he and the class were dismissed.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

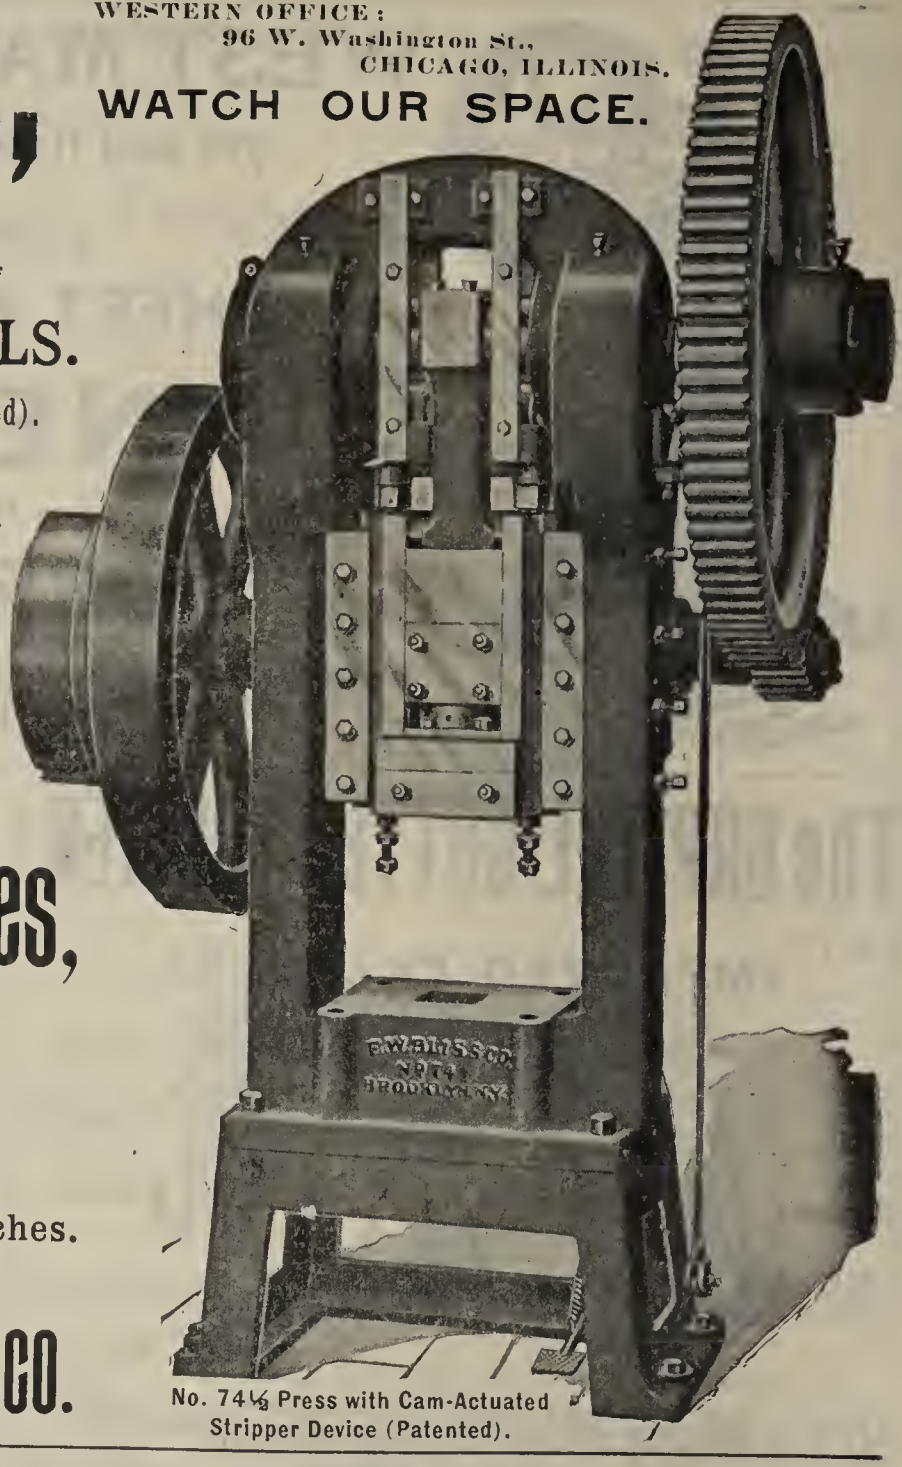
BICYCLE AND ELECTRICAL TOOLS.



No. 74½ Geared Press with Cam-Actuated Stripper Device (Patented).

It is well known that piercing dies having stationary strippers are liable to distort the plates which are pierced by them to such an extent as to require subsequent straightening. These stationary strippers are also a great hindrance to rapid and accurate work, the blank having to be placed under and withdrawn from them in a very inconvenient and time-taking manner.

By attaching the stripper plates to the stripper rods which receive their vertical motion through two cams on the shaft, a clear space is left between punch and die, enabling the operator to manipulate and observe his work quickly and accurately. The stripper plate comes down on the blank first, straightening and clamping it before the punches enter, and holding it under pressure while the punching and stripping is being done In this manner the work comes out perfectly straight and true. As the stripper plate moves up and down with the punches, they may be made shorter than a stationary stripper would admit of, making them considerably more resistant and durable.

A smaller hole in proportion to the thickness of stock may be pierced in this manner because of the close support which the movable stripper gives to the punches up to the point where they enter the stock.

Write for further particulars. Correspondence Solicited.

1847-1898.

If Interested in Steam and Water Boilers—we make a most complete line, and you should send for our Boiler Catalogue and Prices.

CARTON FURNACE CO.,

Makers of Heating Apparatus for over *50 Years,*

UTICA, N. Y.

ECONOMY

J. F. PEASE FURNACE CO.

ECONOMY

Heating Surface

is a prime feature in the **PEASE ECONOMY FURNACES.** Their capacity is not measured from diameters of pot or casing but from constructions in which those two factors stand in proper relation with heating surfaces. These surfaces are liberal and effective. In all of our soft and hard coal burning furnaces the combustion chambers are high and ample—features which permit and ensure combustion of the gases directly over the fire and provide effective heating surface at the point where its utility is unquestionably sure.

This feature is time-tested. A Furnace with limited combustion chamber may save the use of materials and thereby save costs, but in operation the gases are not consumed, and, lacking adequate surface, its power to transmit heat from combustion is curtailed.

We invite attention to the superior character of the surfaces in the *Economy Furnaces.* Our catalogue illustrates this and many other advantages and is mailed, postpaid, to dealers.

Our line of furnaces embraces every style and type necessary for hard and soft coal, coke, gas, lignite or wood. They are equipped with three patterns of grates, with or without perfected air-blast appliance, constructed of steel or cast iron to meet the requirements of high and low grade fuels. Every Furnace is provided with a handsome nickel-plated Regulator with Thermometer. Prices are right.

We shall have two new types of Furnaces ready for the trade this month.

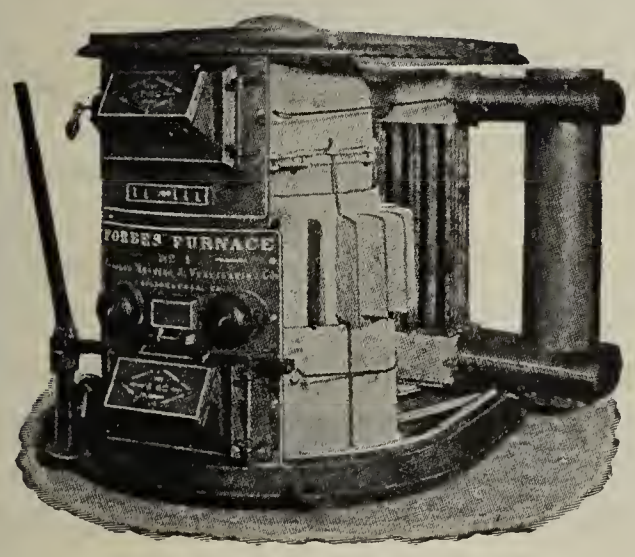
TUESDAY AND FRIDAY,
221 SOUTH FIFTH STREET,
PHILADELPHIA.

HATBORO, PA., Dec. 26th, 1896.



MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.

MY DEAR SIR :

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal.

Very truly,
I. N. EVANS.

DO NOT SPECULATE

IN

Cheap or Experimental

LINES OF

Vapor or Oil Cooking Stoves.

The average mortal has troubles enough of his own without buying those of his neighbor.

Speculation in any of the above mentioned lines will drain your purse and put you to a world of trouble.

Seeds of prudence now well sown in the selection of a line that is both complete and honest will yield a profitable and happy harvest. A good beginning for 1898 means half the battle won.

If you are interested in the handsomest line made, write for our catalogue.

EXCLUSIVE AGENCIES GIVEN.

THE SCHNEIDER & TRENKAMP CO.,

CHICAGO, ILLINOIS. CLEVELAND, OHIO.

Dealers

who desire to attract the attention in these times of their customers to the merits of their wares must of necessity have some one or more leading specialties, commonly termed "Leaders," not necessarily Leaders in price, but in intrinsic value.

The

Monarch Line

GAS AND VAPOR STOVES, ETC.,

is one of such and is more generally used for the purpose by the trade than any other similar product. Do you handle it? If not, why not?

Get our BEAUTIFUL NEW CATALOGUE and read all about them.

The Monarch Stove and Mfg. Company, Mansfield, Ohio.

BRANCH HOUSES:

67 Lake St., Chicago. 284 Pearl St., New York City. 107 N. Second St., Philadelphia.

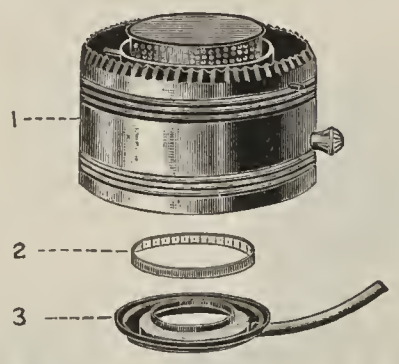
Lincoln, Neb. H. Leonard & Sons, Grand Rapids, Mich. Kiechle, Brentano & Co., Evansville, Ind.



More Orders...

have been placed for Puritan Wickless Blue Flame Oil Stoves than have been placed for any other make. Nearly every Dealer who first bought a sample has now placed his stock order and secured the agency.

What better evidence is there of the superiority of an article?

You can burn the flame low and it

WILL NOT CREEP.

Only 3 Simple Parts to the Burner.

The Puritan has no complicated mechanism, nothing to get out of order, and is the most perfect in operation of any oil stove on the market.

MANUFACTURED BY

THE CLEVELAND FOUNDRY CO.,

THE KELSEY FURNACE CO., Syracuse, N. Y.

DEAR SIRS:—Replying to your favor as to what I think of the Kelsey Generator, feel free to say that in the last 3 years I have placed some over 50 of your Kelsey Generators and they are in every case giving perfect satisfaction.

I thought so well of them that 2 years ago I took hot water out of my own home and put in a No. 24 Generator ; it is highly satisfactory and I find it most easy to operate and decidedly economical in fuel and can recommend it in every way to my trade.

Yours respectfully, A. E. GAY.

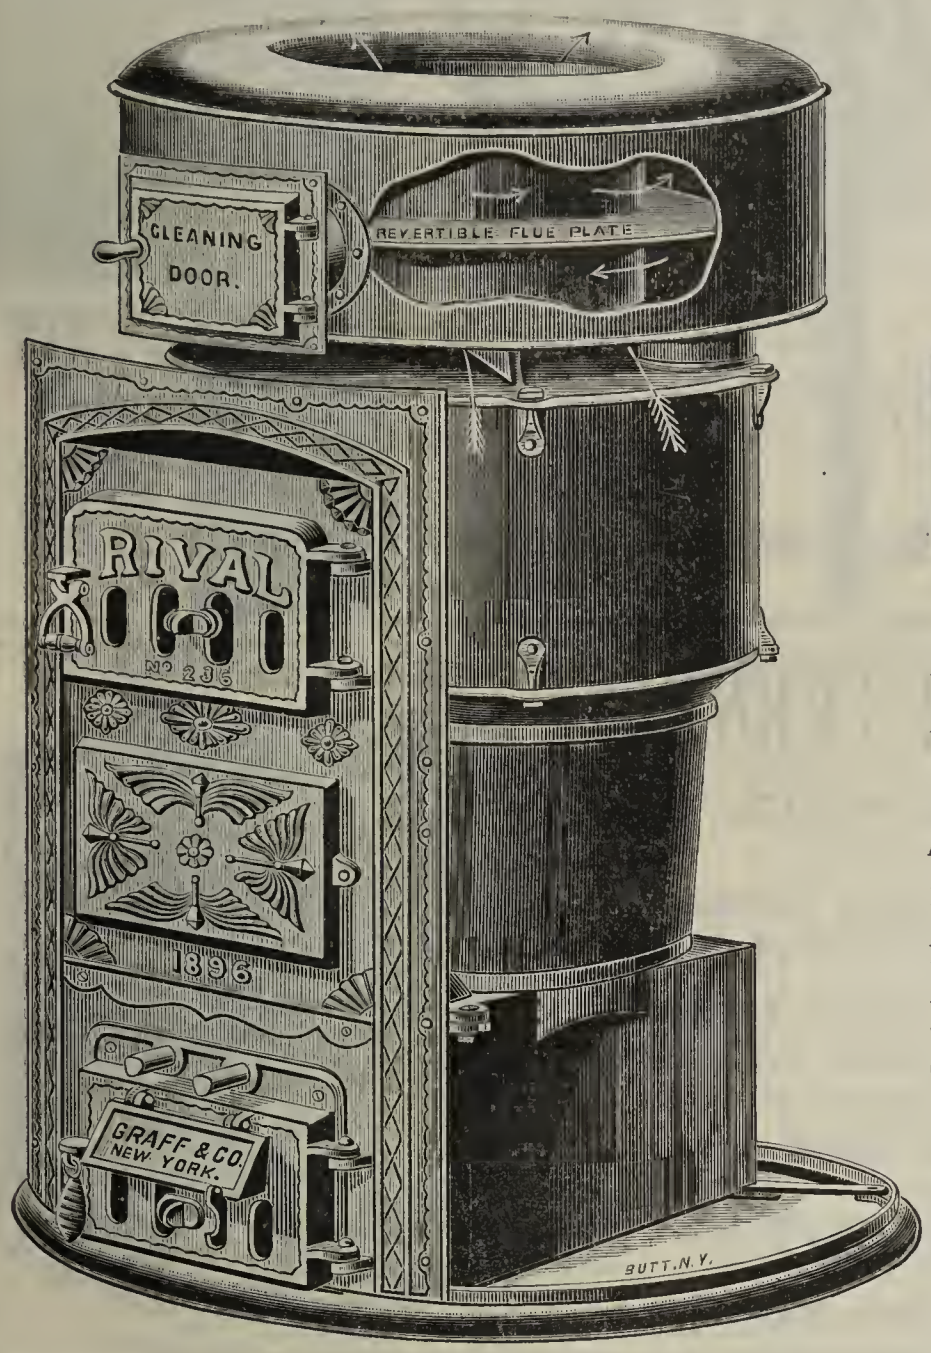
JAMES SMART MANFG. CO., Brockville, Ont., Manufacturers for Canada.

The Model Steel Range.

With New Top Closet or Mantel Shelf for 1898. The edge of shelf, the bottom edge and top edge of closet are stamped out with dies made especially for same, giving a wide oval edge, heavily silver nickeled, doing away with the "Bolted on" edges now used by other manufacturers.



The "Model" is honest in size and weight, handsome in design, noiseless in operation, durable in use, easily operated, and as nearly perfect as mechanical art can make it. It is made in more sizes and styles than any other, so you can get just what you want if you look for it.

It is all that its name implies, and "THE PRICE IS RIGHT."

The Portsmouth Stove & Range Co.

Portsmouth, Ohio.

Buslest makers of Stoves and Ranges In the world.

We Point With Pride

to this unrivalled

Rival Furnace.

Because this construction secures ***as much radiating*** surface, ***and as great heating capacity,*** and ***is as easy to control and keep in order*** as any ***high-priced*** furnace. After two years' use many dealers say they never saw a furnace that could ***outheat*** it. We can give you ***more furnace*** at a ***low price*** than can be found elsewhere. ***Try*** and ***see!***

—Buying by Sample.—A certain gentleman in this town is the proud possessor of a remarkably red nose. The term proud is used advisedly, as the owner is continually relating stories having a bearing on the brilliant hue of his nasal treasure. The following is one of them: He was in Exeter one afternoon and having completed his business, was amusing himself by an inspection of the shop windows.

While admiring some ties in a certain window, and considering whether he should speculate or not, a little girl came out of the establishment, and finally caught him by the sleeve.

"Please, will you come into the shop with me, only for a minute?" she asked.

"Certainly," answered the gentleman, following her at once. Arrived at the counter, the little one astonished everybody by remarking: "Theer, miss, muvver wants a ribbin the same color as this gentleman's nose."—*Weekly Telegraph.*

Main Offices and Warerooms:
CLEVELAND, OHIO.

Branches:
New York City, 105 Beekman Street.
Boston, - - 92 North Street.
Chicago, - - 45 and 47 Lake St.

Sole Producers of "FERROSTEEL."

TWO WORKS are now in operation by THE FERROSTEEL COMPANY—one, devoted exclusively to the manufacture of

Ferrosteel Warm Air Registers and Ventilators,

the other, to the manufacture of

Ferrosteel Special Cold Handled Sad Irons,

and "Mrs. Potts" Irons.

To facilitate distribution we have established branches at NEW YORK CITY, BOSTON, CHICAGO.

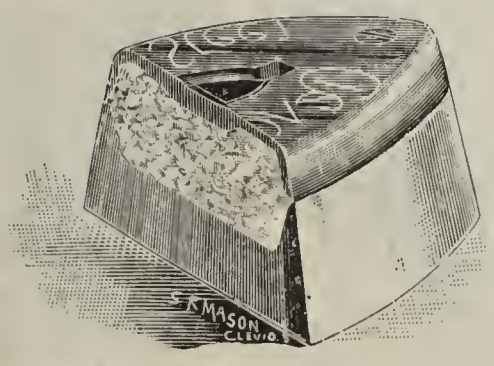
Jobbers at nearly every prominent center of trade are making a specialty of FERROSTEEL PRODUCTS.

THE

"BLUE BOOK for the REGISTER TRADE,"

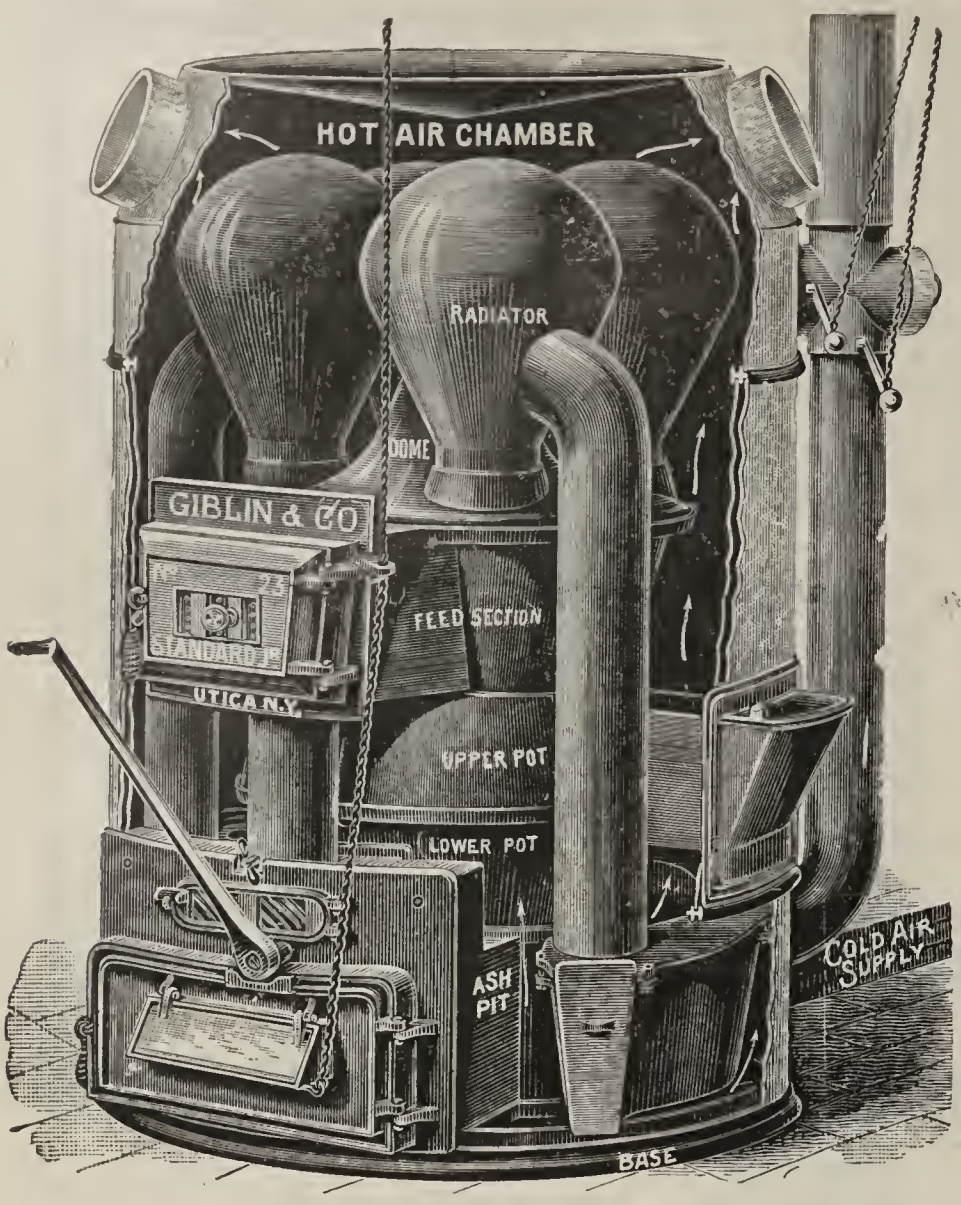
1898 Edition,

SHOULD BE IN THE HANDS OF EVERY USER OF REGISTERS.
PLEASE WRITE FOR COPY.



The No. 20 Ferrosteel Special Iron

having a smooth top is easily kept clean.



The Asbestos Fibre Lining protects the top from excessive heat and also the handle—and as the heat does not escape through the top, it is deflected to the base, thus adding to the ironing power.

The construction of the handle enables it to be easily kept clean.

The top and handle are electroplated in Antique Bronze, making finish very attractive.

Sectional Cut showing Asbestos Fibre Lining.

BUSINESS-BUILDING

to have any permanence must be based on TRUTH and HONESTY Selling furnaces if conducted in accordance with above statement will secure for the dealer a permanent and profitable business. To heat a residence or any other building requires

Intelligence
Good Materials
Honest Workmanship

to plan,

to use,

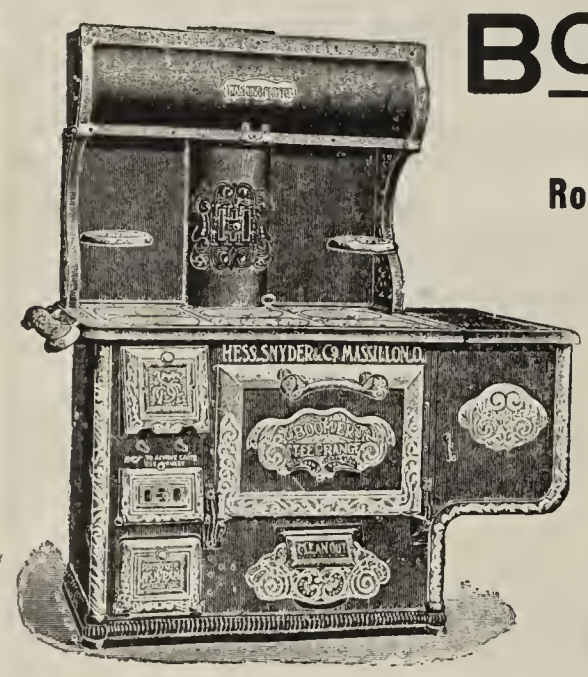
to erect.

A good furnace dealer has the intelligence and the workmanship and

WE FURNISH THE FURNACE,

that essential part of the material, and if all else is good, SUCCESS is SURE.

Intelligence, good materials, good workmanship naturally cost more than the opposites, and the best business policy is to supply these without regard to the low prices of the man across the way, who makes an assignment annually and who sells for any price obtainable.



IT IS A FACT that the majority of the failures within the past five years among the furnace dealers are those who made low prices, sold cheap furnaces, did cheap work.

THE WISE DEALER is the one who does otherwise and he is the one we are interested in.

HIGH GRADE HEATERS We can furnish at reasonable prices fully explained by our catalogue, which can be had

FREE.

THE METAL WORKER

Stove Storage Receipts.

FOR the accommodation of Stove Dealers who desire to undertake the summer storage of stoves for their customers, we have printed books of Receipts arranged on a new and ingenious plan. The Receipt to be given to the customer is on one side of the page, and on the other side is a Memorandum of the conditions, needed repairs and storage charges agreed to. *Opposite the Receipt* is its Duplicate, and *opposite the Memorandum page* is its Duplicate. When the leaf which has the Receipt on one side and the Memorandum on the other is torn out for the customer, it leaves Duplicate of Receipt and Memorandum on pages facing each other.

This arrangement has the advantage of bringing the two Receipt pages and the two Memorandum pages opposite each other, before the customer's Receipt is removed, facilitating copying and comparison, so that the Receipt and Memorandum given to the customer may *exactly correspona* with that retained by the person who receives the stove for storage.

Substantially Bound in Canvas.

H. W. JOHNS M'F'G CO.,

100 William Street, New York. Philadelphia. Chicago. Boston.

—"THIS STORY," says the Washington *Times*, "is told in relation to the recent visit of the Hon. J. D. Edgar, speaker of the Canadian House of Commons, to Speaker Reed. After Mr. Reed had escorted his distinguished guest through all the interesting portions of the House end of the Capitol, on the gallery and House floors, they descended to the basement, explored the different departments, and even went down under the terrace. Leaving the terrace they clambered up the stairs, instead of going back to the elevator. 'We will now enter the rotunda,' said the Speaker, 'and go from there to the Senate, for I want you to meet Vice-President Hobart.' To this the guest acquiesced. Gaining the rotunda, Mr. Edgar expressed a desire to look at the pictures, and in doing so they made a half-circle of the place, and, preoccupied with thoughts of entertaining his guests, the Speaker did not notice that when they entered the corridor it was the one leading to the House. This fact did not dawn on him until he stood directly in front of the main door, which a messenger opened to admit him. Gazing about in amazement, the Speaker exclaimed: 'Bless me, if this isn't the House,' and turning with a comical twinkle in his eye to Mr. Edgar, he added: 'It's no use; I've been trying to get to the Senate for twenty years, and I fall down each time.' "

—THEY DON'T COUNT.—"How many children have you?" asked a constituent of his Congressman.

"One."

"My wife told me that you had three."

"Oh, yes, there's the twins, but they're paired, you know."—*Exchange.*

PRACTICAL HINTS
—ON—
JOINT WIPING,

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

The Climax Ratchet Stock.

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

ART OF COPPERSMITHING.

A PRACTICAL TREATISE ON WORKING SHEET COPPER INTO ALL FORMS.

By JOHN FULLER, Sr.

Size, 10 x 6½ inches; 327 pages; 474 engravings. **Price, $3.00.**

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author has acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are 474, and which add much not only to the interest but the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details.

Fig. 107.—Planishing Tea-Kettle Side.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea-Kettles; Oval Tea-Kettles; Beer Mullers; Funnels; Coffee Pots; Saucepans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set for Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

DAVID WILLIAMS COMPANY, Publishers, 232-238 William Street, New York.

—WONDERFUL RESOURCES—It was a Saturday afternoon train out of town, and the smoking-car had a half-dozen fishermen bound for Cedar Lake. Each man had an array of tackle and a moist cheesecloth bag, within which something was wriggling and kicking.

"What's in there?" asked the man with an undergrowth of whiskers of one of the fishermen.

"Frogs."

"Where in Sam Hill did you ketch any frogs here in Chicago?"

"I bought them."

"Whereabouts?"

"Up at one of the big department stores."

"You git out! You didn't, did you?"

"Certainly. You can buy frogs for bait up there—25 cents a dozen."

"Well, doggone! I guess you can get most anything at one o' them big stores, if the truth 'uz known."

"That's right. While the girl was picking out the frogs for me I went down to the floor below and had a tooth pulled."

"Well, I swan!"

"Then I had a little time to spare, so I took a bath"—

"Right in the store?"

"Certainly. They have a bath department in every store. Then I got a man to mow the grass up at my house."

"You did?"

"Yes, and paid my taxes. You pay your taxes on the same floor that you get the baths. They're convenient, those department stores. When I got through with all my other business I found I had about twenty minutes to spare, so I took a bicycle lesson.

"They let you take wheels, eh?"

"No—ride on the roof. They've got a quarter-mile track on the roof. There must have been fifty people up there riding to-day."

"Say"——

"That's a fact! You can do anything at a department store. Now, just before I left to-day I applied for a divorce from my wife."

"You go plumb to grass!" exclaimed the inquisite man, and he moved to another seat.—*The Chicago Record.*

—CONSIDERATE.—"Here's an account of a Colorado girl who climbed to the top of Mount Popocatapetl and sang "The Star-Spangled Banner."

"She had some sense, didn't she? It's too bad some other girls are not as thoughtful when they want to sing."—*Chicago Post.*

—THE TORTOISE AND THE HARE.—"You remember the story of the tortoise and the hare, and who won the race?"

"Of course, but I see nothing strange in the finish. The soup always does precede the entrées, doesn't it?"—*Cincinnati Enquirer.*

The Business Situation.

The Cuban question has been the topic of overwhelming interest during the week in business circles. The existing uncertainty and the apprehension of an outbreak of hostilities with Spain occupy the public mind more and more as matters seem to be approaching a focus. Naturally enough, the business of the country has been affected to a considerable extent by the prevailing excitement. Buyers and investors are holding off pending developments, and projected enterprises are delayed until something definite is learned as to the outcome of the present difficulties. The shadow of a possible conflict has had a distinctly depressing influence on the speculative markets, where the volume of business has shrunk to almost insignificant proportions in the past few days. Securities are weak and declining, even Government bonds falling sharply. Wall street is nervously awaiting the publication of the "Maine" report and a definite announcement of the policy of the Administration, which are looked for within a few days. The large engagements of gold for import, amounting to about $30,000,000; the continued heavy export movement of grain and other products; the unusual activity of home trade, and the splendid showing of railway earnings are all for the moment overshadowed by the absorbing factor of a possible appeal to arms. Meanwhile the situation, outside of the "war scare," is in every way encouraging. The movement of merchandise is growing as the season advances, the volume of bank clearings showing a gain of about one-third over last year's figures. In the West and Southwest a very large and satisfactory trade is reported, although transportation has been temporarily impeded by blizzards. The East, however, seems to be more affected by the prospect of foreign complications and is less forward than the other sections of the country. The iron and steel industry is very busily employed and large orders are being placed right along, while prices of Bessemer pig, gray forge and charcoal iron are all slightly higher. The consolidation of the Western wire rod interests, which is practically completed, tends to firmness in the lines affected. The metals are all firm, copper conspicuously so, but the volume of business in this department has been hardly as great as last week. Money continues cheap and the reserves of the banks are again mounting up. Collections are referred to as generally satisfactory.

Permanent Exposition of Manufactures in Peru.

On March 20 there was opened at Lima, Peru, under the auspices of the Government, a permanent exposition of manufactured articles designed to exhibit the latest improvements in machinery for agricultural, mining and manufacturing purposes, such as may be suitable for use in Peru. The exposition will also embrace all kinds of novelties for domestic use, also for water service, lighting, transportation, or, in fact, any new inventions or devices applicable to the country. The exhibitors are allowed space free of all charges, and all goods imported for the exposition and which are not sold after being exhibited will be transported to Callao gratis. It is reported that the European manufacturers have already availed themselves freely of this opportunity for increasing their trade in Peru, and in order that the United States may also share in its benefits Frederick Bergmann, Peruvian Consul-General in New York City, has announced that he will forward, free of charge, to Lima any small packages that manufacturers or merchants may desire to send for exhibition. Mr. Bergmann, whose address is 15 Whitehall street, New York, is also ready to furnish manufacturers with all information regarding the enterprise.

Activity Among Iron Founders.

A most encouraging feature of present business conditions is the increasing activity of foundrymen. Although every one connected with the iron trade has for a long time been apt to consider his own line as most seriously overdone, yet the foundrymen have perhaps had the hardest struggle to make both ends meet. That they have often not met is shown by numerous vacant jobbing foundries scattered all over the country. But for some months the tide has been rising in this as well as in other branches of the iron business. Foundrymen have learned that they were not wholly forgotten, and their services have been more and more in demand as the country wakened up to general industrial activity. The pipe foundries are not so well employed as they might be, but they are about the only class really suffering for lack of work. On the other hand, the malleable foundries are the most rushed, the demand for malleable castings being unprecedented. The makers of all kinds of specialties are also crowded, while the jobbing foundries everywhere are well employed. For the first time in years a considerable expansion of founders' facilities is being made. Idle foundries are being leased, or additions are being made to old works, while new undertakings are projected.

The foundry is such a universal expression of the iron trade, a more or less pretentious molding shop being found in even the smallest towns, that much significance can safely be attached to the increasing demand for its products. When the little foundries get busy, it means the widespread prevalence of prosperous conditions. Stinting economy has given way to something like generous indulgence. Repairs are being made to machinery, farmers are undertaking

improvements, manufacturers and merchants are stocking up more liberally, and the foundryman comes in for his share of the general improvement.

Manufacturers of foundry pig iron have excellent reason to feel hopeful over the reports which they are now receiving from their customers. The demand for such iron has for some time been less than the supply, and prices have therefore drooped. But unless the reports are wholly misleading, and the consumption is much below what it is represented to be, the time is near at hand when the output of foundry iron will not more than meet the requirements of the foundry trade. —*The Iron Age.*

International Sanitary Convention.

The International Sanitary Convention will be held at Detroit, August 9, 10 and 11. It combines the annual conference of State and provincial Boards of Health of North America and the quarter-centennial celebration of the organization of the Michigan State Board of Health. It is expected that between 300 and 400 delegates will be present. Nearly every State will be represented, as well as Canada and Mexico.

The officers of the sanitary conference are: President, Benjamin Lee, A.M., M.D., Philadelphia; secretary, J. N. Hurty, M.D., Indianapolis; treasurer, Eleazar Pelletier, M.D., Montreal. The officers of the Michigan State Board of Health are: President, Hon. Frank Wells, Lansing; secretary, Henry B Baker, A.M., M.D., Lansing.

The Detroit Citizens' General Executive Committee of Arrangements is as follows: Chairman, Henry A. Haigh, Hammond Building, Detroit; secretary, Dr. E. S. Sherrill, 270 Woodward avenue; George H. Russel, Dr. H. O. Walker, Levi L. Barbour, Dr. Leartus Connor, Dr. J. E. Emerson, Dr. Heneage Gibbes, George H. Barbour, Dr. J. H. Carstens, Dr. H. W. Longyear, Howard M. Holmes, Dr. C. W. Hitchcock, O. A. Bierce, A. A. Schantz.

Reception Committee.—Hon. Hazen S. Pingree, Hon. William C. Maybury, Dr. and Mrs. Leartus Connor, Dr. and Mrs. J. E. Emerson, Charles Buncher, Mr. and Mrs. George A. Steel, Dr. and Mrs. H. W. Longyear, Dr. and Mrs. W. P. Manton, Dr. Ben. B. Brodie, Dr. and Mrs. E. T. Tappey, Dr. C. T. McClintock, Dr. and Mrs. Geo. E. Frothingham, Dr. and Mrs. J. K. Gailey, Mr. and Mrs. H. C. Parke, Mr. and Mrs. F. K. Stearns, Mr. and Mrs L. L. Barbour, Mr. and Mrs. R. H. Fyfe.

Finance Committee.—George H Russel, Dr. H. O. Walker, C. B. Hubbard, Dr. J. H. Carstens, Bryant Walker.

Entertainment Committee. — Dr. Leartus Connor, George H. Barbour, Dr. H. O. Walker.

Gold from the Sea.

Some time ago it was announced that a company had been formed for the purpose of extracting the gold which it is claimed exists in solution in the waters of the sea. The idea was generally received at the time with more or less levity by the public and placed in the category of the Keely motor and other equally fantastic discoveries. Nevertheless the projectors went ahead, and, under the name of the Electrolytic Marine Salts Company, built extraction works at North Lubec, on the coast of Maine. This week the Government Assay office in New York City received the first consignment of precious metal alleged to have been produced there from sea water. The assay of the ingots received, which weighed 92.2 ounces, showed 0.317½ of gold, 0.634 of silver and the rest base metal. The gold contained in them was found to be worth $599.61, and the silver worth, at the present market price, $32.19. How much capital was expended in securing this return is not stated, nor what amount of time and labor. But if the metal sent to New York from North Lubec is what it claims to be, the product of sea water—and the genuineness of its origin does not appear to be doubted—the original proposition of the projectors of the scheme seems to be proved. It is on record that the assayer of the mint at San Francisco, Cal., some years ago experimented with sea water taken from the bay, and found that a ton of water yielded 4 cents' worth of gold. Thus it would have required the treatment of nearly 15,000 tons of water to furnish the North Lubec gold. At this rate there is no reason to expect that the ocean will prove a serious competitor to the Klondike at present.

A demand is reported to be growing up in England for American slate mantels, which are said to be meeting with considerable favor on the other side.

The Boston Mechanics' Exhibition.

The Massachusetts Charitable Mechanic Association of Boston has issued the prospectus of the twentieth annual exhibition, which is to be held in October and November of this year.

The association was organized in 1795, by master mechanics of "the town of Boston." Paul Revere, the famous Revolutionary patriot, was its first president. With the passing years it grew in numbers and influence, and improved in its methods of work. In 1812 it commenced its charitable work, which still continues. In 1818 it gave its first prize for mechanical excellence, followed for some years by awards for sundry mechanical works, but it was not until 1837 that it commenced holding exhibitions of industry, skill and art with regularity. Since that time they have been held triennially, increasing in importance and popularity with both exhibitors and visitors. For many years they were held in the hall over Quincy Market, which was in time outgrown, and in 1881 land was purchased and the present building erected. The lot covers 110,000 square feet, and the building occupies nearly the entire area. In the basement, which is high, dry and light, are located the boilers, engines, dynamos and other machinery, with long lines of heavy overhead shafting. The building is divided into three sections. That at the corner of Huntington avenue and West Newton street is known as Grand Hall, with a floor surface of 150 x 200 feet, with two balconies. This is the largest hall in New England and is occupied for all the largest meetings held in this city. The center section is known as Exhibition Hall, covering 40,000 square feet. On the balcony floor is Paul Revere Hall, 50 x 90 feet, with spacious adjoining apartments, besides Talbot Hall, the kitchen, &c. In the Administration section are located Russell Hall and the offices of the association.

The Board of Government consists of Horace T. Rockwell, president; Horace H. Watson, vice-president; Newton Talbot, treasurer; Alfred Bicknell, secretary, and the following trustees: Samuel N. Davenport, John F. Buerkel, Edward F. Porter, Henry A. Turner, Henry C. Whitcomb, Ottomar Wallburg, Charles H. Morse, Henry Hall, William L. Miller, Henry D. Dupee, John Evans and James H. Roberts.

The rules provide that the building will be open for the reception of exhibits from September 12 to October 8, the exhibition opening on October 10. Each exhibitor is required to pay an entrance fee according to the location and character of the exhibit, the minimum being $5. Power to drive machinery is furnished free, the speed of the main line of shafting being 200. The arrangement at the exhibition has been placed in the hands of an Executive Committee consisting of Horace H. Watson, chairman; Samuel N. Davenport, treasurer, and Henry D. Dupee, secretary.

The World's Spelter Production.

We are indebted to the American Metal Company for the report of the production of spelter in the world, compiled annually by Henry R Merton & Co. of London. For the past three years the output in Europe and America has been as follows:

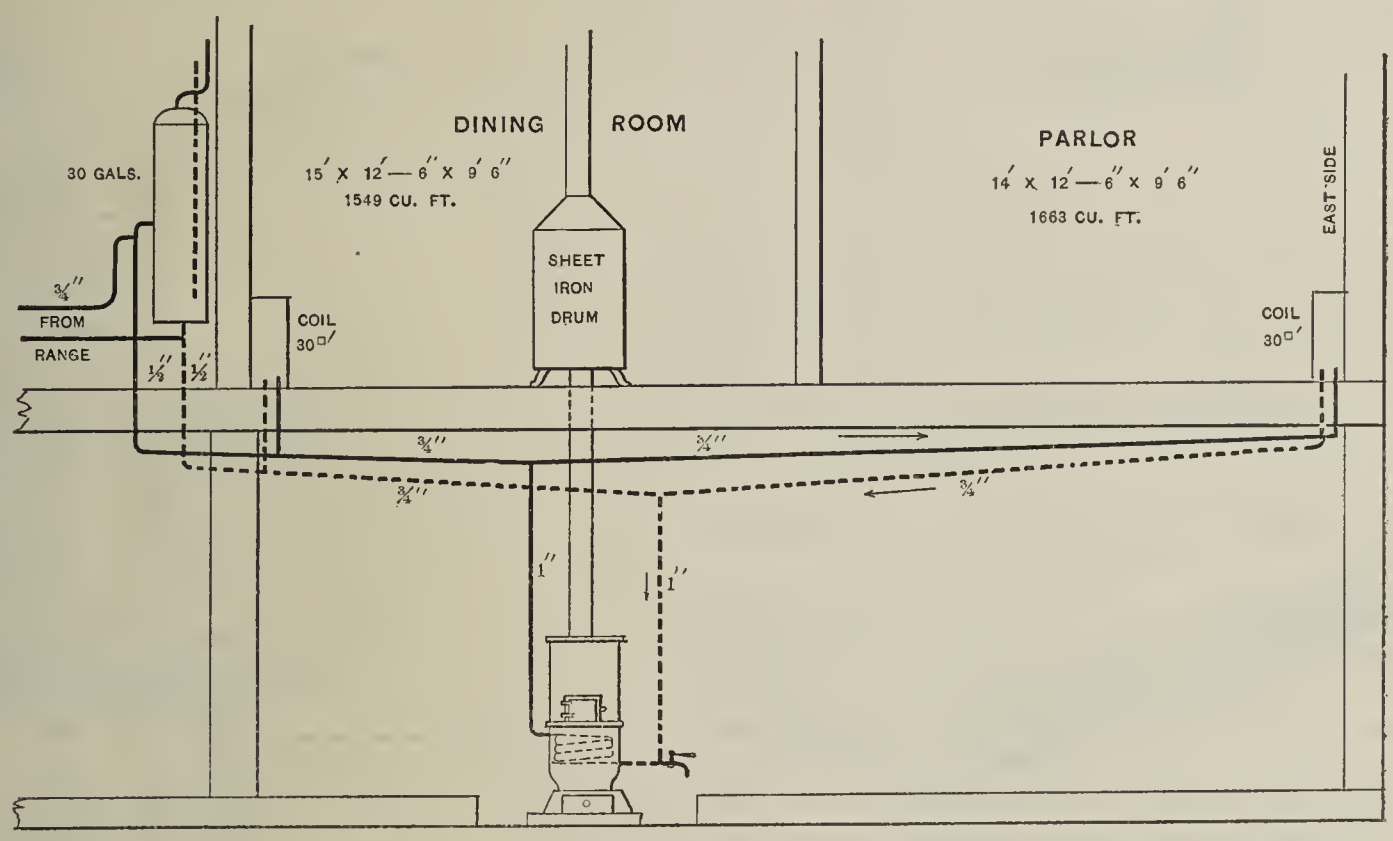
The World's Production of Spelter.

	Gross tons.		
	1897.	1896.	1895.
Rhine, Belgium and Holland	184,455	179,730	172,135
Silesia	94,045	95,875	94,015
Great Britain	23,430	24,880	29,495
France and Spain	32,120	28,450	22,895
Austria	8,185	9,255	8,355
Poland	5,760	6,165	4 960
Total Europe	347,995	344,355	331,855
United States	88,207	73,105	78,206
	436,202	417,460	410,061

The figures for the United States are those collected by the American Metal Company.

In 1887 the production of Europe was 257,155 tons, while that of this country was 45,530 tons. The United States has therefore developed as a producer more rapidly than Europe.

The Bay State Aluminum Company, Quincy, Mass., have received a large order from the Simms-Dudley Defense Company of New York for aluminum caps and steering gear for shells for the 30 dynamite guns ordered by the Government from the last named concern.



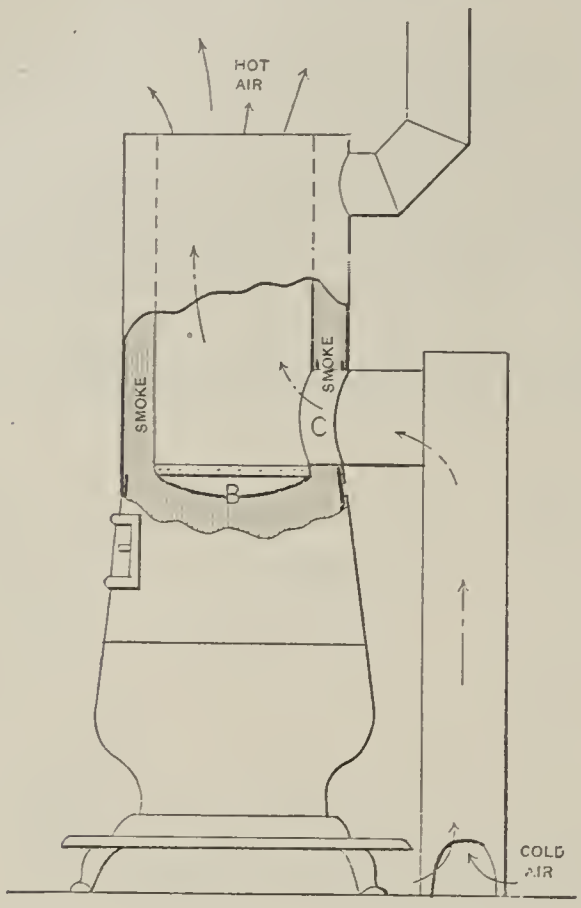
The United States Senate on Monday passed a bill authorizing the construction of eight new revenue cutters, not exceeding in aggregate cost the sum of $2,025,000.

The recent mild weather is reported to have started the breaking up of the logging camps in the State of Wisconsin at the earliest date for many years past.

THE LETTER BOX.

Heating from Stove Coil.

From G. A. L., Hamilton, Ontario.—Will you kindly give me through the columns of *The Metal Worker* some assistance with the following problem? I want to do away with the base burner stove which I have used for heating the front part of my house and which has been located in the dining room. I desire to adopt in its place some method of heating from the cellar. Being in the plumbing business, I have decided on a plan of heating with hot water if feasible, as I think it would be the most satisfactory and to me the least costly. I submit herewith a sketch of what I intend to do. Our house is a small one, the contents of the two rooms to be heated being only 3202 cubic feet. The parlor room faces the east and is 14 x 12½ x 9½ feet, and the sitting room, immediately beyond it, is 13 x 12½ x 9½ feet. To heat these two rooms I intend placing a coil in each under the window, as shown. The coils are to contain 150 feet of 1-inch pipe and will present about 50 feet of surface in each case. The supply and return pipe to each coil will be ¾-inch pipe. The coil to be placed in the stove will be made of 1-inch pipe, running around on the inside of the fire pot in such a position that when in use it will be buried in the fire. The stove I intend to use is one of the kind known as globe heaters, having a fire pot 14 inches in diameter and 14 inches deep, with a grate 11½ inches in diameter. The combustion chamber above is 14 inches in diameter and 18 inches high. To supply the system with water and to use the apparatus partially for heating the water in the range boiler I intend to make the range boiler a part of the system and the source of supply. To prevent too much hot water passing into the range boiler, which will be a little higher than the coils, I intend to connect it with ½-inch pipe with the main and return which supplies the dining room coil. I also intend placing a ⅜-inch safety valve on the hot water pipe at the kitchen sink as a safeguard against explosion should the cold water supply to the boiler be shut off at any time. To supplement the heating coil I intend to carry the stove pipe up through the dining room floor and connect it with a drum 2 feet in diameter and 3 feet 6 inches high, and carry the pipe from the drum to the chimney in the dining room. The kitchen boiler will be connected with the range in the usual way. The boiler is supplied from the city mains and carries an average pressure of 40 pounds to the square inch, although when the stand pipe pressure is put on for fire purposes the pressure is raised to 80 pounds. I want to know what amount of 1-inch pipe will be necessary to place in the stove to give satisfactory results if I connect the apparatus as shown, or can you give a rule generally for figuring the relative value of the heating surface exposed by a coil as compared with boiler surface in similar cases?



Heating from Stove Coil.

Answer.—With the assistance of the drum the amount of surface exposed by the coils will be sufficient for heating the space. The arrangement of the piping will permit a satisfactory circulation. It is quite possible that a 1¼-inch pipe for the main flow and return, and 1-inch branches from it would give better results than to use the small pipe proposed, which might, however, afford satisfactory results, as the system will circulate under a pressure. The size of the heating coil is regulated by the amount of work that it has to perform and the condition of the fire against it. In the piping and the radiating coils about 70 square feet of surface is exposed, and if the heating coil was expected to carry only the piping and the radiation it is quite possible that 11 lineal feet, or about 3½ square feet of heating surface, would answer the purpose, assuming that 1 square foot of heating surface under these conditions would heat only 20 square feet of radiation. When a coil is exposed over a clear fire so that ashes are not banked against it and the fire is kept in bright condition it has been found in a hot air furnace that 1 square foot of surface in the coil will carry 30 or more feet of radiation, but as the surface of the coil will sometimes be in contact with ashes, we have calculated that in this instance 1 foot would only be able to take care of 20 feet of surface. It has been found by experience that 1 square foot of surface in a coil will heat about half as many gallons of water as it will carry square feet of radiation, so that if 1 square foot will take care of 20 feet of radiation in the coil proposed

it would be equal to only about 10 gallons of water, and if it is desirable to make provision for heating water to this extent it means simply to add 3 more lineal feet to the heating coil. Our correspondent will find articles in *The Metal Worker* of February 9 and May 25, 1895, giving information on heating from coils in heating apparatus.

Heating Attachment for Soft Coal Stoves.

From J. F. T., Meadville, Pa.—I submit herewith some sketches of an attachment I am using on a heavy cast iron soft coal stove, and by its use I think I am more

Heating Attachment for Soft Coal Stoves.—Fig. 1.—Showing the Heating Drum.

than doubling the amount of heat that I would get from the stove without it. It will be seen from Fig. 1 that I have made a sheet iron cylinder, which on my stove is about two sheets high, and placed it on the center ring or section of the stove. Then I have made another cylinder which is placed inside of the first cylinder and of a sufficiently smaller diameter to afford ample flue space for the smoke travel between the two. The inner cylinder is of the same hight or length as the outside cylinder. The inner cylinder has a cast iron bottom, as shown at B. I make a 10-inch hole, or, rather, run a 10-inch pipe, through the two cylinders at C to admit air into the inside cylinder. To this pipe I connect a square or flat pipe of the

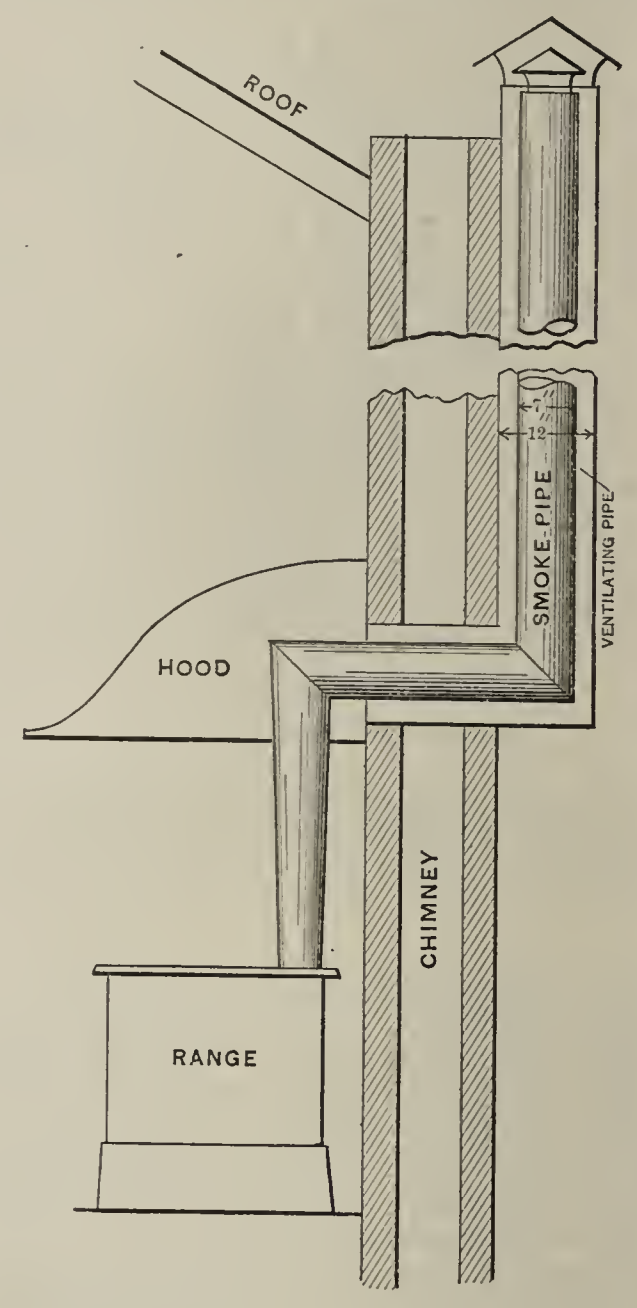


Fig. 2.—Collar Pattern.

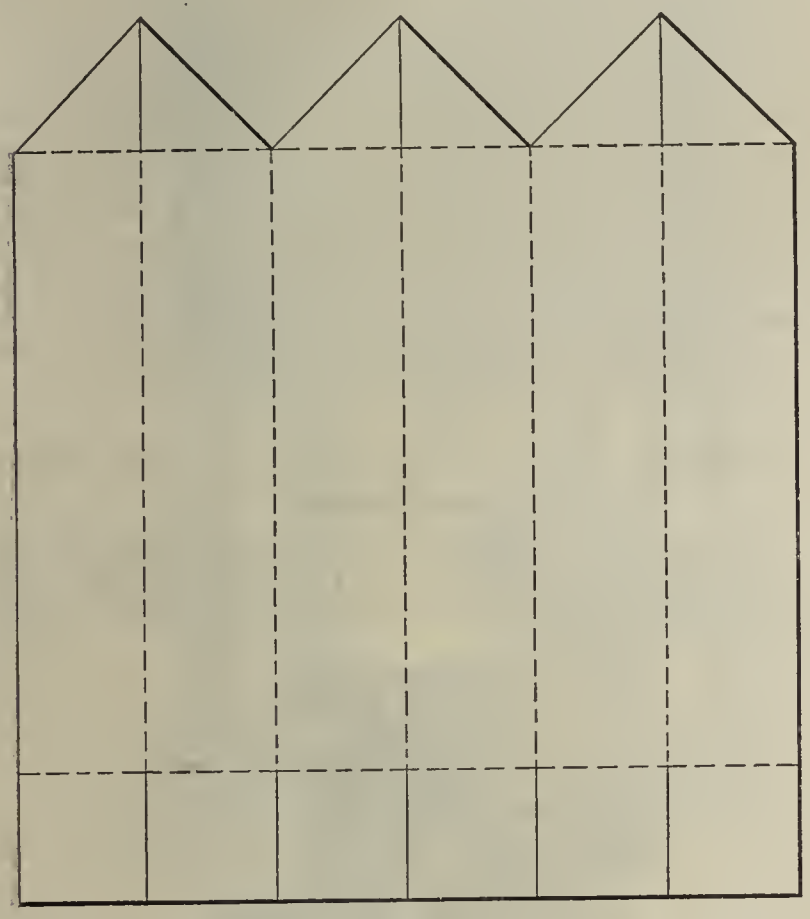
same capacity as the 10-inch opening at C and extend it down to the floor at the base of the stove, so as to take the cold air from the floor and convey it into the inner cylinder and then discharge it highly heated at the top of the stove. The flat pipe should have a sufficient opening at the floor to admit air freely. The inner cylinder should be built of heavy iron, not lighter than No. 18. The smoke pipe or collar should not be less than 7 inches in diameter when soft coal is used. I have used this attachment on an ordinary oak stove also and found that it increased the amount of heat almost double. The stove may be finished with an ornamental top of any approved style if appearances require it.

I feel certain that if any of the readers of *The Metal Worker* will go to the trouble of putting this attachment on their stoves they will find that they are amply repaid for their labor, as in my experience it has proven itself a wonderful heater. If such a stove is used for storerooms or halls the hight of the cylinders is not an objectionable feature. The hight, however, can be made to suit the fancy of the maker, but, as a matter of fact, the higher the cylinder the greater the amount of radiating surface presented. The most difficult part of the work is making a tight connection where the 10-inch pipe passes through the two cylinders at C. This is made of No. 18 iron in two pieces, so that one will slip inside the other. On each piece of pipe a collar is made, somewhat after the shape shown in Fig. 2, and a flange turned off all around. These flange collars are riveted to the two pieces of pipe so that they fit tightly up against the sheet iron cylinder and enable a tight connection to be effected. Any tinsmith who has been in the habit of making tee joints will understand how to cut this collar. Should this meet the eye of any fellow craftsman who tries it and realizes the benefit that can be derived from its use I hope that he will report his success through the columns of *The Metal Worker*.

Removing Odors from Kitchens.

From C. W., Memphis, Tenn.—Being a subscriber to *The Metal Worker* I take the liberty of asking some help in solving a problem that is giving me some trouble. I

Removing Odors from Kitchens.



desire to know how to take the odors of cooking out of kitchens. I have tried several different arrangements but they have all failed. In one case I put a galvanized iron hood over a small kitchen range and ran a 12-inch ventilating pipe through the chimney and outside of the chimney, as shown in the sketch presented herewith, above the top of the chimney at the roof. Through the 12-inch ventilating pipe I ran a 7-inch smoke pipe, as shown. The ventilating pipe was 25 feet high, but it failed to work. If any of the readers of *The Metal Worker* can give any information that will enable me to take the odor out of the kitchen I will be grateful for it.

Note.—We hope our readers will come to the assistance of this inquirer. It would seem that success should have

followed his efforts to secure a current of air from the kitchen which would have carried off the odors. It is quite possible that the hood over the range was not as large as it should have been. The hood should extend at least 6 inches beyond the range on all sides and should not have been more than 7 feet from the floor. The connection with the hood should have been made at the highest point possible under it. The hood must have some assistance from the cook in cleanly utensils and effort to prevent the odors. It is difficult to carry off all of the odor of some foods.

Sheet Iron Molds for Lead or Solder.

From Warwick, Peterboro, N. H.—Since reading the article on fire proof roofs by William Neubecker in *The Metal Worker* of February 26 I have thought about the

Sheet Iron Molds for Lead or Solder.—Fig. 1.—*Pattern for Triangular Mold.*

trough or die illustrated in Fig. 37, of which he says: "Care should be taken to place a number of these pans between strips of wood to keep them from twisting." Now in my time I have seen fellows fussing with something or other in which to pour melted solder or lead so as to have it in strips. Inclosed you will find two paper models, which if made up in sheet iron will save bothering with sticks of wood. The model shown in Fig. 1 and 2 is probably older than I am, and I cannot remember when it was, in my 30 years of metal work, that I first

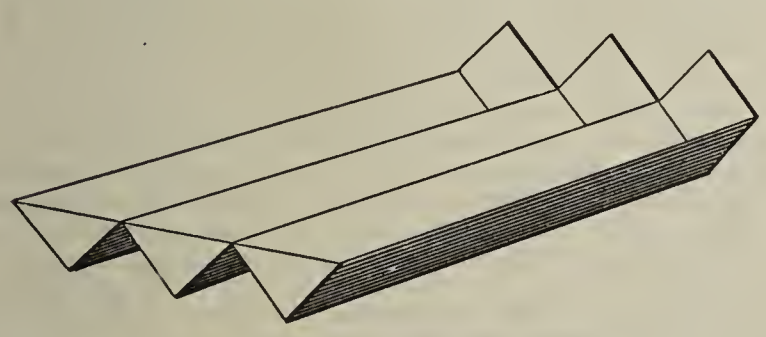


Fig. 2.—*General View of Triangular Mold.*

saw the mold which it represents. Though it is so old, yet I know there are lots of tinners who have not "caught on to it," so I send it to you thinking that perhaps you may consider it worth while to call the attention of some of the younger members of the craft to a simple and easy way of making a mold to run a bar of solder in when melting the scrap.

The mold shown in Figs. 3 and 4 is an improvement on Fig. 1 called forth by reading the article of Mr. Neubecker. I have formed one in sheet iron, and there is but little trouble in doing it. By having six or eight molds formed out of one piece they will warp or twist but little, and by placing a brick or something of moderate weight

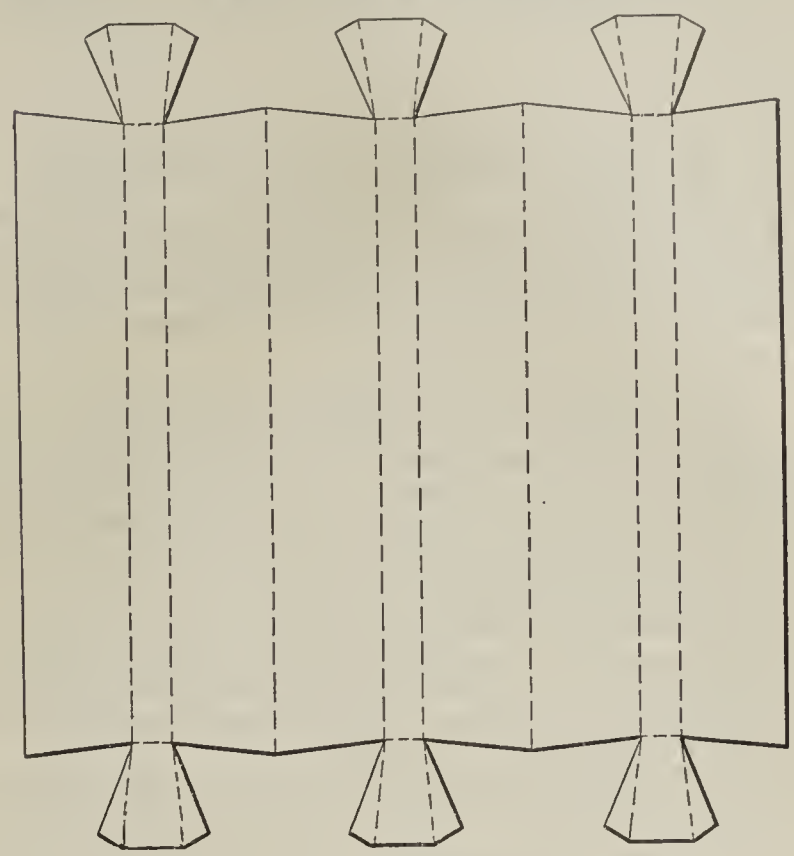

Fig. 3.—*Pattern for Square Mold.*

across the molds they will keep in shape even in 26-gauge iron. This I know because I have used a 26-gauge mold for a number of years for occasional use, the mold being made as shown in Figs. 1 and 2. The mold I use is not riveted at the ends, neither are the corners cut off, but merely bent to shape and allowed to remain so. No

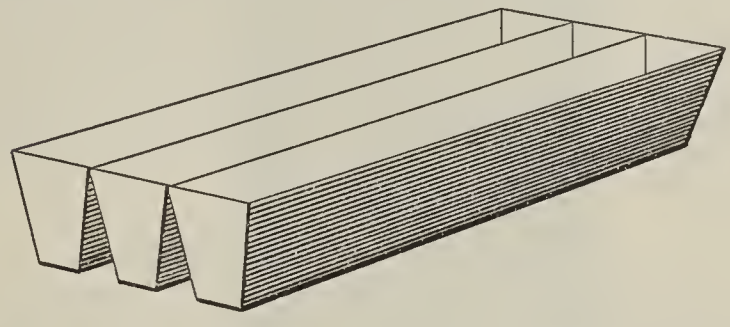

Fig. 4.—*General View of Square Mold.*

doubt it would be better to rivet the ends if using very often. Metal workers must do as other people do—that is, use their own judgment.

How to Make a Fountain Jet.

From Apache, Fort Grant, Ariz.—I have a fountain jet to make for a circular fountain about 100 feet in diameter and will be glad if some of your readers will give me an idea how to proceed.

Wanted Design for Advertising Lamp.

From W. H. R., Iola, Kan.—I want to make a street lamp for a drug firm here, to be set on top of a post and to be lighted by gas. I want it to be neat and ornamental in design, and to serve as an advertisement of my shop. Will some of the readers give me their ideas through the paper? Also can any one tell me how to make an American eagle out of metal?

Finial for Octagon Tower.

From Y. T., Chicago, Ill.—Please tell me how to strike out the pattern for a finial for an octagon tower.

Note.—If our correspondent will consult Problem 21 of the "New Metal Worker Pattern Book," he will find there the pattern for a pedestal which covers the same principles as are involved in the question he asks.

HEATING AND PLUMBING.

Plumbers' Apprentices and Trade Schools.

The Committee on Apprenticeship of the New York State Association of Master Plumbers, composed of Wm. F. Quinn, James J. Horan, Wm. Ferguson, James Temple and John J. Britt, made the following report at the annual convention at Binghamton :

Your Apprenticeship Committee beg leave to report that they have met and talked over the apprenticeship question, but at present have not arrived at any definite understanding or conclusion on the subject whereby they would be justified in presenting any resolutions to this convention for action thereon. They feel that it is a question of vital importance to the master plumber and one that should be handled with care.

The committee feel that the local associations are the proper parties to handle the question in their respective localities. However, the committee have a suggestion to make to the convention, or to the representatives of the different locals present, as follows :

That an apprentice must first serve at least two years under a master plumber before he shall be permitted to enter a trade school. If after serving two years with a master plumber he wishes to enter a trade school for a period of six months he can do so, with the understanding that at the expiration of the said six months he shall return to his former employer, providing the said employer so wishes it, and remain with said employer for the balance of a term—such term can be defined or arranged between the said apprentice and master plumber, or the local association can arrange the same, providing both parties so elect—and it is further suggested that the convention in considering this matter, and if the representatives think well of the foregoing suggestion, that some arangement should be made between the different trade schools, to the end that their applicants for tuition should have first served the required two years with the master plumbers before they are allowed to enter such school, and lastly that an apprentice should be possessed of a common school education, viz.,—that he can read and write the English language and shall be fairly advanced in mathematics.

Arkansas Master Plumbers.

The annual convention of the Arkansas State Association of Master Plumbers was held at Pine Bluff, March 14, and was called to order by President B. J. Dunn. After transacting the regular business the following officers were elected :

President, B. J. Dunn, Fort Smith.

Vice-President, Adam K. Robinson, Pine Bluff.

Secretary, J. M. Dungan, Little Rock.

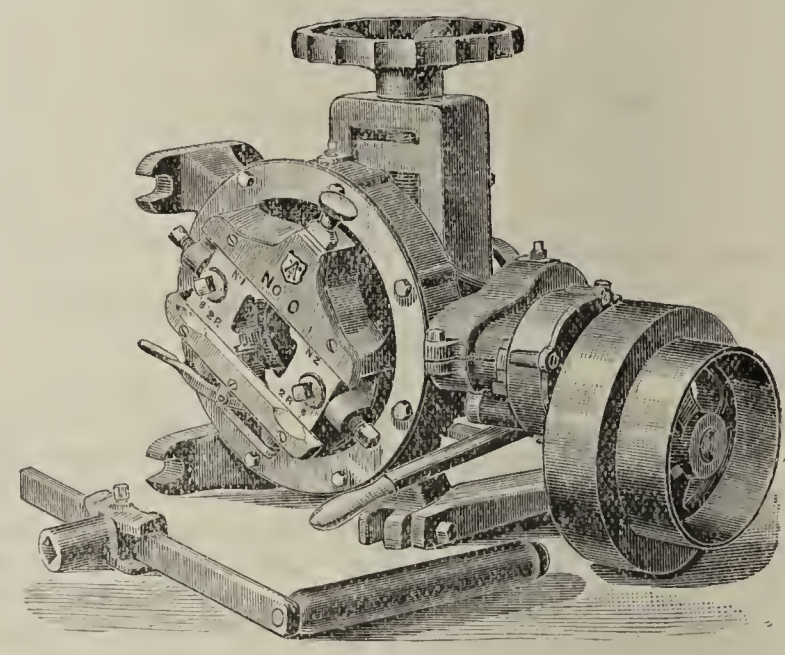
Treasurer, A. A. Mandlebaum, Little Rock.

Sergeant-at-Arms, E. Thomas, Fort Smith.

Executive Committee, N. Peay, Little Rock ; E. Thomas, Fort Smith, and M. B. Saunders, Little Rock.

Delegates to National Convention, B. J. Dunn and J. M. Dungan.

Sanitary Ware Litigation.



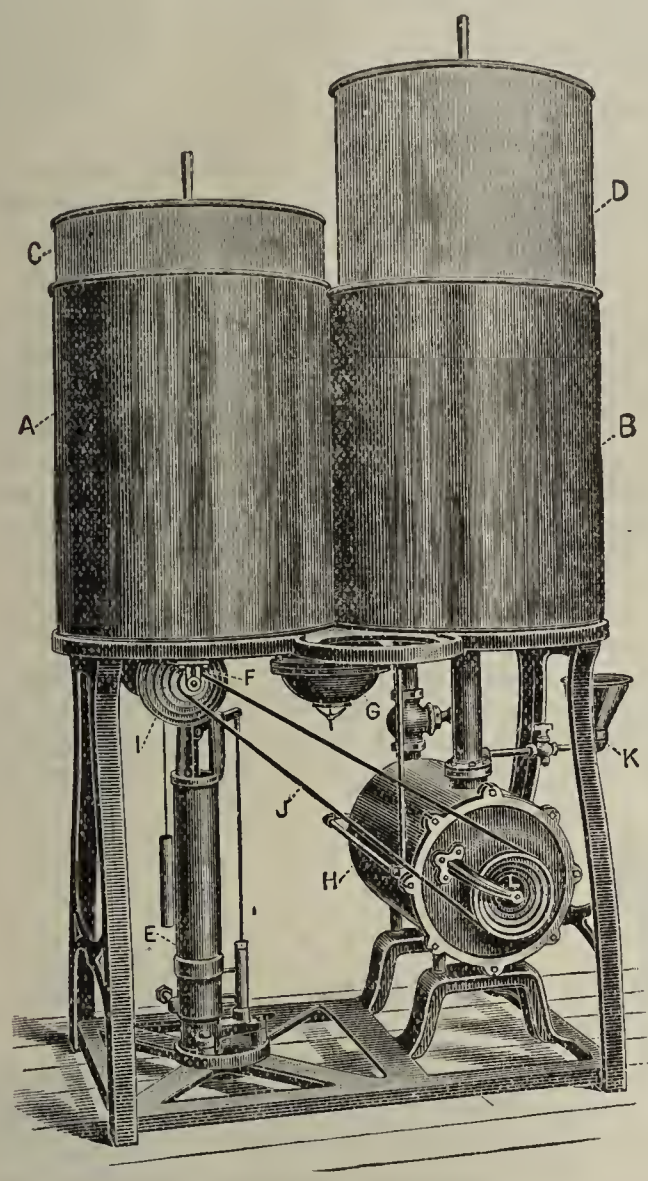
In a suit brought by the Trenton Potteries Company of Trenton, N. J., against the Oliphants to restrain the latter from re-engaging in the business of manufacturing sanitary pottery, Vice-Chancellor Grey of New Jersey filed last week an opinion dismissing the suit on the ground that the agreement sought to be enforced by the Trenton Potteries Company was in restraint of trade and otherwise illegal, and therefore could not be enforced. The Trenton Potteries Company, formed in January, 1891, bought five sanitary ware potteries in Trenton, N. J., one in Tiffin, Ohio, and one in Baltimore, Md.. All of them signed an agreement that for 50 years they would not engage in the pottery business in the United States, except in Nevada or Arizona. The Oliphants, owners of the Delaware Pottery of Trenton, received payment partly in cash and partly in stock of the Trenton Potteries Company. After a time the Oliphants became dissatisfied with the management of the Trenton Potteries Company and started the Bellmark Pottery in Trenton. The Potteries Company sought an injunction.

The suit was begun three years ago on the ground that the Oliphants had violated their agreement, and the defendants set up a claim that the agreement was in restraint of trade and therefore invalid. After hanging fire for a considerable time, the suit, on reargument, has been dismissed with costs, the Vice-Chancellor, in his opinion, saying that it is against the interest of the public that a man may be permitted to bargain away his right to earn a living and also deprive the community of the benefit it should derive from exercise of his energy and skill in business. The clause limiting the Oliphants to Nevada and Arizona to conduct the pottery business might as well have read " Within the borders of Lake Michigan and the Great Salt Lake," as coal, water and labor are as available there as in Nevada and Arizona. They were chosen simply to appear to avoid the operations of the law which makes invalid covenants in general as to space, and at the same time actually to prohibit the defendants from competing with the complainants in the United States.

The Trenton Potteries Company, it is reported, will carry the case to the Court of Appeals.

Armstrong's No. 0 Pipe Machine with Power Attachment.

The merit of the No. 0 new hand pipe threading machine, the latest addition of the Armstrong Mfg. Company to their large line of improved pipe machines, and



Armstrong's No 0 Pipe Machine with Power Attachment.

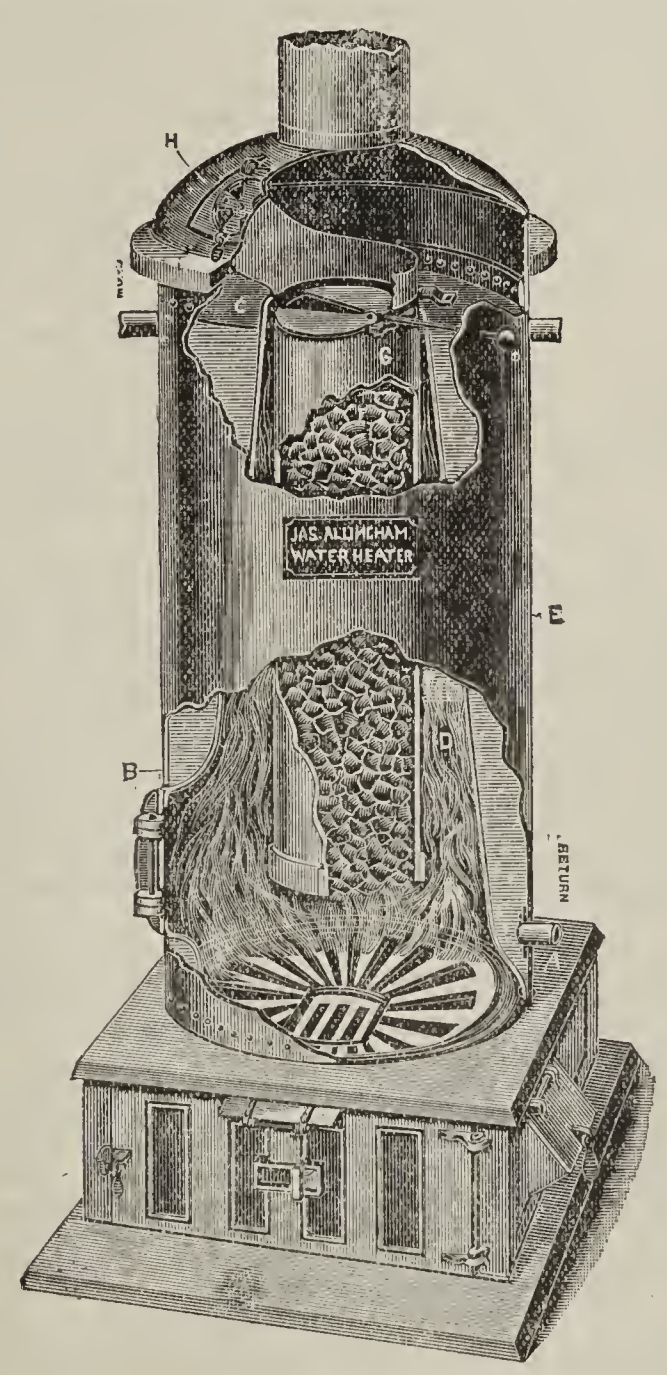
now in general use by the trade, has created a demand from mills and factories for the same machine to be run by power. To meet the market the Armstrong Mfg. Company have lately brought out an attachment which can easily be fitted to the machine and turns it at once into a power machine. This attachment is composed of an extra gear and pinion with two cone pulleys, which is slipped on the pinion of the second speed and has a stay bolted on the base to support it, making it perfectly strong. The engraving shows the machine with attachment ready for the belt. The No. 0 machine is made for threading pipe ⅛ to 2 inches and bolts from ½ inch up to 1½ inches. The working parts are all incased so as to keep them free from chips and dust. The gear of the die head does not bear on the head when revolving, and therefore does not wear loose by friction. This is considered by the manufacturers the very latest improvement on threading machines, and makes it impossible for the operator to produce a " drunken " thread. There are other features original in this machine which will be appreciated. Full particulars can be obtained by addressing the manufacturers either at Bridgeport, Conn., or 139 Centre street, New York City.

William D. Grady, a well-known plumber, formerly with J. F. Mulvey, has opened a shop at 138 Arnold street, Woonsocket, R. I.

The Gasoleum Machine.

The trade will be interested in the accompanying illustration and description of the Gasoleum machine for lighting and heating, manufactured by the Johnson Electric Service Company, Milwaukee, Wis. In the cut A and B are light galvanized steel cylinders closed at the bottom and open at the top, while C and D are open at the bottom and closed at the top, slipping down inside of A and B with their lower edges in the water. If filled with air they do not sink, but are in the position of D in the cut, the

The Gasoleum Machine



external and internal cylinders forming an air pump, G being the inlet valve, through which the air is sucked in. The air passes from D down through the vertical pipe, which enters the drum H as shown. E is a water cylinder with a piston. When water under pressure is admitted below the piston in E it pushes up the rod connected with C, raising the chamber C, and lets in air at G. When C is raised to the proper hight the water valve mechanism is reversed and the water which pushed up the piston in E is allowed to escape, the piston falling and leaving the chamber C suspended above the water with its contained air. C is more or less weighted so that it produces a pressure upon the contained air, and being in communication with D it is evident that unless D is as heavy or heavier than C it will rise in the water. This will occasion C to fall, and when it has reached its lowest limit the water pressure is again admitted to E and C forced upward. When C starts to move up D will begin to fill slightly and keep up the pressure of air. This pressure of air is very small, but it must remain constant in order to give steady light. Within the same casing with the inlet valve is another valve in the pipe between C and D, which prevents air which has once entered D from escaping back into C. Consequently all air which has been sucked in at G must go forward in one direction, keeping up a continual supply.

The drum H is a carburetor, and by mechanism not shown in the cut the air comes in contact with the gasoline in such a manner as to properly combine the proportions of air and vapor to produce the gas. If much gas is used the cylinder C will fill rapidly and mechanical movements will take place rapidly, and a greater quantity of air be carbureted in proportion. If, on the other hand, one light is used, C will fall slowly, the cone I will turn slowly and the carbureting will take place slowly through the movement communicated by the belt J and so, it is pointed out, the gas produced will be equally rich whether one light or many are burning. The gasoline is fed automatically through a pipe at the opposite end of the carburetor H. The manufacturers state that at the usual water rates of 15 cents per hundred it will cost less than 1 cent to furnish the power to produce 1000 cubic feet of gas. The standard Gasoleum machine is arranged to be conected with a horizontal galvanized steel cylinder not more than 24 inches in diameter for holding the gasoline, this tank being placed in the ground outside of the building and connected with the machine by pipes. There is also a machine with a portable tank holding 5 gallons of gasoline, three cylinders being furnished, so that in recharging it is only necessary to put on a new cylinder.

The Gasoleum machines are made in various sizes to meet various requirements, the smallest machine, it is stated, easily doing the cooking and lighting for an ordinary family, and it is also sufficient for completely lighting one or more stores of ordinary size up to a capacity of 50 lights. The larger machines are adapted to 100, 200, 300, 500 and 1000 lights. For cooking purposes it is pointed out that a gas range of four holes absorbs the capacity of a gas machine equal to 20 lights. The space occupied by the smallest machine is 20 inches wide, 40 inches long and 6 feet high.

The James Allingham Hot Water Heater.

The Rockford Grate Company, 146 to 160 Bunker street, Chicago, are manufacturing the James Allingham hot water heater, which is herewith illustrated. A portion of the heater is represented as broken away, to permit the interior construction to be more readily understood. In their description of this heater the manufacturers say that it is constructed with a cone flue, but that, unlike other heaters built on that principle, it uses no cast iron in the dome, mud ring or door frame. The cone flue in the James Allingham heater is made of steel plate, flanged out at the bottom and at the door. This, together with the steel head, allows the flue to give, and thus all trouble caused by expansion is overcome. Breaking of the calk-

The James Allingham Hot Water Heater.

ing joints, drawing of the rivets and buckling of the cone are claimed to be unknown in this heater. The cone flue construction is extremely desirable, as it enables circulation to be effected almost as soon as fire is started, because only a small amount of water is to be heated at the point where the fire is hottest. The grate construction is such that the fire is always hottest at the outer edge or point of contact with the boiler in place of the center. The ash pit is large and the draft openings are arranged to insure perfect combustion and perfect regulation. This heater

is made in a wide range of sizes, the larger sizes being self feeders, but the small sizes are made without magazines. The company have issued a catalogue in which are found a number of very flattering testimonials, including an indorsement of the United States War Department.

SAN ANTONIO AND THE NATIONAL CONVENTION.

Those who intend to go to San Antonio, Texas, as delegates to the convention of the National Association of Master Plumbers, to open April 13, will be interested in the following letter and programme from Ed. Braden, Jr., of San Antonio, a member of the National Executive Committee, which gives information as to railroad and hotel rates and the arrangement of the business sessions and the entertainments:

"Regarding the programme of our local for the entertainment of the delegates during the convention week, ending April 16, I inclose you our programme, given below, which may be changed a little, but only in minor details. The railroads in the State of Texas have given a $5 rate for the 167-mile limit, and a 2-cent rate beyond that limit as a round trip fare. There will also be a one-fare rate all over the United States for this convention. Information as to how to reach San Antonio with as little difficulty as possible I cannot well give, as it will depend on localities and conditions. I will state, however, that accommodations can be secured in San Antonio from $1 up as high as you wish to go per day, on the American plan, or from 25 cents to $2, European plan. The Menger Hotel will be the headquarters of the National Association, rates $2.50 per day to $4, American plan. The Texas State Association will have its headquarters at the Southern Hotel, rates $2 per day. The Southern League at the Manchanke Hotel. You may say to all those attending this convention that all will be done by our little but energetic local to make their stay a memorable one, and especially ask the delegates to try to reach San Antonio on Tuesday evening, April 12, so as to take part in our local concert given by the Southern League of Master Plumbers (for the prevention of disease."

PROGRAMME FOR STATE, LEAGUE AND NATIONAL CONVENTIONS OF MASTER PLUMBERS, TO BE HELD AT SAN ANTONIO, TEXAS, DURING WEEK ENDING APRIL 16, 1898.

MONDAY, APRIL 11.—Texas Association called to order at 9 a.m., at Mission Garden Hall. Continue in session until business is completed. In the evening the delegates will be entertained at Scholz Palm Garden with vocal and instrumental music, recitations and refreshments.

TUESDAY, APRIL 12.—The third annual convention of the Southern League of Master Plumbers (for the prevention of disease) called to order at 9 a.m., at Beethoven Hall. Continue in session until business is transacted and labors for the fiscal year ending are completed. In the evening an entertainment will be given by the Southern League to the national delegates, their ladies and the public.

The programme will be varied and entertaining, consisting of short addresses from prominent master plumbers, musical numbers by local talent, with orchestra accompaniments, other interesting selections and a lecture by Albert E. Hyde.

WEDNESDAY, APRIL 13.—Delegates to the national convention will assemble at the Menger Hotel, national convention headquarters, with visiting plumbers and friends, at 9 a.m. sharp. A column will be formed, which, preceded by a military band, will march to Bethoven Hall, where President Thos. P. Culloton of Chicago will call the seventeenth annnual convention of master plumbers of the United States to order at 10 a.m.

ORDER OF OPENING.—Address by Gov. C. A. Culberson in behalf of Texas. Address by Mayor Bryan Callaghan in behalf of San Antonio. Address by President Braden in behalf of Southern League.

In the evening the San Antonio Local Association will take the delegates in charge and show them a few sights worth seeing. The ladies and their friends will hold a reception in the parlors of the Menger Hotel.

THURSDAY, APRIL 14.—Morning and afternoon session of the convention. For the ladies a carriage drive to the old Missions and other points of interest, with a stop at S. W. Park for refreshments. In the evening the delegates will be given a genuine Mexican supper at San Pedro Springs Park, with music by the band. The covering of their unique banquet hall will be Southern sky. The light of the stars, assisted by mundane illuminations.

FRIDAY, APRIL 15.—All visitors will meet at 9 a.m. on Alamo Plaza, for an excursion around the city and to Fort Sam Houston. At 11 a.m. the delegates and visitors are invited to attend a calisthenic drill to music at the United States Military Post, given in their honor by the commander of the post. There will be also a dress parade at sunset. After luncheon the delegates will probably hold their final session. In the evening a promenade concert will be the main feature, but there will be other features suited to the occasion and the temperament of the visitors.

SATURDAY, APRIL 16.—Plumbers' excursion to the City of Mexico, touching at the principal cities of the Republic. Train of Pullman buffet sleepers leaves San Antonio at 12.30 noon ; spend Sunday at Monterey. Ten days of sight seeing at a per capita cost of $40. The opportunity of a life time. Three days in the City of Mexico with an excursion to Vera Cruz if desired.

NOTE.—If lady visitors choose they will be given a trolley ride to the Alamo Heights on Wednesday afternoon and to West End on Thursday afternoon.

SCHOLZ PALM GARDEN.—A FAMILY RESORT.

The beautiful palm garden is situated on Alamo and Losoya streets, with ladies' entrances on both streets. This garden is the most popular ladies' and gentlemen's resort in Texas. Those desiring to spend a pleasant evening will find this the place to get a nice lunch and hear sweet music by one of the best string bands in the city. In visiting Scholz Palm Garden, you will run no risk of meeting with tough characters such as usually try to make places of amusement their headquarters.

The Universal Bath Seat.

Buffalo Specialty Mfg. Company, Buffalo, N. Y., are offering the bath seat herewith illustrated. The seat is of solid oak nicely finished, 19½ inches long and 5½ inches wide, with rounded edges and ends. The under side is

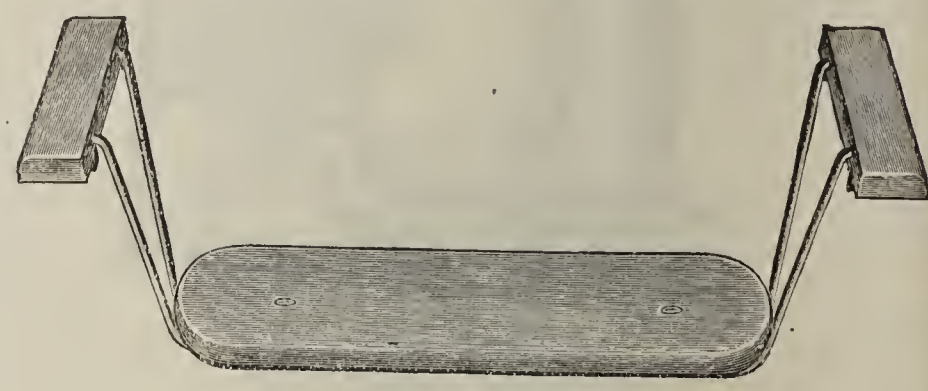


Fig. 1.—*The Universal Bath Seat.*

provided with a wide groove in which the ends of the brackets slide for adjustment to any size of tub. Each bracket is formed from one piece of tinned steel rod. They are held in position by a suitable casting and thumb nut, to insure strong and quick adjustment. The end pieces or rests are also of solid oak, with the under sides fitted with rubber strips to prevent marring the tub. The

Fig. 2.—*Bottom View of Bath Seat.*

device is referred to as light, strong, pleasing and ornamental. By the use of the seat, it is pointed out, foot-baths can be taken with ease and comfort, without disrobing, and that naturally seated while bathing the limbs and body can be readily and comfortably bathed and rubbed. It may be used by ladies as a head rest for keeping the hair from getting wet, and it is also useful when bathing children.

Fitters' Text Book.

The new edition of the Steam and Hot Water Fitters' Text Book, by Thomas E. McNeill, has just been issued. The fact that in so short a time it has been necessary to bring out a new edition of this work testifies strongly to its usefulness and popularity. The book, it will be remembered, is made up from articles published in *The Metal Worker*, and which were originally used as a course

of lectures in the steam and hot water fitting department of the New York Trade School. The instruction is given in the form of a text book by questions and answers, and carries the student along from the simplest information regarding tools and fittings up to the running of pipes, to the planning of different systems of heating by steam and hot water in the various different plans, while at the end is given information about estimating, drawing up specifications, &c. The book is a small volume of 140 pages, profusely illustrated, and can be furnished by the David Williams Company, 232-238 William street, New York City, price $1.

THE ILLINOIS STEAM FITTERS.

The Illinois Master Steam and Hot Water Fitters' Association held their fourth annual convention in Chicago on the 16th and 17th inst. The principal officers in charge of association affairs were as follows: President, T. B. Davis of Rock Island; secretary, E. C. Haas of Springfield; treasurer, John G. Roland of Chicago. The members present comprised the following:

Alton.—R. Garstang, P. J. Kane.

Bloomington.—Robert Loudon, George McIntosh.

Chicago.—R. H. Thomas, B. B. Maginn, W. D. Elwell, Thos. Hanley, Henry Mertz, Thos. J. Douglas, George Rood, Wm. Sullivan, J. L. Cook, E. M. Craig, George Dixon, F. W. Lamb, L. H. Prentice, W. E. Sloan, John J. Spear, John G. Roland, Thomas Kavanaugh.

Danville.—E. J. Ryan.

Joliet.—A. C. Dillman, E. C. Barrett, Robert Meers, George Poehner.

Lincoln.—H. Marshall.

Peoria.—J. P. Nailon, W. W. Murphy, Arthur J. Antcliff, John O'Neill, Jr.

Rock Island.—T. B. Davis.

Springfield.—E. C. Haas.

Quite a number of representatives of the craft were present from adjoining States, who had been invited to participate in the formation of an interstate league. They were formally given the courtesies of the floor.

The usual routine business was transacted, in addition to which resolutions were adopted declaring that after May 1 no bids or estimates would be submitted to general contractors, but only to owners or architects direct; that architects be requested to fix a time for opening bids, and that bidders be privileged to be present at that time, and that the bids be posted in the architects' office where all can see them; that manufacturers and jobbers of steam or hot water heating supplies refrain from making net prices or discounts from price-lists to persons not members of the Master Steam and Hot Water Fitters' Association; that manufacturers and jobbers of house heating boilers and radiators shall cease to make plans, specifications or estimates for construction work and guaranteeing or becoming responsible for construction work done by any master fitter; that a uniform contract be drawn for use by the master steam fitters of Illinois, and that steps should be taken to secure the repeal or amendment of the State lien law. The following officers were elected for the ensuing year:

President.—Thomas Kavanaugh, Chicago.

Vice-President.—A. C. Dillman, Joliet.

Secretary.—W. E. Sloan, Chicago.

Treasurer.—J. P. Nailon, Peoria.

Representative to Western League.—Henry Mertz.

Delegates to National Association.—Thos. B. Davis, Rock Island; R. Garstang, Alton; W. J. Hilliard, Elmhurst.

On Wednesday evening a banquet was given to the visitors and some other members of the trade by the Chicago Master Steam Fitters' Association, in the rooms of the Temple Club, Masonic Temple. Their hospitality was highly appreciated, and all present enjoyed themselves hugely.

WESTERN LEAGUE OF MASTER FITTERS.

During the recesses of the convention the Western League of Master Steam and Hot Water Fitters was launched by representatives of the trade from the States of Illinois, Wisconsin, Minnesota, Iowa, Missouri, Indiana and Michigan. The constitution of the Interstate League of Master Plumbers was adopted, with the necessary changes to make it applicable. Dues were made $1 per quarter. The membership will consist of three representatives from each State association, with three members of the trade to be invited from States having no organization. The following officers were elected:

President.—Henry Mertz, State and Kinzie streets, Chicago.

Vice-President.—Charles E. Hasey, Minneapolis.

Executive Committeeman.—H. P. Blair, South Bend.

Treasurer.—R. H. Thomas, Chicago.

Secretary.—T. F. Hanley, 9 Adams street, Chicago.

CONVENTION OF NATIONAL ASSOCIATION OF MASTER STEAM AND HOT WATER FITTERS.

On next Thursday afternoon the Executive Committee of the National Association of Master Steam and Hot Water Fitters will meet in their headquarters in the Wool Exchange Building, New York, for the purpose of selecting the time and place of holding the tenth annual convention. The affairs of the association have prospered in the hands of Secretary Henry B. Gombers, and visiting members are gratified with the promptness with which their business can be transacted through the systematic arrangement of the papers of the association and the classification of the various matters brought to its attention. The details of any matter are comprehensively presented to those seeking assistance or information as the result of exhaustive and careful classification made by the secretary. The effect has been a renewed interest in the association, and delegates to the next convention can report a pleasing state of affairs on their return to their locals.

THE BOILER MARKET.

The low price of house heating boilers has been the theme of discussion in the trade for a long time, and the latest cause for a revival of it is a rivalry in one of the large cities to see who can strike the lowest level. Those who have no interest in such a competition deplore the effect that the contest will have on the general market.

Boilers should be sold as an article of merit in accordance with the advantages they possess, and not as a lump of metal. The present trend, if followed to the end, will result in the consumer securing a waste of fuel and becoming disgusted with the boiler system of heating. Those who have searched find no evidence of a disposition on the part of boiler manufacturers to adopt a more business like method of selling their product than now prevails, yet there is a general conviction that the condition at present is very unsatisfactory and that it should not continue.

It is noted that while the cost of selling boilers is still too great, it is much less than in previous years. The period of introduction seems to have passed, and the buying is more natural. This is an improvement, and under it boilers should not deteriorate through unnatural competition, which seems most fierce on boilers rated less than 1000 feet, although not confined to them.

The Pierce, Butler & Pierce Mfg. Company's Show Room.

The rearrangement of the sample room of the Pierce, Butler & Pierce Mfg. Company, at 94 Centre street, New York, reflects credit on Manager F. T. Bassett, Jr. On entering the door at the left is a display of the Bremen and Reliance radiators, decorated in bronze, and along the left side are grouped samples of the Florida self feed and surface burning house heating boilers. On the opposite side of the show room samples of the Perfect and Spence hot water heaters are shown. Through the center of the show room are arranged samples of the Florida Junior steam and hot water heaters, as well as the Soleil steam heater, and at the rear a large size of the American vertical sectional boiler, adapted for both steam and hot water heating, is displayed. The company have recently issued a new discount sheet of their boilers and radiators, and

are preparing a new hand book for the trade. They are also bringing out a larger size of the Florida Junior boiler, which will have a capacity for carrying 475 feet of steam radiation and 600 feet of hot water radiation.

Chicago Delegates.

The delegates elected by the Chicago Master Plumbers' Association to represent that body at the national convention, to be held in April, at San Antonio, Texas, are as follows :

Alcock, C. W.
Alcock, J. R.
Bachtold, C. E.
Baggot, E.
Bain, L. R.
Barrett, M. F.
Baumgarten, C. F.
Bowden, Wm.
Boyd, C. J.
Boyd, T. C.
Breyer, C. C.
Breyer, Henry.
Brown, J. W.
Brunt, J. W.
Byrne, C. F.
Cannon, John.
Clark, J. J.
Coleman, R.
Connors, T. G.
Conway, Thomas.
Corboy, M. J.
Degnan, John.
Dempsey, Jack.
Denniston, J. A.
Deveney, J. H.
De War, D. F.
Donnelly, R. J.
Dornbos, Al.
Doyle, J. J.
Elliot, J. I.
Elwell, W. R.
Emblem, J. L.
Finn, R. B.
Foskett, C. M.
Gannon, John.
Geary, T. F.
Geary, W. T.
Gleason, J. J.
Hackett, Ed.
Hanley, Thos. F.
Hanson, Jos.
Heeney, J. P.
Herbert, C. J.
Hickey, A. C.
Hickey, D. J.
Hickey, J. C.
Hutchinson, B. Z.
Jaeshke, Paul.
Jesperson, C. H. C.
Kendrich, F. J.
Kurz, J F.
Larson, G. A.
Lear, R. H.
Manthie, Chas.
Martin, W. S.
Marubio, A.
Marwedel, A. E.
McDonald, M. C.
Molter, N. P.
Morris, W. J.
Mose, A. K.
Murphy, J. C.
Nacey, P.
O'Brien, J. P.
O'Malley, J. E.
O'Shea, Edw.
Page, F. W.
Powers, R. J.
Radcliffe, F. W.
Redieske, Paul.
Reilly, Jos
Roche, J. H.
Rock, D. J.
Ruh, Frank E.
Sanders, John.
Sanders, P.
Sawkins, J. O.
Scheuer, Jos.
Schmidt, Wm.
Scholefield, F. R.
Schweitzer, R. J.
Shuster, F. P.
Smillie, Wm.
Smith, J. B.
Smith, Samuel.
Stanley, Wm.
Thielen, P. J.
Thorogood, R.
Tierney, D. J.
Walsh, David.
Walsh, J. J.
Watson, A. H.
Weber, J. G
Whiteford, D.
Willems, Peter.
Wilson, David.
Zimmerman, H. R.

Quite a number of them will be accompanied by ladies.

A New Incandescent Gas Mantle.

An interesting modification of the ordinary incandescent gas mantle is being placed on the market by Huettlinger & Vivié of 101 Pearl street, New York, who are sole agents for export of the Safety Incandescent Mantle Company. Its special feature is that it is delivered to consumers in a pliable form, so that all danger of injury in packing and shipping and in the hands of consumers is avoided. When placed in position the mantle is lighted, and the gas is not turned on until the outside cover has been burned off. We understand that the manufacture is developing rapidly.

NOTES.

Irreconcilable conditions prevented the success of the recent efforts to organize the manufacturers of Radiators. The fruit of this failure is a notable weakness in the Radiator market. Houses which have heretofore held firmly to prices are now issuing, unsolicited, discount sheets showing lower prices than those which ruled during 1897, and there seems to be a disposition to find the bottom for prices. It is claimed that the smaller buyers who are out shopping are liable to secure goods for immediate use at lower rates than some of the larger buyers, who place confidence in the house with which they have traded and send their orders to be filled on old quotations. The prices for these goods are weak at a time when trade is notably slack, the latter part of March this year being conspicuous for the dullness of trade.

The strength of Wrought Iron Pipe, referred to in our last report, has not been maintained during the past week. Prices are a shade lower again. Otherwise there has been no special change in the situation as regards Plumbers' and Steam Fitters' Supplies. Brass Goods are very firm, with an advancing tendency.

Thomas Yeager & Co., Allentown, Pa., make a fine display of Plumbing Goods and Heating Apparatus to some purpose, they having done the plumbing and heating in many important buildings, among which are the Grand Central Hotel, Y. M. C. A. Building and the Salem and Trinity churches, besides setting 23 Hot Air Furnaces.

The Sieben Trap & Specialty Company of Kansas City, Mo., have filed articles of incorporation with Recorder Queal. The company have $3000 capital stock. The incorporators are Henry Sieben, the city Plumbing Inspector; Benjamin Smith, L. M. Smith and C. E. Burnham, City Attorney.

Mark Jacobs, formerly of Youngstown, Ohio, has formed a partnership with Robert Whitla of New Castle, Pa., to conduct a plumbing establishment in New Castle.

S. F. McCants and T. F. Carey, Spartansburg, S. C., have dissolved partnership in the Stove and gas fitting business. Mr. McCants now owns the business.

Daniel Hood has opened a plumbing establishment on Main street, Westfield, Mass.

Brown & Hinsdale have moved their plumbing shop from Whatcom, and are now located on Eleventh street, Fair Haven, Wash.

A. J. Erbelding, one of the leading plumbers of Augusta, Ga., who conducts a large business on Ellis street, has been awarded the contract for all plumbing work in the Court House at Jackson, Ga.

One item of the tax levy of Lynchburg, Va., reads as follows: On every plumber whose capital is less than $800, $15, and an additional tax of $1.50 on every $100 upon all capital in his business in excess of $800 and not in excess of $75,000.

Plumbers of Taunton, Mass., note that they have frequent calls to look over water services because the owners have heard from the water office that the meter shows an unusual consumption. Closets in which the valves are leaky and keep up a steady dribble are leading causes of the waste of water.

A. M. Michael of Toronto and C. M. Robertson of Montreal, Canada, wholesale dealers in Plumbers' Supplies, spent a few days last week in Pittsburgh arranging to purchase Plumbers' Supplies of all kinds.

The Master Plumbers' Association of Boston and vicinity held their annual dinner last Thursday evening with Inspector of Plumbing Hunnewell as their guest. After the banquet the following officers were elected for the ensuing year: President, T. W. Good: vice-president, D. J. Wild; secretary, H. L. Rose; treasurer, E. W. Clark.

The Dewstoe & Brainard Company of Cleveland, Ohio, have been incorporated, with $20,000, capital stock. The company will engage in the business of plumbing, gas and steam fitting, sewer building, &c. The incorporaters are C. C. Dewstoe, O. N. Brainard, Jr., G. G. Bennett, C. O. Dewstoe and W. B. Whiting.

Austin F. Lawrence is about to engage in the plumbing business in Weeks' Block, Falmouth, Mass.

Hugh Moriarty is building a store for his plumbing and Stove business, at South Manchester, Conn.

The Mexican Clay Mfg. Company have completed the installation of the Sewer Pipe machinery in their plant at Mexico City. The equipment was imported from the United States, and filled 12 cars. Already contracts have been obtained for large quantities of Pipe, one of them being for the sewer system of the city of Guadalajara. The company are composed of Ohio capitalists, with H. A. Robinson at their head as general manager of the works.

The Acetylene Generator Company have been incorporated at Chicago, Ill., with a capital of $50,000, to manufacture Gas Generators. The incorporators are H. W. Carter, A. H. Graves and Charles W. Beck.

The National Pipe Bending Company, New Haven, Conn., have recently sold the Boston Electric Light Company eight of the National Feed Water Heaters of 2250 horse-power each, aggregating 18.000 horse-power. This is probably as large an order for Heaters as has been given by any electric plant in the last year.

The Standard Turning Works, Boston, Mass., distribute as an advertising card a match scratcher, the upper part of which carries photographs of the interior of their works, showing the operations of sawing, turning and finishing. The company do all sorts of turning, including Plumbers' Supplies, such as Closet Pulls, &c.

John W. Hunt, who has been for 13 years in the employ of E. S. Hodge, at Peace Dale, R. I., has moved to Providence, where he has started a tinsmith and plumbing business.

W. C. Joy, 152 Centre street, manager of the New York office of the Titusville Iron Company, entertained President Fertig this week. Mr. Joy is drawing the attention of the heating trade to the line of Radiators made by the house by a new four-page folder which shows the Occident Radiator on the front page and the Zenith Radiator on the last page. The two inside pages contain a long list of notable buildings in which the Joy Radiators have been used, among which is the new Syndicate Building, which is to be 30 stories in hight and which is said to be the tallest building in the world. Buildings of conspicuous prominence are presented in a larger size of type, and buildings in which Joy Radiators are used, although other Radiators had previously been specified, are noted in italics

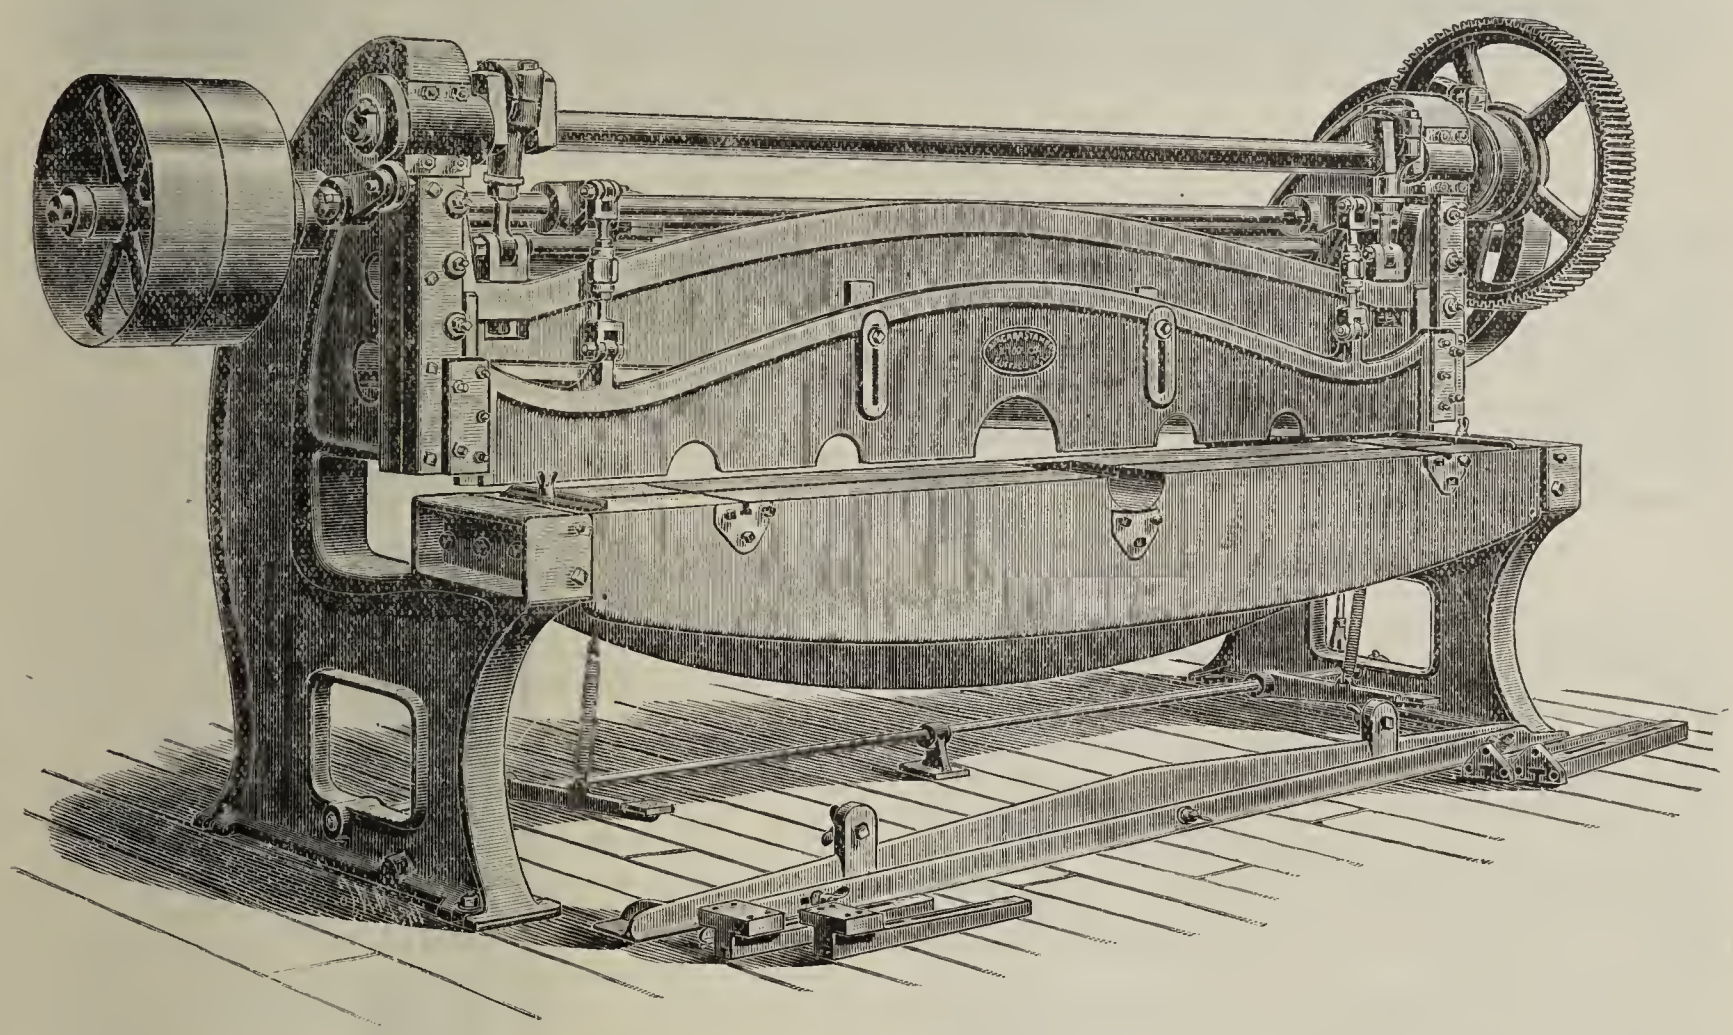
W. F. Gilling of the Boston office of the Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., is making a very fine display of the Florida and other Steam and Hot Water House Heating Boilers made by the company, and also their Radiators. He was visited this week by Manager F. T. Bassett, Jr., of the New York house.

Max Berger of the Plumbers' Examining Board of Long Island City is about to embark for the Klondike.

Manager John I. Leitch, 206 Centre street, New York City, is displaying on his sample floor one of their Empire Radiators decorated in white enamel and gold bronze, which gives a very handsome effect. This is one of the latest productions of the Standard Radiator Mfg. Company of Buffalo, N. Y., and possesses much to attract the heating contractor and his customer.

Thomas Kinney will open a hardware and plumbing establishment on Main street, Plymouth, Pa.

Peterson Bros. and McGregor & Waddington, two plumbing firms at Bloomington, Ill., have dissolved partnership. Out of the dissolutions a new firm will appear, to be known as Peterson & Waddington.



Joseph Raycraft has opened a plumbing shop at Beardstown, Ill.

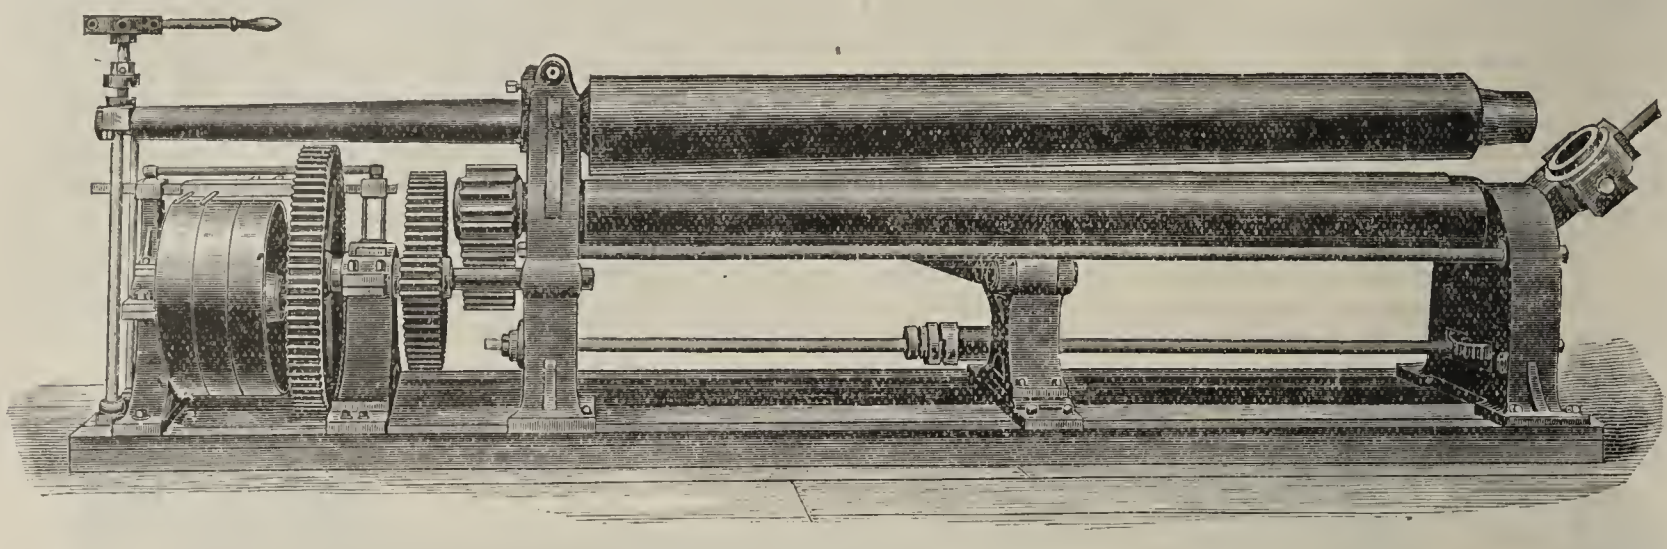
L. D. Ballard, formerly a member of the firm of Adams & Co., Mohawk, N. Y., has started in the plumbing, tinning and steam fitting business in that town.

The Sanitary Specialty Mfg. Company, now at 68 and 70 West Lake street, Chicago, will remove May 1 to a double front building, 55 and 57 Clinton street at one end and 24 to 30 Milwaukee avenue at the other. The entire building, which is a three-story brick structure, will be occupied by this company. The location is but a short distance from their present quarters.

The Niagara Power Gap Shears.

The accompanying cut shows a power squaring shear with a cutting length of 10 feet, recently put on the market by the Niagara Machine & Tool Works of Buffalo, N. Y. It is intended for cutting iron and soft sheet steel up to 3-16 inch in thickness, and, owing to the gap in the housings, sheets of any length can be trimmed and split up to 15 inches from the edge. One of the principal innovations on the machine is an arrangement on the clutch that controls the motion, by which it is coupled in a positive manner to the gear wheel, thereby preventing the heavy cross head from dropping ahead of the wheel on account of its weight. This construction does away with counterweights or the undue brake pressure, which are usually employed to overcome this trouble. The hold-down works in lateral guides in the housings, and is actuated positively by means of a cam from the double crank shaft. Besides the bed a heavy transverse bar that serves at the same time as a support for the driving shaft connects the two housings. All working parts are provided with means for taking up wear. The manufacturers make similar shears with a cutting length of 8 feet.

The Niagara Power Gap Shears.



The British naval estimates for the fiscal year 1898-99 embrace a total appropriation of $118,890,000, an amount which has never been exceeded even in war time. The estimates provide for an addition to the personnel of the navy of 6340 men and for the building of three new battle ships, four amored cruisers and four sloops of war, also for making great extensions of the docks at Gibraltar, Portland and Dover. Surveys are also in progress for works at Bermuda, Jamaica, the Island of Mauritius and the Cape of Good Hope.

John H. Foy of Pottstown, Pa., is reported to have been awarded a contract for constructing a sewerage system for the entire city of Guadalajara, Mexico, for which about 100 miles of pipe will be required. The contract is said to involve about $1,660,000.

A strike which threatens to extend to every branch of the building trades in St. Louis, Mo., is reported as likely to come off on April 1. The step has been decided upon by the Bricklayers' Union, numbering from 1000 to 1500 members, who are threatened with a reduction of wages on the first of next month, and their action is supported by the local unions in the building trades.

The Wais & Roos Bending Rolls.

The bending rolls here illustrated are built by the Wais & Roos Punch & Shear Company, Cincinnati, Ohio, in different sizes and widths to suit requirements. The one shown is 10 feet 2 inches wide, with center bearing ; the lower rolls are 10 inches and the upper roll 13 inches in diameter. All are made of hammered steel. The top roll is raised or lowered exactly parallel by means of a ratchet on the end of a worm shaft, but cone shaped work may also be accomplished by disengaging the clutch so that one end of the top roll may be adjusted while the other end remains stationary. The drop housing for releasing the cylinders is made of cast steel, with swivel or tilting box which conforms with the radius and hence may be easily opened or closed by the operator. Extra heavy gearing is employed on the machine. Either pulleys for right and left belt or friction pulleys are provided, as may be preferred, or the machine may be equipped with an engine.

The Wais & Roos Bending Rolls.

American Patents in 1897.

The annual report of the United States Commissioner of Patents for the calendar year 1897 was presented this week to Congress. It shows that during the year there were received 45,661 applications for patents, and in addition a large number of applications for designs, trademarks, &c. Patents granted amounted in number to 23,729, including designs ; 65 patents were reissued, 1671 trade-marks registered and 14 labels and 16 prints. The number of patents that expired was 12,926. The total expenditures were $1,122,843 ; the receipts over expenditures, $252,798. The total balance of the credit of the Patent Office in the Treasury of the United States on January 1, 1898, was $4,971,438.

In proportion to population more patents were issued to citizens of Connecticut than to those of any other State —one to every 786 inhabitants. Next in order are the following : Massachusetts, District of Columbia, New Jersey, Rhode Island, New York. To residents of England 706 patents were issued ; to residents of Germany, 551 ; Canada, 286, and France, 222. The number of applications received for examination during the year was greater than for any other in the history of the office, yet the report says there was no increase in the facilities or force for doing the work. Applications awaiting action December 28 last numbered 11,382, due to the inadequacy of the office force. For the ten years beginning in 1840 the average number of applications was 1186, and for the eight years beginning with 1890 it has grown to 41,479 per year.

Of the applications for patents the most numerous were those directly connected with the development of electrical inventions. Inventions connected with cycles took the second place.

New Form of Rheostat.

Realizing the field for an improved form of rheostat or switchboard for controlling the current used in electroplating and galvanoplastic operations, the Zucker & Levett & Loeb Company of 526 West Twenty-fifth street, New York, have developed the multiple rheostat here illustrated. The rheostat is shown in combination with their new voltage indicator. The function of a rheostat being to regulate the current, it is essential that there be a sufficient number of steps for fine adjustment and a sufficiently high resistance, so that a single article may be plated without burning. By a new arrangement of the resistances there are in the smallest size 13 steps with 7 resistance strips and in the larger sizes 40 steps. This enables the plater to regulate the current with accuracy and to put the maximum amount of current through his work without danger of burning. The above, in conjunction with the fact that it is impossible to burn out these rheostats, makes them of value to platers doing heavy and constant work. The parts where current is carried or any heat is developed are made of slate or metal. Instead of round resistance wires flat strips are used, and are so proportioned that the smallest can be safely short circuited across the poles of the dynamo without danger.

The arrangement of the resistances is such that the large rheostats are capable of controlling the entire current of the room from one point.

The new form of voltage indicator has been substituted for the galvanometer formerly in use. This instrument is connected so as to be used in the same manner as a voltmeter, but is of simple construction and graduated in degrees instead of volts. Instead, therefore, of reading the voltage directly, as on a voltmeter, the proper deflection at which the work should be run is ascertained experimentally. Properly used, it is a very convenient and effective instrument of real value, and is in no sense the same as the old style galvanometer, which did not indicate the voltage, but showed simply the presence and direction of the current.

New Form of Rheostat.

TIN PLATES.

New Cold Rolling Method.

The cold roll equipment of the new 30-mill tin plate plant which the Shenango Tin Plate Company are erecting at New Castle, Pa., will consist of 28 cold mills, arranged in a manner which embodies a new departure in cold rolling practice. The mills are to be arranged in four trains tandem of three 20-inch mills each, with four trains tandem of four 22-inch cold mills each adjoining them. By this arrangement there will be seven separate lines of feed and each black plate will pass between four pairs of cold rolls instead of three, as has been the common practice hitherto. It is believed that a better finish will be imparted to the black plates by this method. Moreover, the lesser pressure which will be required by passing the plates through four times will ease the strain on the housings and rolls. The arrangement will involve no extra hand labor, as the feeding will be automatic.

SCRAP.

Dullness still reigns in the Tin Plate market here, although better conditions prevail in this department in the West. The mills are generally well supplied with orders and are running full, but the orders are mostly old ones. New contracts have been scarce of late. Prices are still unsatisfactory.

There is a heavy demand for Sheet and Tin Plate Bars, mills being well sold up and unable to make deliveries as fast as needed by consumers. In fact, several Sheet and Tin Plate mills have been compelled to close down for a day or two at a time until delayed Bars would arrive. The price of Bars is very firm.

A number of the Tin Plate works in the Pittsburgh district have been obliged to shut down this week, owing to the floods which prevailed in that section. Among other plants, those of the Monongahela Tin Plate Company and the Star Tin Plate Company, at Pittsburgh, and the Laughlin Nail Company, at Wheeling, W. Va., are reported to have been thus affected.

The United States Iron & Tin Plate Mfg. Company, Demmler, Pa., have added to their brands a Bright Coke Plate named Mifflin and a Terne Plate named Demmler Redipped.

The tin house of the Canonsburg Iron & Steel Company, Canonsburg, Pa., was destroyed by fire on March 13, together with its contents. Although the Tin Plate business of the concern will thus be interfered with for the time being, we are advised by L. A. Meyran, secretary of the company, that the rebuilding of the tin house will be started as soon as possible. Meanwhile the rolling mills and all the other departments of the works, which were not affected by the fire, are in operation as usual.

The report that the Monongahela Tin Plate Company, on the S. S., Pittsburgh, had placed an order for 24 hot and cold mills with Mackintosh, Hemphill & Co. of Pittsburgh is untrue.

The La Belle Iron Works, Wheeling, W. Va., have ordered a 20-ton traveling crane through the Pittsburgh office of Pawling & Harnischfeger, Milwaukee, Wis.

Notice has been given to the workmen at the Morewood Tin Plate Works, at Llanelly, Wales, to terminate contracts at the end of this month, but it is hoped that before that time some arrangement will have been arrived at for the continuance of operations.

"The Best Roofing Plate Made," is the legend printed on a card attached by chains to a fine sample of Osborn's guaranteed Old Style Terne sent out by J. M. & L. A. Osborn, Cleveland, Ohio. The card also gives a complete description of the Plate and its merits. The firm state that this brand has been manufactured for them since the Tin Plate industry was started in this country in 1891, and the time test shows it to be the equal of any Roofing Plate offered in the market. That the architects and roofers recognize its fine qualities is evidenced by the firm having just been awarded a contract for these Plates to go on the new East High School Building, at Columbus, Ohio. Messrs. Osborn advise us that all the principal Plates made in the country were submitted in competition, and out of five brands selected the successful bidder for the work chose Osborn's Guaranteed Old Style.

It is reported that the plant of the American Tin Plate Company, at Elwood, Ind., is likely to be further enlarged at an early date by the addition of six new mills.

Lighting with Acetylene Cartridges.

The Buffington Light Company are erecting a new factory on the property of the Niagara Falls Power Company, at Niagara Falls, for the manufacture of charges for lamps burning acetylene gas. The factory is a frame building 40 x 100 feet, two stories high, of frame. The Buffington Light Company are a new concern having a capital stock of $300,000. H. A. Brognard is manager. It is allied to the Electro Gas Company, which company claim to control the patents on calcium carbide. The Buffington company manufacture calcium carbide cartridges for all kinds of lamps, the cartridges, when water is applied, generating a supply of gas. Pending the completion of their new factory the Buffington company are carrying on operations in a temporary building, their main office being in New York. The business of the company marks a new departure in the use of acetylene, or rather in the manner of its application. To refill a lamp means the simple removal of the old cartridge and the insertion of a fresh one. This process requires but a moment, and can be done without soiling the hands. The lamps are clean, practical and smokeless, the light being pure and white.

Just at present the company are making three sizes of cartridges. One of these is for bicycle lamps, while two of them, known as Nos. 8 and 12, are for table and student lamps. All of the cartridges are made of metal in two parts, one sliding over the other to allow for expansion. When the consumed cartridge is removed from the lamp it is always found in its extended form, the residue occupying more space than the original carbide. The bicycle lamp cartridge is about 1¾ inches in diameter by 1¼ inches deep. It is filled with carbide ground to about the size of wheat, and will furnish a supply of gas sufficient to last from 3½ to 4 hours. The top and bottom of the cartridge boxes are perforated, the top being distinguished from the bottom by a hole in the center, and also by the fact that the piece of absorbent which is provided for the interior is blue on the top and white on the bottom. The absorbent also divides the interior into four parts. In charging the lamp the water valve is closed tight, the water chamber is filled with clean water, the charge is placed on the bottom with a spring on top of it to hold it in place. Then the top and the bottom of the lamp are pressed together on much the same principle as many oil lanterns. To start the lamp the water valve is opened by turning a finger piece to the left, and in a few seconds the gas will generate and the flame will light by simply holding a lighted match to the opening of the chimney at the top of the reflector. The light will not jolt out, but when it is desired to put it out the valve should be closed some minutes before the time it is desired to extinguish it, so as to shut off the water and stop the generation of gas. The size of the flame is regulated by the valve screw which governs the flow of water. If the flame blows it is evidence that the gas is generating too rapidly, the remedy being to close the water valve, and should the light decline it makes known the fact that more water is needed on the carbide. The manufacturers state that none of the cartridges will generate a sufficient amount of gas to explode the lamps in which they are used.

Charges Nos. 8 and 12 are filled with carbide about the size of corn. Both have a perforated tube in the center. No. 8 furnishes a supply of gas, with a ½-foot burner, for from four to five hours, while No. 12 supplies enough gas to last seven to seven and one-half hours. No. 8 uses about 12 ounces of water and No. 12 about 16 ounces in giving off its gas. The Electro Gas lamps will be marked with numbers signifying the number of cartridge to be used in them. Only one end of the large cartridges is perforated, and this end should be up when placed in the holder of the lamps in which they are used. No. 8 cartridge is about the size of an ordinary water glass and No. 12 is slightly larger. It is evident that the designs of the lamps in which these charges are burned can be made in many forms, and this the company will do.

SHEET METAL WORK.

SLATE AND COPPER ROOFING ON FIRE PROOF BUILDINGS VII.

BY WILLIAM NEUBECKER.

IRON FRAMING OF BULKHEADS.

On large iron structures having flat roofs, bulkheads and tank houses are framed by the man doing the iron work on the building, and are then covered with heavy galvanized plain and corrugated iron or infrequently with sheet copper. In Fig. 38 is shown a general view of the iron frame work of a bulkhead on a roof of a fire proof building after the wrought iron workers are through with it. A shows the window or door opening, as required, and holes are shown around the frame work on which the metal is bolted.

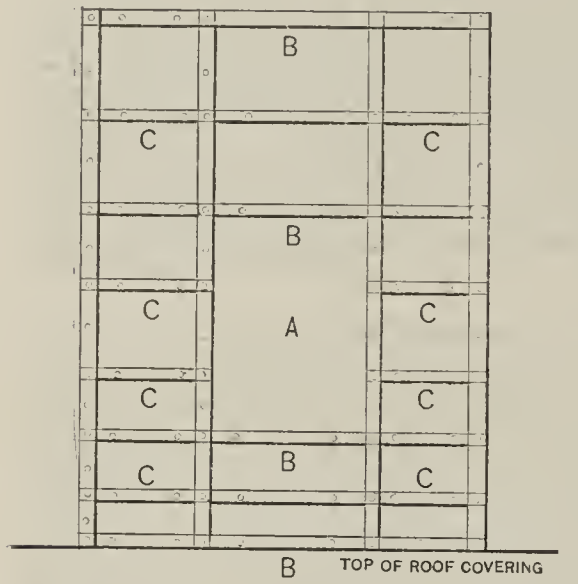


Fig. 38.—Appearance of Iron Frame Work of a Bulkhead on Roof of Fire Proof Building.

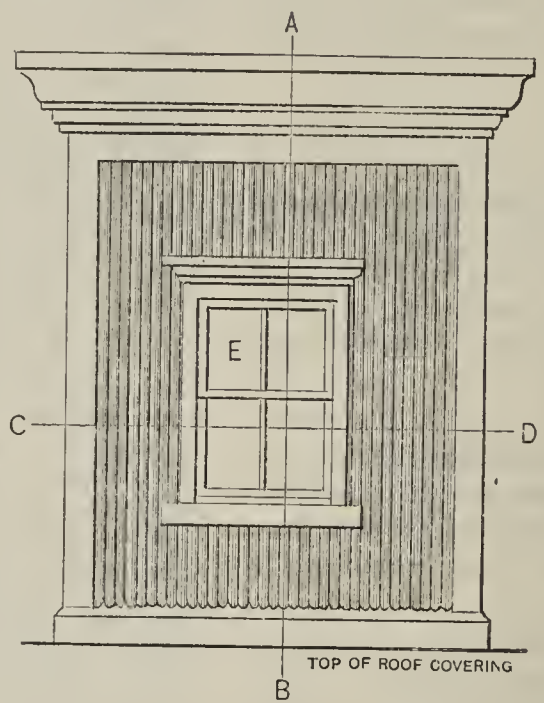

Fig. 39.—Appearance of Finished Bulkhead.

In Fig. 39 is a view of a finished bulkhead after the covering is placed over it. E indicates a wooden sash, while the rest is of metal.

DETAILS OF CONSTRUCTION.

In Fig. 40 is an enlarged section through A B of Fig. 39, showing how the metal work is fastened to the angle iron framing. Let A in Fig. 40 represent the roof line, B B B B the horizontal angle irons, C C C the flat bands having holes punched in them on which to fasten the metal, as shown by C C, &c., of Fig. 38. If the roof A in Fig. 40 is of metal it can be covered first and the flange of the base D soldered over it, while if the roof is of tar, asphalt or brick the base D must be set first, having a 6-inch flange extending out on the roof, over which the tar, asphalt or brick is laid. The base D being set in position with a wash and flange extending upward at E, the next step is to cover the wooden sill of the window frame H. This is covered by the metal sill F extending up under the window sash and nailed in white lead at I. The bottom of the sill has a drip, as shown at G, with a flange extending backward and downward, and is bolted at J. The corrugated sheet K is now slipped under the drip G and fastened to the band irons with round headed bolts at C C and through the flange of the bottom base at E. In Fig. 40 L represents the molding over the window shown

Fig. 41.—Enlarged Section on Line C D of Fig. 39.

Fig. 40.—Enlarged Section on Line A B, Showing Method of Fastening Metal Work to the Bulkhead.

by E in Fig. 39 and is fastened to the frame M by nailing the flange at N. The upper part of the molding has a wash and a flange extending upward at O. On the angle iron B furring strips W are bolted, as shown, over which the roof planking X is laid. Wooden brackets or blocking are now fastened to the roof boards on which to secure the upper molding P, which has a lock bent at the top V on to which the roofing Z is attached. The lower part of the molding P has a drip, as shown at R, and is fastened to the angle iron B by means of the bolt S. The corrugated sheet T is now placed under the drip R, bolted at C and riveted at U O. After the metal is bolted and riveted in position fire proofing is built up on the inside, as shown by the lines F^1 P^1 and F^2 P^2. It is sometimes the case that the fire proofing is already placed in the angle irons before the metal is put on, in which case long round headed

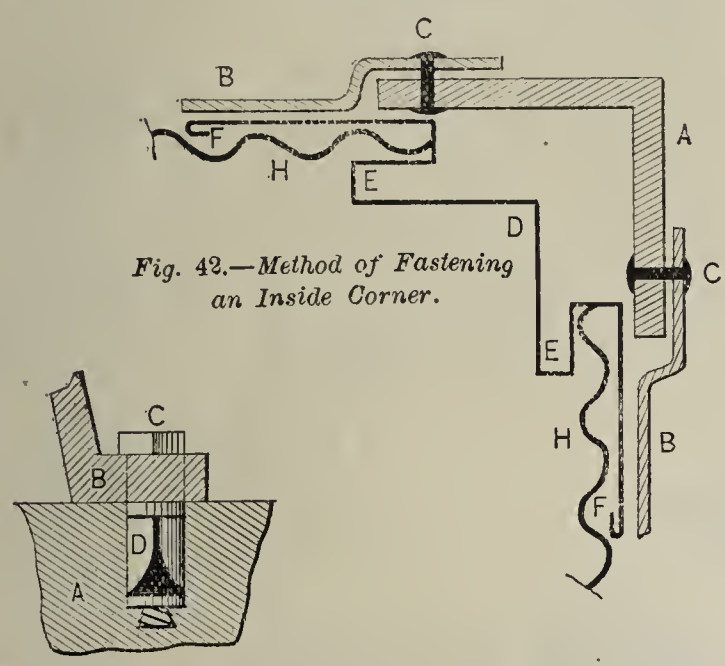

Fig. 42.—Method of Fastening an Inside Corner.

Fig. 44.—Method of Applying Expansion Bolt in Stone, Brick or Iron.

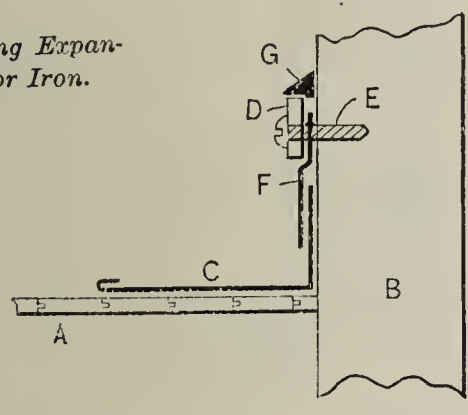

Fig 43.—Method of Securing Water Tight Joint Between Metal Flashing and Iron Work

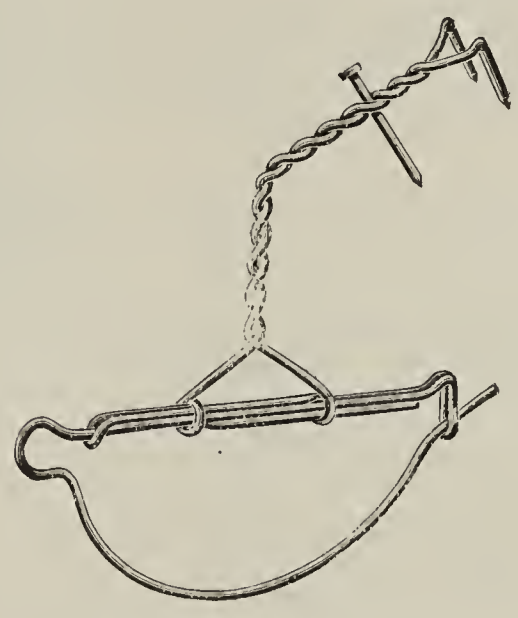
SLATE AND COPPER ROOFING ON FIRE PROOF BUILDINGS

bolts of the desired length are run through the metal and fire proofing, as shown at A^1.



In Fig. 41 is shown an enlarged section through C D of Fig. 39, giving the details of fastening and construction. A A shows the vertical corner angles, B B the vertical angles of the window opening, C C C C the horizontal band irons and D the wooden window sash. Corner blockings of wood of the required size and shape are bolted to the vertical angles shown at H H and H^1 H^1 and are covered by the corner angles E E, having drips formed as at F F. These with flanges extend outward, having water locks attached, as shown at I I. The corner angles are fastened to the wooden blockings, as shown at X X, &c. The water lock is placed at I, as in case of water soaking behind the corrugated iron it will follow the course of the water lock and flow out at the bottom over the base flashing. The corner strips or angles for the window openings are formed and fastened in a similar manner with the exception that the inside returns against the wooden window frame and is nailed as shown, all similar parts being designated by similar letters. The angles having been put on as described, the corrugated sheets L L, &c., are placed behind the drips F F and fastened by means of the bolts M M, &c. The fire proof blocking is now built behind same, as shown by F^1 P^1 and F^2 P^2. It is sometimes the case that an inside angle occurs, when it is finished as shown in Fig. 42, A indicating the angle iron, B the flat bands riveted at C, while D is the sheet metal angle with drips at E E, and water locks on flanges at F and F; the corrugated iron covering is slipped under the drips at E and E, as shown.

OBTAINING WATER TIGHT JOINT BETWEEN COPPER AND IRON.

It is sometimes the case that a cast iron column extends through the roof, and around which the copper base and cap flashing must be flashed. In Fig. 43 is shown the method of obtaining a water tight joint under the conditions above named. Let A represent the roof line and B the iron column. The base flashing C is placed in the position shown, after which holes are tapped into the iron column a sufficient distance above the base flashing. The cap flashing F is now placed in its proper position, over which the flat band iron D, ¼ x 1½ inches in size, is placed, holes are punched into the band iron to correspond to the holes in the column or *vice versa*, then a screw is passed through the band iron and cap flashing and screwed into the tapped holes in the column. Roofers' cement is now placed over the band iron joint, beveled as shown at G, which makes a water tight job. In Fig. 44 is shown the method of applying expansion bolts in stone, brick or iron. Let A represent stone, brick or iron, having a hole drilled to correspond to the size bolt used. Let B be the bracing, with a hole drilled into the flange of the required size. Now place the bolt C into the drilled holes and by means of a wrench turn the head C, thus expanding the shell D, which holds the brace firmly.

Bell's Twisted Wire Hanger.

The eave trough hanger illustrated herewith is a recent addition to the line of hangers manufactured by John W. Bell & Co. of Mercer, Pa. The hanger is made of

Bell's Twisted Eave Trough Hanger.

two pieces of galvanized wire. The bar across the top is composed of three wires, so arranged and bound together as to get the greatest strength. The roof wires leave the bar separately, and each a short distance from the center, and are twisted together to form the roof piece, each terminating in a pointed driving hook. It is claimed that by this peculiar construction a hanger is produced which is exceedingly stiff and strong, that it can be quickly and easily put on the trough, and that it is very convenient to adjust and fasten to the roof. They are made in five sizes, from No. 5 to 9 inclusive, taking 3½, 4, 5, 6 and 7 inch eave trough in the order named. A patent is pending. The manufacturers will be pleased to mail a sample of it to persons who are interested.

C. G. Brunnckow, Providence, R. I., has secured the contract for Sheet Metal work for the Rhode Island State House, now under construction in Providence. The work includes two circular glass and copper domes, 18 skylights and the copper roofing.

FLASHINGS.

The Manhattan Cornice & Skylight Company of New York City have been incorporated with a capital of $5000 by M. S A. Wilson and J. T. Robin of Manhattan, and L. L. Firuski of Brooklyn, N. Y.

The Montpelier Steel & Sheet Company have been organized at Montpelier, Ind., on the co operative plan, with an authorized capital of $100,000, to manufacture Sheets.

J. H. Burns, Enosburg Falls, Vt., intends to erect a Tin shop for his own use as soon as spring opens.

O. Moncur, Yuba City, Col., is building an addition to his Tin shop.

The Piedmont Slate Company have organized for the development of slate quarries near Cedartown, Ga.

The Scottdale Iron & Steel Company, Limited, Scottdale, Pa., manufacturers of Iron and Steel Sheets, recently started two new Sheet mills, making eight which they are now operating, giving employment to about 375 men.

The La Crosse Steel Roofing & Corrugating Company, La Crosse, Wis., although in operation for a comparatively short time, have outgrown their quarters and need greater facilities. A site has therefore been bought on the corner of Jay and Third streets, near the Fred. Kroner Hardware Company, whose interests are closely identified. A substantial brick building, four stories high, 75 x 150 feet, is to be erected, which will be the largest business block in the city. Every convenience is to be installed for the rapid and economical dispatch of business. It will be connected with the building of the Fred. Kroner Hardware Company, which is across the street, by both an overhead bridge and a tunnel running from one basement to the other.

The well-known Slate firm of John Galt & Sons, 253 Broadway, New York, have issued a new edition of their useful little hand book on Roofing Slate. It is a booklet of 16 pages, containing in condensed form a large amount of practical information on the subject which cannot fail to be of interest to roofers, architects and users of Roofing Slate. The advantages of Slate as a roofing material are fully set forth, with information about buildings which can be slated, boards for roofing, how Slate is put on, rules for measuring Slate, and other special information in this line. Descriptions of the various kinds of Roofing Slate are also furnished, together with a table showing the sizes of Roofing Slate, the rule in lathing and the number of pieces in each square, and another table of the variation in the lap, showing the length of Slates exposed when laid. Messrs. Galt are also dealers in Slaters' Tools, Slate Dressing Machines, Slaters' Felt and Cement, Slate Nails, Structural Slate, Slate for stalls, platforms, steps, hearths, washtubs, flagging, and all kinds of milled stock.

A Reliable Test for White Lead Paint.

With the exception of the man who makes painting a business, there is perhaps no one, says a writer in *The Florist's Exchange*, who uses white lead to a greater extent than the florist. All the wood work about his houses is treated to at least one coat of it, and during the summer he applies it to the glass to shade plants still kept in side. He is often surprised and annoyed to find the paint cracking and peeling off, thus necessitating the additional expense of another coat. The trouble is not in the white lead itself, which if pure is the best material for his purposes. It lies in the adulteration of the lead with worthless substances, which cannot be detected by the eye. Much time, annoyance and expense may be saved by means of a simple, effectual test that will not require a chemical laboratory to get results. Here is one that requires only ten minutes and no apparatus but a bottle, a teaspoon and some blotting paper:

In a wide mouthed bottle put a large teaspoonful of the mixture of lead as it comes from the drum or keg. Add about four times its bulk of gasoline and shake thoroughly for about a minute. Pour it out upon white blotting paper or chemists' filter paper and allow it to drain. When the excess of gasoline has evaporated, put the lead back in the bottle, add about four times its bulk of strong vinegar and shake as before. If the powder disappears entirely the lead is pure. If it does not all dissolve allow the sediment to fall, pour off the liquid, add more vinegar and shake again. If still there be a residue, the lead has been adulterated. It will pay to buy some brand that leaves no residue.

This is but a simple question of chemistry. White lead is a basic carbonate produced by the action of carbonic acid and water upon metallic lead. This carbonate is readily soluble in acetic acid, which is the principal acid of vinegar. Sulphate of barium and sulphate of lead, the two substances most largely and frequently used as adulterants, are insoluble in acetic acid, so that the addition of either of these materials to white lead can readily be detected by the method explained. The object of using the gasoline is to dissolve out the oil which might interfere with the action of the acid. Gasoline need not be used if the lead be purchased in the form of powder and not already mixed with oil.

Comparison of Aluminum with Other Metals.*

It is evident that for any use of aluminum in the form of sheets, bars, tubes, wire or castings its light weight relatively to other metals should be taken into consideration in comparing the relative costs for any given purpose. The common metals—wrought iron, cast iron, steel, copper, zinc, tin, lead, brass, bronze, German silver, nickel, antimony and Britannia metal—are all much heavier, and the relative economy in using them in either the cast or worked shape can only be arrived at by multiplying the price of the heavier metal by the factor of its specific gravity relative to the specific gravity of aluminum. For convenience in these calculations the following table is given:

Metals.	Specific gravity.	Factor of specific gravity relative to aluminum.	Selling price per pound New York market in May, 1896, in large lots.	Relative selling price per pound New York market to aluminum obtained by multiplying price per pound by factor given in column B.	Value per pound that aluminum is thus relatively cheaper.	Value per pound that aluminum is relatively dearer.
	A	B	C	D	E	F
No. 1 aluminum, cast	2.56	1.000	$0.35	$0.35	.....	.....
No. 1 aluminum, wrought	2.68	1.000	.45	.45	.....	.....
Commercial copper, cast	8.85	3.457	.1025	.354	$0.004	.....

Iron, wrought	7.698	2.872	.015	.0421	.....	.4079

The first uses to which aluminum was applied were naturally those which would stand the high cost of the metal at its selling rate of $10 to $15 per pound.

The first considerable use of the metal was for tubes of opera glasses and other optical instruments. Then, as the metal became lower in price, it was used in thin sheet and metallic foil in a similar way to gold and silver. It was also used in powder made from the foil. Thereafter came the use of the metal in the manufacture of a large line of fancy goods, where the cost of the metal used was a small proportion of the total cost, including the workmanship involved. These, for a considerable length of time, were the staple uses for aluminum; but the tonnage —or rather, to be more accurate, the "poundage"—of metal which could be used for these articles was of necessity very limited, and before the aluminum could be used like other metals the price had to be materially reduced. This was done in the years 1891 and 1892—at first due to accidents of patent litigation, and before the companies then manufacturing aluminum by the present process had so far perfected the process and increased the capacity of their works really to warrant the decreased selling prices by their cost of manufacture; but since the year 1892, with the greatly improved and extended facilities for production introduced by the large manufacturers of aluminum, they have been enabled gradually to reduce the selling price, until to day the rate is such that aluminum is a cheaper metal, section for section, than copper, and as cheap as brass.

* From a lecture on the "Utilization of Aluminum in the Arts," given before the Franklin Institute of Philadelphia, by President Alfred E. Hunt, of the Pittsburgh Reduction Company.

THE RETAIL STORE.

William Vogel.

We regret to record the death, after a painful illness from cancer in the head, of William Vogel, founder and head of the well-known tinware manufacturing firm of William Vogel & Bros., Brooklyn, N. Y., which occurred at his home, 202 Keap street, Brooklyn, on Monday, March 21. Mr. Vogel's illness dates back to last December, when, although apparently in vigorous health, the first sign of a cancerous growth appeared above the left ear. This was removed, but reappeared shortly in the neck. Two months ago an operation was performed, which for a time appeared to promise success. That also failed, however, and although Mr. Vogel occasionally went to business until about three weeks ago, the disease made rapid progress, terminating fatally as mentioned above.

William Vogel was born in Brooklyn, in 1839. After a public school education he obtained employment with a tin roofer. In 1863, in conjunction with his brother Henry, he began the manufacture of tinware on a small scale on Grand street, Brooklyn, removing to various locations in the Eastern District of the city as the business grew in proportions. Twenty years ago the brothers purchased a small lot 50 feet square and put up a factory building on the site of the present extensive five-story factory of the firm, which now extends from 37 to 47 South Ninth street and on 433 and 435 Kent avenue, giving employment to a large staff of work people. The growth of the business of the firm from small dimensions to its present extent is a singular instance of what frugality, integrity and habits of strict attention to business, such as exercised by the late Mr. Vogel, can do. As the head of the firm he was particularly careful never to increase or extend his business unless he was prepared at the same time to meet increased obligations. He paid all his indebtedness in cash, and by thus avoiding the discounting of bills was always able to furnish his customers with the articles he manufactured at reasonable or the lowest market prices.

WILLIAM VOGEL.

William Vogel had a number of interests outside of his immediate business pursuits and was in every sense of the word a public spirited citizen. He was of a generous and sympathetic nature and attracted to himself many warm friends, also giving freely of his means to all deserving local institutions. He was a lifelong advocate of temperance and was active in church work. He was a trustee of All Souls' Universalist Church of Brooklyn, and was an ardent Free Mason, besides being a member of the Union League and Hanover clubs. He was also a director in several local financial corporations and was connected with the Manufacturers' Association of Kings and Queens Counties, the Society of Old Brooklynites and a number of other organizations.

Mr. Vogel leaves a widow, two daughters and a son, William H. Vogel, who, together with his uncles, Henry J. and Louis H. Vogel, compose the present firm of William Vogel & Brothers. The funeral service was held on Wednesday evening at All Souls' Universalist Church, and was very largely attended by the friends and business associates of the late Mr. Vogel. Interment was made the following day at Greenwood Cemetery.

MEMORANDA.

Wm. Holker, who has purchased the stock of J. C. Stanley on Water street, Newburyport, Mass., has decided to move his large stock of Stoves, &c., from his present quarters in Market square to the store in which Mr. Stanley did business.

Oliver S. Kendall & Co., dealers in Stoves, Furnaces and Heaters, 466 Main street, Worcester, Mass., will occupy new quarters after July 1, which will enable the firm to increase their facilities. For some time past there has not been sufficient room to meet the growth of the business, so the present store of Lathrop, the shoe dealer, at 564 Main street, has been secured, as well as the story above and the basement. The shop, which will be fitted with new machinery and steam power, will be located in the old electric light plant in the rear of the store, and will occupy the first, third and a quarter of the fourth story. Messrs. Kendall have been in the present location for 11 years and in the store two doors north another 11 years, making 22 years in all, during which time the business has rapidly expanded.

J. T. Templeton has retired from the Stove and Hardware firm of Johnson, Doss & Co., Nashville, Tenn.

The regular meeting of the Retail Stove Merchants' Protective Association held in St. Louis March 9 was well attended, but there being no serious business to demand the time of the members the conference turned into a social occasion, and included an instrumental and vocal musical programme, besides some effective oratory. The whole occasion was most enjoyable, and speaks well for the interest taken by the members in the association. The officers are: President, G. A. Pauly; vice-president, F. S. Bolte, and secretary, M. Koch.

R. E. White has moved to the Eans Building, Smithville, Texas, and has arranged to carry in stock a complete line of Tinware.

The Artistic Enameling Works, Ninth and Monroe streets, St. Louis, Mo., issue a circular calling attention to their specialty, which is Enameling on Steel and Cast Iron. They do all sorts of work in this line, and particularly mention their facilities for coating cooking utensils, saying that they are prepared to enamel and decorate any style of coffee or tea pot, cooking pots, large or small, and any cooking utensils for hotel or family use.

Goodwin & Co., 133-137 Newhall street, Birmingham, England, and Bunney's, Limited, Church street, Liverpool, England, are desirous of receiving catalogues and price-lists of household Refrigerators.

The large Tinware factory of Keen & Hagerty, Baltimore, Md., which, as reported in our last issue, was visited by a severe fire on the 12th inst., is again under roof and the machinery is now running night and day, the company having adjusted their insurance so far as it is concerned. The stock of merchandise which was not burned or ruined by smoke and heat was damaged by

water. Fortunately, however, the larger part of the machinery was intact and uninjured.

The H. F. Neumeyer Mfg. Company, Macungie, Pa., issue a descriptive and illustrated catalogue of their manufactures. The goods shown in the little pamphlet include Nozzles of various styles and shapes for fire and garden purposes. The Niagara Lawn Sprinkler is illustrated, likewise the Peerless Automatic Anti-Freezing Hydrant, as well as the Peerless Street Washers.

The Middlesboro Furniture & Stove Company have opened up business at Middlesboro, Ky., with I. Ginsberg as manager.

The Cold Wave Refrigerator Company, Fond du Lac, Wis., have issued an illustrated catalogue of their Cold Wave line of Refrigerators. They are constructed of hard wood, with seven walls for insulation, zinc lined, have removable cleanable ice tanks, and are fitted with porcelain lined water coolers in same styles. A full line is made for all requirements.

C. Stoutenborough, manufacturer and dealer in House Furnishing goods, will remove his office and warerooms on April 1 from 272 Pearl street, New York, to larger quarters, at 277 Pearl street.

At the postponed annual meeting of the Central Stamping Company, New York, recently held, the following officers were elected for the ensuing year: President, John H. Sprague; vice-president, Walter M. Aikman; secretary, George W. Ketcham; treasurer, E. W. Ketcham, and D. B. Hunt, assistant treasurer. The new management contemplate some betterments and enlargements of their factory facilities for the purpose of increasing their output.

Clinton Wire Cloth Company, Clinton, Mass., well known as manufacturers of Wire Cloth, Wire Lath, Fencing and Nettings, issue an attractive card in colors, showing 19 different styles of perforation in metals, and announce that they have exceptional facilities for perforating of every kind, including steel, iron, bronze, brass, zinc, copper and galvanized iron, Filter Press Plates and Brass Centrifugal Plates.

Henry B. Haigh, vice-president and general manager of the Iron Clad Mfg. Company, 22-24 Cliff street, New York, has severed his relations with that company, and is now president of the American Stoker Company, whose main offices are at 26 Court street, Brooklyn, N. Y. The American Stoker Company are manufacturers of an automatic mechanical device for feeding coal into boiler furnaces.

Thomas F. Farmer and D. E. Hirshfield, under the firm style of Thos. F. Farmer & Co., have recently established themselves in business as manufacturers' agents, with headquarters at Waco, Texas, and branches at Dallas and San Antonio. Mr. Farmer is an old Texas traveling salesman, and formerly represented the Oliver Wire Company of Pittsburgh and other concerns. Mr. Hirshfield was for nine years a broker in Fort Worth. Up to this time the firm have not carried stock, but a little later they expect to establish a transfer house in Dallas. They are at present representing manufacturers of Shelf and Builders' Hardware, Brass Goods, Electrical Supplies, Stoves and Ranges, Plumbers' Supplies, Agricultural Implements, Wagons, Railroad Supplies, &c., representing among other concerns the Morrison Mfg. Company, Fort Madison, Iowa; Central Oil & Gas Stove Company, Gardner, Mass.; York Mfg. Company, Portsmouth, Ohio, and Toledo Wheelbarrow Company, Toledo, Ohio.

Bump & Walrond have succeeded H. A. Easton & Co. in the retail Hardware and Stove business in Petoskey, Mich.

The partnership existing between H. E. Noble and H. H. Case, at Medicine Lodge, Kan., under the firm name of Noble & Case, and also the partnership existing between Messrs. Noble and Case under the style of Noble & Case Hardware Company, Alva, O. T., have recently been dissolved by mutual consent Mr. Noble will continue the Alva business, carrying Shelf and Heavy Hardware, Stoves and Tinware, Pumps, Wind Mills, Wagons and Buggies, Implements, &c., and Mr. Case the Medicine Lodge business, carrying a line of Hardware and Implements.

J. G. Olive & Son have succeeded J. G. Olive in the Hardware business in Cuba, N. Y. A tinning and plumbing shop has been added to the establishment.

Zach. T. Miller & Sons have succeeded Myers & Miller, at Bloomington, Ill., wholesalers and retailers of Shelf Hardware, Stoves, Tinware, Furnaces, Electrical Supplies, &c. The new firm have just completed remodeling the interior of the storeroom.

W. J. Westergaard has succeeded Westergaard & Coop, at Valley City, N. Dak. Mr. Westergaard handle Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Sporting Goods, &c. He has just completed a warehouse on the railroad, 30 x 50 feet in dimensions, two stories high. This will be utilized for the storage of Implements, Buggies and Carriages.

The Jarboe-Woolley Hardware & Implement Company, Davis, I. T., are successors to Wm. M. Moore in the wholesale and retail Hardware, Stove, Implement and Sporting Goods business. Mr. Jarboe was formerly with Gilkey Bros. of Chickasha, and Mr. Woolley has been connected with the Royal Cement Plaster Company of Marlow.

Barkley & Arnett have purchased the Hardware stock of Holloway & Co., Nicholasville, Ky. The stock comprises Shelf and Heavy Hardware, Agricultural Implements, Sporting Goods, Stoves and Tinware, &c.

W. O. Aikman and Dudley D. Norton have formed a partnership, at Cazenovia, N. Y., under the firm style of Aikman & Norton. Mr. Aikman has had fifteen years' experience in the Hardware business at Roxbury. Mr. Norton is a practical plumber, and particular attention will be given by the new firm to plumbing and heating. They will also retail a line of Shelf Hardware, Tinware and Stoves.

Hunt & Flaherty have recently opened up in the Hardware, Stove and Implement business in Stithton, Ky.

C. E. Harrison is about opening a new Hardware store at Binghamton, N. Y. A wholesale and retail business will be carried on in Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements and Sporting Goods. Mr Harrison's fixtures are all new and the store is of modern character. Silver Plated Flat Ware and Sporting Goods are taken care of in counter showcases, while wall cases are provided for his line of Tools and boxes for Shelf Hardware. The second floor of the building carries the stock of Bicycles and Baby Carriages, while the basement is devoted to storage.

Some Erie Specialties for Burning Gas.

One of the interesting novelties which have recently been placed upon the market by the Griswold Mfg. Company of Erie, Pa., whose New York warerooms are at 294 Pearl street, is what is known as the Erie gas or vapor stove griddle, views of which are presented herewith. These griddles are the manufacturers' regular Nos. 12 and 14 polished iron griddles, equipped with hollow base, which, it is stated, prevents the extreme heat of a gas or vapor stove from overheating the center of the griddle while distributing the heat uniformly under it. Fig. 1 of the illustrations shows the general appearance of the griddle, while in Fig. 2 is presented a cross section. The heat enters the base through holes in the lower part and passes out around the edges of the griddle, as shown in the cross section. Still another interesting production of

Some Erie Specialties for Burning Gas.—Fig. 1.—Erie Gas or Vapor Stove Griddle.

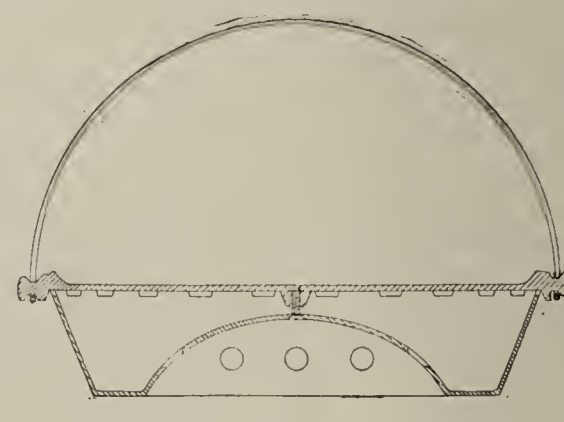

Fig. 2.—Cross Section of Griddle.

this company is the nursery gas stove shown in Fig. 3 of the engravings. A special feature of the device is an iron saucer under the burner which keeps the heat from the table, and holds any dripping which may be spilled while cooking operations are in progress. There is a special arm on the end of the burner for the purpose of holding

Fig. 3.—Nursery Gas Stove.

curling irons. The device is offered in three styles of finish—plain, white nickel and polished nickel.

"Klondike Grubstakes."

"Klondike Grubstakes" is the suggestive title of a monthly publication issued in Seattle, Washington, having for its purpose the dissemination of knowledge peculiar to outfitting for the Yukon and Klondike gold fields. In it are schedules giving assortments and quantities of supplies for one year for one man in provisions. In the grocery list are 39 separate items in comestibles, considered indispensable, ranging from flour and bacon to Jamaica ginger, yeast cakes and evaporated vinegar. Then there are separate lists of clothing, leather and rubber goods, medicine kit, &c. Sharing in importance with the grocery items is the catalogue of necessary Hardware, designed for the use of two persons, which we reproduce *in extenso*. Where the quantities are not given the individuals will use their own discretion, the statement being made that the various inventories contain the names of all that is necessary for a complete Yukon outfit, the data having been compiled from reliable sources:

1 Yukon Stove.
2 Picks.
1 extra Pick Handle.
2 Shovels.
1 Pit Saw with tiller and box.
1 5-foot one-man Saw.
2 Pit Saw Files.
1 24-inch 7-point Hand Saw.
1 28-inch Rip Saw.
2 Hand Saw Files.
1 single or double bit Axe.
2 extra " "
1 Axe Stone and File (14-inch mill).
1 2-pound Broad Hatchet.
1 No. 2 Claw Hammer.
1 1-crease Calking Iron.
1 No. 13 Jack Plane.
1 Draw Knife (Cantello).
1 Brace and 3 Bits.
1 spool No. 24 Copper Wire.
1 box assorted Copper Rivets and Burrs.
1 6-inch Monkey Wrench.
1 4-inch Screw Driver.
1 2-foot Rule.
1 6-inch Magnet.
Awls and Tools.
Chisels.
8 and 10 ounce Tacks.
Hob Nails.
Padlock.
Hasp and Staple.
Quicksilver.
2 Miners' Lamps.
Can Opener.
Candles.
Tape Line.
Law book.
Chalk and Line.
2 Candlesticks.
1 pair 7-inch Scissors.
2 good Pocket Knives.
1 8-inch Butcher Knife.
1 2 x 6 Emery Stone.
3 Fry Pans.
2 Coffee Pots.
3 Granite Plates.
2 Granite Cups.
3 Knives, Spoons and Forks.
2 Basting Spoons.
3 Granite Buckets.
2 Gold Pans.
1 4-ounce Gold Scale.
1 Compass.
Fishing Tackle.
Rifle and Cartridges.
15 pound 8d. Wire Nails.
10 pounds 10d. Wire Nails.
5 pounds 20d. Wire Nails.
100 feet ⅝-inch Manila Rope.
100 feet ¾-inch Manila Rope.
5 pounds Oakum.
5 pounds Pitch.
3 pounds Tallow.
1 Pack Strap.
Spring Balance.
Whet Stones.
3 coils Electric Solder.
1 12-quart Retinned Milk Pan.

Gurney Refrigerators.

The Gurney Refrigerator Company, Fond du Lac, Wis., have issued two illustrated catalogues, one referring to the Gurney patent and the other to the new La Belle refrigerators. The Gurney patent line comprises a full assortment of domestic constructions, grocers' boxes, ice chests, cooling rooms, water coolers, &c. They are insulated not only by walls of inodorous paper, zinc and inner and outer cases, but also by a packing of mineral wool. A special feature is the removable galvanized ice compartment, which is not only designed to secure cleanliness, but also exceptionally free circulation of air. The exterior designs adopted for this season are unusually attractive. The new La Belle line is made of hard wood, with six walls, including two of charcoal sheathing made expressly for this work, an ice chamber with large end flues for the free circulation of air, removable galvanized ice rack, metallic shelves, solid brass and bronze hinges, &c. These refrigerators are made in all styles for all requirements.

New Tinware Plant.

The Eastern Tinware Company have decided to enlarge their present factory at Portland, Conn., to about double its present capacity. The new factory, on which work has begun, will be built contiguous to the present plant, but will be operated by independent power, and will give employment to 400 or 500 more hands. The company's existing plant, although extensive, has proved inadequate to the requirements of their business. For some time past the run of orders received has necessitated continuous overtime. Joseph Scheider, the president of the Eastern Tinware Company, is also the head of the American Stamping Company of Brooklyn, N. Y., and the interests of the two concerns are closely allied.

Swedish Linemen's Pliers and End Cutting Nippers.

Smith & Hemenway Company, 10 Warren street, New York, are importing the Swedish round edge linemen's pliers, shown in Fig 1, patents for which have been applied for. The plier with side cutter is known as No. 115,

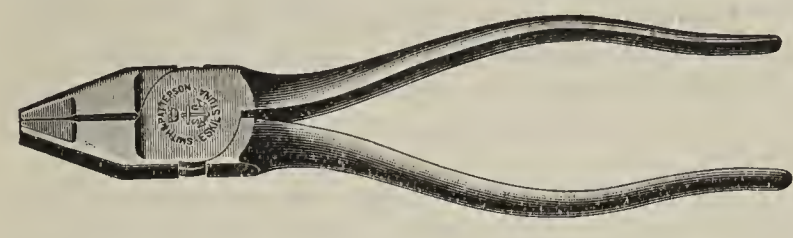

Fig. 1.—Linemen's Round Edge Side Cutting Pliers

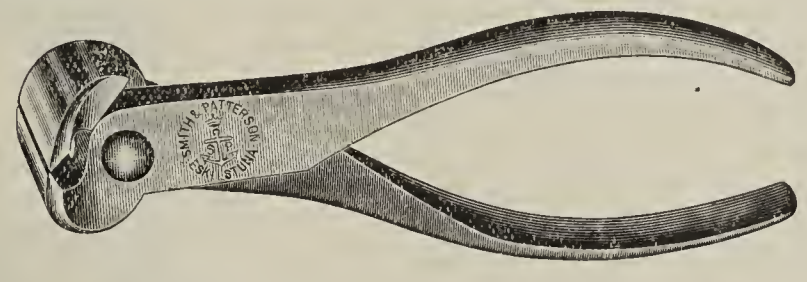
and is made in 4, 5, 6, 7 and 8 inch sizes from Swedish electro boracic steel. They are designed especially for linemen, although suitable for any wire workers' use who have need of a tool of this character. The edges are rounded so that if dropped no injury is done to wire they might strike. The joint is so made that there is no space between it and the cutters, and the two parts are fastened with a patent bolt joint. They have also put on the mar-



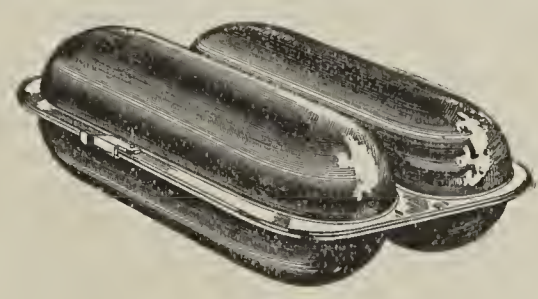


Fig. 2.—Samson Joint End Cutting Nipper.

ket the Samson No. 2 Swedish end cutting nipper, as seen in Fig. 2. This is made of the same stock and can be had in 5, 6, 7 and 8 inch sizes. The material and workmanship in both tools is such that tempered and regular steel wire nails of large sizes can be readily cut, and while held by the cuttters bent into various shapes without affecting the jaws. They will then make a clean cut of thin paper by hand pressure.

Ideal Double Bake Pan.

The accompanying cut shows the new double bake pan which Matthai, Ingram & Co., Baltimore, Md., are introducing. The pan is in the main similar to the single pan introduced by the makers a short time ago, the difference being that it will bake two loaves at one time. When not required for use and for convenience in storage the pan may be nested in halves and its bulk thus easily reduced. The makers state that the pan is an admirable baker in

Ideal Double Bake Pan.

every respect, is very easily cleaned, and may be sold cheaper than any bread pan of the same order at present on the market.

The newly organized Atlantic Transportation Company have received a contract to furnish a large quantity of New River steam coal per annum, for five years, for the use of the ocean tugs and barges of the Chesapeake & Ohio Railroad Company at Newport News, Va.

STOVE TRADE NOTES.

William Doyle.

William Doyle of Albany, N. Y., one of the few remaining old time stove manufacturers of the country, died at his residence in that city on the 18th inst. in the seventy-fifth year of his age. Mr. Doyle was a veteran in the business and was well known as one of the most prominent founders and inventors in the trade in the days when Albany and Troy were the leading stove manufacturing cities of the United States. He was born at Pittsburgh, Pa., on January 6, 1824, his parents removing to New York City when he was a child, and there he received his education in the public schools and colleges of that time.

When a young man, his father having died, he moved with his mother and brothers to Albany, where he became connected with the Rathbone & Kennedy Stove Works, then the largest concern in the world, devoted exclusively to stove making. He succeeded to the position of general superintendent, which he held until the year 1857, when he purchased a foundry and machinery works at Kenosha, Wis., where he did an extensive business until 1860. He then decided to accept an offer to dispose of the business, which he did, and returned with his family to Albany. After looking for an investment for some time, he purchased the Eagle Stove Foundry in that city, known for many years as the Eagle Air Furnace, the melting of iron having been done there by natural draft without the use of a blast. Here he built up and conducted a large and profitable business for over a quarter of a century and accumulated a large fortune.

WILLIAM DOYLE.

Few men in the trade are better known among the old line of stove and hardware men East of the Mississippi than Mr. Doyle, and his likeness which we present to our readers will be readily recognized by many friends and former patrons in all sections of the country. Politically Mr. Doyle was a stanch Democrat of the Jeffersonian school and represented his party in the Legislature in the years 1861 and 1862, and though often urged to accept nominations since for positions of honor and trust, he persistently refused to consider them, preferring to remain in the ranks and devote his time to his business interests. He was a warm personal friend of the senior Erastus Corning, Peter Cooper, William Cassidy and Daniel Manning, who each in his time was the leader of the party in Albany city and county.

Through heavy investments in iron mining properties, the product of which proved of no value he became financially embarrassed and disposed of his business in 1890. His health also failing him, he became discouraged and gave up active business. His wife, to whom he was devotedly attached, died in 1895, and this wore heavily on him, doubtless hastening his death. Mr. Doyle's ancestors were early settlers in this country, one branch of the family settling in Pennsylvania, the City of Doylestown being founded by them; another branch settled in Georgia, and were heavy slave holders in ante-bellum days, while still another branch are settled somewhere in California. He is survived by one son, Edward H. Doyle of New York City, and three daughters, Mrs. James O'Neil, Mrs. F. D. Howe and Mrs. M. V. Dolan of Albany. His funeral took place on Sunday the 20th inst. from the Cathedral of the Immaculate Conception, and was largely attended. His remains were interred in the family plot in St. Agnes' Cemetery.

A Paragon Among Pamphlets.

An elongated pamphlet bound in imitation agate ware and carrying on the cover a pathetic picture of distressed gentility commands attention and constrains any one who reads the first paragraph to follow it through to the end, where are mentioned the Paragon furnaces, made by Isaac A. Sheppard & Co. of Philadelphia and Baltimore. This is one of a multitude of clever pieces of trade literature from the press of Charles Austin Bates of New York. As an example of the style of the story we quote below the first page, and like the unfinished stories in the weekly papers we know that all will be interested to learn the conclusion, and this can be easily done by writing to Messrs. Sheppard & Co. for a copy of the booklet.

This man is somebody's customer. Is he yours? Does that hurt look on his face lie to the debit side of your ledger? Are you responsible for the things this man is thinking away down in his æsophagus? Is it your customer who plunges madly down into the nether darkness, arrayed in faultless attire, to well nigh jolt his medulla oblongata in to his acetabulum in the struggle to shake a furnace sold him by you? Is it your customer who shakes and shakes and shakes, until he dislocates a township and twists two parallels of latitude, merely to succeed in filling the entire house with a cloud of dust and ashes, as dense as a restaurant beefsteak, and as persistent as a lightning rod agent? Is it your customer who loads his furnace with coal—real Klondike coal, worth $7.50 a ton—clear to the gills, and battens down the hatches, and then goes upstairs and sits in a row on the register and shivers like a jelly fish, while the heat from that coal goes up the chimney, and overheats the Pleiades and wastes its warmness on the far off stars? Does he do all this every day, day after day, through seed time and harvest, until he has chronic cricks and even rivers in the nape of his neck, and large, hard, callous spots on his conscience, until finally the coroner's jury writes his epitaph: "He strove to shake the furnace, but the furnace shook him?"

Carbonic Oxide and Red Hot Stoves.

In a recent issue of the *Progressive Age* appears an article translated from *Le Genie Civil*, on the toxic properties of carbonic oxide, which is an interesting contribution to the discussion of the effect of red hot iron surfaces on air. The article contains the records of a number of experiments, one of them, it is stated, confirming the fact that the production of carbonic oxide gas by a red hot stove had been discovered. This was done by taking a

porcelain tube, filling it with particles of broken up cast iron, heating the tube to a red heat, and passing carbonic acid gas slowly through it. The gas after passing through the tube showed the presence of carbonic oxide in large quantities. This experiment was repeated many times with always the same results. The practical conclusions deduced from the experiments, as stated in our contemporary, are :

A conclusion follows from all the experiments upon red hot cast iron stoves that should interest every maker of stoves or heaters. If one wants to use cast iron surfaces carried to a red heat it is necessary to cover these surfaces with plates so far removed that they themselves will not become red hot. Double doors are thus necessary. It is, moreover, necessary that the air which circulates between these plates, or inside the casing, should not be conducted directly into the space to be heated, but should be led off in a pipe parallel to the stove pipe or flue. Manufacturers no doubt will find such an arrangement not difficult to devise.

Puritan Gas Ranges.

Within the covers of a very attractive catalogue of 48 pages the Cleveland Foundry Company of Cleveland, Ohio, illustrate and describe some of the various styles and sizes of Puritan gas stoves and ranges. Reference is made to the excellent workmanship and fine quality of material employed, and it is pointed out that the burners are constructed on "economical principles giving the greatest efficiency with the least possible consumption of gas." Attention is first invited to Series No. 250, in which the top of the range with shelf has an area 32 x 22 inches, while the hight of the stove is 33 inches. The range is provided with a simmering and double burner, the latter operated with one valve, balance drop doors provided with a strong spring which prevents the hinges from breaking and makes the doors self closing when raised, asbestos lined ovens, removable cast iron oven bottom and adjustable valves to suit any pressure of gas, either natural or artificial. Several styles of this series of the Puritan range are shown by means of handsome engravings, after which attention is given to Series No. 450. made in an enamel finish which, it is claimed, will not rust and has all the best improvements, including adjustable valves and the company's new oven lighter, these goods being followed by Series No. 350, embodying many valuable features of construction. Some of the ranges illustrated show styles provided with improved broiler and also with broiler and water heater. Two and four hole ranges of moderate price are considered, together with a varied assortment of Puritan gas hot plates, high gas stoves with drilled burners, tubing, ovens, &c. The pamphlet is issued in very attractive form, and is bound in colored paper covers. The company also manufacture a large line of gas heating stoves, gas radiators, hot air registers and Mrs. Potts sad irons, for which separate catalogues are issued.

ODD PLATES.

The Secretary of State of Ohio has issued papers of incorporation to the Standard Heating & Mfg. Company of Cleveland, with a capital stock of $25,000. The company are to engage in the manufacture of Hot Air Furnaces. The incorporators are George W. Hill, Robert L. Short, Henry I. Emerson, Frank C. Marrak and Peter H. Gifford.

Under the will of the late Isaac A. Sheppard, president of Isaac A. Sheppard & Co. of Philadelphia, provision is made for the payment to each person that has been continuously in the employment of the firm at their foundries in Philadelphia and Baltimore for the period of two years before the death of Mr. Sheppard a sum of money equal to two weeks' pay. In addition to the sum of $16,000 bequeathed by Mr. Sheppard to various charities, $1500 is left in trust to be invested and the interest to be applied to the purchasing of suitable gold and silver medals, to be awarded from time to time to the two most worthy graduates of each of the first two public manual training schools of Philadelphia, in which the testator had taken so much interest in endeavoring to advance practical education. The schools designated are the Central and Northeast Manual Training Schools.

The Mountain City Stove Company, Love & Headdon, proprietors, Chattanooga, Tenn., have found it necessary by reason of the large increase in their business to remove to more commodious quarters, which are located opposite their old store on Market street. We understand that in connection with their wholesale department a complete stock of Stoves will be put in to be sold at retail. The company expect to occupy their new quarters about April 1.

The Great Western Stove Works of Leavenworth, Kan., expect to have the annex to their plant completed some time about the middle of June. It will be used principally for a storehouse or as an addition to the main room in the principal building for the manufacture of Ranges. The new structure is 49 x 150 feet in size and four stories and basement in hight. The wing of the main building touching the annex on the west side will be used for the nickel plating department, a new nickel plating plant having been ordered, and will be in operation within the next six weeks or two months. The plant will include a 6 horse-power dynamo, a number of polishing machines and tanks for the plating solution, and will give employment to 20 additional hands.

"We want you to see the new Eclipses for 1898" is the inscription in bold letters on a neat folder which reaches us from the Eclipse Stove Company of Mansfield, Ohio. The illustrations show the Sunrise Eclipse, a new six-hole coal Range with duplex or flat grate, square oven and attractive ornamentation; the Pennant Eclipse six-hole wood Range, embodying the latest improvements, and the Excel Eclipse coal cook, made in three sizes. These goods are referred to by the manufacturers as being first class in all respects, handsome in design and strictly up to date.

One of the buildings occupied by the Great Western Stove Repair Company, Minneapolis, Minn., was pretty well demolished by fire on March 17, the loss including a stock of new Gasoline Stoves. We understand that a portion of the loss was covered by insurance.

The Knoxville Range Company is the name of a concern incorporated a few days ago at Knoxville, Ky., with a capital of $20,000. The Scates Warm Air Furnace Company of the same place were also incorporated, with a capital stock of $40,000. The incorporators of both companies are F. E. Fuller, J. L. Nelson, R. R. Scates, W. A. Hickey and R. L. Culton.

It is stated that J. M. Bridgeford & Co. of Louisville, Ky., are considering the advisability of moving their extensive Stove foundry to another city, and that President Miller and Manager Ogle visited New Albany, Ind., the first of the present week for the purpose of looking for a desirable location for their foundry.

The S. Obermayer Company, Cincinnati, Ohio, and Chicago, Ill., manufacturers of Foundry Facings and Foundry Supplies and Foundry Equipments, report business much better than the first part of last year. They have added a new department to their large business, and having secured the services of a foundry equipment expert are now in a position to figure with parties on the entire building of a brass or iron foundry, from the ground up completing it with the latest and most improved equipments. The S. Obermayer Company will also furnish plans of foundries showing the most economical plans of operating them. They are large importers and refiners of East India Plumbago or Silver Lead or Graphite.

By reason of a misunderstanding between the State Board of Control and J. Loewenberg & Co., lessees of the Northwest Stove Foundry at Salem, Ore., operations at the foundry at the Penitentiary were recently suspended.

The Gurney Foundry Company, Limited of Toronto, Canada, have brought out a line of heavy steel plate Ranges, known as the John Bull, which are referred to as being especially adapted for hotels, hospitals, convents and public institutions. These Ranges, we are informed, are made of the best wrought steel, the plates exposed to the direct action of the flame being covered and protected by asbestos. The company also manufacture an extensive line of Steam Jacket Cookers, Steam Roasters and Steam Vegetable Kettles for hotels and public institutions.

The Hill & Griffith Foundry Supply Company, Cincinnati, is the style name of a new firm who have secured premises immediately adjoining the William Resor Company's Foundry on the Cincinnati, Hamilton & Dayton Railroad. The main building is of brick, three stories in hight, 40 x 120 feet. The cellar will be used for the reception of raw material, which is thrown in through chutes direct from the cars There will also be located the crushers and drying pans. The first floor will be devoted to the packers, of which there are four, and to the shipping department. At the south end of this floor a one-story addition, 30 x 100 feet, will be utilized for the storage of small supplies. The second floor is divided up into offices, warerooms and the milling department and bolting chests. The third floor will be entirely given up to storage purposes. The engine and boiler plant will be located in a separate structure, also of brick, two stories in hight, 33 x 68 feet, the ground floor being occupied with two 5 x 8 Greenwald boilers and a 300 horse-power Greenwald engine. The upper floor, connected by a bridge with the main building, will be given up entirely to the men's bathroom. The entire premises cover approximately 250 x 250 feet, and are admirably adapted for the purpose. Both Mr. Hill and Mr. Griffith are so well and favorably known to the foundrymen throughout the country as to preclude the necessity for any special

mention. The new concern start up with ample facilities.

The Palermo Mica Company, 27 Peck slip, New York, will shortly occupy the premises at 115 Beekman street, near Water, which are now being thoroughly overhauled and renovated for the company's accommodation.

The Eclipse Gas Stove Company, Rockford, Ill., have issued a little pamphlet with a bright red cover, which everybody who gets it is warranted to read through before he lays it down. It is entitled "The Old Fashioned Kitchen," and contains a number of poems contrasting the old days with the modern era, in which the Gas Stove, of course, plays a conspicuous part. The illustrations are of a highly original character, made expressly to suit the poems.

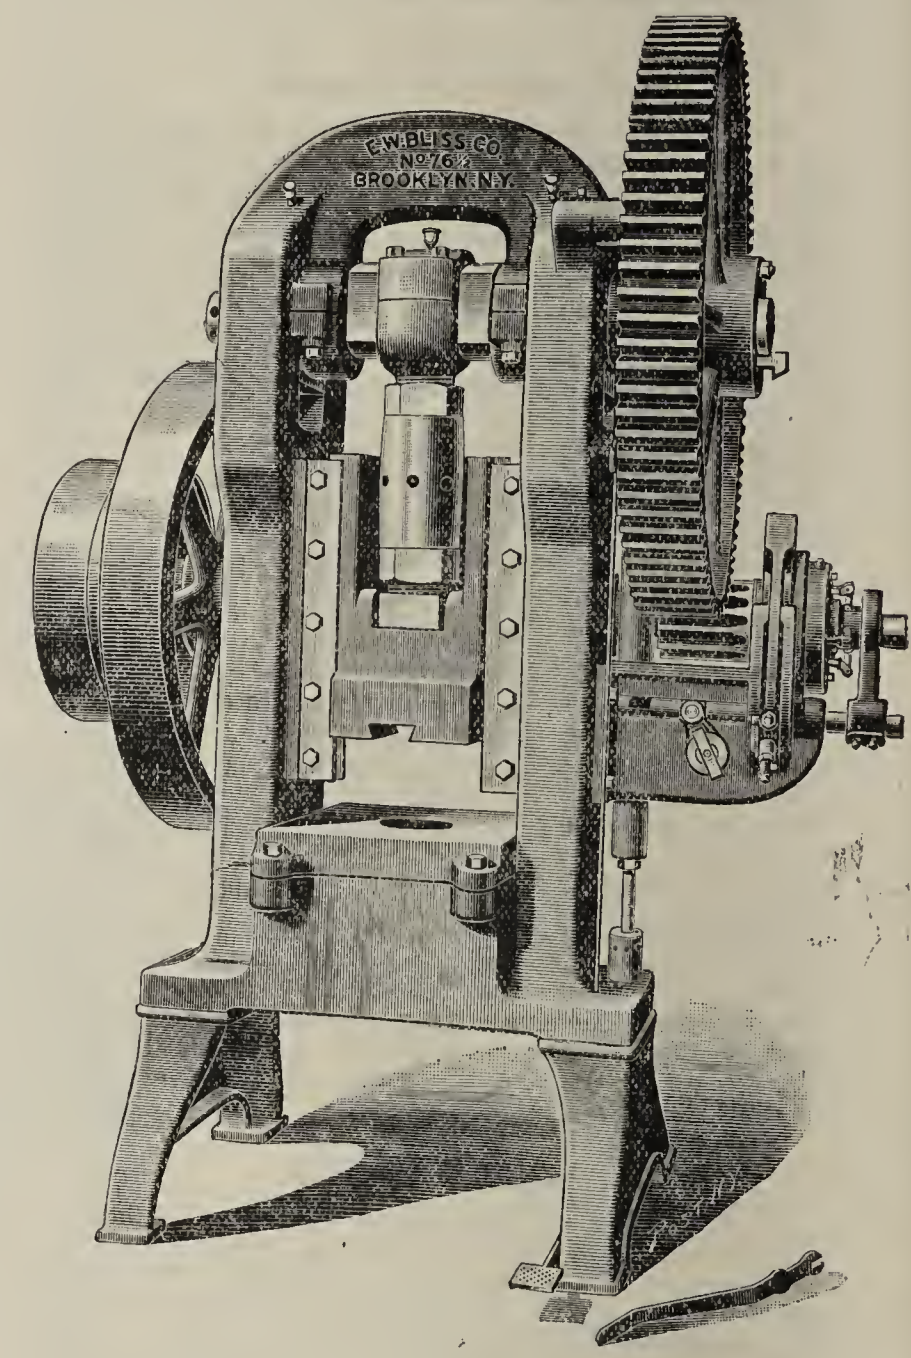
The Excelsior Steel Furnace Company, 38 and 40 West Monroe street, Chicago, have issued a handsomely printed illustrated circular setting forth the special features of their Sectional Double Wall Pipe, of which they are the exclusive manufacturers. Heavy buff colored paper is used with green ink.

A press dispatch of March 24 from Dayton, Ohio, states that the Craig-Reynolds Foundry Company's shops in North Dayton were flooded with 10 feet of water which reached some carbide of calcium. This formed acetylene gas, causing several explosions and a fierce blaze. The fire department had to fight the flames from boats. The damage is estimated at $10,000.

Rumors are afloat in New York to the effect that recent information from South Africa says that "specifications and plans are wanted for the erection of an electric lighting and tramway scheme in East London." As the matter now really stands, for a considerable length of time the people of East London have been desirous of having some private corporation invade their town and, in view of liberal franchises and concessions, build an electric tramway and lighting station. It will be necessary for the company, if found, to bear the cost and risk of the entire undertaking, as there is no one in East London who is willing to invest in the scheme. East London is beautifully situated on the coast of South Africa, and it is the object of the people to make it more of a convenient summer resort by lighting it with electricity and running electric tramways through the city and to outlying sections. A large South African machinery house prepared specifications and bids for the furnishing of these plants some time ago, but the city refused to attempt the undertaking, as it had not sufficient sums. It now seems as though the people were again trying to get some American corporation to carry out their schemes and bear the expense and risk of the undertaking. Other electrical operations which are more liable to take place are the erection of an electric light plant at the Monastery Diamond Mine, Orange Free State, and the substitution of an electric tramway for the present steam road at the Sheba Gold Mines.

A New York journal had it last week that an order had just been placed with a New York office of a pipe mill for 5000 tons of wrought iron pipe for South Africa. The facts of the case are that an inquiry from South Africa for 5000 tons of wrought iron piping has been causing considerable excitement among the trade, but when the real order put in an appearance it called for less than one-tenth of the amount on which prices were asked. In other words, the inquiry which caused all the trouble brought forth an order for slightly more than 400 tons of piping. A manufacturer in the Pittsburgh district, with New York offices, captured the order. Business in this line indicates a good near future, as the demand is increasing steadily. There is no change in values.

President Almeric H. Paget of the Chihuahua & Pacific Railroad Company has signed a contract with the Nassau Construction Company of New York City for the construction of a steam railroad in Mexico, from the sea to the silver mining regions of that country. The total distance from Chihuahua to the Gulf of California is 350 miles, and under the terms of the contract 120 miles are to be completed before November 1. The contract is said to be the largest made in this country for steam railroad construction since 1893.



The works at Lorain, Ohio, have lately taken an order for some street railroad work at Jamaica, and are building complete a street railroad plant, girder rails, special work, &c., for Brazil, the only exception being the cars.

The Baldwin Locomotive Works of Philadelphia have received an order for 15 heavy Mogul type freight locomotives for the Egyptian State Railway. The engines are to be shipped early in May.

The Bliss Straight Sided Power Press.

The machine shown in the accompanying engraving embodies the modifications which the E. W. Bliss Company of 16 Adams street, Brooklyn, have made in their regular line of straight sided presses. These presses are especially adapted for work requiring heavy pressure, such as stamping, punching, blanking and shaping, required in the manufacture of such articles as bicycle crank hangers, pedals, sprockets, saddles, &c., skates, sewing machines and locks. They are also applicable for trimming drop forgings, either hot or cold, in which case they are supplied with a side punch, as shown in the engraving. This punch is used for cutting off purposes.

The shafts are of very large diameter. An automatic clutch insures immediate response to the treadle action. The shaft may be turned back to release the punch if stuck in the die, and it may be locked, so that for safety

The Bliss Straight Sided Power Press.

it is not necessary to throw off the belt when setting dies. The automatic friction clutch used when the presses are geared obviates the difficulties experienced with positive automatic clutches in such machines. It acts instantaneously and avoids entirely the heavy shock which in positive clutches tends to destroy the clutch parts. The large gear wheel, instead of revolving continually, is with these clutches keyed to the shaft and at a standstill until the clutch is brought into action. This constitutes an additional advantage in the saving of considerable wear. Otherwise the clutch acts as usual, causing the shaft to make one revolution and stop automatically at the highest point of the stroke. A cam stripper is applied to these presses when used for piercing and stamping. This type of machine is made in a number of sizes, either with fly wheel or geared, as the nature of the work may require.

A sweeping anti-trust bill was passed last week by the Kentucky Legislature which under the penalty of forfeiture of charter prohibits combinations of persons or corporations organized for the raising or lowering of the price of any article so as to prevent competition in any line of trade or to create or carry out restrictions on trade, or to limit or reduce the production of merchandise, commodities, &c.

TRADE REPORT.

METAL MARKET.

Pig Tin.—The metal has been quiet during the past week. Purchases were fair in amount and generally for consumptive account. Prices have advanced slightly, largely in sympathy with higher quotations from London. Arrivals during the week have been light, and the quantity afloat and due here this month will hardly be sufficient to fill the demand for consumption. The market was very steady at the close. Jobbers quote Straits Pig in retail quantities at 15c. to 15¼c. per lb.

Copper.—The market here has been quiet, with no large sales, but a fair run of moderate sized purchases. The absence of spot Copper keeps prices as firm as ever. In London there was quite a smart advance during the week. Some good export shipments have been made on large contracts made previously, the total amount sent abroad reaching 8500 tons so far this month. Very few new sales for export have been made. All varieties of the metal remain quite firm. Lake Ingot in small lots from stock is quoted at 13¼c. per lb., and Ansonia Grade Casting Copper at 12½c.

Sheet Copper.—Prices remain firm and the consumptive movement shows improvement. In retail quantities from store Sheet Copper is generally quoted at 16c. per lb., basis.

Pig Lead.—There has been a change for the better in this metal during the past week. Consumers show more disposition to buy, while holders are less anxious to sell. As a consequence, wholesale prices have stiffened from 2½ to 5 points. Some good business is understood to have been put through within the past few days, and the tone of the market generally is better, although it cannot be said to be notably active. Small lots of American Pig from store are quoted by jobbers at 4⅛c. to 4¼c. per lb

St Louis advices are as follows : The market has eased off somewhat during the past week. Offerings have been quite free and buyers have been slow to purchase, and a weakening tendency in the price is quite evident.

Spelter.—Is very firm and prices show an inclination toward advancing. Consumers have come into the market recently and made large purchases, while the production if anything is at the present time a little behind the consumption. Large exportations to Europe also tend to stiffen the market, which is advancing on the other side. The outlook is regarded as bright for better prices and an active demand. Jobbers' prices for good Western brands in retail lots rule at about 4.65c. to 4¾c. per lb.

St. Louis advices are as follows : There is no change to note in this metal. At last week's prices buyers seem willing to purchase, especially so as there is very little offered at these prices. Stocks are light and are kept so by the shipment of liberal quantities for export.

Antimony.—The market is characterized by great firmness. The demand is fairly active and stocks somewhat light. Small parcels from stock are usually quoted at 8½c. per lb. for Cookson's, 8c. to 8¼c. for Hallett's and 7½c. to 7¾c. for Japanese.

Nickel—There is a heavy demand for this metal at present, and prices have shown a tendency to mount up. Small lots are generally quoted at 37c. to 38c. per lb.

Aluminum.—A fairly active demand continues for this metal and prices remain unchanged as follows : No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb.; 100-lb. lots, 30c.

Tin Plate.—It can hardly be said that this market shows any tangible improvement, for the volume of business has been very moderate in the past week, and recent contracts have been placed at prices which show no improvement over the low level that has ruled for some weeks. Yet there seems to be rather more confidence in the trade as the season advances, and it is felt that the large consumers in the canning trade must shortly come into the market. The temporary stoppage of some of the mills on account of floods, and the renewed difficulty in obtaining prompt supplies of steel, which is hindering operations in a few works, are likely to involve delays in deliveries as well as more or less restriction in the current month's production. This is a factor which should tell on the market, and with any rush of orders may tend to create a shortage later on. The stiffening of the raw material is also a "bull" factor. On these grounds many in the trade look forward hopefully to better prices and an enlarged demand in the near future. Meanwhile uncertainty regarding the proposed consolidation and the prevailing war talk are undoubtely keeping back purchasers. The retail trade shows some improvement with the advance of the season, and jobbers in this quarter are holding their prices for small lots fairly firm. Moderate sized quantities of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. There is no change in the position of Foreign Plates, which are selling slowly at prices which remain largely nominal.

Sheet Iron.—The demand for Sheets continues fairly free. Some good sized orders for Black Sheets have been placed in the past week, and the mills, as a rule, are well sold up for some time to come. Some mills are refusing orders for future delivery at the current prices, in view of the advancing tendency in Steel and the difficulty in securing sufficient supplies of the raw material. Yet retail prices do not respond to these influences, remaining low and unsatisfactory. Galvanized Sheets are in active demand, and prices are somewhat firmer. Jobbers in this quarter quote small lots of No. 27 Common Black Sheets at 2.40c., and Galvanized Sheets at 80 per cent. off the list.

Chicago advices are as follows: Manufacturers' agents report a light demand for Black Sheets, which are weaker owing to the efforts made by some of the mills to unload accumulated stocks. Galvanized Sheets are more active, with some heavy transactions. Jobbers continue to quote small lots from stock at 2.30c. to 2.40c. for No. 27 Black and 80 and 2½ to 80 and 5 per cent. off for Galvanized.

Old Metals.—The market shows little change. An active demand still exists for Scrap Copper and Brass for domestic consumption, but Scrap Iron is rather quieter. Prices show no quotable change. Yard dealers in this city and vicinity are paying the following rates for moderate sized lots, delivered here:

Heavy Copper	per lb. 9⅞c.
Light and Tinned Copper	per lb. 9¼c.
Heavy Brass	per lb. 6½c.
Light Brass	per lb. 5½c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 3 c.
Zinc Dross	per lb. 2.70c.
Zinc Skimmings	per lb. 1.10c.
Sal ammoniac Skimmings, per ton	$20 to $24
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$8 25
Heavy Cast Scrap, per gross ton	8.25
Stove Plate Scrap, per gross ton	5.75
Burnt Iron, per gross ton	4.25
Tin Plate Scrap, per ton	2 25

THE IRON MARKET.

There never was a time when, generally speaking, the Iron and Steel plants in the United States were as fully employed as they are at the present. One of the largest works in the West has actually been forced to buy a little Steel in the open market, its own enormous output being inadequate. Another great plant expects to turn out close to 200,000 tons of Ingots in the month of March. With isolated exceptions, the modern Steel plants in the United States are rushing and there is considerable complaint among consumers of delays in deliveries.

With cloudless political skies, there could be but one inference to draw from this state of affairs, coupled with the fact that order books are well filled for months to come. But prolonged apprehension concerning our relations with Spain, or actual rupture, would check a very large amount of constructive work and bring out cancel lations compared with which orders for war material

would fade into insignificance. War might afford opportunities for speculators, but the majority of manufacturers would suffer, and our growing export trade might collapse entirely.

As yet, however, the Iron trade has been proceeding serenely and the movement toward harmonizing contending interests goes on. The Western Wire consolidation is practically concluded, though it may yet gather additional smaller concerns into its fold. It is understood that the sales territory is to be divided into three districts, the Eastern, Central and Western, each handled by a general manager. The course of the markets in the near future may be dependent upon the attitude assumed by the large outside interests.

There is a movement on foot to interest all the leading producers of Foundry Iron South, East and West in some scheme to restrict production; or, in other words, render comprehensive the arrangement talked of by the majority of the Alabama and Tennessee makers. With the frayed reputation of all "gentlemen's agreements" on the one side, and the fear of collision with Federal authorities on the question of trusts on the other, any success must be regarded as a remarkable *tour de force*. The conviction is growing, not alone among producers, but also among buyers, that nothing short of actual consolidation can keep contending interests up to a mark, however sharply drawn and carefully fenced in.

One of the latest schemes, which it is believed has chances of success, is to get the Mesaba Ore interests to unite in advancing prices. This would probably prove of most interest to the furnace plants making foundry irons.

It is gratifying to note that a very good tonnage of orders is steadily coming out, but the nerve of manufacturers has been shaken by the recent proofs of a wonderful elasticity in productive capacity, and prices therefore remain at a low level.

Pig Iron.—The market in New York and vicinity continues irregular as to prices and quiet so far as new business is concerned. There has been some movement in Southern warrants. We note some large sales of special Charcoal Iron for army and navy work. We quote as follows: Northern brands, No. 1, $11 to $11.50; No. 2, $10.50 to $11; No. 2 Plain, $10 to $10.50. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.50; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

In the Chicago market, inquiries continue to come up and a great deal of Iron is still to be bought to satisfy consumers. It is evident, however, that it must be had at a reasonable price. Buyers will not pay advanced rates, except for small lots for special purposes. The Southern producers are apparently willing to meet buyers' views in this respect. They are keeping their prices down, and some companies outside of the Southern combination are reported to be shading the regular schedule. The transactions of the week covered a good tonnage in the aggregate, but the largest deal is reported to have involved only 500 tons. The local furnace companies are almost out of the market, holding prices so far above ordinary rates as to check business which would naturally come to them. A moderate movement is taking place in Charcoal Iron, but no large transactions have recently transpired in this line. We quote for cash as follows:

Lake Superior Charcoal	$12.00 to $13.00
Local Coke Foundry, No 1	11.50 to 12.50
Local Coke Foundry, No. 2	11.00 to 12.00
Local Coke Foundry, No. 3	10.50 to 11.50
Local Scotch, No. 1	11.50 to 13.00
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.35 to 10.70
Southern Coke, No. 3	10.10 to 10.40
Southern, No. 1 Soft	10.85 to 11.00
Southern, No. 2 Soft	10.35 to 10.70

Philadelphia advices as to Pig Iron indicate that it is a very hard market to quote. Some get more money than they could get earlier in the month, others have to take a little less. The only explanation of this is that some Irons are comparatively scarce, others are too plentiful, consequently prices have to be adjusted according to circumstances. Sales of No. 2 X have been made at $11.25, more at $11 and at $10.75, and some at less than $10.75. Still if the market is fairly averaged it will be found that more business is being done and that prices are not lower unless quality is in proportion. There is an impression that things are getting into better shape, and while the indications in this respect are not very distinct the chances of improvement are not without some foundation. The range for all grades is about as follows, with the usual rebate according to freights at points within a radius of 100 miles south or west: No. 1 X Foundry, $11.75 to $12; No. 2 X Foundry, $10.75 to $11; No. 2 Plain, $10.40 to $10.50.

In the Pittsburgh market Bessemer Pig is held firmly. There has not been much trading done buyers holding off to await the outcome of the plans for the new Pig Iron Association, the final details of which are nearly completed. Foundry Irons are very dull. We quote, f.o.b. cars Pittsburgh: No. 1 Foundry, $10.40 to $10.50; No. 2 Foundry, $9.90 to $10; Bessemer, $10.40 to $10.65, depending on delivery.

The feeling that Iron will go lower if it changes at all seems to dominate the Cincinnati market just now. Beyond supplying immediate needs buyers will not figure, and as a consequence there has been nothing doing except in a retail way, with the aggregate something below the average. Machine shops, agricultural works and general foundries are all very busy, and it is reported that there is a demand for Malleable Castings, which the plants in this section are unable to supply. There is no complaint regarding car service and deliveries are holding up remarkably. Thus while new business is dull and immediate prospects for trade not good, the general situation is very satisfactory. Quotations are nominally unchanged, and in the absence of any test on the part of buyers may be said to be steady. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$9.75 to $10.00
Southern Coke, No. 2	9.25 to 9.50
Southern Coke, No. 3	9.00 to 9.25
Southern Coke, No. 1 Soft	9.50 to 9.75
Southern Coke, No. 2 Soft	9.25 to 9.50
Southern Coke, Gray Forge	8.50 to 8.75
Southern Coke, Mottled	8.50 to 8.75
Ohio Silvery, No. 1	12.00 to 12.50
Ohio Silvery, No. 2	11.50 to 12.00
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00

There is nothing in the St. Louis Pig Iron situation to encourage sellers, as consumers continue to buy as their immediate needs require and cannot be induced to change this policy. Sales during the week were light, being largely confined to carload lots, with an occasional order for 100 tons. We quote as follows for cash, f.ob. cars St. Louis:

Southern, No. 1 Foundry	$10.00 to $10.50
Southern, No. 2 Foundry	9.75 to 10.00
Southern, No. 3 Foundry	9.50 to 9.75
No. 1 Soft	9.75 to 10.00
No. 2 Soft	9.50 to 9.75

CHICAGO REPORT.

Scrap.—Business has latterly been quiet. Consumers seem to be well supplied. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7.50	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	5.50	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.50	....
Old Gas Pipe and Boiler Tubes	6.00	....
Cast Borings	3.25	....
Turnings	4.50	....
Horseshoes	8.50	....
Copper Wire and Heavy	....	10¼c.
Copper Bottoms	....	9¼c.
Copper Clips	....	10 c.
Red Brass	....	8½c.
Yellow Brass	....	7½c.
Light Brass	....	5¼c.
Pipe Lead	....	3 c.
Tea Lead	....	3 c.
Zinc	....	3¼c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—The market is dull. The prices of carload lots of 12 tons minimum are as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	7.00	7.25
Council Bluffs, Iowa	7.00	7.25
Lincoln, Neb	7.15	7.40
Sioux City, Iowa	7.50	7.75
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.55
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6.75
Des Moines, Iowa	7.00	7.25
Davenport, Iowa	6.30	6.55
St. Joseph, Mo	7.00	7.25
Leavenworth, Kan.	7.00	7.25
Omaha, Neb	7.00	7.25

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

With the advance of the season there is an increasing movement in spring goods, and in some of these lines trade is referred to as large and satisfactory. This is especially the case in the West, where business is active, with an excellent outlook for the summer. There is also more trade in Builders' Hardware and Tools, which it is hoped will increase as the season progresses. With the announcement of the practical abandonment of the efforts which have for so long a time occupied the attention of the trade looking toward the consolidation of the Wire Rod and related interests, the apparent successful organization of the American Steel & Wire Company is a fact of some importance. It is the aim of the large companies whose interests are thus consolidated to control as far as they can the market for Wire Nails, Barb Wire, &c., anticipating the accession of some other companies to their organization, and hoping also for the general maintenance by their leading competitors of the prices which they may establish. It is thought likely that the effect on the market will thus be felt in the announcement of somewhat higher prices on these lines. There is no doubt that the talk of foreign complications has the effect of retarding business, as merchants and manufacturers are unwilling to engage in new enterprises of moment with the possibility of disturbance in business conditions. Reports, on the whole, from the different trade centers are encouraging, but business in New England and the East generally continues somewhat backward as compared with that of other portions of the country.

Advices from Chicago.—Shelf Hardware jobbers report a still heavier business, the demand having increased considerably during the week. New stocks have been an important feature. Mail orders show a decided gain. The movement from retailers is so rapid that buyers cannot wait until the visits of salesmen. The demand is particularly heavy for seasonable goods, such as Poultry Netting, Screen Doors and related articles, in which the movement is stated to be in excess of that of any previous year. A very good trade, however, is noted in general Shelf Hardware. Building operations throughout the country are evidently on a larger scale than for some years, and Builders' Hardware is consequently in good demand. Staple goods are also being shipped freely. The movement of Wire Nails and Barb Wire is steadily increasing. Some changes are being made in prices, particularly in Bolts, Nuts and other heavy articles. Carriage Bolts have been marked up by the manufacturers during the week to 75 and 10 and 10 per cent. Heavy Hardware jobbers are also feeling an increased movement and report a very good demand, not only for Wagon and Carriage Stock, but also for Iron and Steel.

Advices from St. Louis.—The Hardware jobbing trade enjoys a continuance of the activity which has characterized the market since the opening of the year. The West and Southwest are buying more liberally than for years past, and that these goods are being marketed is evident by the heavy increase in telegraph orders. The spring trade has set in early and gives promise of continuing late. Garden Tools are being ordered in very liberal quantities and such staples as Nails and Barbed Wire, Screws, Bolts, &c., are very free sellers. Copper goods are active and prices higher. Galvanized Iron and Tin Plates are also active. Reports from all jobbers indicate that in Builders' Hardware the present year will likely prove a record breaker and some houses find it difficult to keep up their assortment in this line, so heavy is the demand.

NOTES ON PRICES.

Wire Nails.—The Wire Nail market is, so far as prices are concerned, in substantially the same condition as a week ago, though there has been perhaps a slight yielding in quotations. The volume of business, however, has not been heavy, the trade maintaining a waiting attitude with a view to seeing what the course of the market will be. The important fact in this connection during the past week has been the practical consummation of the negotiations referred to in our last issue between the Consolidated Steel & Wire Company, the Salem Wire Nail Company, the American Wire Nail Company, I. L. Ellwood Mfg. Company, HP Nail Company and American Wire Company. These companies have, it is announced, reached an agreement which results in their practical consolidation under the name of the American Steel & Wire Company, the formal consolidation awaiting the expiration of the options, terminating April 1, which were given to those identified with the movement for amalgamating the Wire Rod interests. It is understood to be the intention of the consolidated companies to make an advance in the price of Nails and Barb Wire with the expectation that the leading manufacturers outside of this organization will maintain prices. The effect of this unifying of the interests of so many prominent manufacturers will, it is anticipated, have a good effect on the market, diminishing competition and making it an easier matter to hold up prices to a level that will be at least profitable. Prices in the New York market are substantially the same as last week, small lots from store being quoted at $1.65 to $1.70.

Advices from Chicago.—It is settled that Chicago will be the headquarters of the new American Steel & Wire Company formed last week. The policy of the new consolidation is awaited with a great deal of interest. Hardware jobbers are completely at sea, but the general opinion inclines to the view that not much change will be made in prices, if any. Meanwhile the market from first hands is rather quiet. Jobbers probably have enough Nails to carry them over for a few weeks and will await developments. Jobbers quote small lots from stock at $1.55 to $1.60, and report a very good demand from the retail trade.

Advices from St. Louis.—The Wire Nail market continues quite active and prices are decidedly firmer than heretofore. No unusual advance in Wire Nails is anticipated as a consequence of the consolidation, but as most producers have been complaining for several months past that the price of Wire Nails was pretty close to cost, a moderate advance over the prices ruling to-day will be in order.

Cut Nails.—The Cut Nail market continues uniform and devoid of special feature. The price which has prevailed for some time is pretty regularly maintained. The volume of business is fair, but does not as yet exhibit the increase which was anticipated at this time.

Advices from Chicago.—Prices are a little easier now and small lots from stock are to be had at $1.40 to $1.45.

Advices from St. Louis.—The demand for Cut Nails does not show any improvement and manufacturers are making some extremely close prices to secure business. Jobbers are selling small lots from store at $1.35 to $1.40, base.

Barb Wire.—The Barb Wire market is practically unchanged in the matter of prices. The organization of the American Steel & Wire Company has not as yet had a perceptible effect on the market, but it is hoped by those interested in the movement that higher prices will soon be announced and maintained. The attitude of outside manufacturers has obviously much to do with the success of the plan, but assurances have been given that the consolidation prices will be maintained as far as possible.

Advices from Chicago.—The same influences are operative in the Barb Wire trade as above referred to under the head of Wire Nails. The market is quiet at present. Manufacturers report that all of them have light stocks on hand and that jobbers are by no means supplied with contracts to cover their spring requirements. Small lots from stock are selling at $1.65 for Painted and $1.95 for Galvanized.

Advices from St. Louis.—There is no cessation in the demand for Barb Wire and prices are being maintained without any particular effort. Jobbers ask $1.70 to $1.75 for small lots of Painted Wire, with the usual advance for Galvanized.

Wrought Iron Pipe.—The market for Wrought Iron Pipe has weakened somewhat in the past week, and slight concessions are made from the prices quoted a week ago. Dealers name four 10's extra beyond the base prices for small lots.

Glass.—There is no change in the local Window Glass market, limited demand being the rule, at 85 and 15 per cent. discount. Reports from association factories indicate that they are getting a fair amount of business and that Glass is not being stocked at factories. The output of most, if not all, independent factories is contracted for or controlled by jobbers.

White Lead.—The improvement noticed last week for White Lead in oil keeps up in a moderate way, but is more pronounced in the West than East. Prices remain the same. Terms are also unchanged. A fair amount of business is being done in Dry Lead.

Linseed Oil.—There is somewhat of an improved demand as the season progresses, representing a fair average spring distribution. Out of town competition is keen, affecting the tone of the market unfavorably. The recent slow but continued decline in the prices of raw material also has a weakening tendency. Prices, however, are without change.

Spirits Turpentine.—Prices during the past week have shown a further decline, retail prices for single barrel lots being quoted at about 35c. Large buyers are holding back until a freer movement of the new crop still further reduces values Business is confined to moderate purchases for current needs.

TRADE NOTES.

The Viaduct Brass Works, Cleveland, Ohio, are to be dismantled and sold out.

The New Jersey Aluminum Company, Newark, N. J., have removed from 60 Arlington street to larger quarters at 350 Plane street. The change has been rendered necessary by the increasing business of the concern.

The Joseph Dixon Crucible Company, Jersey City, N. J., issue an interesting leaflet on friction and lubrication containing much information, among other things a summary of tests conducted by Professor Thurston comparing graphite lubricants with the best sperm oil, very much to the advantage of the former.

The Whitely Mfg. Company of Camden, N. J., have been incorporated, with a capital of $300,000, to produce Metal Goods of all descriptions. The incorporators are William N. Whitely of Springfield, Ohio ; William T. Stillwell of Baltimore, John R. Williams of Merchantville, N. J., and W. N. Gibbs and George S. Graham of Philadelphia.

It is probable that the armor plate mills of the Carnegie Steel Company, Limited, at Homestead, Pa., will be started up within a short time. Work will then be started on the order for armor plate recently secured by this concern from the Russian Government.

The report of the sinking of the steampship "Coya" of the William R. Grace & Company's lines which was circulated last Saturday has caused much excitement among New York machinery houses. The freighter was bound for the western coast of South America and had a large amount of American machinery on board. It has developed since the report of her sinking, however, that the news must have been erroneous, as in consideration of the time of her leaving New York and the point where she was supposed to have sunk all conflict with her schedule. The company's officers assert that she could not have reached the spot where she was reported to have been seen submerged at the time reported. The general belief therefore, is that it must have been a wreckage other than the "Coya" which was seen last Saturday.

The Minnesota Iron Company have declared a quarterly dividend of 1½ per cent., payable April 15. Transfer books close March 31. It is stated that the company did not originally intend to commence paying dividends until July, but the year 1897 was a very profitable one and justified such action at an early date. The large expenses for improvements for lake steamers for several years past have all been made out of earnings, and there was no reason why stockholders should not begin to receive a part of the surplus earnings. There is little doubt that business this year will be larger than last, as far as sales of ore are concerned, and it is anticipated that the profit per ton will also be larger. There is no apparent reason why 6 per cent. dividends cannot be maintained, as the company are fully equipped in every department to do a larger business than they have ever had.

D. H. Smalley & Co. of Aurora, Ill., manufacturers of hand power punches and shears, have just completed the fifth new pattern machine since July last, which will be known as the Aurora punching machine No. 9. In this machine the lever works forward, enabling one man to feed and operate it conveniently. This pattern will punch up to a ½-inch hole in ⅜-inch iron or steel. The punches and shears made by this firm are of more than ordinary interest to jobbers and dealers. They are not only modern and well built, of unusual power and capacity, but are sold at a moderate price. The advertisement of this firm will be found in another part of this issue.

Edward Miller & Co., Meriden, Conn., whose extensive line of bicycle sundries has been recently shown to the wholesale trade in all parts of the country, now includes the A1 bicycle lamp, Everlit bicycle lamp, Miller's beacon light, Royal beaded bell and Burdick cyclometer. We are advised that this line is meeting with much favor in the hardware trade, and many retail dealers in all parts of the country are now handling the goods. Edward Miller & Co. have been manufacturers of lamps for many years and their factory is one of the largest and best equipped in the country for light metal work. The plant was established in 1844 and the experience gained by a long period in manufacturing has been utilized in making their line of bicycle sundries as perfect as possible.

The Edward J. Brandt-Dent Company, Watertown, Wis., are manufacturing the Brandt automatic cashier, which is somewhat similar in appearance to the well known cash registers, but has its own distinctive features. It is made in several styles, the largest one accomplishing the payment of any amount from 1 cent to $5, giving the usual divisions of change, by depressing but one key. The operator makes no selection of coin and does no counting. He merely depresses the key calling for the amount needed and the change is instantly and correctly made. Other machines make change up to $1 or the fraction of $1, down to 1 cent or in multiples of 5 cents, &c.

The Schenectady Locomotive Works, Schenectady, N. Y., have received an order for 12 locomotives for the Kiu Shiu Railroad of Japan. This is a duplicate of a similar order completed for the same railroad last year. The locomotives are to have cylinders 16 x 24, and are to be 3 feet 6 inch gauge.

Pays for a Technical Education at Home.

Also courses in Steam Engineering, Mechanical, Electrical, Civil, and Mining Engineering, Mechanical and Architectural Drawing, Chemistry, Shorthand, Bookkeeping, and English Branches.

ALL WHO STUDY GUARANTEED SUCCESS.

We have helped thousands to better positions and salaries. Send for free circulars, stating the subject in which you are interested.

THE INTERNATIONAL CORRESPONDENCE SCHOOLS,
Box 968, SCRANTON, PA.

Established 1891. 35,000 Students and Graduates.

Learn Pattern Cutting by mail

A COMPLETE COURSE OF STUDY, under the instruction of a practical Cornice-maker, each individual receiving careful instruction.

STUDIES CARRIED ON AT HOME without interrupting your work, and embrace the entire subject, from the simple use of Draughting Instruments, to the most intricate problems of Triangulation.

ALL CLEARLY EXPLAINED, particular attention being paid to the reading of plans, and the practical application of Drawing to the Cornice-makers and Tinners Trade, together with practical helps on Costs and Estimating.

COSTS BUT $2 PER MONTH.

Lessons may be started at any time and continued without interruption until you become proficient.

Circular giving further particulars on application.

CHARLES D. MONTAGUE,
SPRINGFIELD, MASS.

Pattern Lessons given in English, French or German as desired by the Student.

AVOID MISTAKES AND LOSS

BY USING THE

CONTRACT and ESTIMATE RECORD BOOK FOR PLUMBERS.

By B. H. JESSUP.

OFFICE EDITION. (Second Enlarged Edition) 200 Pages. Arranged for 100 Estimates, size 9 x 12 inches, cloth, $2.00.

POCKET EDITION. 200 Pages. Arranged for 50 Estimates, size 3½ x 8 inches (oblong), flexible, cloth, $1 00

Plumbers will find the use of the Contract and Estimate Record Books a great saving in money and time.

These carefully prepared books offer a means of recording systematically and with little trouble each estimate or contract and will be of especial value to the trade because they give all the items in connection with each estimate, by which the danger of omission and error is avoided.

Each book contains a list of all material likely to be used in any ordinary house, and parallel columns give space for entering the cost.

OFFICE EDITION.

This edition is specially adapted for desk use The improvements and additions now introduced make this a perfect estimate book.

An alphabetical index is given in the front of this book for entering the names of those for whom estimates have been furnished, together with the number of the page on which the estimate is to be found in detail.

POCKET EDITION.

This book is printed on thin, strong paper, and arranged in the most compact and handy form for pocket use.

At the beginning of each form is a space for the name of the person for whom the estimate is made, and the date.

Plumbers will be well repaid who depart from old or imperfect methods of keeping track of work, and take these books into their shops for practical use.

Sent, prepaid, on receipt of price by

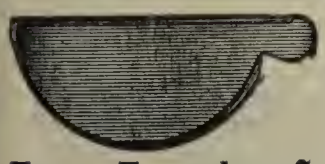
—Latest Trick of the Pickpocket.—An Englishman recently took a seat at a café table in Paris. A Frenchman sat on the other side of it. He began to play with the lever of a seltzer siphon, when suddenly, and seemingly by accident, a stream of the aerated water struck the Englishman in the face. The Frenchman apologized profusely and wiped off the water with his own handkerchief. After the polite Frenchman had gone the Englishman discovered that his purse containing nearly £500 had also disappeared.—*London Weekly Telegraph.*



—The Difference.—"This razor you sold me was defective. I want to change it for another one," said the customer.

"All right," replied the salesman at the department store. "You might as well sit down. It'll take about fifteen minutes to go through the whole operation. We have a system for making exchanges, and it takes"——

"And while I am about it, I want to return a half-dollar you overpaid me by mistake in giving me the change. I suppose that will have to go through the same process."

"No, I can fix that for you in a second. All you have to do is to hand it back. Thanks."—*Chicago Tribune.*

BERGER BROS. CO., Mfrs. of Tinners' Hardware and Roofers' Supplies.

Factory at Germantown Junction. Office and Stores, 231-237 Arch St. Philadelphia.

Don't grieve

when you look over your stock of tinware and realize how small a part of it, if any, is the product of your own hands. The retrospect certainly is not cheering. But instead of repining for the "good old times" it would pay you to turn your thoughts to "good old time tinware." There's where your opportunity to reclaim old trade comes in. People like tinware for cooking purposes as well as ever they did; it cooks quicker, and is not open to the objections made to vessels of iron coated with chemicals—but they don't like to buy new outfits every month or so because the tinware commonly sold is not serviceable. We can furnish the "good old-fashioned tin plates"—GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES, made by the same methods that were employed in tin plate making years ago—and you can then make tinware which will last years instead of months, and sell it at a reasonable price, with your guarantee as to its durability. Try a box of these plates, it is impossible to "overpraise" them.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Iron Bars, by the good old fashioned hand methods employed 50 to 75 years ago in making charcoal tin plates, insuring absolute freedom from pinholes. No better plate *is* made; no better plate *can* be made. For tinware or roofing they are unequaled. Send for a sample.

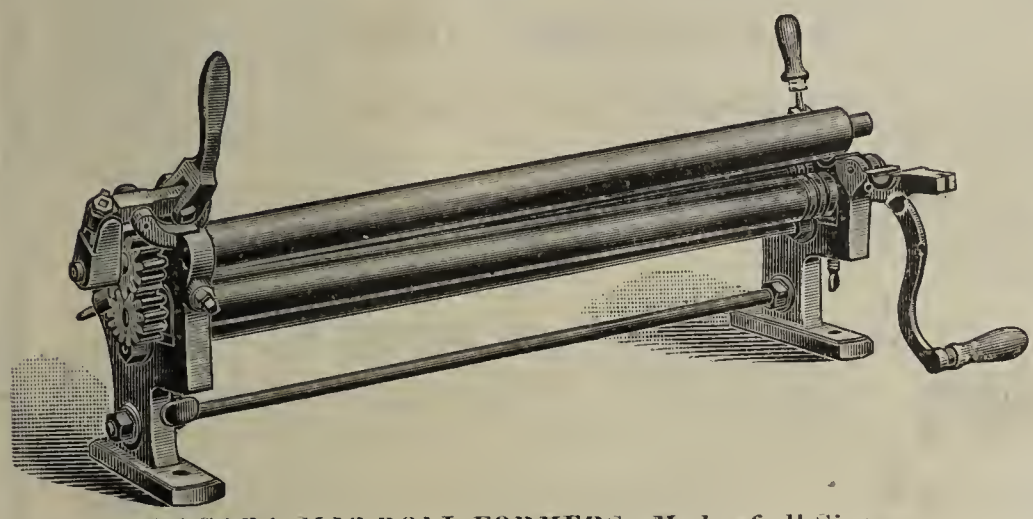
OF EVERY DESCRIPTION

Manufactured by

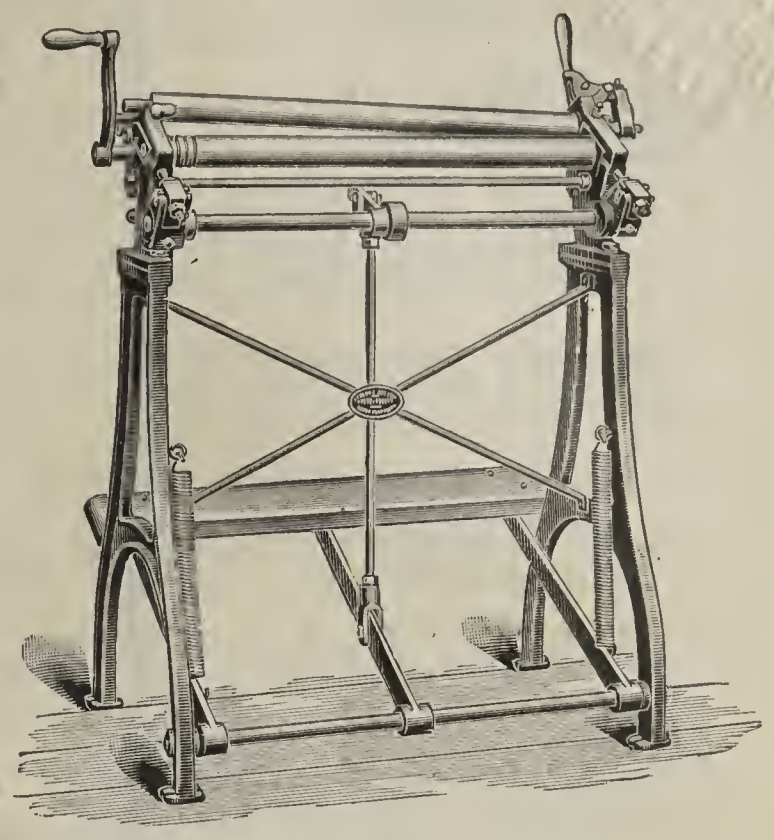
BERTSCH & CO.,



CAMBRIDGE CITY, IND.

Niagara Machine and Tool Works,

BUFFALO, N. Y.

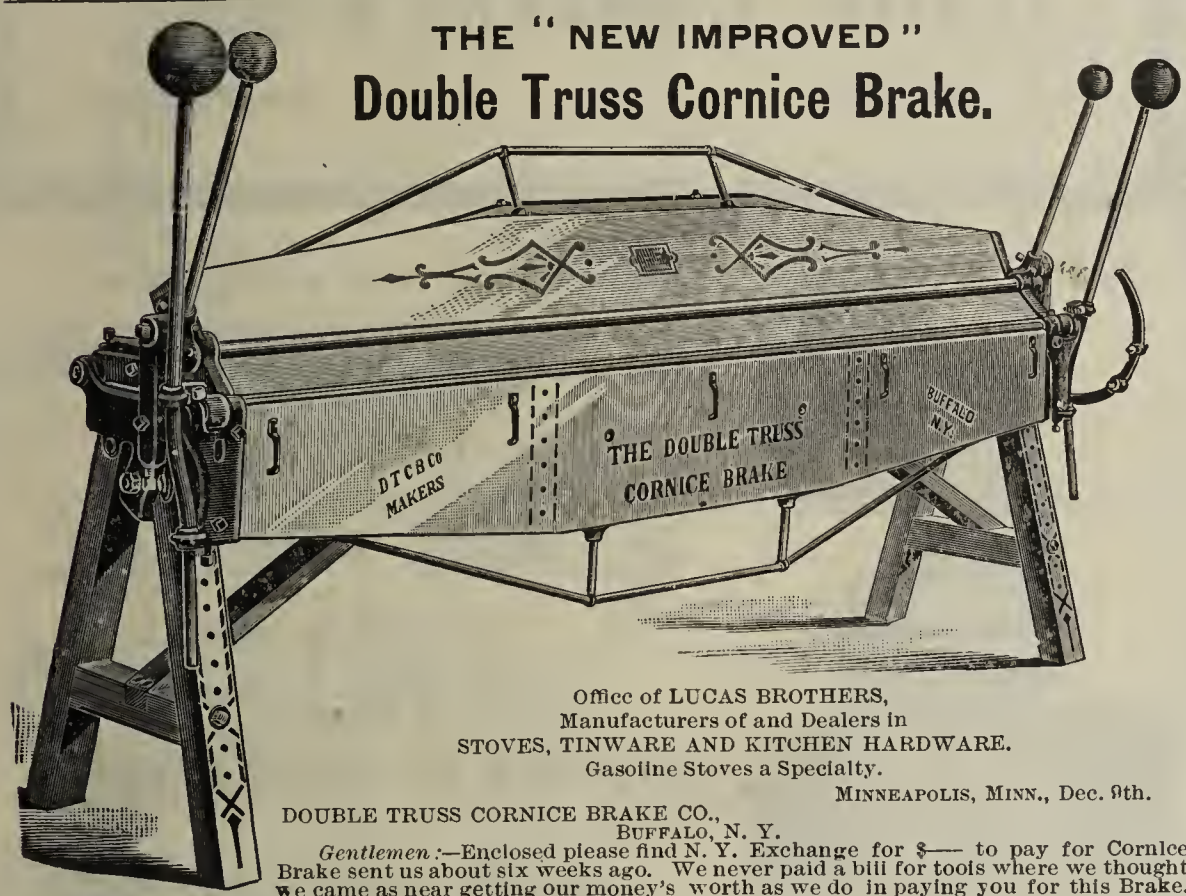


Manufacturers of

Tinsmiths' Tools, Shears, Presses, Dies and Special Machinery for Sheet Metal Work.

NIAGARA SLIP ROLL FORMERS. Made of all Sizes.

With simple and quick-acting mechanism for lifting the one end of the upper roll and holding it suspended while work that has been formed around it is being removed.



OVAL FORMER WITH SLIP ROLL.

In addition to forming round cylinders, this machine is adapted for forming oval, oblong and irregular shapes. The back or forming roll can be raised and lowered instantly to any desired position by means of the foot treadle attachment. The operator is left with both hands free to handle the sheet. Adjustable stops are provided to fix the highest and lowest position of the forming roll, according to the curve desired. The upper roll has a device for raising its one end and holding it suspended while slipping off the work.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

—OVERSTOCKING.—When a mistake has been made of over-purchase in a certain line of goods, it is far better to reduce the price and get rid of the stock than to hold it over for another season. The first loss is the best loss, so sell for what the goods will bring, irrespective of worth. This is the only wise course to pursue. The mistake has been made and cannot be rectified. Wisdom in the choice of stock for the future will be gained by the experience. Some merchants persistently harbor old goods until their storerooms and shelves are clustered up with a valueless conglomeration of odd sizes and styles that even a ragman would want to sort before purchasing.—*Bookseller, Newsdealer and Stationer.*
